## II Y D R O S T A T I C

ASCIENCE which treats of the weight, motion, and equilibria of liquid bodies. Under this head, not only accounts of the nature and properties of floids in general are introduced, and the laws by which they act; but alio the art of weighing folid bodies in fluids, in order to difcover their \{pecific gravities.

## Sect. I. of Flutds in general.

## Fluid de.

 fincd, \&se.Sik lfaac Newton's definition of a fluid is, That it is a body yielding to any force imprefed, and which hath its parts very eafly moved one among another. Sce Fluidity.

This definition fuppofes the motion fpoken of produced by a partial preffure; for in the cale of an incomprefible fluid, it is demonftrated by Dr Keil, ihat under a total or an equal preffure, it would be impoffible that the yielding body hould move.

The original and conflituent parts of 月uide are by the moderns conceived to be particles fmall, fmooth, hard, and Spherical: according to which opinion, every particle is of itfelf a folid or a fixed body; and, when conlidered fingly, is no fluid, hut becomes fo only by being juined with other paticles of the fame kind. From this definition, it hath been concluded by fome plilofophers, that fome fubftances, fuch as mercury, are eflentially fluid, on account of the particular configuration of their particles; but later difcoveries have evinced the fallacy of this opinion, and that fuidity is tusly to be reckoned an effect of heat. See Fluidity.

That fuids have vacnities, will appear upon mixing falt with water, a cercain quantity whereof will be diffolved, and thereby imbibed, without enlarging the slimenfions. A fluid's becoming more buoyant, is a certain prool that its fpecific gravity is increafer, and of confequence that mary of its vacuities are thereby silled: after which it may fill receive a certain quantity of other diffoluble bodies, the particles whereof are adapted to the vacancies remaining, without adding any thing to its bulk, though the ablolate weight of the whole finid be thereby increafed.

This might be demonttrated, by weighing a phial of rain-water critically, with a nice balance: pour this water into a cup, and add falt to it ; refund of the clear liquor what will again fill the phial ; an inereafe of weight will be found under the fame dimenfoula, from a repletion, as has been faid, of the vacuities of the freth water with faline particles.

Vol. IX. Part Io

And as fluids have vacuities, or are not perfectily denfe; it is alfo probable, that they are compounded of fmall fpheres of different diameters, whofe interftices may be fucceffively filled with apt materials for that purpofe: and the fmaller thefe interftices are, the greater will the gravity of the fluid always be.

For inflance, fuppofe a barrel be filled with bullets in the molt compact manner, a great many fmall thot may afterwards be placed in the intertices of thofe balls, the vacuities of the thot may then be replenifhed with a certain quantity of fea-fand; the interfices of the grains of the fand may again be filled with water; and thus may the weight of the barrel be greatly angmented, without iucreafing the general bulk.Now this being true with regard to folids, is applicable alfo to fluids. For inflance, river-water will diflolve a certain quantity of falt ; after which it will receive a certain quantity of fugar ; and after that, a certain quantity of alum, and perhaps other diffoluble bodies, and not increafe its firt dimenfions.

The more perfect a fluid is, the more eafily will it yield to all impreffions, and the more eafily will the parts unite and coalefce when feparated. A perfect fluid is that whofe parts are put into mosion by the leaft force imaginable: an imperfect one is that whofe parts yield to a fmall force, not the leaff. It is probable, that in nature there is no perfect 月uid, the element of fire perhaps excepted; fince we fee that the mutual attraction of the parts of all the fluids, fubject to our experiments, readers them cohefive in fome degree; and the more they cling together, the lefs perfect their fluidity is. If, for infance, a glafs be filled with water above the brim, it will vifibly rife to a convex furface, which, was it a perfect fluid, frce from either tenacity or cohefion, would be impomhle.

Mercury, the molt perfect fluid we know, is not exempt from this attraction; for thould the bottom of a flat glafs, having a gentle rifing toward the middle, be covered thin with quickfilver, a little motion of the machine will caufe the fluid foon to feparate from the middle, and lie round it like a ring, having edge: of a confiderable thicknefs.

But if a like quantity thereof be poured into a golden cup, it will, on the contrary, appear higner confiderably on the fides than in the middle. Which may proceed in part, perhaps, from the gold's being of great dentity, and therefore capable of exerting thereon a greater degree of attraction than other metals. Probably too it may happen from its having pores of

Its nature and pra. perties.

Prefurc of an apter difpofition and magnitule to receive the minute morcurial particles, than thofe of iron and fome other metals; and therefore the attraction of cohefion in this experiment may obtain alfo: and every one knows hov: eafily thefe two bodies incorporate, and make a perfet amolyama. But the reafun commonly riven fo the two phenomera is, thatemercury, in the firt cafe, attracts itfelf more than it does glafs; and, in the laft cafe, mercury attracts gold more than it does itfelf.

Sir Ifaac Neston held all matter to be miginally homngenenus; and that from the different modifications and texture of it alone, all bodies receive their various flrufture, compofition, and form. In his defirition of a fluid, he feems to imply, that he thought furids to be compoled of primary folids; and. in the beginning of his Primipia, he fpeaks of fand and powders as of imperfect fluids.

Burlli has demonftrated, that the conflituent parts of fluds are not fluid, but confillent bodies; and that the clements of all bodies are perfectly firm and hard. The incompreflibility of water, proved by the Florencine experiment, is a fufficient evidence alfo, that each primary particle or fpherule thereof is a perfect and impenctrable folid. Mr Locke too, in his ESi/uy en Human Underflonding, admits this to be fo.

This famous experiment was lirf attempted by the freat lord Vorulan, who inclofed a quanticy of water in lead, and found that it inclined rather to make its way through the pores of the metal, than be reduced into leis compais by any force that could be applied. The acadensics of Florence made this experinent afterwards mort accurately with a globe of filver, as being a metal lefs yielding and ductile than gold. This being filled with water, and well clofed, they found, by liammering geutly theicon, that the fphericity of the globe was altered to a lefs capacious figure (as might geometrically be proved) ; but a part of the water always like dew came throngh its fides before this could be obtained. This has been attempted by Sir Ifaac Newton, and fo many competent judges, on gold and feveral other metals fince, with equal fucceff, that we do not hold any fluid in its natural ftate, except the air, to be either comprefible or elaftic. In fome experiments by Mr Canton, it hath been obferved, that water is more or lefs compreffed according to the different conftitution of the atmofphere; whence it hath been concluded that the Florentine cxperiment was erroneous: but it will not follow, that water can be compreffed by any artificial force, becaufe nature hath a method of compreffing it ; any more than that folid metal can be compreffed artificially, though we know that very light degrees of hea: and cold will expand or contract its dimenfions. See Water.

## Sect. II. Of the Gravity and Preflure of Fluids.

73luide pref

All bodics, both fluid and folid, prefs downwards by the force of gra:ity: but fluids have this wonderful property, that their preffure upwasds and fidewife is equal to their preflure downwards; and this is always in proportion to their perpendicular height, withcut any regard to their quantity: for, as each particle is ruite fice to move, it will move towards that
part or fide in which the preffure is leaft. And hence, Preffure of no particle or quantity of a fluid can be at reft till it is cvery way equally preffed.
t'o fhow by experimeat that fuids prefs upwad as well as downward, let $A B$ be a long uprirht tube filled with water near to i:s top: and CD a finall tube open at both ends, and immerfed into the water in the large one: if the immerfion he quick, you will fee the water rife in the f nall tube to the fane pight that it ftands in the great one, or until the luffaces of the water in both are on the fane level: which fhows that the water is prefled upward into the fmall tube by the weight of what is in the great one ; otherwife it could never rife thercin, contrary to its nacural gravity, uniefs the diameter of the bore were fo fmall, that the attraction of the tube would raife the water; which will never happen, if the ture be as wide as that in a common barometer. And, as che water rifes no higher in the fmall tube than till its furface be on a level with the furface of the water in the great one, this hows that the preflure is no: in propotion to the quantity of water in the great tube, but in proportion to its perpendicular hei, the thercin: for there is much more water in the great tube all around the fmall one, than what is raifed to the fame height in the fmall one as it fands in the great.

Trake out the fmall tube, and let the water run nut of it; then it will be filled with air. Stop its upper end with the cork $C$, and it will be full of air all be. low the cork: this done, plunge it again to the bottom of the water in the great tube, and you will fee the water rife up in it to the height E. Which fhows that the air is a body, otherwife it could not hinder the water from rifing up to the fame lieight as it did before, namely, to A ; and in fo doing, it drove the air out at the top; but now the air is confined by the cork C: And it alfo hows that the air is a compreffible body; for if it were not fo, a drop of water could not enter into the tube.

The pieffure of fluids being equal iu all directione, it fullows, that :he fides of a veffel are as much pretled by a fluid in it, all around in any given ring of points, as the fluid below that ring is predled by the weight of all that frands alrove it. Hence the preffure upon every point in the fides, immediately abuve the bottom, is equal to the preflure upon every poiat of the bottom. -To fhow this by experiment, let a hole be made at e Fig. 3. in the fide of the tube A B clufe by the butto.n, and another hole of the fane fize in the bottom at $C$; then pour your water into the tube, keeping it full as long as you choofe the holes fhould run, and have two bafons ready to reccive the water that ruas through the two holes, until you thiuk there is enough in each bafon: and you will find by meafuring the quantities, that they are equal. Which fhows that the water run with equal fpeed through both holes; which it could not have dune, if it had not been equally prefled through them both. For, if a hole of the fame fize be made in the fide of the tube, as about $f$, and if all three are permitted to run together, you will find that the quantity run through the hole at $f$ is much lefs than what has run in the fame time through either of the holes C or $e$.

In the fame figure, let the tube be re curved from the bottom at C into the fhape DE, and the hole at

Preffure of $C$ be ftopt with a cork. Then pour water into the Fluids: tube to any height, as Ag, and it will fout up in a jet EFG, nearly as high as it is kept in the tube $A B$, by continuing to pour in as mach there as runs through the hole E; which will be the cafe whilt the furface Ag keeps at the fame height. And if a little ball of cork $G$ be laid upon the top of the jet, it will be fupported thereby, and dance upon it. The reafon why the jet rifes not quice fo high as the furface of the water $A_{\delta}$, is owing to the refiftance it meets with in the open air: for if a tube, either great or fmall, was ferewed upon the pipe at $E$, the water would rife in it until the furfaces of the water in both tubes were on the fame level; as will be fhown by the next experiment.
The hydro- Any quantity of a fluid, how fmall foever, may be fatic para. made to balance and fupport any quantity, how great dox. foever. This is defervedly termed the bydrofatical paradox; which we fhall firft fhow by an experiment, and then account for it upon the principle abuve mentioned, namely, that the preflure of fluids is direcily as their perpendicular beight, without any regard to ibeir quantity.
Plate Let a fmall glafs tube DCG, open at both ends, ccxaxix. and bended at $B$, be joined to the end of a great one
fig. 4 - AI at $c d$, where the great one is allo open; fo that thefe tubes in their openings may freely communicate with each other. Then pour water through a fmall necked funnel into the fmall tube at H ; this water will run through the joining of the tubes at $c d$, and rife up into the great tube; and if you continue pouring until the furface of the water comes to any part, as $A$, in the great tube, and then leave off, you will fee that the furface of the water in the fmall tube will be jut as high at $D$; fo that the perpendicular altitude of the water will be the fame in both tubes, however fmall the one be in proportion to the other. This fhows, that the fmall column DCG balances and fupports the great column Acd: which it could not do if their preffures were not equal againft one another in the recurved bottom at B.-If the finall tube be made longer, and inclined in the lituation GEF, the furface of the water in it will ftand at $F$, on the fame level with the furface $A$ in the great tube: that is, the water will have the fame perpendicular height in both tubes, although the column in the fmall tube is longer than that in the great one; the former being oblique, and the latter perpendicular.

Since then the prefure of fluids is directly as their perpendicular heights, without any regard to their quartities, it appears, that whatever the figure or fize of veffels be, if they are of equal heights, and if the areas of their bottoms are equal, the preffures of equal heights of water are equal upon the bottoms of thefe veffels; even though the one fhould hold a thoufand or ten choufand times as much water as would fill the Fig. 5,6. other. To confirm this part of the hydroltatical paradox by an experiment, let two veffels be prepared of equal heights, but very unequal contents, fuch as A B fig. 5. and AB in fig. 6. Let each veffel be open at both ends, and their bottoms $\mathrm{D} d, \mathrm{D} d$ be of equal widths. Let a brafs bottom CC be exactly hitted to each veffel, not to ge into it, but for it to fland upon; and let a piece of wet leather be put between each veffel and its brals bottom, for the fake of clofenefs.

Join each bottom to its veffel by a hinge $D$, fo that Preffure of it may lie open like the lid uf a box; and let each bot. Eluids. tom be kept up to its veffel by equal weights $E$ and $E \xrightarrow{\longrightarrow}$ hung to lines which go over the pulleys $F$ and $F$ (whole blocks are fixed to the fides of the velfels at $f$ ), and the lines tied to hooks at $d$ and $d$, fixed in brais bottoms oppofite to the hinges D and D . Things being thus prepared and fitted, hold the veffel $A B$ (fig. 6.) upright in your hands over a bafon on a table, and caufe water to be poured into the veffel flowly, till the preflure of the water bears down its bottom at the fide $d$, and railes the weight $E$; and then part of the water will run out at d. Mark the height at. which the furface H of the water ftuod in the veffel, when the bottom began to give way at $d$; and then, holding up the other veffel AB (fir. 5.) in the fame manner, caule water to be poured iuto it at H : and you will fee, that when the water rifes to $A$ in this reflel, jult as high as it did in the former, its bottom will allo give way at $d$, and it will lufe part of the water.

The natural reafon of this furprifing phenomenon is, that fince all parts of a fluid at equal depths below the furface are equally preffed in all manner of directions, the water immediately below the fixed part B $f$ (fig. 5.) will be preffed as mnch upward againlt its luwer furface within the veffel, by the action of the column A $g$, as it would be by a column of the fame height, and of any diameter whatever; (ds was evident by the experiment with the tuhe, fig. 4.) and thercfore, fince action and reaction are equal and contrary to each other, the water immediately below the furface $\mathrm{B} f$ will be prefed as much downwatd by it, as if it was immediately touched and preffed by it column of the height $g A$, and of the diameter $\mathrm{B} f$ : and therefore the water in the cavity $\mathrm{BD} d f$ will be pleffed as much downward upon its bottum CC, as the bottom of the other veffel (fig. 6.) is preffed by all the water above it.

To illultrate this a little farther, let a hole be made fig. s. at $f$ in the fixed top $\mathrm{B} f$, and let a tube G be put into it; then, if water be poured into the tube $A$, it will (after filling the cavity $B d$ ) rife up into the tube $G$, until it comes to a level with that in the tube $\mathbf{A}$; which is manifettly owing to the preflure of the water in the tube $A$, upon that in the cavity of the voflel below it. Confequently, that part of the top $\mathrm{B} f$, in which the hole is now made, would, if corked up, be preffed upward with a force equal to the whole weight of all the water which is fupported in the tube $G$ : and the fame thing would hold at $g$, if a hole were made there. And fo, if the whole cover or top $B f$ were full if holes, and had tubes as high as the middle one $A g$ put into them, the water in each tube would rife to the fame height as it is kept in the tube $A$, by pouring more into it, to make up the deficiency that it fuftains by fupplying the others, until they are all full ; and then the water in the tube A would fupport equal heights of water in all the relt of the tubes. Or, if all the tubes except A, or any other one, wsre taken away, and a large tube equal in diameter to the whole top Bf were placed upon it and cemented to it, and then if water were poured into the tube that was left in either of the holes, it would afcend through all the reft of the holes, until italled the large tuve to the

4
Prefure of fame height that it flands in the fmall one, after a fufEluids. ficient quantity had been poured into it: which fhows, that the top $B f$ was prefled upward by the water under it, and before any hole was made in it, with a force equal that wherewith it is now prefted downward by the weight of all the water above it in the great tube. And therefore, the reaction of the fixed top Bf mut be as great, in preffing the water downward upon the bottom CC , as the whole prefure of the water in the great tube wonld have been, if the top had been taken awdy, and the water in that tuoe left to prefs directly upon the water in the cavity

6
The hy dro$\mathrm{BD}) d f$.
Perhaps the belt machine in the world for demonRatic ber- ftrating the upward preflure of Auide, is the hydro. lows, fig. $i$.flatic bellows, which confilte of two thick oval boards $A B, E F$, each about 16 inches broad, and 18 inches long: the fides are of leather, joined very clofe to the top and bottom by froug nails. CD is a pipe ferewed into a piece of brafs on the top-board at $C$. Let fome water be poured into the pipe at $D$, which will run into the bellows, and Separate the boards a little. Then lay three weights, each weighing 100 pounds, upon the upper board ; and pour more water into the pipe, whieh will run into the bellows, and saife up the board with all the weights upon it; and if the pipe be kept full until the weights are raifed as high as the leather which covers the bellows will allow them, the water will remain in the pipe, and fup. port all the weights, even though it fhould weigh no more than a quarter of a pound, and they 300 pounds: nor will all their force be able to caufe them to defeend and force the water out at the top of the pipe.

The reafon of this will be made evident, by conlidering what has been already faid of the refult of the preflure of fluids of equal heights without any regard to their quantity. For if a hole be made in the upyer board, and a tube be put into it, the water will rife in the tube to the fame height that it does in the pipe; and would rife as high (by fupplying the pipe) in as many tubes as the board could contain holes. Now, fuppofe only one hole to be made in any part of the board, of an equal diameter with the bore of the pipe, and that the pipe holds jutt a quarter of a pound of water; if a perfon claps his finger upon the hole, and the pipe be filled with water, he will find his finger to be prefled upward with a force equal to a quarter of a pound. And as the fame prefure is equal upon all equal parts of the board, each part, whofe area is equal to the area of the hole, will be preffed upward with a force equal to that of a quarter of a found: the fum of all which preffures againft the underfide of an oval board 16 inches broad, and 18 inches long, will amount to 300 lb .; and therefore fo much weight will be raifed up and fupported by a quarter of a pound of water in the pipe.
$w^{7}$ a man Hence, if a man ftands upon the upper board, and mav raife blows into the bellows through the pipe, he will raife himplif us himfelf upward upon the board: and the fmaller the ward hy his bore of the pipe is, the eafier he will be able to raife himfelf. And then, hy clapping his finger upon the top of the pipe, he can fupport himfelf as long as he pleafes; provided the bellows be air-tight, fo as not to lofe what is blown into it.

Upon this principle of the upwatd preffure of fluids,

## T A T I C S.

Sect II.
a piece of lead may be made to fwim in water, by im- Preffure of merfing it to a proper depth, and keeping the water Fluids. from getting above it. Let CD be a glais tube, open at both ends ; and EFG a flat piece of lead, exactly How lead fitted to the lower end of the tube, not to go within mayy be it, but for it to fland upon; with a wet leather be. made to tween the lead and the tube, to make clofe work. Let faim in this leaden bottom be half an inch thick, and held Fig. 8 . clofe to the tube by pulling the packthread IHS, upward at L with one hand, whilit the tube is held in the other by the upper end C. In this fituation, let the tube be immerfed in water in the glafs veffel $A B$, to the depth of fix iuches below the furface of the water at K : and then, the leaden bottom EFG will be plunged to the depth of fomewhat more than eleven times its own thicknefs: holding the tube at that depth, you may let go the thread at L ; and the lead will not fall from the tube, but will be kept to it by the upward preflure of the water below it occafioned by the height of the water at $K$ above the level of the lead. For as lead is 11.33 times as heavy as its bulk of water, and is in this experiment immerfed to a depth fomewhat more than 11.33 times its thicknefs, and no water getting into the tube between it and the lead, the column of water EabsG below the lead is preffed upward againft it by the water KDEGL all around the tube; which water being a little more than 11.33 times as ligh as the lead is thick, is fufficient to balance and fupport the lead at the depth KE. If a little water be poured into the tube upon the lead, it will increafe the weight upon the column of water under the lead, and caufe the lead to fall from the tube to the bottom of the glafs velfel, where it will lie in the fituation $b d$. Or, if the tube be raifed a little in the water, the lead will fall by its own weight, which will then be tou great for the preflure of the water around the tube up. on the colomn of water below it. But the following method of making an extremely heavy body float upon water is more elegant. Take a long glafs tuoe, open ai both ends; llopping the lower end with a finger, pour in fome quickfilver at the other end, fo as to take up about half an inch in the tube below. Immerfe this tube, with the finger till at the bottom, in a deep glafs veffel filled with water; and when the lower end of the tube is about feven inches below the furface, take away the tinger from it, and then you will fee the quicklilver not fink into the veffel, but remain fufpended upon the tube, and floating, if we may fo exprefs it, upon the water in the glafs-veffel.

In the fame manner as an heary body was made to How 9 ight fwim on water, by taking away the upward preffure; wood may fo may a light body, lise wood, be made to remainhe made ti funk at the bottom, by depriving it of all preffure lic at the from below : for if two equal pieces of wood be planed, water. furface to furface, fo that no water can get between them, and then one of them $(\sigma d)$ be cemenced to the irfide of the veffel's bottom; then the other being placed upon this, and, while the veffel is filling, being kept down by a tlick; when the fick is removed and the vefftl full, the upper piece of wood will not rife from the lawer one, but continue funk under water, though it is actually much lighter than water; for as there is no refiltance to its under furface to drive it upward, while its upper furface is firongly preffed down, it mutt neceffarily remain at the botton.

Sect. III.

## Sect. III. Of the Specific Gravity of Bodies.

WhEN an unfpongy or folid body finks in a veffel of water, it removes a body of water equal to its own bulk, out of the place to which it defcends. If, for inttance, a copper ball is let drop into a glafs of water, we well know, that if it finks, it will takc up as much room as a globe of water equal to itfelf in fize took up before.

Let us fuppofe, that this watery globe removed by the ball were frozen into a folid fubltance, and weighed in a fcale again? the copper ball: now the copper ball being more in weight than the globe, it is evident that it will link its own fcale, and drive up the oppofite, as all heavier bodies do when weighed againt lighter; if, on the contrary, the copper ball be lighter than the water globe, the ball will rife. Again, then let us fuppofe thie copper ball going to be iminerfed in water; and that, in order to defcend, it mult difplace a globe of water equal to itfelf in bulk. If the eopper ball be heavier than the globe, its preflure will overcome the other's refiltance, and it will link to the bot. tom ; but if the watery globe be heavier, its preflure upwards will be greater than that of the ball downward, and the ball wiil rife or fwim. In a word, in proportion as the ball is heavier than the fimilar bulk of water, it will defcend with greater force; in proportion as it is lighter, it will be raifed more to the furface.

From all this we may deduce one general rule, which will meafure the force with which any folid body tends to fwim or fink in water; namely, Every body immerfoll in woter, lofes juft as much of its wesight as'equals the seveight of an equal bulk of water. Thus, for inftance, if the body be two ounces, and an equal bulk of water be one ounce, the body when plunged, will link towards the bottom of the water with a weight of one ounce. If, on the contrary, the folid body be but one ounce, and the weight of an equal bulk of water be two ounces; the folid, when plunged, will remove but one ounce, that is half as much water as is equal to its own bulk: fo that, confequently, it cannot defcend; for to do that, it mult remove a quastity of water equal to its own bulk. Again, if the folid be too ounces, and the equal bulk of water two ounces, the folid, wherever it is phanged, will neither rife nor fink, but remain fufpended at any depth.

Thus we fee the reafon why fome bodies fivim in water, and ouhters fink. Bodies of large bulk and little weight, like cork or feathers, mult neceflarily fwim, becaufe an equal bulk of water is heavier than they; bodies of little bulk but great weight, like lead or gold, munt lirk, becaufe they are heavier than an equal bulk of water. The bulk and the weight of any body confidered together, is called its /pecific gravity; and the proportion of both in any body is eafily found by water. A body of little bulk and great weight, readily finks in water; and it is faid to have fpecific gravity; a body of great bulk and little weight, lofes almoft all its weight in water, and therefore is faid to have but little fpecific gravity. A woolpaek has actually greater real gravity, or weighs more in air, than a cannon ball ; but for all that, a cannon ball may have more fpecific gravity, and weigh more than the woolpack, in water.

Denfity is a general term that means the fame thing; specific Jpecific gravity is only a relative term, ufed when foldds $\underbrace{\text { Gravitics. }}$ are weighed in fluids, or fluids in fluids.

As every folid links more teadily in water, in proportion as its fpecific gravity is great, or as it contains greater weight under a fnaller buik, it will fullow, that the fame body may very oftea have different fpecific gravities, and that it will fink at one time and fwim at another. Thus a man, when he lappens to fall alive into the water, links to the bottom; for the fpecilic gravity of his body is then greater than that of watcr: but if, by being drowned, he lies at the bottom for fome days, his body fwells by putrefaction, which difunites its parts : thus its fecitic gravity becomes lefs than that of water, and he floats upo: the furface. being able exactly to determine the fpecilic gravities cover adulof bodies. We can, by weighing metals in water, neterats difcover their adulterations or mixtures with greater exactuefs than by any cther means whatfoever. By this means, the counterfeit coin, which may be offered us as gold, will be very eafily difinguifthed, and known to be a baler metal. For inilance, if we are offered a brafs counter for a guinea, and we fulpect it ; fuppofe, to clear our fulpicions, we weigh it in the ufual manner againt a real guivea in the oppofite fcale, and it is of the exact weight, yet fill we fufpect it ; What is to be done? To melt or dettroy the lifure of the coin would be inconvenient and improper: a much better and more accurate method remains. We have only to weigh a real guinea in water, and we fhall thus find that it lofes but a nineteenth part of its weight in the balance: We then weigh the brafs counter in water, and we actually find it lofes an eighth part of its weight by being weighed in this manner. This at once demonttrates, that the coin is made of a bafe metal, and not goid; for as gold is the heavieft of all metals, it will lofe lefs of its weight by being weighed in water than any other.

This method Archimedes firft made ufe of to detect a fraud with regard to the crown of Hiero king of Syracule. Hiero had employed a goldfmith to make him a eerown, and furnifhed him with a certain weight of gold for that purpoie; the crown was made, the weight was the fame as before, but lill the king fufpected that there was an adulteration in the metal. Archimedes was applied to; who, as the ftory goes, was for fome time unable to deteet the impotition. It happened, however, one day as the philofopher was Atepping into a bath, that he took notice the water rofe in the bath in proportion to the part of his body immerfed. From this accident he received a hint; wherewith he was fo tranfported, that he jumped out of the bath, and ran naked about the IIrects of Syracufe, crying in a wild manner, I bave found it! I bave found it!-In confequence of this fpeculation, he procured a ball of gold and another of filver, exactly of the weight of the crown, confidering, that if the crown were altogether of gold, the ball of gold would be of the fame bulk as the crown, and when immerfed in water, would raife the water jutt as high as the crown. immerfed ; but if it were wholly of filver, the ball of filver being immerfed, would raife the water no higher than the erown immerfed; and if the crown was of
gold and flyer mixed in a certain proportion, this proportion would be difeovered by the height to which the crown would raife the water higher than the gold and lower than the fiver. Accordingly, let AMLB be a veffel filed with water to the height DC, and let the mars of gold, equal in weight to the crown, on being inmerfed into the water, raife the forface of it to $E$, and the mails of filer raife it to $G$; then if the height of the veffel above $D C$ be divided into equal parts, and $D F=1 \%$, and $D G=19$, it is plain the bulks of gold and filver will be as D F to DG, and the specific gravities in the inverfe proportion of the le quantities, or as $D G$ to $D \mathrm{~F}$. If the crown be im merfed, it will ratite the furface of water to E ; whence The proportion of the bulks of the gold and filer in $t^{7}$ le cons may be determined. For fince the differene of the fpecilic gravities of the gold and filver is $1)-D F=F G=x$, if the bulk of the crown is
ied into eight equal parts, it is evident, that fence the fpecific gravities of the debated and pure gold coo: us will be as the bulks inverfely, that is, as DF to 1) I, we can eafily find the point H , which will express the Specific gravity of the former; for $D E: D E:: D G:$ 1) T. This point $H$ always divides the difference FG into two parts GH, HE, which have the fame proporton as the parts of filver in the crown to the parts of gold ; for as the point E afccnds, the point H defends, and when E coincides with $G, H$ falls upon $E$, and the crown becomes wholly filver; on the contrary, when E defends to F , and H afcends to G , the crown becomes wholly gold; therefore FH will be every where to HG as the parts of gold to the parts of filler in the crown. Conlequently, in the prefent cafe, becaufe the crown, when immerfed, raifes the water to the height $D E$, and $H$ is three divifions below $G$, it flows that three of the eight parts of the crown are dilver, and the other five pats gold, as $H$ is five of the divifions above $F$. Hence the bulk of the gold in the crown is to that of the filver as 5 to 3. In fome fuch method as this Archimedes deduce his proposition, viz. that the difference of the feecivic gravities of the compound and lighter ingredient, i. e. 5 (fuppofing the fpecitic gravity of gold to filer as 19 to 11 , and the fpecitic gravity of the king's crown to be 16 ), is to the difference of the fpecitic gravities of the heavier ingredient and the compound, i. e. 3, as the bulk of gold to that of Silver made up of: fo that if the whole crown were divided into eight parts, the gold would conlif of five, and the liver of three; and the magnitudes 5 and 3 , multiplied by the specific oravilies 19 and 11 respectively, will give the numbers 95 and 33 , expreffing the proportion of the weight of the gold to that of the filver.

This propolition of Archimedes may be demonftrated analytically in the following. manner: let the magnitudes of the gold and filver in the crown be $A$ and $B$, and their fpecific gravities as $a$ and $b$; then, fence the absolute gravity of any body is compounded of its magnitude and fpecific gravity, the weight of the gold is a 1 , of the fiver $b B$, and of the crown $a \mathrm{~A}+b \mathrm{~B}=c x \mathrm{x}+\mathrm{B}$, fuppoling $c$ to be the fpecific gravity of the mixture. Hence $a \mathrm{~A}-c \mathrm{~A}=c \mathrm{~B}-b \mathrm{~B}$; and confequently $c-b: a-c:: A: B$, as before.

Upon this difference in the weight of bodies in open air and water, the hydroltatic balance has been formed; which differs very little from a common balance, but that it hath an hook at the bottom of one fcale, on which the weight we want to try may be lung by fratic baan horle-hair, and thus fulpended in water, without lance. wetting the scale from whence it hangs. First, the weight of the body we want to try is balanced again the parcel or weight in open air; then the body is fufpended by the hook and horfe-hair at the bottom of the fcale in water, which we well know will make it lighter, and dellroy the balance. We then can know how much lighter it will be, by the quantity of the weights we take from the fcale to make it equipoife ; and of confequence we thus precifely can hind out its Specific gravity compared to water (A). This is the mot exact and infallible method of knowing the genuinenefs of metals, and the different mixtures with which they may be adulterated, and it will anfiver for all fuch bodies as can be weighed in water. As for thole things that cannot be thus weighed, foch as quickfiver, fall fparks of diamond, and fuch like, as chey cannot be fufpended by an horfe-hair, they mut be put into a glass bucket, the weight of which is already known: this, with the quickfilver, mull be balanced by weights in the oppofite fcale, as before, then immerfed, and the quantity of weights to be taken from the opposite Scale will how the Specific gravity of the bus. ket and the quicksilver together: the fpecitic gravity of the bucket is already known; and of confequence the fpecific gravity of the quicklilver, or any other frmilar fubllance, will be what remains.

As we can thus difcover the \{pecitic gravity of different folds by plunging them in the fame fluid, fo we can difcover the fpecitic gravity of different Adds, by plunging the lame fold body into them; fur in proportion as the fluid is light, fo much will it diminif the weight of t? body weighed in it. Thus we may know that fpirit of wine has luis fpecific gravity than water, becaufe a fold that will fivim in water will fink in Spirit; on the contrary, we may know that first of nitre has greater Specific gravity than water, because a fold that will fink in water will fain upon the luirit of nitre. Upon this principle is made that fimp?e in Atrument called an bydrometer, which serves to meafure The hydrothe lightness or weight of different fluids. For that meter. liquors weigh very differentia; from each other is found by experience. Suppufe we take a glafs veffel which is divided into two parts, communicating with each other by a small opening of a line and an half diameter. Let the lower part be filled up to the divilion with red-wine, then let the upper part be filled with water. As the red.wine is lighter than water, we foal fee it in a hort time rifint, like a fma!l thread up through the water, and diffusing itself upon the furface, till at length we hall find the wine and water have changed their places; the water will be len in the lower half, and the wine in the upper half, of the vel. rel. Or take a mall bottle AB, the neck of which mut be very narrow, the mouth not more than $\frac{z}{\sigma}$ of an inch wide; and lave a glats.veffel $C D$, whole height exceeds that of the bottle about two inches. $t$ With

Plate CCXL. fig. 2.
(A) This is the common hydroftatic balance. The reader will fie an improved apparatus at Hydroflatic S.ILAACR, in order of the alphabet.
specific With a fmall funnel fill the bottle quite full of redGravities, wine, and place it in the veffel CD, which is to be full of water. The wine will prefentiy come out of the bottie, and rife in form of a fmall column to the furface of the water: and at the fame time the water, entering the buttle, will fupply the place of the wine; for water being fpecifically heavier than winc, mult hold the larelt place, while tbe otber naturally rifes to the top. A limilar effect will be produced if the bottie be filled with water, and the veffel with wine : for the bettle heing placed in the veffel in an inverted pofition, the water will defcend to the bottom of the veficl, ard the wine will mount into the bottle.

In the fane rianner we may pour four different liquors, of oifferent weights, into any gials-veffel, and they flall all ftand feparate and unmixed with each other. Thus, if we take mercury, wil of tartar, fyirit of winc, and fpirit of turpentine, frake them together in a glaff, and then iet them foule a few minutes, each fiall fland is its proper plaze, mercury at the hottum, oil of tartar next, fpirit of wilie, and then fpirit of turpentine above all. This we fee liq!ors are of very different denfities: and this difference it is that the hydrometer is adapted to compare. In general, all vinous fpirits are lighter than water: and the lefs they contain of water, the lighter they are. The hydrometer, therefore, will inform us how far they are genuine, by fonwing us their lightrefs; for in pure fpirit of wine it finks lefs than in that which is mixed with a fnall quantity of water.

The hydrumeter fhould be made of copper: for ivory imbibes fpirituous liquoss, and thereby alters the ir gravity; and glafs requires an attention that is incompatible with expedition. The moof fimple hydrometer confifts of a copper ball $B b$, to which is foldered a brafs wire $A B$, one quarter of an inch thick. The upper part of this wire being fited flat, is marked proof, at m, fig. 4. becaufe it firks exactly to that mark in prooff.f:rits. There are two other marks at $A$ and $B$, fig. 3 : to thow whether the liquor be une-tenth above or below: prouf, according as the l.gdrometer finks to A , or emerges to B , when a brais weight, as C or K , is ferewed to its hottom $c$. There are echer weights to ferew on, which thoss the fpecific gravity of different fluids, quite down to common waitr.

The round part of the wise above the ball may be marked fo as to reprefent river-water when it links to RW, fig. 4. the wright which anfwers to that water being then ferewed on; and when put into fpringwater, mineral-water, fea-water, and water of falt fprings, it will gradually rife to the marks SP, MI, SE, SA. On the contrary, when it is put into BriAnl water, rain-water, port-wine, and mountain-wine, it will fucceffively fink to the marks ir, ra, po, mo. Inftruments of this kind are fometimes called areumeters.
There is another fort of hydrometer that is calculated to afcertain the fpecific gravity of fluids to the greateit precilion poffible, and which confifts of a large hollow ball $B$, fig. 5 with a finaller ball $b$ ferewed on to its botton, partly filled with mercury or fmall fhot, in order to render it but little fpecifically lighter than water. The larger ball has alfo a mort neck at C , into which is ferewed the graduated bafs-wire AC , wbich, by a frall weight at $A$, caufes the tudy of the inftrunnent to defected in the fluid, with part of the flem.
Fig. 3

## S T A T l C S.

When this infrument is fwimming in the liquor contained in the jar ILMK, the part of the fluid difplaced by it will be equal in bulk to the part of the infrument under water, and equal in weight to the whole inftrument. Now, fuppofe the weight of the whole to be four thoufand grains, it is then evids.it we can by this means compare the different dimenfions of four thoufand grains of feveral forts of fuids. Fur if the weight at $A$ be fuch as will caufe the ball to firk in rain-water till its furface come to the middle point of the firm 20; and after that, if it be immeried in common fpring-water, and the furface be obferved to Itand at one-tenth of an inch bclow the middle point 20: it is apparent, that the fame weight of each water differs unly in bulk by the magnitude of one-tenth of an inch in the llem.
Now, fappofe the fem to be ten inches long, and to weigh a hundred grains, then every tenth of an inch will weigh one grain: and as the flem is of biafs, which is about cight times heavier than water, the fame hulk of water will be equal to one cighth of a grain, and confequently to the cre-eighth of one fourthoufandth part, that is, one thisty two thoufandth part of the whole tulk. This inlleument is capable of fill greater precifion, by makiug the llem or tuck confitl of a flat thin hip of brafs, inftead of one that is cylindrical: for by this means we increafe the furface, which is the mof requifite circumlance, and diminifh the fulidity, which neceffarily ronders the infrument titl more accurate.

To adapt this iullrument to all purpofes, there Thould be two llems, to ferew on and off, in a finall hole at $a$. One llem finuld be a frooth titin $\prod_{i j}$ o of brafs, or rather thecl, like a watch fpring fet itraight, fimilar to that we have juft now mentioned; on oule fide of which is to be the feveral marks or divifions to which it will fi,k in different forts of water, as rain, river, fpring. fea, and falt-fpring waters, $\alpha<\cdot$; and on the other flue you may mak the divilions to whie:h it friks in variuss lighter funids, as hut Bath water, Britul water, Linconsb water, Chefoniodin waer, port-wine, muantain, maraira, and other forts of wive, But here the weight at A on the top mull be a little lefs than befo e ellen it was ufed for heavier waters.
But in trying the Arength of the ipirituous liqums, a common cylindric then will do beft, becaufe of its Arength and teadinefs; and this onght to be fo cont trived, that, when inmerfed in what is called prooffpirit, the furface of the fpirit may be upon the middle point 20; which is eafily done by duly adjulting the froall weight $A$ on the top, and making the thein of fuch a length, that, when immerfed in water, it may junt covtr the bali and rife to $a$; but, when im:nerfed in pure ferrit, it may rife to the top $A$. Then, by dividing the upper and lower parts $a=0$ and $A 20$, into ten equal parts each, when the inttrument is inmerfed into any fors of rinituous iiquor, it will immediactly fhow how much it is above or below proof.

Proof-fpirit coufifts of half water and balf pure fpirit, that is, fuch as, when poured on gun powder, and fet on lire, will burn all away; and permits the powder to take fire and flafh, as in open air. Wut if the fpirit be not fo highly rectilied, there will temair fome water, which will make the powder wet, and unfit to take fire. Proof.fpirit of any kind weighs feven pounds twelie cuices per galion.

IJydrome-
ter made byJo.es.

The eommon method of fhaking the fpirits it a plial, and raifing a head of hubbles, to judge by their mauner of rifing or breaking whether the fpirit be proof, or near it, is very fallacious. There is no way fo certain, and at the fame time fo ealy and expeditions, as this by the hydrometer.

A variety of different conltructions of the hydrometer have recently been made with a particular view of improving the infrument, fo as to afcertain the ftrengths of fpirits, and worts in brewing, in the molt eafy and accurate manner. As it would be unncceflary to defcribe all of them here, we thall conclude this fection with defcriptions of thofe only which have been moll approved and are now in general ufe. The Cuftoms have for a long time adopted an hydrometer of an old conitruction, by the hate Mr Clarke. It differs very little from the one above defcribed (fig. 3.4.); and has belonging to it a great variety of weights, which are uccafionally fecured on to the bottom of the ftem: This renders the inftrument troublefome and complicated in its ufe, and where difpatcli in bufinefs and accuraey are wanted, not fo commodious as fuch an inftrument fhould be.

An hydrometcr upon a very fimple confruction, eafy in its application, and fufficiently accurate for the common purpofes it is wanted to anfwer, by diftillers and others concerned in the fale and flate of firits, is made by $\mathrm{Mr}^{\mathrm{m}} \mathrm{m}$. Jones mathematical intrument makerin Holborn. It requires only three weights, to difcover the Itrengeths of ipirits from alcolol dowa to water. This hydrometer, like others, is adjufed to a temperate Atate of the air, or $60^{\circ}$ of the thermometer with Fahrenheit's fcale; but as an alteration of this temperature very materially affects the gravity of firits, cauling them by the inftrument to appear ftronger when the weather is hotter, and the contrary, it has been found indifpenfably neceffary 10 place a thermometer in the firits previous to the immerfing of the inflrument, and make a jutt allowance for the feveral degrees that the mercury may be above or below the temperature above mentioned. This las been utually, though inaccurately, eftimated at the rate of one gallon allowance for every three degrees of the thermometer above or below $60^{\circ}$; viz. for cvery three degrees warmer, reckoning the firit oue gallon in the 100 weaker than what is flown by the hydromiter; and for every three degrees colder than $60^{\circ}$, allowing one gallon in the 100 itronger. In this hydrometer, the thermometer is united with the influment; and from experiment its divifions are adjulted to the different degrecs above or below the temperate flate. The concentration is alfo confidered in this indtrument, which is the mutual penetration of fpiit and water when mixed together; which in ttrong firits is fo confiderable as to caufe a diminutution of 4 gallons in the 100: for example, if to 100 grallons of fpirit of wine, found by the inftrument to be 66 gallons in the 100 over proof, you add 66 gallons of water in order to reduce it to a proof flate; the mixture, inftead of producing 166 gallons, will produce i $6 z$ gallons only of proof fpirits, and therefore + gallons will be loft in the mutual penetration of the particles of the water and Spirit.

Fig. 6. is a reprefentation of the whole inftrument, with the thermomcter united. Its length AB is atout $9 \frac{1}{2}$ inches; its ball C, is of the fhape nearly of an egg, and made of hard brafs, and about $1^{\frac{1}{2}}$ inches
in its horizontal diameter. It. has a fquare Rem A D, on the four tides of which are graduated the different flength of the fpirit. The other three lides not flown in this figure are reprefented in fig. 7. with the three weights belonging to them, marked $n^{\lrcorner} 1,2$. and 3 . correfponding to the fides finilarly marked at the top. When the initrument is placed in the fpirit to be tried, if it finks to the divifions on the flem withont a weight, the ftrength will be fhown on the fide marked o on the top; and it will indicate any Arength from 74 gallons in the 100 , to 47 to the 100 abuve proof. The fmall ligures, as 4 at $66,3 \frac{1}{2}$ at $61,2 \frac{1}{2}$ at 48 , \& c . fhow the concentration by mixture above mentioned, viz. the rate of diminutions that will take place, by making a mixture with water, to reduce the 「pirt at thofe ttrengths to proof. If the hydrometer does not fink to the hem without a weight, it mult be made to do fo by auplying either of the three weights requifite. The tile $\mathrm{n}^{2} \mathrm{I}$. with the weight no 1. Shows the Atrength of fpirits from 46 to 13 gallons to the 100 above proof, as before. The concentration figures are $2,1_{2}^{\frac{1}{2}}, \& \in$. the ufe as before. The fide $1^{2} 2$, with the weight $1^{\circ} 2$. Thows the remainder of the over-proof to proof, the divifion or which is marked P on the influment, and every gallon in 100 under proof down to 29. The fide $n^{3}$ 3. with its weight, flows the remainder from 30 gallons in the 100 under proof down to water, marked W, which may be confidered roa in 160 . The application of the thermometer ( $F$ ) now appears eafy and expeditious; for as it is immerfed in the fpirits with the hydrometer, they both may be obferved at one experiment or trial. The fcale of the thermoneter is divided into four columns; two on onc fide, as fhown in the figure, and two on the other. At the top of the columns are marks 0. 1.2.3. agreeing with the weights, or no weight, in ule; and that column of divitions of the thermometer is to be obferved which correfponds with the weights in ufe; if no weight is ufed, then the column marked 0 is obferved. The divifions of the thermometer commence from the middle of each column at the temperate point, which is marked 0: then for as many divifions as the quickfilver in the tube appears above o, fo many gallons in the 100 mult the fpirit be reckoned weaker; and for fo many divifions as the quickilyer may appear bclow 0 , as many gallons in the 100 muft be reckoned flronger.

Hydrometers of a fimilar conflruction, and with no more weights, Mr Joues makes for difcovering to great exactnefs the different trrengths or fpecilic gravity of worts in brewing, of different minerals, fea-waters, \&c. For thefe purpofes the thernometer is not united with the inftrument; but is fomid to be more ufeful leparately, and of a larger dimenfion. Not withHanding the above hydrometer anfivering the general purpo- One by $M$ fes in an accurate and ealy manner, yet the induftry of feveral ingenious perfons interelled in the fale of fpirits rule. has been exerted to conftiuct an inftrument of the greatef poffible exactnefs. The effects of heat and cold upon different Itrengths of firits not being fo uniform as generatly undertood, and every different degree of Atrength of firit between water and alcohol having its peculiar degree of contraction and dilatation, errors of fome importance mulf be found in the hydrometers conftructed upon the ufual principle of temperature. With a view to obviate this defect, Mr Dicas of Liverpool conflructed fone ycars back an hydrometer of the form

Specilic Eravities. Noigi.
"/il!.1.

Siec.fic generally ufed, with $3^{6}$ weights, which were valued Cravit!eb. from o to 370 , including the divifions on the llem; but the improvement confifts folely in ai: ivory liding rule which accompanies the inftrument. In the graduation of this rule, is confidered the different effects of heat and old above-mentioned on the fpirits. Every degree of frength included by the hydrometer between 0 and 370 , has the fame feries of numbers placed on the fliding part of the rule ; oppofite to which, on the fixed rule, are marked the different trengths, and which are thus determined by immediate infpection. They proceed on one fide from water to pronf, and on the other from proof to alcohol, and divided in fuch a manner, as to thow how many gallons in the too the fipitits are above or below proof. There is alfo a line, containing the concentration for every degree of ftrength; and, what is the chief advantage of the rule, at one end of the fice is placed a fcale, containing the degree of heat from 30 to 80 of Fahrenheit's feale, with a flewer de luce oppofite, as an index, to fix it to the temperature of the fpirits. By the affillance of this niding rule, the cxact flate of the fpirits is correctly ob ained. A perfect comprehention of this rule can only be had by an infpection of it, and it always accompanies the hydrometer on fale. Mr Dicas has obtuined a patent for his improvement.

An hydrometer of a more univerfal confruction has been made by Mr Quin, who for many years has been accuflomed to contruct hydrometers of various kinds. This hydrometer is made of hard brafs; and therefore not fo liable to be injured as fine copper, of which hy. drometers are ufually made: it is conftrueted fo as to afcertain, in a plain and espeditious manner, the Itrength of any fpirit from alcohol to water, with the conceritration and fpecific gravity of each different Ilrength ; and difcovers alfo the weight of worts, \&ce. with four weights only; which, according to the old confruction of hydrometers, would require a far greater number of weights. Fig. 8. is a reprefentation of the inflrument, with its four fides of the flem graduated and figured at top, to correfpond with the weights below. The fide of the fquare-Hem engraved $A, B, C, D, \& \in c$ to $Z$, fhows the flengtb of any firit from alcohol to water; and the three other fides, numbered $1,2,3$, are adapted for wrots, Sc. The heat and cold altering the denlity of firits, and giving to every degree of flrength a peculiar degree of contraction and dilatation; this circumflance is confidered in dividing the fliding rule belonging to and fold with the hydrometer. This niding rule is nearly 'fimilar to that of Mr Dicas's abovementioned, and differs but very little from it. Some dirctions for the ufe of this hydrometer may further exemplify its fimplicity and accuracy.

Find the heat of the fpirit by a thermometer, and bring the flar on the fliding rule to the degree of heat on the thermometer fcale, and againft the number of the weight and letter on the ftem you have the Arength of the fpirit pointed out on the fiding rule, which is lettered and numbered as the inflrument and weighits are.

The weights apply on the under flem at C .
Example. Suppofe the heat of the fpirit $65^{\circ}$ by the thermometer, and of fuch ftrength as to fink the hydometer to D on the flem, without any weight; then Fat the thar (on the rule) to $65^{\circ}$ of the thermometer,
and againft D you have 75 gallons to the roo over proof; at this Atrength the concentration is 5 gallons (marked above 75) ; and the \{pecilic gravity is nearly 811 , as marked below D: fo that if 75 , gallons of water are added to 100 gallons of this fpirit, the mixture will be hydrometer proof; but will only produce in meafure 170 gallons. Again, let the heat be $50^{\circ}$, and the fpirit require the weight $n^{\circ} \mathrm{t}$. to link the intrument to $I$ on the ftem; then put the Itar to $50^{\circ}$ of lieat, and againft $I$ on the flidin; rule you have $52 \frac{1}{2}$ gallons to 100 over proof, concentration $2 \frac{3}{3}$ gallons, and the feccific gravity $85+$.

If the inflrument with the weight $n^{\circ} 2$. Thould fink to $C$ on the flem, and the heat $41^{\circ}$, it thows the flrengeh 19 gallons to the 100 over proof, concentration $\frac{3}{4}$, Specific gravity 905.

If the fpirit be at $3^{\circ}$ of heat, and the weight $n^{\circ} 3$. finks the inftrument to letter $S$ on the flem, on the niding rule, it thows the liquor to be 13 gallons in the 100 under proof concentration $\frac{2}{4}$, ipecific gravity $9+5$. So of the reft. In afcertaining the flrength or gravity of worts, the weight $\mathrm{n}^{2} 4$. is always to continue on the hydromeser; and the weights no $1,2,3$, are adapted to the fides $n^{0} 1,2,3$, of the fquare ftem; which difcovers the exact gravity of the worts.

The inflrument is adjufted fo as to fink in rain water at $60^{\circ}$ of the thermometer with the weight $n^{\circ} 1$. to W , on the fide of the ftem $\mathrm{n}^{\circ} \mathrm{I}$, and fhows to $26^{\circ}$ heavier than water. The fide $u^{\circ} 2$, with its correfponding weight $\mathrm{n}^{\circ} 2$. Shows from $26^{\circ}$ to $53^{\circ}$, and the fide $n$. afcertains from $53^{\circ}$ to $81^{\circ}$, or $40^{\frac{1}{2}}$ pounds per barrel heavier than water; two degrees on the flem being a pound per barrel.

To ufe the bydrometer in afcertaining the gravity of two or more zuorts.

Rulle. Multiply the gravity of each wort by its refpective number of batrels or gallons; divide the fum of the products by the number of gallons or barrels; the quotient will be the mean gravity required.

| $60^{\circ}$ <br> 30 barrels <br> 1800 <br> 700 | $35^{\circ}$ <br> 20 |
| :--- | :--- |

$50) 2500\left(50^{\circ}\right.$ mean gravity required. 2500
When the heat of the worts cannot be conveniently tried at $60^{\circ}$ of the thermometer, the following fmall table fhows the number of divifions to be added fur the heat :

$$
\left.\begin{array}{lll}
\text { Degrees of the thermometer } & 60 & 0 \\
72 & 1 \\
32 & 2 \\
91 & 3 \\
99 & 4
\end{array}\right\} \begin{aligned}
& \text { Degreses of } \\
& \text { thehydro } \\
& \text { meter to be } \\
& \text { added. }
\end{aligned}
$$

This tahle is not philofophically true; yet the error from it will not exceed a quarter of a pound per barrel in any gravity, and for fermentation; but for more accuracy in this particular Mr Quin completes a fcale which may be applied to any particular degree of heat.

Specific Gravities.

Specific Gravities.

Mr Nichulfon has lately improved tbe conftruction of the hydrometer, and made it a new inftrument for meafuring the Specific gravity of bodies; and for that purpofe it appears the moft accurate of any yet conftructed. See fig. 9 . where $A A$ reprefents a fmall fcale, which may be taken off at $D$; diameter $1 \frac{1}{2}$ inch, weight 44 graino. B a flem of hardened ftel wire; diameter $\frac{50}{\ddagger 0}$ inch. E a hollow copper globe; diameter 2 $\frac{8}{\frac{8}{3}}$ inches, weight with flem 369 glains. FF a flirrup of wire forewed to the.globe at C . G a fmall fale ferving likewife as a counterpeife; diameter $1 \frac{1}{2}$ inch, weight with Airrup 1634 grains. The other dimerifions may be had from the figure, which is $\frac{7}{3}$ of the linear magnitude of the inftrument infelf.

In the conilruction, it is affumed, that the upper fcalc fall conflantly carry 1000 grains when the lower feale is empty, and the inftument funk in diftilled water as the temperature of $60^{\circ}$ Fahrenheit to the middle of the wire or ftem. The length of the ttem is arbitrary, as is likewife the dittance of the lower feale from the furface of the globe. But the length of the ftem being fettled, the lower fcale may be made lighter, and confequently the globe lefs, the greater its diftance is taken from the furface of the globe; and the contrary. It is to be noted that the diamcter of each fcale mult not be lefs than the fide of a cube of water weighing 1000 grains.
The diftances of the upper and lower fcales refpectively from the neareft furface of the globe being fettled, add half the fide of a cube of water weighing 1000 grains to the diftance of the upper fcale. This increafed diftance, and the faid diflance of the lower fcale, may be conlidered as the two arms of a lever; and, by the property of that mechanical power,

As the number expreffing the lower dittance,
Is to the whole weight above; namely 1000 grains added to the weight of the upper fcale;
So is the number expreffing the upper diflance,
To the lower weight, when the inftrument has no tendency to any one pofition.
-This laft found weight muft he confiderably increafed, in order that the inflruments may acquire and prcferve a perpendicular pofition.

Add together into one fum the weight of the lower fcale thus found, the weight of the upper fcale and its load, and the eftimate weight of the ball and wires. Find the folid content of an equal weight of water ; and thence, by the common rules of meafuration the diameter of an equal fphere. This will be the diameter, from outtide to outlide, of the globe that will float the whole.

As this precefs, and every other part of the prefent defcription, may be eafly deduced from the well known laws of hydroftatics, it is unneceffary to enlarge here on the demiontrative part.

To masfure the Jpecific gravities and thermometrical e:Nponfious of foulds. If the extreme length or height of the inflrument be moderate, its weight, when loaded, will be about 3100 gra ins. It is, however, necef. fary in practice, that its weight fhould be accurately found ty experiment. This whole weight is equal to that of a quantity of diftilled water at the temperature of $60^{\circ}$, whofe bulk is equal to that part of the inftru. ment which is below the middle of the ftem. If, therefore, the inftrament be immerfed to the middle of the ftem in any other fluid at the fame temperature
(which may be done by altering the load), the differ ence between this laft load and 1000 grains will be the difference between equal bulks of water and of the other fluid, the weight or the mafs of water being known to be 3100 grains. If the faid difference be excef $f_{3}$ above 1000 grains it mult be added, or if it be defect fuburacted from 3100 grains: the fum or remainder will be a number whofe ratio to 3100 will cx prefs the ratio of the fpecific gravity of the affumed fluid to that of water. And this ratio will be expreffed with confiderable accuracy; for the inftrument having a cylindrical ftem of no more than $\frac{1}{10}$ of an inch diamter, will be raifed or depreffed near one inch by the fubtraction or addition of $\mathrm{r}^{2} 0$ of a grain, and will thesefore indicate with eafe fuch mutations of weight as do not fall fhort of $\frac{1}{20}$ of a grain, or $\overline{\text { ricset }}$ th part of the whole. Confequently, the fpecific gravities of all fuids, in which this in?rument can be immerfed, will be found to five places of figures.

It is evident, that this infrument is a kind of thermometer, perhaps better adapted than the common one for meafuring the expanfions of fluids by heat. As the fluid, in the common thermometer, tifes by the excefs of expanfion of the fluid beyond the expaution of the glafs veffel; fo this inftrument will fall by the excefs of the fame expanfion beyond the proper expanfion of the materials it is compofed of.

To meafure the fipeciffic gravities of fovid bories. The fo lid bodies to be tried by this inftrument muft not exceed 1000 grains in weight. Place the inflrument in dittilled water, and load the upper fcale or difh till the furface of the water interfects the middle of the ftem. If the weights required to effect this be exactly 1000 grains, the temperature of the water anfwers to $60^{\circ}$ of Fahrenheit's fcale ; if they be more or lefs than 1000 grains, it follows, that the water is colder or warmer. Having taken a note of this weight, unload the feale, and place therein the body whofe fpccific gravity is required. Add more weight, till the furface of the water again bifects the ftem. The difference between the added weight and the former load is the weight of the body in air. Place now the body in the lower feale or difh under water, and add weights on the upper fcale till the furface of the water nnce more tifects the flem. This laft added weight will be the difference between 1000 grains and the weight of the body in water. To illuftrate this by an example.
N. B. The fpecific gravity of lead and tin, and (probably other metals) will vary in the third figure when the fame piece of metal is melted and cooled a fecond time. This difference probably arifes from the arrangement of the parts in cooling nore or lefs fuddenly

| The load was found by experiment | Grains. $999,10$ |
| :---: | :---: |
| A piece of call lead required the additional weight |  |
| Difference is abfolute weight in air | 788,25 |
| Additional weight when the lead was in the lower fcale | 280,09 |
| Difference between the two additional weights or lofs by immerfion $788.25 \quad 113^{8}+$ | 69,24 |
| Hence Specific gravity $\frac{10.24}{69.24}=\frac{}{1000}$ |  |

When the inftrument is once adjufted in difilled water, common water may be afterwards ufed. For the ratio of the Specific gravity of the water made ufe of to that of difilled water being known $\left(=\frac{b}{a}\right)$, and the ratio of the fpecific gravity of the folid to the water made ufe of being alfo known $\left(=\frac{c}{b}\right)$, the ratio of the fpecific gravity of the folid to that of diflilled water will be compounded of both (that is, $\frac{c b}{a b}$ ).

There is reafon to conclude from the experiments of various authors, that they have not paid much attention either to the temperature or Specific gravity of the water they made ufe of. They who are inclined to be contented with a lefs degree of precifion than is intended in the conftuction here defcribed, may change the ftem, which for that purpofe may be made to take out for a larger.

One of the greatell difficulties that attends hydroftatical experments, arifes from the attraction or repulfion that obtains at the furface of the water. After srying many expedieuts to obviate the irregularities arifing from this caufe, Mr Nicholfon finds reafon to prefer the fimple one, of carefully wiping the whole inftrument, and efpecially the ftem, with a clean cloth. The weights in the dith mult not be efteemed azcurate while there is either a cumulus or a cavity in the water round the flem.

Itt, after all, we cannot with great geometrical certainty rely upon either the hydrometer or the hydroftatic balince; for there are fome natural inconveniences that difturb the exactnefs with which they difcover the £pecific gravities of different bodies. Thus, if the weather be hotter at one time than another, all fluids will fwell, and confequently they will be lighter than when the weather is cold : the air irfelf is at one time heavier than at another, and will buoy up bodies weighed in it ; they will therefore appear lighter, and will of confequence feem heavier in water. In thort, there are many caufes that would prevent us from making tables of the fecific gravities of bodics, if rigorous exactnefs were only expected; for the individuals of every kind of fublance differ from each other, gold from gold, and water from water. In fuch tables, therefore, all that is expected is to come as near the exact weight as we can; ard from an infpection into feveral, we may make an avcrage near the truth. Thus, Mufchenbroek's table makes the fpecific gravity of rain-water to be nearly eighteen times and an half lefs than that of a guinea; whereas our Englin tables make it to be but feventeen times and an half, nearly, lefs than the fame. But though there may be fome minute variation in all our tables, yet they in general may ferve to conduct us with fufficient accuracy.

In conftructing tables of Specific gravities with accuracy, the gravity of water mult be reprffented by unity or 1.000 , where three cyphers are added to give room for expreffing the ratios of other gravitics in decimal parts, as in the following table.

A TABLE of the Specticic Grarities of feveral Solid and Fluid Bodies.

rity of adu teration in metals. each body.

The ufe of the table of fpecific gravities will beft appear by an example. Supufe a body to be compounded of gold and filver, and it is required to find the quantity of each metal in the compound.

Firft find the fpecific gravity of the compound, by weighing it in air and in water; and dividing its aerial weight by what it lofes thereof in water, the quotient will fhow its fpecific gravity, or how many times it is heavier than its bulk of water. Then fubtract the fpecific gravity of filver (found in the table) from that of the compound, and the fpecifie gravity of the compound from that of gold: the firlt remainder fhows the bulk of gold, and the latter the bulk of lilver, in the whole compound: and if thefe remainders be multiplied hy the refpective fpecific gravities, the products will fhow the proportion of weights of cach nuctal in the body.

Suppofe the fperific gravity of the compounded body be 13; that of tandard filver (by the table) is 10.5 , and that of gold 19.63 : therefore 10.5 from 13 , remains 2.5 , the proportional bulk of the gold; and 13 from 19.63 , remains 6.63 , the proportional bulk of filver in the compound. Then, the firft remainder 2.5 , multiplied by 19.63 , the fpecifie gravity of gold, produces 49.075 for the proportional weight of gold; and the lalt remainder 6.63 multiplied by 10.5 , the fpecific gravity of filver, produces 69.615 for the proportional weight of filver in the whole body. So that for every 49.07 ounces or pounds of gold, there are 69.6 pounds or ounces of filver in the body.

Hence it is caly to know whether any fulpected metal be genuine, or allayed, or counterkit; by finding how much it is heavier than its bulk of water, and comparing the fame with the table: if they agree, the metal is good; if they differ, it is allayed or counterfeited.

A cubical inch of good brandy, rum, or other proof fpirits, weighs 235.7 grains; therefore, if a true inch cube of any metal weighs 235.7 grains lefs in fpirits than in air, it fhows the fpirits are proof. If it lofes lefs of its atrial weight in fpirits, they are above proof; if it lofes more, they are under: For, the better the fpirits are, they are the lighter; and the worfe, the heavier.

## Sect. IV. Hydraulics.

Hydraulics is that part of hydroftatics, which seaches to eltimate the fwiftnefs or the force of fluids in motion.

It has been always thought an inquiry of great curiofity, and ftill greater advantage, to know the caufes by which water fpouts fiom veffels to different heights and diftances. We have oblerved, for inttance, an npen veffel of liquor upon its ftand, pierced at the bottom: the liquor, when the opening is firt made, fpouts out with great force; buit as it continues to run, becomes lefs violent, and the liquor flows more feebly. A knowledge of hydraulies will inflruct us in the caufe of this diminution of its frength; it will fhow precifely how far the liquor will fout from any veffel, and how faft or in what quantities it will flow. Upon the grinciples of this fcience, many machines worked
by water are entirely couffructed; feveral differert en. Hydrunlics. gines ufed in the mechanic arts, various kinds of mills, pumps, and fountains, are the refult of this theory, judicioully applied.

And what is thus demonflated of the botton of the The veloveffel, is equally true at cuery other depth what foever city of Let us then reduce this into a theorem: The velocity water. avils cwhichs water fpouts oot at a bole in the .fille or bottoin of a reffet, is as the fyuare ront of the depts or difance of the bole below the furface of the avater. Firr, in order to make duuble the quantity of a Puid run through one hole as through another of the fane lize, it will require four tinxes the preffure of the other, and therefore mult be four times the depth of the other below the furface of the water: and for the fane reafon, three times the quantity running in an equal time through the fame fort of hole, mutt run with three times the welucity; which will require nine times the preffure, and confequently muft be nine times as deep below the furface of the flaid: and fo ons.- [o prove Plate
 equal-fized borcs, be fixed into the fite of the veffel fis. 9. , $A B$; the pipe $g$ being four times as deep below the furface of the water at $b$ in the veffel as the pipe $C$ is : and whilt thefe pipes run, let water be cunttantly poured into the veffel, to keep the furface fill at the fame height. Then if a cup that holds a pint be fo placed as to receive the water that fouts from the pipe C, and at the fame moment a cup that holds a quart be fo placed as to recrive the water that fouts from the pipe $g$, both cups will be filled at the fame time by their refpective pipes.

23
The horizontal dillance in which a fuid will rpout The horifrom a horizontal pipe in any part of the fide of an znnalai diupright veffel below the furface of the fluid, is equal to fance t". $t$ wiee the length of a perpendicular to the fide of the tur will veffel, drawn from the mouth of the pipe to a Cemi-fpouf froms. eirele deferibed upon the alcitude of the fluid: and pipes. therefore, the fluid will fpout to the greateft diftance poffible from a pipe whofe mouth is at the centre of the femicircle; becaufe a perpendicular to its diameter (fuppofed parallel to the fide of the veffel) drawa from that point, is the longeft that can poffibly be drawn from any part of the diameter to the circumférence of the femicircle. Thus, if the veffel AB be full of water, the horizontal pipe $D$ be in the middle of its Gide, and the femicircle $\mathrm{N} e d c b$ be deferibed upon D as a centre, with the radius or femidiameter $\mathrm{D} g \mathrm{~N}$, or $\mathrm{D} f b$, the perpendicular $\mathrm{D} d$ to the diameter ND $b$ is the longeft that can be drawn from any part of the diameter to the circumference $\mathrm{N}_{e} d c b$. And if the veffel be kept full, the jet $G$ will fpout from the pipe D , to the horizontal diftance $\mathrm{N} M$, which is double the length of the perpendicular $\mathrm{D} d$. If two other pipes, as $C$ and $E$, be fixed into the fide of the veffel at equal diftances above and below the pipe D , the perpendiculars $\mathrm{C} c$ and $\mathrm{E} e$, from thefe pipes to the femicircle, will be equal : and the jets $F$ and H fpouting from them will each go to the horizontal diftance NK; which is double the length of either of the equal perpendiculars $\mathrm{C} c$ or $\mathrm{D} d$.

Fluids by their prefure may be conveyed over hills and 24 dot hills and How wates valleys in bended pipes, to any height not greater than nay be the level of the fprings from whence they flow. This c-nvejed is what the ancients were ignorant of ; and therefore and valothey leys.

Hydraulics. they ufualiv built AQUeducts (vaft rows of arches one above another, between two hills, at a vaft expence of money, time, and labour), in order to cunsey water over them, crofs the valley, in a common channel. This is now done to equal advautage, and at much lefs expence, by a range of pipes laid down one hill and up the other. An inftance whereof may be given by a bent tube or crane; into one of the equal legs whereof if water be poured, it will rife to the fame devel exactly in the other. The reafon is obvious: In the leg $A$, (lig. 14.) these are, fuppole, two ounces of water endeavouring by the power of gravity to defcend with the force of 2 ; thefe will thrut forward, buoy up, and fupport an equal quantity of a like fluid in B ; and the bottom of the machine $C$, againtt which both fides equally bear, will of conlequence futtain a donble prefurc, or that of four nunces; and in the prefent cafe will pretty well reprefent the prop or fixed foint of a balance lieam; as the equal fuid columns AC, A BC, may be admitted to denote equal weights, fufpended on the balance arms, counterpoifing each other. So that the rife of Huids to their firit level, thus confidered, is a cafe truly fatical; and all their other motions proceed only from weight added.

A fyplon, generally ufed for decanting liquors, is a bended pipe, whofe legs are of unequal lengths; aud the fortelt leg mult always be put into the liquor intended to be decanted, that the perpendicular altitude of the column of liquor in the other leg may be longer than the column in the immerfed leg, efpecially above the furface of the water. For, if both columns were equally high in that refpect, the atmofphere, which preffes as much upward as downward, and therefore acts as much upward againt the column in the leg that hangs without the reftel, as it acts downward upon the furface of the liquor in the veffel, would hinder the running of the liquor through the fyphon, even though it were brought over the bended part by fuction. So that there is nothing left to caufe the motion of the liquor, but the fuperior weight of the column in the longer leg, on account of is having the gieater perpendicular height.

Let $D$ be a cup filled with water to $C$; and $A B C$ a fyphon, whole Thorter leg BCF is immerfed in the water from $C$ to $F$. If the end of the other leg were no lower than the line AC, which is level winh the furface of the water, the fyphon would not run, even though the air thould be drawn out of it at the mouth A. For although the fuction would draw fome water at firf, yet the water would flop at the moment the fuction ceafed; hecaufe the air would act as much upward againft the water at $A$, as it aeted downward for it by preffing on the furface at $C$. Dut if the leg $A B$ comes down to $G$, and the air be drawo out at $G$ by fuction, the water will immediately follow, and continue to run until the furface of the water in the cup comes down to F ; becaufe, till then, the perpendicular height of the column BAG will be gseater than that of the column CB ; and, confcquently, its weight will be greater, until the fürface comes down to $F$; and then the fyphon will flop, though the leg CF fhould reach to the bottom of the cup. For which reafon, the leg that hangs without the cup is always made long enough to reach below the level of its botion;
as from $d$ to E : and then, when the Syphon is emp. Hy draulies. tied of air by fuction at E, the water immediately follows, and by its contmaity brings away the whole from the cup; juft as pulling one end of a thread will make the whole clue follow.

If the perpendicular height of a fyphon, from the furface of the water to its bended top at $B$, be more than 33 feet, it will draw no water. even though the other leg were much longer, and the fyphon quise emptied of air, becaure the weight of a column of water 33 feet ligh, is equal to the weight of as thick a column of air, reaching from the furface of the earth to the top of the atmofimere: fo that there will ther be an equilibrium; and confequently, though there would be weight enough of air upon the furface C to make the water afcend in the $\operatorname{leg} C B$ almoft to the height B , if the fyphon were emptied of air, yet the weight would not he fufficient 10 force the water over the bend; and therefore it could never be brought inio the leg BAG.

Mercury may be drawn through a fyphon in the fame manner as water; but then the umolt height of the fyphon muft always be lefs than 30 inches, is mercury is near $1+$ times heavier than water. That fuids are forced through the fyplon by the preffure of the atmolphere, is proved experimentally by the air-pump; for, if a fyption inmerled in a veffel of water be placed when runaing in the receiver, and the air excracked, the running will immediately ceafe. It is however certain, that a fyphon of a particular kind, once fet a running, will perfilt in its motion, though removed into the mof perfect vacuum our airpumps will make : or, if the lower orifice of a full lyphon be flut, and the whole be thus placed in a receiver, with a contrivance for opening the orifice when the air is exhauted ; the water will be all-emptied out of the veftel, as if it had been in open air.

This fact has been fufficiently. afeertained by many approved hydroftatical writers. Defagulicrs informs us, that he made the experiment both with water and mercury; for having filled a Cyphon, recurved at the extremitios of its legs, fucceffively with thofe liquors, and fufpended it by a hip wie in the receiver of an airpurnp, over two fmall jars containing mercury to unequal heights : (and water, when water was ufed in the fyplion), he exhaulled the air ont of the receiver, and then leiting down the fyplion, fo that its two ends went into the liquor in the jars, the !iquer ran from the higher into the lower veftel. He alfo made an experiment in the open air, where the mercury ran through a §yphon, whofe bend was more than 3 t inches abuve the lower orifice of the fhort leg of the fyphon. But neither of thefe experiments affurd a juft ubjection againit the preceding doctrine, siz. that the air is the caufe of the difcharge of liguors from one veftel into another by means of fyphons; for its runuing in vacuo was only owing to the attraction of colsefion, which acts for a fmall height ; becaufe the experiment will not fucceed in racuo, if the fyplion ufed for mercury has its bend fix inches higher than the orilice of the mort leg, and if the bend for the fyphon of water be two or three feet high; neither will the laft mentioned with mercury in the open air anfwer, if the bend of the fyphon be forty inches high : and in all the experimtats the bores of the fyptous muft be very finall.

Hyciraitics. The figure of the fyphon may be varied at pleafure, (fee fig. 1.2.3.) provided only the orifice C be below the level of the furface of the water to be drawn up; but Gill the farther it is diflant from it, the fafter will the fluid be carried off. And if, in the courfe of the flux, the orifice A be drawn out of the fluid, all the liquor in the fyphon will go out at the lower orifice C; that in the leg CB dragging, as it were, that in the fhorter $\operatorname{leg} A B$ after it. If a filled fyphon be fo difpofed, as that both orifices A and C be in the fame horizontal line; the fluid will remain pendant in each leg, how unequal foever the length of the legs may be. Fluids, thereforc, in fyphons, feern as it were to form one continued body; fo that the heavier part defcending like a chain, pulls the lighter after it.

Upon the principle of the fyphon depend the experiments of Tantalus's cup, $\mathrm{n}^{\circ}+4$; the Fountain at command, $\mathrm{n}^{\circ} 45$; and the inverted drinking.ghafs, no 58 . As to the laft of thefe, it may be here obferved, that if the paper was put dry on fuch a veffel empty, it would fink in the air, and fall away even by its own gravity; and if put on wet, it were to be doubted whether a very fmall weight added thereto would not feparate it from the glafs, fo inconfiderable would the tenacity of the water be in this cafe. The paper therefore cannot be fuppofed to fupport the incumbent weight of water; and the true caufe thereof muft be this: The bottom and fides of the inverted glafs-veffel being sigid, keep off the preflure of the air from the fluid above, whereas it hath liberty of accefs and freely acts thereon below: and that it does fo, will in part appear to an obferver by the concavity of the paper underneath. Could the air's preffure in this cafe be any how admitted through the foot of the veffel inverted, without doubt the whole column would defeend together. And the like would happen thould the paper be removed; but for a different realon, viz. the large column of water in the mug, being compofed of many collateral ones, which, being difpofed as in a bundle, reft on the paper wherewith the veffel is covered, as on a common bafe; and there being all equally denfe, and equall fluid, are all retained, and continued of the fame length, by the general and uniform preflure of the air againt the paper below; and fo long as this continues, none of them getting the lealt advantage over the reft, they are all fuftained in a body compact together. But when the paper is removed, it being farce poffible to hold the veffel fo exaatly level, but that fome one or other of thefe fmaller fluid columns will become longer, confequently heavier, than thofe adjacent, and, over-balancing the reft, will defcend, and give the lighter fluid, the air, leave to rife in its place, even to the top of the glafs: the general preffure whereof being there admitted, will foon caufe the reft of them to more, and the whole quantity will then defcend, feemingly together.
A gain, fhould a veffel be but part filled with water, the fame effect will follow to a certain degree. For inflance, fuppofe we fill a long glafs half with water, cover it with paper, and turn it down as before. Six inches fuppofe of water, endeavouring to defcend, will by its weight rarefy the air in the glafs above it, perhaps a 6oth part or more. The denfer air without will then overpoife the air rarefied within; and there-
fore a certain quantity of water, equal to the diffe- Hydraulice. rence of the two preflures, will in this cafe be thereby bnoyed up and fupported. But the air within the glafs being dilated as aforefaid, the water fufpended muft be expected to hang fomething below the mouth of it ; though not enough, perhaps, to overcome the tenacity of the water, and make it all defeend.

Upon the principle of the fyphon alfo we may eafily Internit- ${ }^{26}$ account for intermitting or reciprocating forings. Let ung frongs AA be part of a hill, within which there is a cavity Piate BB ; and from this cavity a vein or channel running fix. 2. in the direction of BCDE. The rain that falls upon the fide of the hill will fink and ftrain through the fmall pores and crannies G, G, G, G; and fill the cavity K with water. When the water rifes to the level HHC , the vein BCDE will be filled to C , and the water will run through CDF as through a fyphon; which running will continue until the cavity be emptied, and then it will Hop until the civity be filled again.

We have feen that fluids led in pipes will always rife to the level of the refervoir whence they are fup. plied; the rifing column being pulhed forward, and raifed by another equally heavy, at the fame time endeavouring to defeend. A like effect might be expected from jets of water thus impelled, did not friction againt the fides of the machines, and the refittance of the air, both lateral and perdendicular, generally prove an abatement, and prevent its rifing fo high as the head.

Where jets are executed in the beft manner, and the fristion fpoken of is as much as poffible remored, the impediment of the air only, through which they needs mult beat in their rife, will caufe them, according to experiment, to fall hart of the height of the refervoirs, in the following proportions, viz.

| $\overline{\mathrm{JEF}_{\mathrm{r}}}$ <br> Feet. | Reservoir. Feet. Inches. |
| :---: | :---: |
| 5 | 5 : |
| 10 | 10:4 |
| 15 | 15 : 9 |
| 20 | $21: 4$ |
| 25 | 27 : 1 |
| 30 | $33: 0$ |
| 35 | 39 : 1 |
| 40 | $45: 4$ |
| 45 | $51: 9$ |
| 50 | $58: 4$ |
| 55 | $65: 1$ |
| 60 | 72 : 0 |
| 65 | 79 : 3 |
| 70 | $86: 4$ |
| 75 | $93: 9$ |
| 80 | 101:4 |
| 85 | 109 : 1 |
| 90 | 177 : 0 |
| 95 | $125: 1$ |
| 100 | $133: 4$ |

Whence in general it may be obferved: That as often as a five- foot jet (to be taken in thefe matters as a flandard,)

The fiurface of the water in the reforvatory which fupplies it, ought to exceed that jet in height.

Thus, to obtain a jet of 30 feet, which contains five feet fix times, the refervoir ought to be 36 inches or a yard higher; and a jet of 50 feet may be had from a head higher by four times tha: difference, $11+$ inches, or four yards. So that jets done in the beft manner foll Bort of the beights of their refervatories, in a lind of fub. duplicate ratio of the beights to which they rife.

This great difproportion in the rife of jets mull in general be owing to the reffiftance of the air they are made to move through; which has been fhown to be in proportion to the fquares of their celcrities refpectively: nor can the acceleration of the falling water in the pipe, or the retardment of the riling ftream by the action of gravity, be concerned at all in it ; fince thefe are probably adequate, and counterbalance each other every where in the fame level.

Their air's refitance being thus confiderable, it will always be found necelfary to increafe the bore of the adjutage or fpouting-pipe with the height of the refervatory: for if it be ton fmall, the rifing ftream will want fufficient weight and power to divide the air; which being denfelt near the earth, a fmall fream of water, endeavouring to mount to a great height, will be dafhed againft it with fo great violence, as to fall away in a milt and be wholly loft. And it may be obferved, that the weightier any body is, the greater force it will have when in motion: fince an ounce-ball fired from a mufket, will go much farther, and do greater execution, than will an equal weight of fhot ; and thefe again may be projected farther than fo much lead rafped into powder and fired off. A charge of water fired from a piftol would fcarce wet a paper at the diftance of fix feet. Accordingly, mould a cafk of water be any where pierced with holes of two, four, fix, eight, and twelve lines over, all in the fame level, the larger bore will always be found to throw the wa. ter farthef.

It may be of ule here to add Mr Marriote's proportions of the bores of the adjutages and pipes of conduct, who was very converfant in thefe things, and hath written very well on this fubject.
N. B. The French divide their inch into 12 equal parts, which they call lines.

whereby the jet is delivered, and the pipe condubang aty irauitc it from the head. In general, About five times the dia- Engines. " meter of the adjutage for jets under balf an inch, and fox or feacen times for all above, will fize the pipes of conduit pretty quell: not but it will always be an error on the right fide, to have them rather larger than in Irritnefs they ought to be, that the jet may always be frecly fupplied with water, and in due time.

For a like reafon, if there be occalion for a cock to be placed in any part of the pipe of conduct, particular care mut be taken that it hould be there bigger in proportion, that the water-:say may not be pinched; but that the cavity be left at lea!t equal to the bore of the relt of the pipe.

The bore of an adjutage cannot be too fmooth or true. Thole that are cylindrical are beft ; thofe that are bored conical wort, becaufe of the reflections of the water from the inclined fides of the machine, which in the hurry of the iffuing ftream will in them unavoidably be made.

When fluids are defigned to be raifed higher than the fprings from whence they flow, forcing engines mult be uled; of which and other hydraulic machines, we come now to give a particular account.

## Sect. V. Hydraulic Engines.

The pump is at once the molt common and mof of pumps ufeful of all the hydraulic inftruments. It was firft invented by Ctefebes, a mathematician of Alexandria, $120 \mathrm{~B} . \mathrm{C}$. ; when the air's preflure came afterwards to be known, it was much improved, and it is now brought to a great degree of perfection.

Cicfebes's pump acted both by fuction and pulion; Plate and its Itructure and action are as follow:-A brafs cy- CCXI.II?. linder $A B C D$, furnithed with a valve in $L$, is placed in fig. Is. the water. 2. In this is fitted the embulus MK, made of green wood, which will not fwell in the water, and adjufted to the aperture of the cylinder with a covering of leather, but without any valve. In H is fitted on another tube NH, with a valve that opens upwards in I. Now, the embulus EK being railed, the water opens the valve in $I$, and rifes into the cavity of the cylinder:-and when the fame embulus is again depreffed, the valve I is opened, and the water driven up through the tube HN. This is the pump ufed among the ancients, and that from which the others aftermentioned are deduced. Sir S. Morland has endeavoured to increafe its force by leffening the friction: which he has done to good effect, infomuch as to make it work without almoft any.frifion at all.

Of this pump as now ufed there are fimply three. kinds, riz. the fucking, the forcing, and the lifting. pump. By the two lall, water may be raifed to any height, with an adequate apparatus and fufficient power: by the former it may, by the general preffure of the atmofphere on the furface of the well-water, be raifed no more than 33 feet, as was before hinted, though in practice it is feldom applied to the raifing it much above 28 ; becaufe from the variations obferved on the barometer, it is apprehended that the air may, on certain occafions, be fomething lighter than 33 feet of water; and whenever that fhall happen, for want of the due counterpoife, this pump may fail in its per... formance.

The common fuckingr-fum?, with which we draw water out of wells, is an engine both pneumatic and hydraulic. It confitts of a pipe open at bothends, in which is a noweable pillon, bucket, or fucker, as big as the bore of the pipe in that part wherein it works; and is leatlered round, fo as to fit the bore exactly; and may be moved up and down, without fuffering any air to come betwcen it and the pipe or f)ump barrel.

We fall expiain the confluction of this and the forcing-pump by pictures of glafs models, in which boih the action of the pillons and motion of the valves are feen.

Hold the model DCBL upright in the veffel of water $F$, the water being deep enouzh to rife at leaft as high as from A to I. The value $a$ on the moveable bucket $G$, and the valve $b$ on the fixed box $H$ (which box quite fills the bore of the pipe or barrel at H ), will each lie clofe, by its own weight, upun the hole in the bucket and box, until the engine begins to work. The valves are made of brefs, and covered underneath with leather for clofing the holes the more exactly: and the bucket $G$ is railed and depreffed alternately by the handle $E$ and rod $D d$, the bucket being fupposed at 13 before the working begins.

Take holl of the handle IE, and thereby draw up the bucket from $B$ to $C$, which will make ronm for the air in the pump all the way below the bucket to dilate itfelf, by which its fpring is weakened, and then its force is not equivalent to the weight or preffure of the ontward air upon the water in the veffel $K$ : and therefore, at the firlt Atroke, the outward air will prefs up the water through the notelied foot $A$, into the lower pipe, about as far as $e$ : this will condenfe the rarefied air in the pipe between $c$ and $C$ to the fame flate it was in before; and then, as its foring within the pipe is equal to the force or preffure of the outward air, the water will rife no ligher by the firlt ftroke; and the valve $b$, which was raifed a little by the dilation of the air in the pipe, will fall, and ftop the hole in the box H ; and the furface of the water will Itand at $e$. Then deprefs the pilton or bucket from $C$ to $B$; and as the air in the part $B$ cannot get back again through the valve $b$, it will (as the bucket deScends) raife the valve $a$, and fo make its way through the upper part of the barrel $d$ into the open air. But upon raifing the bucket $G$ a fecond time, the air between it and the water in the lower pipe at $a$ will be again left at liberty to fill a larger fpace; and fo its fpring being again weakened, the preffure of the outward air on the water in the veffel.K will force more water up into the lower pipe from $e$ to $f$; and when the bucket is at its greatelt height C , the lower valve $b$ will fall, and itop the hole in the box H as before. At the next Itroke of the bucket or pitton, the water will rife through the box H towards B ; and then the valve $b$, which was raifed by it, will fall when the bucket $G$ is at its greateft height. Upon depreffing the bucket again, the water cannot be pufhed back through the value $b$, which keeps clofe upon the hole whild the pifton defcends. And upon raifing the pifton again, the outward preffure of the air will force the water up through H, where it will raife the valve, and Sollow the bucket to C . Upon the next depreffion of she bucket G , it will go down into the water in the
barrel $B$; and as the water cannot be driven back through the now clofe valve $b$, it will raife the valve $a$ as the bucket defeends, and will be lifted up by the bucket when it is next raifed. And now, the whole face below, the bucket being full, the water above it cannot fink when it is next depreffed; but upon its depreflion, the valve $a$ will rife to let the bucket go down; and when it is quite down, the valve $a$ will fall by its weight, and ftop the hole in the bucket. When the bucket is next raifed, all the water above it will be lifted up, and begin to run off by the pipe F. And thus, by raifing and depreffing the bucket alternately; there is tlill more water raifed by it ; which getting above the pipe F, into the wide top 1, will fupply the pipe, and make it run with a continued ftream.

So at every time the bucket is raifed, the valve $b$ rifes, and the valve $a$ falls; and at every time the bucket is deprefled, the valve $b$ falls, and $a$ rifes.

As it is the preflure of the air or atmofphere which caufes the water to rife and fullow the pitton or bucket $G$ as it is drawn up; and fince a column of water 33 feet high is of equal weight with as thick a column of the atmofphere from the earth to the very top of the air; therefore, the perpendicular height of the pifon or bucket from the furface of the water in the well mull always be lefs than 33 feet; otherwife the water will never get above the bucket. But when the height is lefs, the preffure of the atmofphere will be greater than the weight of the water in the pump. and will therefore raife it above the bucket: and when the water has once got above the bucket, it may be lifted thereby to any height, if the rod $D$ be made long enough, and a fufficient degree of thrength he errployed to raife it with the weight of the water above the bucket.

The force required to work a pump, will be as the keight to which the water is raifed, and as the fquare of the diameter of the pump bore in that part where the pitton works. So that, if two pumps be of equal heights, and one of them be twice as wide in the bore as the other, the widell will raife four times as much water as the narroweft ; and will therefore require four times as much ftrength to work it.

The widenels or narrownefs of the pump, in any other part befides that in which the pilton works, does not make the pump either more or lefs difficult to work, except what difference may arife from the friction of the water in the bore; which is always greater in a narrow bore than in a wide one, becaufe of the greater velocity of the water.

The pump-rod is never raifed directly by fuch a handle as $E$ at the top, but by means of a lever, whofe longer arm (at the end of which the power is applied) generally exceeds the length of the fhorter arm five or fix times; and, by that means, it gives five or fix times as much advantage to the power. Upon thefe principles, it will be eafy to find the dimentions of a pump that thall work with a given force, and draw water from any given depth. But as thefe calculations have been generally neglected by pump-makers (either for want of fkill or indultry), the following table was calculated by the late ingenious Mr Booth for their benefit. In this calculation, he fuppofed the haddle of the pump to be a lever increafing the power five times; and had often found that a man can work a pump four inches

$\begin{array}{lllllllllll}H & Y & D & R & O & S & T & \text { A } & I & C & S\end{array}$

Hydraulie inches diancter and 30 feet high, and difcharge 27 x Engines gallons of water (Englifh wine-meafure) in a minute. Now, if it be required to find the diameter of a pump that fhall raife water with the fame eafe from any other height above the furface of the zuell; look for that height in the firt column, and over againf it in the fecond you have the diameter or width of the pump, and in the third you find the quantity of water which a man of ordinary ftrength can difcharge in a minute.

| Height of the pump above the furface of the well. $\begin{aligned} & n_{1}^{\prime} \\ & \stackrel{n}{6} \end{aligned}$ | Diameter of the bore where the bucket works. <br>  | Vater dis a minu wine-m Q C O 0 | $\begin{aligned} & \text { arged } \\ & \text { Eng } \\ & \text { fure. } \\ & \text { ry } \\ & \stackrel{y}{8} \end{aligned}$ |

The forcing-pump raifes water through the box H in the fame maner as the fucking pump dncs, when the plunger or pifton $g$ is lifted up by the rod $D d$. But this plunger has no hole through it, to let the water in the barrel BC get above it, when it is depreffed to $B$, and the valve $b$ (which rofe by the afcent of the water through the box H when the plunger $g$ was drawn up) falls down and fops the hole in H , the moment that the plunger is raifed to its greatelt height. Therefore, as the water between the plunger $g$ and box H can neither get through the plunger up on its defcent, nor back again into the lower part of the pump Le, but has a free paffage by the cavity around H into the pipe MM, which opens into the air-veffel KK at P ; the water is forced through the pipe MM by the defcent of the plunger, and driven into the air-veffel; and in running up through the pipe at P. it opens the valve $a$; which fluts at the moment the plunger bepins to be raifed, becaufe the action of the water againft the under fide of the valve then ceafes.

The water, being thus forced into the air-veffel KK by repeated Atrokes of the plunger, gets' above the lower end of the pipe GHI, and then begins io condenfe the air in the veffel KK. For, as the pipe GH
is fixed air-tight into the veffel below $F$, and the ait has no way to get out of the veffel but through the mouth of the pipe at I, and cannot get out when the mouth I is covered with water, and is more and more condenfed as the water rifes upon the pipe, the ait then begins to act forcibly by its Spring againft the furface of the water at $H$ : and this action drives the water up through the pipe IFGF, from whence it fpouts in a jet $S$ to a great height; and is fupplied by alternately raifing and deprefling of the plunger $\tilde{\delta}$, which conftantly forces the water that it raifes through the valve $H$, along the pipe $M M$, into the air-veffel KK.

The higher that the furface of the water H is raifed in the air-veffel, the lefs fpace will the air be condenfed into which before filled that vellel; and therefore the force of its fpring will be fo much the ftronger upon the water, and will drive it with the greater force through the pipe at $F$ : and as the fpring of the air continues whild the plunger $g$ is rifing, the fleam or jet $S$ will be uniform, as long as the action of the plunger continues; and when the valse $b$ opens, to let the water follow the plunger upward, the valve $a$ hhuts, to hinder the water, which is forced into the air-weffel, from running back by the pipe MM into the barrel of the pump.

If there was no air-veffel to this engine, the pipe GHI would be joined to the pipe MMN at P; and then the jet $S$ would flop every time the plunger is raifed, and run only when the plunger is depreffer.

Of lifting.pumps there are feveral forts; the moft common is thus conftrutted. AB is the barrel, fixed The liftuing in the frame KII.M; which is alfo fixed immovenble, Plate with the lower part in the water that is to be pumped cexxxt\% up. GEQHO is a frame with two Atrong iron rods, "IG. 13. moveable through holes in the upper and lower parts of the pump, IK and LM. In the bottom of this frame is fixed an inverted pillon B1, with its bucket and valve uppermolt at D. From the top of the barrel there goes off a part KH , either fixed to the barrel, or moveable by a ball and focket (as here reprefented at $F$ ); but in either cafe fo very exact and tight, that no water or air can poffiby get into the barrel, as that would prevent the effect of the pump. In this part, at $\mathbf{C}$, is fixed a valve opening upward.

When the pifon frame is thruft down into the water, the pifton 1) will defeend, and the water beneath it rufh up through the valve at D , and get above the pillon; where, upon the frame's being lifted up, the pifon will force the water through the valve C , into the ciftern P , there to run of by the foout. It is to be remembered, that this fort of pump mult be fet fo far in the water, that the pifton may play below ite furface. It appears by the above defcription, that this is ouly a different manner of conftructing a for-cing-pump.

By means of forcing pumps, water may be raifed to any height above the level of a river or fpring; and machines may be contrived to work thefe pumps, either by a running ftream, a fall of water, or by horfes. An intance in each fort will be fufficient to thow the method.

1. By a running fream, or a fall of water. Let piate $A A$ be a wheel, turned by the fall of water BB; and cCXL? 4

Hydraulic.
Engines. $\underbrace{\text { Engines. }}$
$3^{2}$ A pumpengine to go by wa. scr.

## Plate

CCXLH.
fg. 7 .
$\mathrm{F}, \mathrm{G}, \mathrm{H}$, on its axis, according to the ftrength of the fall of water, and the height to which the water is intended to be raifed by the engine. As the wheel turns round, thefe cranks move the levers, $c, c, e, f, g, b$, up and down, by the iron rods $i, k, l, m, n, 0$; which alternately raife and deprefs the piftons by the other iron rods $p, q, r, f, t, u, z v, x, y$, in 12 pumps; nine whereof, as $\mathrm{L}, \mathrm{M}, \mathrm{N}, \mathrm{O}, \mathrm{P}, \mathrm{Q}, \mathrm{R}, \mathrm{S}, \mathrm{T}$, appear in the plate ; the other three being hid behind the work at $V$. And as pipes may go from all thefe pumps, to convey the water (drawn up by them to a frall height) into a clofe ciftern, from which the main pipe proceeds, the water will be forced into this ciltern by the defcent of the piftons. And as each pipe, going from its refpective pump into the ciftern, has a valve at its end in the ciltern, thefe valves will hinder the return of the water by the pipes; and therefore, when the ciftern is once full, each pifton upon its defcent will force the water (conveyed into the ciftern by a former ftroke) up the main pipe, to the height the engine was intended to raife it : which height depends upon the quantity raifed, and the power that turns the wheel. When the power upon the wheel is leffened by any defeet of the quantity of water turning it, a proportionable number of the pumps may be laid afide, by difengaging their rods from the vibrating levers.

This figure is a reprefentation of the engine erected at Blenheim for the duke of Marlborough, by the late ingenious Mr Alderfea. The water-wheel is $7 \frac{2}{2}$ feet in diameter, according to Mr Switzer's account in his Hydraulics.

When fuch a machine is placed in a fream that runs upon a fmall declivity, the motion of the levers and action of the pumps will be but flow; fince the wheel muft go once round for each Aroke of the pumps. But when there is a large body of flow runsing water, a cog or fpur wheel may be placed upon each fide of the water-wheel AA, upon its axis, to turn a trundle upon each fide; the cranks being upon the axis of the trundle. And by proportioning the cog-wheels to the trundles, the motion of the pumps may be made quicker, according to the quantity and flrength of the water upon the firft wheel; which may be as great as the workman pleafes, according to the length and breadth of the float-boards or wings of the wheel. In the fame manner the engine for raifing water at London-Bridge is confructed.

The wheels of the London-bridge water-works are placed under the arehes of the bridge, and moved by the common ftream of the tide-water of the river. A B the axle-tree of the water-wheel is nineteen feet long, and three feet in diameter ; in which $C, D, E, F$, are four fets of arms, eight in each place, on which are fixed G G. G G, four fets or rings of felloes twenty feet in diameter, and the floats HHH fourteen feet long, and eighteen inches deep, being about ewenty-fix in, number. The whet lies with its two gudgeons, or centre pins, A, B, upen two braffes in. the pieces MN, which are two great levers, whofe fulcrum or prop is an arched piece of timber $L$; thelevers being made circular on their lower fides to an arch of the radius MO , and kept in their places by. ewo arching fluds fixed in the flock L, through two mortoifes in the lever $\mathrm{M} N$. The wheel is by thefe levers. made to rife and fall with the tide in the following
manner. The levers M N are fixteen feet long; fromHydraulic M the fulcrum of the lever to O the gudgeon of Engines. the water-wheel, fix feet; and from $O$ to the arch at $N$, ten feet. To the bottom of the arch $N$ is fixed a flrong triple ehain P , made after the farhion of a watch-chain, but the links arehed to a circle of one foot diameter, having notches or teeth to take hold of the leaves of a pinion of caft iron O , ten inches diameter, with eight teeth in it moving on an axis. The other loofe end of this chain has a large weight hanging at it to help to counterpoife the wheel, and preferve the ehain from niding on the pinion. On the fame axis is fixed a cog-wheel R, fix feet diameter, with forty-eight cogs. To this is applied a trundle, or pinion S of fix rounds or teeth; and upon the fame axis is fixed T, a cog-wheel of fifty-one eogs, into which the trundle $V$ of fix. rounds warks, on whofe. axis is a winch or windlafs W , by which one man with. the two windlaffes raifes or lets down the wheet as there is oceafion. And becaufe the fulcrums of thefe levers MN are in the axis of the trundle K , viz. at M or X , in what fituation foever the wheel is raifed or let down, the cog-wheel I, I, is always equiditant from M, and works or geers truly. By means of this machine the flrength of an ordinary man will raife about fifty ton weight.

I, $I$, is a cog-wheel fixed near the end of the greet axis eight feet diameter, and forty-four cogs working into a trundle K , of four feet and an half diameter, and twenty rounds, whofe axis or fpindle is of caft iron four inches in diameter, lying in braffes at each end as at $\mathrm{X} . \quad \mathrm{ZZ}$ is a quadruple crank of cait iron, the metal being fix inches fquare, each of the necks being turned one foot from the centre, which is fixed in braffes at each end in two lieaditoeks faltened down by eaps. One end of this crank at $Y$ is placed. clofs abutting to the cnd of the axle-tree $X$, where they are at thofe ends lix inches diameter, each having a flit in the ends where an iron wedge is put one half into the end X , the other half into Y , by means of which the axis X turns about the crank ZZ . The four necks of the crank have eaeh an iron fpear or rod fixed at their upper ends to the refpective libra or lever, a 1, 2, 3, 4, wihhin three feet at the end. Thefé levers ate twenty four feet long, moving on centres ir the frame $6 b 66$; at the end of which, at $c 1,2,3,4$; are jointed four rods with their forcing plugs working into $d_{1}, 2,3,4$, four caft iron cylinders four feet three quarters long, feven inches bore above and nine below where the valves lie, faftened by ferewed flanches over the four holes of a hollow trunk of caft iron, having four valves in it juft over eece, at the joining on of the hottom of the barrels or cylinders, and at one end a fucking pipe and grate $f$ going into the water, whichfupplies all the four cylinders alternately.

From the lower part of the cylinders $d 1, d 2, d 3_{x}$ $d_{4}$, come out necks tarning upward arch-wife, as $g g g g$, whofe upper parts are caft with flanches to ferew up to the trunk $b \neq b b$; which necks have bores of fever. inches diameter, and holes in the trunk above communicating with them, at which joining are placed four valves. The trunk is calt with four boffes or protuberances ftanding out againft the valves to give rooms for their opening and fhutting; and on the upper fide are four holes ftopped with plags to take out on oceafion to cleanfe the valves. One end of this trunk is. 6

Iraulic ftopped by a plug i. To the other iron pipes are joined as $i 2$, by flanches, through which the water is forced up to any height or place required.

Befides thefe four forcers there are four more placed at the other ends of the libre, or levers (not Mhown here to avoid confufion, but to be feen on the left hand), the rods being fixed at $a \mathbf{1}, \mathbf{2}, 3,4$, working in four fuch cylinders, with their parts $d d, \& c . e e, f, g g$, and $i$, as before defcribed, flanding near $k k$.

At the other end of the wheel (at B) is placed all the fame fort of work as at the end A is defcribed, viz.
The cog-wheel I. The four levers $a c, a c$, \&c.
The trundle K. $\quad 8$ forcing rods $a d$, ad , \&c.
The fpindle X.
The crank Y, Z. 8 Cylinders de, de, \&c.

The fucking pipes $f .2$ Forcing pipes as $i$.
So that one fingle wheel works $16^{\prime}$ pumps.
All which work could not be drawn in one perfpective vicw without making it very much confufed.

Mr Beighton, who has defcribed the flructure and operation of this engine (fee Phil. Tranf. abr. vol. vi. p. 358.) has calculated the quantity of water raifed by it in a given time. In the firt arch next the city there is one wheel with double work of fixteen forcers; and in the third arch one wheel with double work at one end and fingle at the other, having twelve forcers; a fecond wheel in the middle having eight forcers, and a third wheel with fixteen: fo that there are in all fifty-two forcers; one revolution of a wheel produces in every forcer $2 \frac{1}{5}$ Atokes; fo that one turn of the four wheels makes 184 ftrokes. When the river aets with moft advantage, the whetls go fix times round in a minute, and but $4 \frac{\pi}{\frac{1}{2}}$ at middle water: hence the number of flrokes in a minute is 684 ; and as the flroke is $2 \frac{1}{2}$ feet in a feven-inch bore, it raifes three ale gallons; and all raife per minute 2052 ale gallons; i.e. 123120 gallons $=1954$ hogheads per hour, and at the rate of 46806 hogheads in a day, to the height of 120 feet. Such is the utmof quantity they can raife, fuppofing that there were no imperfections or lofs at all ; but Mr Beighton infers, from experiments performed on engines whofe parts were large and excellently confructed, that they will lofe one fifth and fometimes one fourth of the calculated quantity. For an eftimate of the power by which the wheels are moved, fee Phil. Tranf. ubi fupra.

Mr . Beighton obfervef, that though thefe waterworks may juftly be efteemed as good as any in Europe, yet fome things might be altered much for the better. If (he fays), inflead of fixteen forcers, they worked only eight, the flroke might be five feet in each forcer, which would draw much more water with the fame power in the whecl; becaufe much water is loft by the two frequent opening and mutting of the valves; and that the bores that carry off the water from the forcers are too fmall; and that they fould be near nine inches in ciameter. This objection Dr Defaguliers fays is of no force, unlefs the velocity of the piftons was very great ; but here the velocity of the water paffing through the bores is much lefs than two feet in a fecond. This laft writer obferves, that a triple crank diftributes the power better than a quadruple one. He adds, that forcers made with thin leather tanned, of about the thicknefs of the upper-leather of a countryman's fhoe, would be much better than thofe
of the fiff leather commonly ufed. D: Defaguliers Fyyda Pic has formed a comparifon of the powers of this engine Envines. with thofe of the famous machine at Marly. Eitimating the quantity of water merely, raifed by thefe machines, the former raifes almot twice and a quarter as much as the latter; but confidering that the London bridge water-works raife this water but 120 feet high, and that the Marly engine raifes its water 533 feet high, he deduces from a calculation formed on thefe different heights, and on the difference of the fall of water on both engines, this conclution, viz. that the effeet of the four wheels at London-bridge is three times greater than that of four of the wheels at Marly.

The engine at London-bridge was put up by Mr Sorocold towards the beginning of this century : the contrivance for raifing and falling the water-wheel was the invention of $\mathrm{Mr}_{r}$ Hadley, who put up the firf of that kind at Worcefter, for which he obtained a patent.
$A B C D$ is a wheel turned by water according to the $A$ quadres. order of the letters. On the horizontal axis are four ple pumpo fmall wheels, toothed almoft half round ; and the parts raining waof their edges on which there are no teeth are cut ter. down fo as to be even with the bottoms of the teeth Plate where they fland.

The tecth of thefe four wheels take alternately into the teeth of four racks, which hang by two chains over the pullies $Q$ and $L$; and to the lower ends of thefe facks there are four iron rods fixed, which go down into the four forcing.pumps, $\mathrm{S}, \mathrm{R}, \mathrm{M}$, and N . And, as the wheels turn, the racks and pump-rods are alternately moved up and down.

Thus fuppofe the wheel G has pullcd down the rack I , and drawn up the rack K by the chain: as the lat tooth of G juft leaves the uppermoit tooth of I, the firt tooth of H is ready to take into the lowermot tooth of the rack K , and pull it down as far as the teeth go; and then the rack I is pulled upward thro' the whole fpace of its teeth, and the wheel G is ready to take hold of it, and pull it down again, and fo draw up the other.-In the fame manner, the wheele E and F work the racks O and P .

Thefe four wheels are fixed on the axle of the great wheel in fuch a manner, with rcfpect to the pofitions of their tecth, that, whill they continue turning round, there is never one inflant of time in which one or other of the pump-rods is not going down and forcing the water. So that, in this engine, there is no occafion for having a general air-veffel to all the pumps, to procure a conflant ftream of water flowing from the upper end of the main pipe.

From each of thefe pumps, near the loweft end, in the water, there goes off a pipe, with a valve on its fartheft end from the pump; and thefe ends of the pipes all enter one clofe box, into which they deliver the water: and into this box the lower end of the main conduct-pipe is fixed. So that, as the water is forced or pufhed into the box, it is alfo pufhed up the main pipe to the height that it is interded to be raifed. and gentlemen want to have water raifed, and brought go by to their houfes from a rivulet or fpring; this may be horfeso effected by a horfe-engine, working three forcing-

Hydrualic pumps which fand in a refervoir filled by the fpring Engine: Plate coxle. Gy. 6. or rivulet: the piftons being moved up and down in the pumps by means of a triple crank $A B C$, which, as it is turned round by the trundle G, raifes and depreffes the rods D, E, F. If the wheel has three times as many cogs as the trundle bas flaves or rounds, the trundle and cranks will make three revolutions for every one of the whect: and as each crank will fetel a lltoke in the time it goes round, the three cranks will make nine ftrokes for every turn of the great wheel.

The cranks mould be made of catt iron, becaufe that will not bend; and they fhould each make an angle of 120 with both of the others, as at $a, b, c$; which is (as it were) a view of their radii in looking endwife at the axis: and then there will be always one or other of them. going downward, which will pufh the water forward with a continued llream into the main pipe. For when $b$ is alinoft at its lowell fituation, and is therefore juft beginning to lofe its action upon the piton which it moves, $c$ is beginning to move downward, which will by its pifton continue the propelling force upon the water: and when $c$ is come down to the pofition of $b, a$ will be in the pofition of $c$.

The more perpendicularly the pifton reds move up and down in the pumps, the freer and better will their frokes be: but a little deviation from the perpendicular will not be material. Therefore, when the pump. rods $D, E$, and $F$, go down into a deep well, they may be moved directly by the cranks, as is done in a very good horfe-engine of this fort at the late Sir James Creed's at Gieenwich, which forces up water about $6_{4}$ fect from a well under ground, to a refervoir on the top of his houfe. But when the eranks are only at a fmall height above the pumps, the piitons mult be moved by vibrating levers, as in the above engine at Blenheim: and the longer the levers are, the nearer will the flrokes be to a perpendicular.

Let us fuppofe, that in fuch an encine as Sir James

Now, fince a column of water 18 inches long, and Hydrauli 4 inches thick, contains 226.18 cubic inches, this E:gines number multiplied by 1683 (che Atrokes in an hour) gives 380661 for the number of cubic inches of water raifed in an hour.

A gallon, in wine-meafure, contains 231 cubic inches, by which divide 380661 , and it quotes 1463 in round numbers, for the number of gallons raifed in an hour ; which, divided by 63 , gives $26 \frac{1}{2}$ hogheads. If the horfes go faller, the quantity raifed will be fo much the greater.

In this calculation it is fuppofed that no water is watled by the enginc. But as no forcing enyine can be suppofed to lofe lefs than a fifth part of the calculated quaritity of water, between the piltons and barrels, and by the opening and fhutting of the valves, the horfea ought io walk almoll $2^{\frac{7}{2}}$ miles per hour to fetch up this lufs.

A column of water 4 inches thick and $\sigma_{4}$ feet high, weighs $349 \frac{9}{10}$ pounds avoirdupois, or $4^{2} 44^{5} 5$ pounds truy; and this weight, together with the triction of the engine, is the refiltance that muit be overcome by the Atrength of the horfes.

The horfe tarkle fhould be fo contrived, that the horfes may rather puin on than drag the levers after them. Fur, if they draw, in going round the walk, the outfide leather-ftraps will tub againdt their fides and hans; which will hinder them from draning at right angles to the levers, and fo make them pull at a difadvantage. But if they pufh the levers before their brealls, inllead of dragging them, they can always walk at right angles to thefe levers.

It is no ways material what the diameter of the main or conduct pipe be: for the whole refiftance of the water thereiru againt the horfes will be according to the height to which it is raifed, and the diameter of that part of the pump in which the pilton works, as we lave already obferved. So that by the fame pump, an equal quantity of water may be raifed in (and confequently made to run from) a pipe of a foor diamcter, with the fame cafe as in a pipe of five or fix inclese : or rather with more eafe, becaufe its velocity in a large pipe will be lefs than in a fmall one, and therefore its friction againit the lides of the pipe will be lefs alfo.

And the force required to raife water depends not upon the length of the pipe, but upoa the perpendicular height to which it is raifed therein above the le. Plate vel of the fpring. So that the fame force which CCXLI would raife water to the height $A B$ in the uptight fig. $3 \cdot$ pipe $\mathrm{A} i k / \mathrm{m} n o p q$ B, will raife it to the fame height or level BIH in the oblique pipe AEFGH. For the preflure of the water at the end A of the latter is no more than its preffure againft the end $A$ of the former.

The weight or preflure of water at the lower end of the pipe, is always as the line of the angle to which the pipe is elevated above the level parallel to the horizon For although the water in the upright pipe $A B$ would require a force applied imnediately to the lower end $A$ equal to the weight of all the water. in it, to fupport the water, and a little more to drive it up and out of the pipe; yet, if that pipe be inclined from its upright polition to an angle of 80 degrees (as in A 30), the forse requited to fupport or to
$H_{1}$ :anlie raife the fame cylinder of water will then be as much lefs as the fine $80 b$ is lefs than the radius $A B$; or as the fine of So degress is lefs than the fint of go. And fo, decrealing as thic fine of the angle of elevation leffens, until it arrives at its level AC or place of refl, where the force of the water is nothing at cither end of the pipe. For although the abfolute weight of the water is the fame in all pofitions, yet its preflure at the lower end decreafes as the fine of the angle of elevation decreafes; as will appeas plainly by a fatther confideration of the figure.

Let two pipes $A B$ and $A C$, of equal lengtiss and bores, join eath other at $A$; and let the pipe,$B$ be divided into 100 equal parts, as the fcale $S$ is; whofe lengtl is equal to the length of the pipe.Upon this len rth, as a radius, defcribe the quadrant $\mathrm{Bl}) \mathrm{C}$, and divide it into go equal parts or degrees.

Let the pipe AC be elevated to 10 degrees upon the quadrant, and filled with water: then, part of the water that is in it will rife in the pipe $A B$; and if it be ktpt full of water, it will raife the water in the pipe AB from $A$ to $i$; that is, to a level $i$ to with the mouth of the pipe at $10:$ and the upright line $a 10$, cqual to A $e$, will be the fine of 10 degrees elevation; which being meafured upon the feale $S$, will be about 17.4 of luch parts as the pipe contains 100 in length : and therefore, the force or preffure of the water at $A$, in the pipe A 10, will be to the foree or preffure at A in the pipe $A B$, as 17.3 to 100 .

Let the fame pipe be elevated to 20 degress in the quadrant ; and if it be kept full of water, part of that water will run into the pipe $A B$, and rile the rein to the height $A k$, which is equal to the length of the uprigbt line $b 20$, or to the line of 20 degrees elevation; which, being meafured upon the fcale $S$, will be $3+2$ of fuch parts as the pipe contains 100 in lenyth. And therefore, the preffure of the water at $A$, in the full pipe A 20, will be to its preffure, if that pipe were raifed to the perpendicular fituation $A \mathrm{~B}$, as $3 \mathrm{z} \cdot 2$ to 100.

Elevate the pipe to the pofition A 30 on the quadrant, and if it be fupplied with water. the water will rife from it, into the pipe $A B$, to the height $A /$, or to the fame level with the mouth of the pipe at 30 . The frne of this tlevation, or of the angle of 30 de. grees, is 30 ; which is jult equal to half the lengeh of the pipe, or to 50 of fuch parts of the fcale as the length of the pipe contains 100 . Therefore, the preffure of the water at $A$, in a pipe elevated 30 degrecs above the horizontal level, will be equal to one half of what it woold be if the fame pipe food upright in the fituation $A B$

And thus, by elevating the pipe to $40,50,60,70$, and 80 degrees on the quadrant, the fines of the $f e$ elevations will be $d 40$, e $50, f 6 a, g ; c$, and $b S O$; which will be equal to the hrights Am, An, Ao, $A p$, and $A q$ : and thefe heights meafured upon t.e fuisle $S$ wiil be $64.3,76.6,80.6$. 94.0 , and 98.5 ; which exprefs the preffures at $A$ in all thefe elevations, confidering the preflure in the upright pipe $A B$ 34, ICD.

Becaufe it may be of ufe to have the lengths of all: the lines of a quadrant from o degrees to go, we have given the foregoing Table, fhowing the length of the fine of every degree in fuch parts as the whole pipe (equal to the radius of the quadrant) contains 1000 . Then the fines will be integral or whole parts in length. But if you fuppofe the length of the pipe to be divided only into 100 equal parts, the laft figure of each part or fine mult be cut off as a decimal; and then thofe which remain at the left hand of this feparation. will be integral or whole parts.

Thus, if the radius of the quadrant (fuppofed to. be equal to the length of the pipe $A C$ ) be divided into 1000 equal parts, and the elevation be 45 digrees, the tine of that elevation will be equal to 707 of thefe parts: but if the radius be divided only into, 100 equal parts, the fame fine will be only 70.7 or $700^{7}$ of thefe parts. For, as 1000 is $1070 \%$, fo is: 1001070.7.

As it is of great importance to all engine makers., to know what quantity and weight of water will be- contained in an upright round pipe of a given diameter: and height; fo as, by knowing what weight is to be: raifed, they may proportion their engines to the force : which they can affurd to work them; we thall fubjoin Tables fhowing the namber of cubic inches of water contained in an upright pipe of a round bore, of any diameter from one inch to fix and a half, and of anys height from one foot to two hundred: together with the weight of the faid number of cubic inches, both.

Hydrofatic in troy and avoirdupois ounces. The number of cur Tables. bic inches divided by 231, will reduce the water to gallons in wine-meafure; and, divided by 282, will reduce it to the meafure of ale-gallons. Alfo, the troy ounces divided by 12 , will reduce the weight to troy pounds; and the avoirdupois ounces divided by 16 , will reduce the weight to avoirdupois pounds.

And here we muft repeat it again, that the weight or preflure of the water acting againft the power that works the engine, mult always be eftimated according to the perpendicular height to which it is to be railed, without any regard to the length of the con-duct-pipe, when it has an oblique pofition, and as if the diameter of that pipe were juft eqal to the diameter of that part of the pump in which the pifton works. Thus, by the following Tables, the preffure of the water, againft an engine whofe pump is of a $4^{\frac{7}{2}}$ inch bore, and the perpendicular leigbt of the water in the conduct.pipe is 80 feet, will be equal to 8057.5 troy ounces, and to 8848.2 avoirdupois ounces; which makee 671.4 troy pounds, and 553 avoirdupois.

Example. Required the number of cubic incles, and the weight of the water, in an upright pipe 278 feet high, and $1 \frac{1}{2}$ inch diameter.

| Feet. | Cubic incles. | Troy oz. | Avoir. oz. |
| :---: | :---: | :---: | :---: |
| 200 | 4241.1 | 2238.2 | 2457.8 |
| 70 | 1484.4 | 783.3 | 860.2 |
| 8 | 169.6 | 89.5 | 98.3 |
| Anfw. 278 | 5895.1 | 3111.0 | $34^{16.3}$ |

Here the neareft fungle decimal figure is only taken into the account; and the whole being reduced by divifion, amounts to $25 \frac{7}{2}$ wine-gallons in meafure; to $259 \frac{1}{\frac{1}{2}}$ pounds troy, and to $213 \frac{1}{\frac{1}{2}}$ pounds avoirdupois.

Thefe tables were at firlt calculated to fix decimal places for the fake of exactnefs: but in tranfcribing them there are no more than two decimal figures taken into the account, and fometimes but one; becaufe there is no neceffity for computing to hundredth-parts of an inch or of an ounce in practice.

Vol. IX, Part I.
a particular account of that uffefl invention, with a Engines correct defeription and plate of it in its improved fate.
$T_{\text {BE }}$ nultiplying machine, has no dependence on the steamaction of the atmofphere; but, by the weight of wa-engine. ter only, and without pump-work of any kind, raifes water fufficient to ferve a gentleman's feat, with an Engine fur overplus for fountaius, fifh-ponds, \&c.
ailing uxa-
AB are two copper pans or buckets of unequal nulliplying weight and fize, fufpended to chains, which alternately wheel. wind off and on the multiplying-wheel YZ; whereof Plate CCXIV. the wheel $Y$ is fmaller in diameter, and $Z$ larger, in fig. 6 . proportion to the different lifts each is defigned to perform.

When the buckets are empty, they are flopped level with the fpring at X , whence they are both filled with water in the fame time.
The greater of the two, $A$, being the heavier when full, preponderates and defcends ten feet, perhaps from C to D ; and the leffer, B , depending on the fame axis, is thereby weighed up or raifed from $E$ to $F$, fuppofe 30 feet.

Here, by particular little contrivances, opening the valves placed at bottom of each of thefe buckets, they both difcharge their water in the fame time, through apertures proportionable to their capacities; the fmaller into the ciftern $W$, whence it is conveyed for fervice by the pipe T , and the larger at D , to run wafte by the drain below at H . The bucket B being empty, is fo adjuted as then to overweigh; and defcending fleadily as it rofe betwixt the guiding rods VV, brings or weighs up A to its former level at X, where both being again replenifhed from the fipring, they thence proceed as before. And thus will they continue conftantly moving (merely by their circumltantial difference of water-weight, and without any other affllance than that of fometimes giving the iron-work a little oil) fo long as the materials fhall laft, or the Sptivi fupply water.
The fleadinefs of the motion is in part regulated by a worm turning a jack-fy, and a little fimple wheelwork at LM; which communicating with the multiplying wheel axle at M, is thereby moved forward or backward as the buckets either rife or defcend. But what principally keeps the whole movement fteady, is the equilibrium preferved in the whole operation by a certain weight of lead, at the end of a lever of fit length, and fixed on one of the fpindles of the wheelwork, the numbers whereof are fo calculated a3, during the whole performance up and down, to let it move no more than one-fourth of a circle, from $G$ to K ; by which contrivance, as more or lefs of the chains fufpending the buckets come to be wound off their refpective wheels X and Z , this weight gradually falls in as a counterbalance, and fo continues the motion equablc and eafy in all its parts.

The water wafted ty this machine is not above the hundredth patt of what a water-wheel will expend, to raife an equal quantity. But where a fall, proportionable to the intended rife of water, cannot be had, with a convenienc fewer to carry off the wafte water over and above, this device cannot be well put in practice.

Water may alfo he raifed by means of a fream $A B$ The Perturning a wheel CDE , according to the order of the fian wheed
${ }^{39}$ gires.

## Plate

cexint
fig. 5 .

Hydraulie letters, with buckets $a, a, a, a$, \&c. hune upon the Euskines ylue
cexbl.
fis. 8 . wheel by ttrong pins $b, b, b \quad b, 8 x c$. fixed in the fide of the rim: bur the wheel mul be made as high as the water is intended to be raifed above the level of that part of the theam in which the wheel is placed. As the wheel turns, the buckets on the right liand go doan into the water, and are therthy filled, and go up full on the left band, until they come to the top at $k$, where they Alrike againt the end $n$ of the fixed trough in, and are thereby overfet. and empty the water into the trough; from which it may be conveyed in pipes to the place which it is defigned for: and as each bueket gets over the trough, it falls into a perpendicular polfion again, and goes down enpey, until it comes to the water at $A$, where it is filled as before. On each bucket is a fpring $r$, which, going over the top or crown of the bar $m$. (fixed to the troug! M), raifes the botton of the bucket above the level of its mouth, and fo caufes it to empty all its water into the trough.

Sonetimes this wheel is made to raife water no higher than its axis; and then, inftead of buckets hung upon it, its fpokes, $\mathrm{C}, d, c, f, g, b$, are made of a bent form, ard hollow within; thefe hullows opening into the holes $C, 1, E, F$, in the outfide of the wheel, and alfo into thofe at O in the box N upon the axis. So that as the holes CD, \&e. dip into the water, it runs into them; and as the wheel turns, the water rifes in the hollow fpukes $c d$, see. and runs out in a Atream P from the holes at O , and falls into the trough $Q$, from whence it is conveyed hy pipes. And this is a very eafy way of raifing water, becaufe the engine requires neither men nor horfes to turn it.

Engines for extinguifhing fire are either foreing or lifting pumps; and being niade to raife water with great veloeity, their exerution in great meafure depends upon the length of their levers, and the foree wherewith they are wrought.

For example, $A B$ is the common fquirting fireengine. D C is the frame of a lifting-pump, wrought by the levers E and F acting always together. During the flroke, the quantity of water raifed by the pifton N 「ponts with force through the pipe G, made capable of any degree of clevation by means of the yielding leather-pipe H , or by a ball and focket, capable of turning every way, fcrewed on the tnp of the pump. Between the llrokes on this machine the tlream is difcontinued. The engine is fupplied by water poured in with buckets above; the dirt and fleh whereof are kept from choaking the pump.woik by help of the frainer IK.

A confiderable improvement has fince been made to thefe machines, in order to keep them difcharging a continual fream. In doing whereof it is not to be underllood that they really throw out more water than do the fquirting ones of the Came fize and dimentions with themfelves; but that the velocity of the water, and of courfe the friction of all the parts, being lefs viulent, the ftream is more even and manageable, and may he cirected hither or thither with greater eafe and certainty than if it eame forth only by fits and ftarts: The machine, thus improved, is therefore generally better adapted to the purpofe intended than the former, efpecially in the beginning of thefe calamitous accidents.

The ftream is made continual from the fpring of air Hydrauli confined in a flong metal veffel CC , in the fire engine Engine $A B$, fixed between the two forcing pumps $D$ and $E$, Pate wrought with a common double lever FG moving on cctextr. the centre H . The piltons in D and E both fuck and for o. foree alternitely, and are here reprefented in their dif. ferent actions; as are alfu the refective valves at 1 K and L.M.

The water to fupply this engine, if there be uo opportunity of putting the end of a fucking-pipe, necafionally to be ferewed on, into a moat or canal, which would fpare mueh hurry and labour in cafe of fire, is alfo poured into the veffel $A B$; and being Itrained through the wire grate N , is, by the preflure of the at mofphere, raifed through the valves $K$ and M into the barrels of D or E, when cither of their forcers afecnd; whence again it will be powerfully puhed when they defeend in the air-veflet CC, through the valves I and L by turns: by the force whereof the common air between the water and the top of the airveffel $O$ will from time to time be forcibly crowded into) lefs room, and much compreffed; and the air being a hody naturally endowed with a ftrong and lively fpring, and always endeavouring to dilate itfelt every way alike in fuch a cireumftance, bears Itrongly both againt the fides of the vefel wherein it is contined, and the furface of the water thus injected; and fo makes a conllant regular flream to rife through the metal pipe $P$ into the feather one $Q$, fcrewed thereon; which heing flexible, may be led about into rooms and entrics, as the eafe may require.

Shonld the air contained in this veffel be compreffeit into half the fpace it took up in its natural itate, the fpring thereof will be much about doubled; and as before it equalled and was able to fuftain the preffure of a fingle atmofphere, it having now a double force, by the powce of that fyring alone will throw water into air, of the common degree of denfity, about thirty feet high. A nd fhould this compreflure be fill augmented, and the grantity of air which at firt filled the whole veffel be redueed into one.third of that fpace, its fpring will be then able to refit, and confequently to raife the weight of a treble atmofphere; in which cafe, it will throw up a jet of water fixty feet high. And fhould fo much water arain be foreed into the veffel as to fill three parts of the capacity, it will be able to throw it up about ninety feet high : and wherever the ferviee thall require a nill greater rife of water, more water mult be thrult into this veffel; and the air therein being thas driven by main force into a fill uarrower compafs, at each explofiun, the gradual reftitution thereof to its firf dimenfions is what regularly carries on the ftream between the ftrokes, and renders it continual during the operation of the machine.

This experiment, in little, may be either made on the lifting or foreing pump, the nofels of which may be left large, on purpofe for the reception of the fmall pipe F , reaching nearly to the valve at E , and oceafionally to be ferewed in. Between this pipe and the fides and top of the nofel H , a quantity of air will neceffarily be lodged, which, when the forcer acts, will be compreffed at every thoke by the rife of the water; more whereof will be pufhed through E than can immediately get away through the pipe $F$, which

Hydrauice is to be always lefs in diameter than the opening of the valve at E : the degree of which condenfation, and that of the reftitution to its natural ttate of denfity, may be obferved through the glafs:machines, to fatisfaction.

Archamedes's screw is a fort of fpiral pump, and receives its name from its inveutor. It conlifts of a long cylinder $A B$ with a hollow pipe $C D$ round it; and is placed in an oblique pofition, with the lower end iat the water, the other end being joined to the lower end of the wisch 1 K , fupported by the upright piece IR.

When this ferew is immerfed in the water, it inmediately rifes in the pipe by the orifice C to a level with the furface of the water EF; and if the point in the fpiral, which in the beginning of the motion is coincident with the furface of the water, happen not to be on the lower fide of the cylinder, the water, upon the motion of the ferew, will muve on in the fpiral till it conse to the point on the other fide that is coincident with the water. When it arrives at that point, which we will fuppofe to be O, it cannot afterwards poflefs any other part of the fpiral than that on the lowelt part of the cylinder: for it cannot move from O toward H or $G$, becauie they are higher above the horizon; and as this will be coittantly the cafe after the water in the Epiral has attained the point $O$, it is plain it mult always be on the under fide of the cylinder.

But becaufe the cylinder is in conlant motion, every part of the fpiral fcrew, from O to D , will by degrees fucceed to the under part of the cylinder. The water therefore mult fucceed to every part of it, from O to D , as it comes on the lower fide ; that is, it muat afcend on the lower part of the cylinder through all the length of the pipe, till it come to the orifice at D, where it mult run out, having nothing further to fupport it.

There is a fimple and cafy method of working two pumps at oncc, by means of the balance AB, laving a large iron ball at each end, and placed in equilibrium on the two findles $C$, as reprefented in the 6 th figure. On the right and left are two boardis I, nailed totwo crofs picces, faftened to the axis of the machine. On thefe boards the perfon who is to work the pump ftands, and fupports himfelf by a crofs piece nailed to the two poits ED, fig. 5. At the diftance of ten inches on each fide the axis are fattencd the pillons MN.

The man, by lcaning alternately on his right and left foot, puts the balance in motion, by which the pumps OP are worked, and the water threwn into the pipe H , and carricd to a height proportional to the liameter of the valves and the force of the balance. There muft be placed on each fide an iron fpring, as F and $G$, to return the balace, and prevent its acquiring ton great velocity.

The Chain-pump, A B, is ordinarily made from twelve to twenty-four feet long; and confifts of two collaterat fquare barrels, and a chain of piltons of the fame form, fixed at proper diftances thereon. The chain is moved in thefe round a coarfe kind of wheelwork at either end of the machine, the teeth whereof are fo made as to receive one half of the flat piltons, and let them fold in : and they take hold of the links as they rife in one of the barrels, and return by the wher. The machise is wrought either by the turning
of one handle or two, according to the labour requi- Entertainred, depending on the height to which the watt $r$ is to ing experibe raifed. A whole row of the pittons (which go menes. free of the fides of the batrel by pethaps a quarter of an inch) are always lifting when the pump is at work; yet do they, by the general pufh in the ordinary way of working, as it is pretty brik, cosmmonly bring up a full bore of water in the pump. This machine is fo contrived, that, by the continual folding in of the pifons, fones. dirt, and whatever happens to come in the way, may alfo be cleared; and therefore it is generally made ufe of to drain ponds, to empty fewers, and remove foul waters, in which no other pump could work.
The laft machine to be defcribed confitts of five The hy ${ }^{43}$ pieces of board, forming a fort of fcoop, as B. The draulic handle $C$ is fufpended by a rope faftended to three poles, froop. placed in a triangle, and tied together at A.
The working of this machine confilts entirely in fig. 2. balancing the fcoop that contains the water, and directing it in fuch manner that the water may be thrown in any given dircction. It is evident that the operatuon of this machine is fo very eafy, that it may rather be confidered as an agreeable and falutary recreation than lard labuur.
With this machine a man of moderate Atrength, by two frokes in four feconds, can draw half a cubic foot of water, that is, more than four hundred cubic feet in all hour.

Thlis machine is frequently ufed by the Dutch in cmptying the water from their dikes.

## Sect. VI. Entertaining Experiments.

1. Several amufing appearances may be produced of the fyo by difguiking or diverlifying a fyphon. It may, for phonted difexample, be difguifed in a cup, from which no liquor Tantalus's will flow till the fluid is raifed therein to a certain cup, \&c. height ; but when the fflux is once begun, it will continue till the veffel is emptied. Thus, fig. 11 . is a Plate cup, in the centre whereof is fixed a glats. pipc $A$, ccxxxix, continued through the bottom at $B$, over which is put another glafs tube, made air-tight at top by means of the eork at C ; but left fo open at foot, by holes made at 1 , that the water may freely rife between the tubes as the cup is filled. Till the fluid in the cup fhall have gained the top of the inmof pipe at $A$, no motion will appear. The air however from between the two pipes being in the mean time extruded, by the rife of the denfer fuid, and paffing down the inner tube, will get away at bottom; and the water, as foon as the top of the inclofed tube hall be covercd thereby, will very foon follow, and continue to rife in this machine, as in the fyphon, till the whole is run off.
This is called by fome, a Tantalus's cup; and, to humour the thought, a hollow figure is fometimes put over the inner tube, of fuch a length, that when the fluid is got nearly up to the lips of the man, the fyphon may begin to adt and empty the cup.
This is in effect no other than if the two legs of the fyphon were buth within the veffel, as in fig. 12. into wheh the water pourcd will rife in the fhorter lig of the machine, by its natural preffure upwards, to its own level; and when it flall have gained the bend of the fyphon, it will come away by the longer leg, as D 3 already

Entertain- already defcribed. An apple, an orange, or any other ing esperiments.

Plate
CCXLIII.

The foun-
tain at com
mand.
Plate
CCXLI.
fis. folid, may be put isto the veffel, to raife the water, when it is near the bend, to fet it a-running, by way of amufement.
Again, let the handle of the cup, fig. It be hollow ; let the tube CD, fcrewed therein, communicate frecly with the water poured into the cup, that it may rife equally in bo.t. Being once above the level ED, it will overlow, and defeending through the cavity DB, will empty the cup of its liquot.
2. The device called the fountain at command, acts upon the fame principle with the fyphon in the cup. Let two veffels $A$ and $B$ be joined together by the pire C , which opens into them both. Let A be opened at top, B clofe both at top and bottom (fave only a

47 fnall hule at $b$ to let the air get our of the veffel $B$ ), atid A be of fuch a fize as to hold about fis times as much water as 13 Let a fyphon DEF be foldered to the wfrld D, fo that the part D) Ee may be within the videl, and $F$ without it ; the end 1 ) almof touching the botton of the veffll, and the end F bellow the level of D : the vellel B hanging to 1 by the pipe C (foldered inta bont), and the whole fupposted by the pillars $G$ and $H$ upno the thand I. the bore of the pipe mult be comiderably leis than the bure of the 1) phon.

The whale be:ng thus coaftucted, let the veffel A be filled with wacer, which will run through the pipe C , and fill the veffil B . Whan 13 is filled above the top of the fyohon at 1 , the wate will min through he Fyphon. anel be difeharged ar But is the bore of the fy phom is largen than the bore of the pipe, the fyphon will run fatier than the pipe, and will foon enpty the weffel B; upon which the water will ceafe fium runaing through the fyph in at F , until the prpe $\mathbf{C}$ refills the veffel 13, and then it will begnt to run as before. And thus the fyphon will continue to run and ftop alternatcly. until ail he water in the veficl $A$ has rua through the pipe C. - So thas, after a few trials, one may eafily gucfs about what time the lyphon will flop, and when it will begin to run; and then, to amule others, he may call out, " $\operatorname{llop}$," or "run," accorlin ly.
3. This figure reprefents a very pretty portable fountain, which, being charged with water, and inverted, will phy a jet nearly as ligh as the refervoir, till the flui. is exhaufted; and then turned up on the other end, thr fame thing will happen, and a real elepfydra, or water-cluck, be thereby formed.
This device confifts of two hollow veffels, $A$ and $B$, communicating with each other only by the recurved tubes C and D ; at the ends of which, E and F , are placed frmall adjutayes to direct the jet $G$ and $H$ are two upen tubes, foldered into the bottom of the bafons belonging to A and B , through which the water flows in, and i.lls thole veffels to a certain height, that 15 , according to their length. They by their difsulition allo prevent the return of the water the fame way, when the machine is turned upfode dowa
4. Piovide a cilindric:veffei ol elafs ur china, A BCD, at out a foot high, and four inches dameter. Make a hule in its botion, in which glue a fmall glals tube E. of abuln une-third of an inch diameter, and whufe end has bien partly clofed in the flame of a lamp, io, that it will not fuffer the water to pafs out but by
drops, and that very flowly. Cover the top of the vef. fel with a circle of wood $F$, in the centre of which make a round hole about half an inch diameter.
Have a glafs tube GH, a foot high, and a quartcr of an inch diameter ; and at one end let it have a fmall glafs globe I, to which you may hang a weight L. by which it is kept in equilibrio, on or near the furface of the water; or you may pour a finall quantity of mercury into the tube, for the fame purpore. Fill the veffel with water ; put the tube in it, and over it place the cover F, through the loole of which the tube mull pafs freely up and duwn. Now, as the water drops gradually out of the veffel, the tube wil! contime to defcend till it come to the butom.
Therefore, pafle on the tube a graduated paper, and put it in the veffel when nearly full of water. Hang a watch by it, fet to a certain hour; and as the tuoce deficends, mark the hours, with the half and quarter huars. If the vifitl be fulficiently large, with regard to the hole at the bottom, it will go for 12 homrs, a day, or as much longer as you pleafe, and requires no other trouble than that of pouring in water to a certaln height. Care mult be had, hawever, that the water be clean; for if there be any fedment. it will in time thop the fmall hole at bottom, or at leaft render the motion of the water irresrular.
The veffel may be of tin, but the pife at bnttom fhould be glafs, that its fnall aperture may $n$,t alter by ufe It is to be obferved, that the tuhe of one of thefe clocks is not to be graduated by another: for thuugh the veffel be of the fame diameter at top, it may not be perfectily cyiindrical thronthont: nor is it taly to make the hole at the bottoon of one vediel exactly of the fane dimenfion with that of another.
5. The Hon. Mr Chatles Hamiton has deferibed Cheifydre a curious clepfyda or water-clock of new coultruce fis: 7 . tion. An open catal ee, fupplied with a conftant and equal Aream by the fyphoit $d$, has at each end ff, open pipes of exaetly equal bores, which deliver the water that runs along the camal $e$, alternately into the vecfel; $g \mathbf{1}, \delta, 2$, in fuch a quantity as to raife the water from the mouth of the tantalus $t$, exatly in an hour. The canal ee is equally puifed by the two pipes $f 1, f_{2}$, upon a centre $r$, the en is of the canal $e$ are railed alternatcly, as the cups $z z$ are deprefied, to which they are conneted by lines running over the pullieall. The cupo $z \approx$ are tixed at each end of the bilance $n \mathrm{~m}$, which muves up and duwn upon its centre v. $n 1, n 2$, Are the edges of two whels or pullies, moving different ways alternately, and fitted to the cy' in!er o by oblique teeth both in the cavity of the wheel and upun the cylinder, which, when the wheel $n$ mures one way, that is, in the direction of the minute hand, meet the teeth of the cylinder and carry the eslinder with it, and, when $n$ muves the contrary way, hip over thuie of the cylinder, the teeth not meeting, but recediag from each wher One or other of thefe wheels $n n$ continually moves 0 t. the fame direftum, with an equable and uninterrupted mation. A fine chain gues twice round each whel, having at one end a weight $x$, ahways out of water, which equiponderates uth $y$ at the other end when kept floating on the furface of the wa:er in :he veTt! g, which $y$ muft atways be; the two cups $z, z$, one at each ont of the balance, keep it in equilibrio, till une of them is furced down

HYJROSTATIC゚
Yig.
2

-Ming. 10 .

- ThiBallerfuin. Wral. Imelfileg. Vivis.
ateran- down by the weight and impulfe of the water, which it teceives from the tantalus $t i$ : each of thefe cups $z, z$, has likewife a tantalus of its own $b, b$, which emp. ties it after the water has done running from $g$, and leaves the two cups again in equilibrio: $q$ is a crain to carry of the water. The dial-plate, \&cc. needs no defrription. The motion of the clepiydra is effected thius: As the end of the canal ee, bixed to the pipe $f_{\mathrm{B}}$, is, in the figure, the lowett, all the water fupplied by the typhon uns through the pipe $f t$, into the veffel $g 1$, till it runs over the top of the tantalus $t$; when it immediately runs out at $i$ into the cup $z$, at the end of the balance $m$, and forecs 6 it down ; the balance moving on its centre 0 . When one fide of $m$ is brought down, the fltring which connects it to $f 1$, tunning over the puiles $l$, raifeo the end $f$, of the canalit, which turns upon its centre $r$, higher than $f 2$; confequently, all the water which runs through the fyphon $d$ paffes through $f 2$ into $g 2$, till the fame operation is perforried in that veftel, and fo on alternately. As the heizht the witter rifes in $g$ in an heur, viza from $s$ to $t$, is equal to the circuniterence of $n$, the Aloat $y$ riling through that height alune with the water, lets the wei ht $x$ act upon the pulley $n$, which carries with it the cylinder o; and this, making a revolution, caufes the index $k$ to deferibe an hour on the dial plate. This re. volucion is performed by the pulley $n t$ : the $n$ nex: is performed by $n 2$, whill $n$, goes back, as the water in $g$ I runs out through the tantalus; lor $y$ muutt fol low the water. as its weight incereafs, out of it. The axis oalways keeps moving the funie way; the index $p$ de:cribes the ninuucs; cath tantalus musi be wider thit the fiphon, that the veffels $g z$ nayy be emp ied as luw as s, before the water return - to thein.

6. To the tube wherein the water is to rife, fit a fophe rical ur lenticillat heed, AB. made of a plate of mettai, and purferititd at twp with a grat number of lutele holes. Thie wher nling wi b vehemence tuwards $A B$, will be there divaded into innume rable littic ellireds, and aftew wads troke, and di perted into the fineth thops.
7. Tou the tube $A B$, folder two fpher cal fepmentits $C$ and D , dnott touching each o:her; whb a ferew E , to comtrace or anplify the istettlice or chi k at plaz furc. Others choofs to make a faoosh, evin clett, in a fpherical or Innticulay head, fited njum the tub. The water fpuring though the chink, on cleft, will expand itfeit in manner ifa cluth.
8. Make a bollow globe A, of copper ne lead, and of a fize adapted to the quartity of water that comes frum the pipe to which it is to be placed. Pierce a number of friall holes thro' this glitee, that altend towardo its center: obferving, however, that the dianicters of all thefe hales, taken together, mat not exceed that of the pipe at the fatt from whence the wate firss. Amnex to it a pipe B, of fuch height as you think convenient; and let it he fcrewed at C , to the pipe from whence the jet flows. The water that comes from the jet ruhiars with violence into the gl be, w.ll be forced cut at the holes, with the direction in which they are trade, and will procise a very pleafing fphere of water.
9. Procure a bittle figure male of cork, as AB, whieh you riay paint, or drifs in a light Infff, after your owa fancy. In this figure ycu are to place the fmall haclow cone C, irade of thin leaf biafs. Whea
the figure is placed in the jet d'eau that plays in a Enterta nperpendicular direction, it will remain fulpended on ming experithe top of the water, and perform a great variety of nents. motions.

If a hollow ball of copper, of an inch diameter, and very light, be placed on a limplar jet, it will, in like manner, remain fufpended, revolving on its centre, and fpreading the water all round it, in the manaer reprefented by fig. 6 or Plate CCXIIS. fig. 1.- But note, that as it is neceffary the ball, \&ce, when on the defcent, thould keep the fame precife perpendicular wherein it rofe (frace otherwite it would mifs the liream and fall downright), fuch a fountain thould only be played in a place firee from wind.
10. Make a hollow leaden core $A$, whofe axis is one- The hemis third of the ciameter of its bafe. The circle C, that fitherical forms its batc, mull be in proportion to the furface of Plare water that flows from the jet on which it is to be pla- Coxien, ced, that it may fow from it equally on all fides. To fir. it. the cone join the pipe $B$, which ferves not only as a fuppurt, but is to be pierced with a number of holer, that it may fupply the cone with a fufficient quantity of water. Screw the tube juit mentioned to the tup of that from wherce the jet proceeds. - The water that rufhes inio the cone from the pipe, will ran over its circumference, and form a hemifipherical cafcade. If this piece be fo confrufted that it may be piaced in a reverled poition, it will produce a fountain in the form of a vafe, (fee fig. 2); and if there be a fufficiont quansity of water, both thefe pieces may be placed on the came pipe, the fountain at top and the caf ade underneath which by their variety will produce a very plealing appearance.
11. Let here be two portions of a hollow fphere, that The watero are very fhathow: and let them be fo joined together, furp that the circular fpace between them may be very nar- PCXISAV. row. hix the in vertically to a pipe from whence a ject fige s. frocecds. In that part by which the pations of the Patere are inned there muth be mate a number of hontes; then the water ruhing inco the narnow cavity wiil be forced out fr tra the holes, and phorlyee a regna1. lis lute ot the fun, as in the plite. This piece reyuires a large quat tiey and force of water to make it appear to at fumtage.

Severai pretes if this fort may be placed over each other, in a horizutal dir ction, and to that the fane pipe may fropply them all with water (fee fir. 6 o of phite CCXLV ) It is proper to obferve, that the diameter of thele pieces inutit cuntin, ally diminilh, in propention to their ditlance fo mn the bottom.
12. Make a hollow circle $A$, the tales of which are io The ${ }^{59}$ remibe pierced with 12 or 15 heles, male in as inclin $d^{8:}$ g watere diutetion: or you may place the like number of fant plate tubea round the circle. Fix this circle on the tupe Plate Lull. of a jet, in fuch mamer that it may turn frety round. $\mathrm{f}_{\mathrm{s}}$. s . The water rufing viulently into the holinw ci.cle will kepp it it continual motion ; and at the fame ture forcing out of tise holes or fmall tubes, will form a revolving ligure with rays in differeat directions, as in the plite.
13. Provide a ftrong enpper vefel $A$, of fuch figure as The conro you think convenient ; in shich folder a pipe BE, ofp-C if jes the fame inetai. Let there be a cock at H , which hull fician. be made fo tight that ne air can fa's by it. The pi,se
DEi mut go very near the buttom of the veTet, bat

Enterain- not zouch it. There mult be another pipe F , at whofe. ine experiments. extremity $G$ there is a very fnall hole: this pipe nult be ferewed into the former.

The veffel being thus difpofed, take a gond fyringe; and placing the end of it in the hole at $G$, open the cock, and force the air into the vellet; then turn the cock and take out the fyringe. Repeat this operation feveral times, till the air in the veffel beftrongly condenfed. Then fill the fyringe with water, and force it into the veffel, in the fame manner as you did the air ; and repeat this operation till you can force no more water into the veffel ; then fhut the cock. This vetiel will be always ready to perform an estempore jet d'eat : for, on turning the cock, the fpring of the compreffed air will force out the water with great violence, and the jet will continue, though contan:ly decreating in force, till the water is all exhaulted, or the air within the velfel is come to the fame denfity with that
14. Let there be inade a tin veffel, about fix inches high, and three inches in diameter. The mouth of this veffel nut be only one quarter of an inch wide; and in its bottom make a great number of fand holes about the lize of a common fewing needle. Plange this ventel in water, with its mouth open; and when it is Cull, cork it up and take it out of the water. So long as the veffel remains corked, no water whatever will come out; but as foon as it is oncorked, the water will iflue out from the finall holes at is buttom. You mult obferve, that if the holes at its bottom of the veffel be more than one fixth of an inch dianeter, or if they be in too great number, the water will run out though the veffel be corked; for then the preffure of the air againft the bottom of the veffel will not g 3 be fufficient to conline the water.
A glafs full An experiment fimilar to this is made with a glafs of water filled with water, over which a piece of paper is placed. inverted, and the waeer not fpilt,
fig. I3.
59
The circu-
Jating foun-
zain.
Plate
cCxLV.

Gg. 4 -

The glais is then inverted; and the water, by the preflure of the air under it, will remain in the glais. That the paper, though the feeming, is not the real, fupport of the water, will appear from $n^{\circ} 25$.
15. In this fountain, the air being compreffed by the concealed fall of water, makes a jet, which, after fome continuance, is conlidered by the ignorant as a perpetual motion; becaufe they imagine that the fame water which fell from the jet arifes again. The boxes CE and DYX being clofe, we fee only the bafon ABW, with a hole at $W$, into which the water fpouting at B falls; but that water does not come up again; for it runs down through the pipe WX into the box DYX, from whence it drives out the air through the afeending pipe Y Z, into the cavity of the box CE, where, prefling upon the water that is in it, it forces it out through the fpouting pipe OB , as long as there is any water in CE ; fo that this whole play is only whilft the water contained in CE, having fpouted out, falls down tbrough the pipe WX into the cavity DY X. The force of the jet is proportionable to the lieight of the pipe WX, or of the boxes CE and DY abuve one another: the height of the water, mealured from the bafon ABW to the furface of the water in the lowerbox DYX, is always equal to the height meafured from the top of the jet to the furface of the water in the middle cavity at CE. Now, fince the furface CE is always falling, and the water in $D \mathbb{V}$ always riling,
the lieight of the jet muft continually decreafe, till it is fh.srter by the lieight of the depth of the cavity CE, which is emptying, added to the depth of the cavity 1) $Y$, which is always folling; and when the jet is fallen fo low, it immediately ceafes. The air is reprefented by the points in this figure. 'Io prepare this fountain for playing, which thould be done unoblerved, pour in water at W, till the cavity DXY is filled; then invert the fountain, and the water will run from the cavity DXY into the cavity CE, which may be known to be full, when the water tums out at 13 held down. Set the formtain up again, and, in order to make it play, pour in about a pint of water into the bafon ABIV; and as foon as it has filled the pipe WX, it will hegin to play, and continue as long as there is any water in CE. You may then pour back the water left in the bafon A BUV, into any veffet, and invert the fountain, whici, being fet upright agdill, will be made to play, by putting back ille watcr poured out into Al3W ; and io on as oftell as you pleafe.

The fountain fig. 3 . is of the fame kind; but having double the number of pipes and concealed cavities, it plays as high again. In order to undetitand it. flructure, fee fig. 7. The bafon is $A$, the four catvities are $B, C, D$, and $E$, from which the water through the pipe $f$ G fpouts up to couble the height of the fountain, the air at E, which drives it, being doubly condenfed. The water going down the pipe I (e. हु. three feet long), condenfes the air that goes up into the cavity C through the pipe 2, fo as to make it $x^{2}$ fironger than the common air; then the water, which falling in the pipe 3 from C to D , is capable, by the height of its lall, of condenling the air at E , fo as to inake it to ftronger, being pulhed at C by air already coridenfed into tr $^{2}$ lefs fpace, caufes the air at $E$ to be condented twice as much; that is, to be $\frac{2}{5}$ flronger than common air ; and therefore it will make the water at $G$ fpout out with twice the force, and rife twice as high as it would do if the foumtain had been of the fame llructure with the former. In playing this fountain turn it uplide down, and taking out the plugs $s, l$, fill the two cavities C and E , and having thut th.e holes again, fet the fountain upright, and pour forme water into the bafon $A$, and the jet will play out at $G$; but the fountain will begin to play too foon, and therefure the beft way is to have a cock in the pipe 3 , which, being open, whilit the cavities C and E are filled, and fhut again before the fountain is fet up, will keep the water thrown into the bafon from going down the pipe 1 , and that of the cavity C from going down the pipe 3, by which means the fountain will not play before its rime, which will be as foon as the cock is opened.
16. Procure a tin reffel $A B C$, five inches high and The $m$ four in diameter; and let it be clofed at top. 'To the cal caf bottom of this veffel let there be foldered the pipe DE, fig. s. of ten inches length, and halfan inch in diameter: this pipe mult be open at each end, and the upper end mult be above the water in the veffel. To the buttom alfo fix five or fix fmall tubes $F$, about one-eighth of an inch diameter. By thefe pipes the water contained in the veffel is to run flowly out.

Place this machine on a fort of $\operatorname{tin}$ bafon GH , in the middle of which is a hule of one quarter of an inch
ertan- diameter. To this tube DE, fix fome pieces that may experi- fupport the veffel over the bafon; and obferve that the end D , of the tube DE , mult be little more than one quarter of an inch from the bafon. There muft be alfo another veffel placed under the bafon, to receive the water that runs from it.

Now, the fmall pipes difcharging more water into the bafon than ean run out at the hole in its centre, the water will rife in the bafon, above the lower end of the pipe DE, and prevent the air from getting into the vefiel $A B$; and confequently the water will ceafe to flow from the fmall pipes. But the water continuing to flow from the balon, the air will have liberty again to enter the veffel $A B$, by the tube $D E$, and the water will again flow from the fmall pipes. Thus they will alternately fop and flow as long as any water remains in the veffel AB.

As you will eafly know, by oblerving the rife of the water, when the pipes will ceafe to flow, and by the fall of it, when they will begin to run again, you may fafely predict the change; or you may command them to run or ftop, and they will feem to obey your orders.
17. This fountain begins to play when certain candes placed round it are lighted, and fops when thofe candles are extinguifhed. It is conftructed as follows. l'rovide two cylindrical veffels, AB and CD . Conneet them by tubes open at both ends, as HL, FB, \&e. fo that the air may defeend out of the higher into the lower veffil. T'o thefe tubes fix candlellicks H, \&c. and to the hollow cover CF, of the lower veffel, fit a finall tube EF, furnifhed with a coek G , and reaching alpof to the bottom of the vefficl. In G let there be an aperture with a ferew, whereby water may be poured into CD .

Now, the eandles at H, \&e. being lighted, the air in the contiguous pipes will be thereby rarifed, and the jet from the fmall tube EF will begin to play: as the air beeomes more rarified, the foree of the jet will increafe, and it will continue to play till the water in the lower veffel is exhaulled. It is evident, that as the mution of the jet is rauled by the heat of the candles, if they be extinguifhed, the fountain mult prefently ftop.
18. This fountain is contrived to play by the fpring of the air, increafed by the heat of the fun, and ferves alfo for a dial at the fame time. GNS is a hollow globe of thin copper, eighteen inches in diameter, fupported by a fmall inverted bafon, refting on a frame $A B C$, with four legs, between which there is a large bafon of two feet diameter In the leg C there is a concealed pipe, proceeding from $G$, the bottom of the inlide of the globe, along HV, and joining an upright pipe $u$ I, for making a jet at I. ithe flort pipe I $u$, going to the bottom of the bafon, lias a valve at $i s$ under the horizontal part HV, and another valve at $V$
above it, and under the cock, \& . At the north pole EntertainN , there is a ferew for opening a hole, through which ing experithe globe is furplied with water. When the globe is ${ }^{\text {nents. }}$ half filled, let the machine be fet in a garden, and as the fun heats the copper and rarifies the included air, the air will prefs upon the wa:er, which, defcending through the pipe GCHV, will lift up the valve V, and flut the valve $u$, and the cock being open, fpout out at I, and continue to do fo for a long time if the fun Shines, and the adjutage be frmall. At night, as the air condenfes again by the cold, the outward air prefing into the adjutage $I$, will fhut the valve $V$, but by its preflure on the balon DuH , pulh up the water which has been played in the day-time through the valve $u$, and the pipe $u$ HG into the globe, fo as to fill it up again to the fame height which it had at lirtt, and the next fun thine will caufe the fountain to play again, \&c. The ufe of the cock is to keep the fountain from playing till you think proper: a frall jet will play lix or eight hours.

If the globe bc fet to the latitude of the place, and rectified before it be fixed, with the hour-lines or meridians drawn upon it, the hours marked, and the countries painted, as on the common globe, it will form a good dial : the fun then mining upon the fame places in this globe as it does on the earth itfelf. This fountain was invented by Dr Defaguliers.
19. There is a pretty contrivance, by which the fpecific gravity of the body is fo alcered, that it rifes and finks in water at our pleafure. Let little images of men, about an inch high, of coloured glafs, be befpoke at a glafs-lioufe: and let them be made fo as to be holiow within, but fo as to have a fmall opening into this hollow, either at the fole of the foot or elfewhere: I.et them be fet afloat in a clear glafs phial of water, filled within about an inch of the mouth of the bottle; then let the bottle have its mouth clofed with a bladder, clofely tied round its neck, fo as to let no air efcape one way or the other. The images themfelves are nearly of the fame fpecific gravity with water, or rather a little more light, and confequently float near the furface. Now when we prefs down the bladder, tied on at the top, into the mouth of the bottle, and thus prefs the air upon the furfaec of the water in the botle; the water being preffed will force into the hollow of the image through the little opening: thus the air within the images will be preffed more clofely together, and being alfo more filled with water now than brfore, the images will become more heavy, and will confequently defeend to the hottom; but, upon taking off the prellure from above, the air within then will again drive out the water, and they will rife to the fame heights as before. If the cavities in fome of the ima. ges be greater than thofe in others, they will rife and fall differently, which makes the experinsent more amufing.

with the other penitents, but were obliged to ftand without, expofed to all the inclemency of the weather.

## HYGEIA, in mythology. Sce Health.

HYGIEINE, Tyum, formed of vyons, "found, healthy," that branch of medicine which confiders health, and difcovers proper means and remedies, with their ufe, in the prefervation of that flate.

The objects of this branch of medicine are, the nonnaturals. See Diet, Exercise, \&cc.

Hygienve, more largely taken, is divided into three parts; prophylactice, which forefees and prevents difeafes; fynteritice, employed in preferving health; and analeptice, whofe office is to cure difeales, and reftore health.
HYGINUS (Caius Julius), a grammarian, the freedman of Auguftus, and the friend of Ovid, was born in Spain, or, according to others, in Alexandria. He wrote many books which are mentioned by ancient authors; all of which are loft, except fome fables, and a work ensitled Afronomicon Posticon; and even thefe are come down to us very imperfect. The beft edition of the fe remains is that of Munker, publifhed with fome other pieces of antiquity in 2 vols Svo, 168s, under the title of Myblograpbi I.atini.

HYGROMETLRR, an inftrument for meafuring the degrees of drymefs or moilture of the atmofphere, in like manner as the barometer and thermometer mea. fure its different degrees of gravity or warmth.

Though every fubllance which fwells in moift, and fhrinks in dry weather, is capable of becoming an hygrometer ; yet this kind of inflrument is far from being as jet arrived at fuch a degree of perfection as the barometers and thermometers There are three general principles on which hygrometers have been conftucted. I. 'The lengthening and thortening of Itrings by drynefs and muifture, or their twifting and untwitting by the fame. 2. The fwelling and fhrinking of folid fubftances by moifture or drynefo; and, 3. By the increale or decreafe of the weight of particular bodies whofe nature is to abforb the humidity of the atmofphere.

1. On the firf of thefe principles Mr Smeaton hath con frrected an hygrometer greatly fuperior to any that had tppeared before; and of which the following account is given in the 62 d valume of the Philofophical Tranfactions.
" Having fome years ago attempted to make an accurate and fenfible hygrometer by means of a hempen cord of a confiderable length, I quickly found, that, though it was more than fufficiently fufceptible of every change in the humidity of the atmofphere, yet the cord was upon the whole in a continual ftate of lengthening. Though this change was the greatell at lirf, yet it did not appear probable that any given time would bring is to a certainty; and, furthermore, it feemed, that as the cord grew more determinate in mean length, the alteration by certain differences of moifture grew lefs. Nuw, as on conlidering wood, cat gut, paper, \&c. there did not appear to be a likelihood of finding any fublance fufficiently fenfible of differences of moitture that would be unalterable under the fame degrees thereof; this led me to confider of a
conftruction which would readily admit of an adjuft. Hyg ment; fo that, though the cord whereby the inftrument is actuated may be variable in itfelf, both as to abfolute length, and difference of tength under given degrees of moifture, yet that, on fuppofition of a material departure from its original fcale, it might be re. dily reltored thereto ; and, in confequence, that any number of hygrometers fimilarly conftructed, might, like thermometers, be capable of fpeaking the fame language.
"The two points of heat the more readily determinable in a thermometer, are the points of freezing and boiling water. In like manner, to conftruct hygrometers which thall be capable of agreement, it is neceffary to eflablifh two different degrees of a moiflure which fhall be as fixed in themfelves, and to which we can have recourle as readily and as often as poffible.
"One point is given by making the fubltance perfectly wet, which feems Cufficiently determinable; the other is that of perfect dry, which I do not apprehend to be attainable with the faıne precifion. A readinefs to imbibe wet, fo that the fubllance may be foon and fully faturated, and alfo a facility of parting with its moillure on being expofed to the fire to dry; at the fame time, that neither immerfion, nor a muderate expulition to the warmtla of the fire, fhall injure its texture ; are properties requifite to the firlt mover of fuch ans liygrometer, that in a manner exclude all fubftances that I amacquainted with, betides hempen and $\ell$ axen threads and cords, or fubllances compounded of them.
" Upon thefe ideas, in the year 1758 , I conftructed two hygrometers as nearly alike as polfible, in order that I might lave the means of exannining their agreoment or difagreement on fimilar or diffimilar treatment. The interval or fcale between dry and wet I divided into 100 equal parts, which I call the degrees of this hygrometer. The point of o denotes perfect dry; and the numbers incieale with the degrees of moifture to 100 , which denotes perfect wet.
" On comparing them for fume time, when hung up together in a paffage or ftaircafe, where they would be very little affected by fire, and where they would be expofed to as free an air as pullible in the inlide of the houfe, I found that they were generally within one degree, and very rarely differed tuo degrees; but as thefe comparifons neceflarily touk up fome time, and were frequently interrupied by long avocations from loome, it was fome ycars before 1 could form a tulerable judgment of them. One thing I foon obferved, not altogether to my liking, which was, that the flaxen cords made ufe of feemed to make fn much refillance to the entry of fmall degrees of moifture (fuch as is commonly experienced within doors in the fituation above mentioned), that all the changes were comprifed within the firlt $30^{\circ}$ of the fcale; but yet, on expofing them to the warm fleam of a wahh-houfe, the index efuickly mounted to 100 . I was therefore defirous of impregruating the cords with fomething of a faline nature, which fhould difpofe them more forcibly to attract moifture; in order that the index might, with the ordinary changes of the moifure in the atmofphere, rravel over a greater part of the fcale of 100 . How to do this in a reyular and fixed quantity, was the fubject of many experiments, and feveral years interrupted inquiry. Atlaft tried the one hereafter defcribed, which feened

## FIG

prome to anfwer my intention in a great meafure: and tho, upon the whole it does not appear probable that ever this inftrument will be made capable of fuch an accurate agreement as the mereurial thermometers are, yet if we can reduce all the difagicements of ar hygrometer within ${ }^{\frac{1}{0}-\text { th }}$ part of the whole fcale, it will probably be of ufe in fome philofophical inquiries, in lieu of inllruments which have not yet been reduced to any common fcale at all.
"Fig. 1. and 2. $A B C$ is an crthographic delineaproportion. DE is that of the profile, or influe ment feen edgewife. FG in both reprefents a faxen coro avout 35 inches long, fufpenced by a turning peg $F$, and attached to a loop of brafs-wire at $\lambda$, which goes down into the box cover H , and $\mathrm{d} f$ fends the in dex. \&cc. trom injury; and by a glafs expofes the fcale to view.
"Fig. 3. hhows the inftrument to a larger fcale, the upright part being hortened, and the box-cover removed; in which the fame letters reprefent the fame parts as in the preceding figures; GI are two loops or long links of brafs-wire, which lay hold of the index KL. moveable upon a fmall fud or centre K . The cord FG is kept moderately ftrained ty a weight M of about half a pound avoirdupois. - It is obvious, that. as the cord lengthens and fhortens, the extreme end of the index rifes and falls, and fucceffively paffes over $\mathrm{N}:$ the fcale difpofed in the arch of a circle, and containing 100 equal divifions. This fcale is attached to the brafs Aliding ruler QP, which moves upon the directing piece RR, fixed by fcrews to the board, which makes the frame or bafe of the whole; and the fcale and suler NQP is retained in any pl:se nearer to or fur hir from the centre $\mathbf{K}$, as may be required by the Ecrew S .

Fig. 4. reprefents in profile the fliding piece and ftur I (fig. 3.), which traverfes upon that part of the index next the centre $\mathbb{K}$; and which can, by the two ferews of the Itud, be retained upen any part of the index that is made parallel ; and which is done for three or four inches from the centre, for that purpofe. The Atud is filed to the edges, like the fulcum of a fcale-beam; one being formed on the under fide, the other on the upper, and as near as may be to one another. An hook formed at the lower end of the wire-loops CI, retans the index, by the lowermoft edge of the flud ; while the weight M hangs by a fmall hook upon the upper edge: by thefe means the index is kept ftrady and che cords Itrained by the weight, with very little friction or burthen upon the central flud K .
". Fig. 5. is a parallelogram of plate-brafs, to keep out duft, which is attached to the upper edge of the box covet H ; and ferves to thut the part of the boxcover nectflarily cut away, to give Itave for the wire GI to traverfe with the fliding flud nearer to or further trom the centre of the index K ; and where, in fig. $\varsigma \cdot a$ is an hole of about an inch diameter, for the wirc GI to pafs through in the rifing ard falling of the index ficely without touching; $b$ is a nit of a lefler fize fufficient to pafs the wire, ard admit the cover to conc off without deranging the cord or index ; cc are two denall ferews applitd to two fits, by which the plate flides lengthways, in order to adapt the hole a

Vol. IX. Part I.

## H Y G

to the wire GI, at any place of the flud I upon the Hygrome. index KL
" 1. In this conftruction, the index KL being 12 inches long, 4 inches from the extreme end are filed fo narrow in the direction in which it is feen by the eye, that any part of thefe four inches lying over the divifions of the fcale, becomes an index thereto. The fcale itfelf flides four inches, fo as to be brought under any part of the four inches of the index attenuated as aborementioned.
" 2. The pofition of the directing piece $R R$ is fo determined as to be parallel to a right line drawn thro' - upon the fcale, and the centre K of the index; conrequently, as the attenuated part of the index forms a part of a radius or right line from the fame centre, it follows, that whenever the index points to o upon the fcale, though the fcale is moved nearer to or further from the centic of the index, yet it produces no change in the place to which the index points.
" 3 . When the divided arch of the fale is ar 10 inches from the centre (that is, at its mean diftance); then the centre of the arch and the centre of the index are coincident. At other diftances, the extremes of which are eight or twelve inches, the ccutre of the divifions, and the centre of the index pointing thereto, not being coincident, the index cannot move over the fpaces geometrically proportionable to one another in all fituations of the fcale; yet the whole fcale not exceeding $30^{\circ}$ of a circle, it will be found on computation, that the error can never be fo great as , $\frac{1}{c}$ part of the fcale, or $1^{\circ}$ of the hygrometer; which in this inftrument bcing confidered as indivifible, the mechanical error will not be fenfible.
"The cord here made ufe of is flax, and between $\frac{\pi}{2}$ th and $\frac{1}{10}$ th of an inch in diameter; which can be readily afcertained by meafuring a number of turns made round a pencil or finall Itick lt is a fort of cord ufed in London for making nets, and is of that particular kiud called hy net-makers flaxen three-threads laid. A competent quantity of this cord was builed in one pound avoildupois of water, in which was put two pennyweights troy of cummon falt; the whole was reduced by boiling to fix ounces avoirdupois, which was done in about half an hour. As this afcertains a given ftrength of the brine, on taking out the cord, it may be fuppofed that every fibre of the cord is equally impregnated with falt. The cord being dried, it will be proper to flretch it ; which may be done fo as to prevent it from untwifting, by tying three or four yards to two ndils againfl a wall, in an horizontal pofition, and hanging a weight of a pound or two to the middle, fo as to make it form an obtufe angle. This done for a week or more in a room, will lay the fibres of the cord clofe together, and prevent its tretching fo fall after being applied to the inftrument as it would ntherwife be apt to do.
". The hygrometer is to be adjufted in the following manner. The box cover being taken off to prevent its being fpoiled by the fire, and choofing a day naturally dry, fet the inftrument ne rly upright, about a yard from a moderate fire; fo that the cord may become dry, and the inflrument warn, but not fo near as would lpoil the finet linen by too much heat, and yet luly evapoare the moifure; there let the infrument flay till the index is got as low as it will go ; E

## H Y G

Figgrome- now and then flroaking the cord betwixt the thumb ter. and finger downwards, in order to lay thre fibres thereof clofe together; and thereby cauling it to lengthen as much as poffible. When the index is thus become ftationary, which will generally happen in about an hour, more or lefs as the air is naturally more or lefs dry, by means of the pegr at top raife or deprefs the index, till it lies over the point $o$. This done, remove the inftrment from the fire; and having ready fome warm waterin a tea cup, take a middling camel's hair pencil, and, dipping it in the water, gently anoint the cord till it will drink up no more, and till the index becomes fiationary and water will have no more effect upon it, which will alfo generally happen in about an bour. If in this fate the index lies over the degree marked 100 , all is right : if not, flack the forew $S$, and fide the fale nearer to or furthes from the centre, till the point 100 comes under the index, and then the inftrument is adjufted for ufe : but if the compafs of the flide is not fufficient to effect this, as may probably happen on the firft adjuftment, nack the proper fcrews, and move the fliding flad $I$ nearer to or further from the centre of the index, according as the angle formed by t!re index between the two points of dry or wet happens to be too fmall or too large for the fcale."

On this principle, a fimple hygrometer has been made by Mr Coventry of Southwark, London. It is not upon the moft accurate conflruction, yet will act very fenfibly in the common changes of the air. Fig. 6. reprefents the hygrometer as applied to a wall or board. A is a fring of whip-cond, catgut, \&c. of any length at pleafure: it is fufpended on a bracket B , and kept extended by a weight at the bottom C. DD is a fip of wood, which with the bracket is fixed perpendicularly to a wall or fide of a room. It has a ftraight line $E$ drawn down in the middle of the board, ferving to point out the divifions upon the edges of the two thin circular cards $F$ and G. At the centre of the bottom of each of thefe cards is glued a piece of $\cos k$, through which the flring $A$ is drawn: Thefe cork-pieces ferve to preferve the lonizontal pofition of the cards. The upper card $F$ is divided into 10 equal parts or divifions, and the under card $G$ into 100 equal parts; the Arisig. A being meafucd into 10 equal parts, from the point of fufpenfion H to the furface of the lower card I. The card F is hung at the firft part from $H$, and the card $G$ at the 10 th part from the fame point : confequently, from the twifting and untwilkins of the fring A by the different changes of the air, the lower card $G$, from the mechanical principies of motion, wrill defcribe so revolutions for one of the upper card F; or, when the lower card $G$ has made one revolution, the upper card $F$ will have deforibed but the oth part, or one of its divifions. From whence it appears, that by the affiftance of the upper card $F$, an index is thereby ohtained of the number of revolutions the lower card $G$ performs, which are reckoned by the line E on the nlip of wood.

Example. It muft firt be obferved what divifion of the cand $F$ the line $E$ is againit, fuppofe 3 and alfo what divifion of the lower card $G$, is cut by the fame line, fuppofe 10 : it then appears, that the ftate of the bygrometer is thus, 3 degrees and 10 tundredths of another. If the whole 10 divifions of
the card $F$ have paffed the line E, the lower eard $G$ will Hygrom have revolved 10 times, or 10 hundred parts, equal to 1000; the accuracy to which the principle of this fimple contrivance anfivers. Before ufe, the hygromoter fhould be adjufted; to do which, the cards $F$ and $G$ are firft fet to the line $E$ at the o of each, or commencement of the graduations: whatever direction the cards afterwards take, it mult evidently be from the change to greater moifture or drynefs in the air; and they will accordingly point it out.

On th.is principle, but with a degree of ingenuity and pains perhaps never before employed, an hygrometer has been conftructed by M. de Sauffure, profeflor of philofophy at Geneva. In his Effais fur PHygrometrie, in 4to, 1783 , is an important detail on the fubject of bygrometry; from which the following defcription of his hygrometer is taken. The author found by repeated experiments, tlat the difference between the greatelt cxtenfion and contraction of a bair, properly prepared, and that has a weight of abont threc grains fufpended to it, is nearly $\frac{\pi}{4}$ of its whole lengtly; that is, $3^{\frac{2}{2}}$, or $3^{\frac{2}{3}}$ lines in a foot. This circumftance fuggefted the idea of a new hygrometer: And, in order to render thofe fmall variations perceptible and ufeful, the following apparatus was conftructed.

Fig. 7. is a reprefentation of the whole inftrument, with the hair and other appendages complete. The lower extremity of the hair $a b$ is held by the chaps of the fcrew pincers $b$. Thefe pincers are reprefented afide at B : by a forew at its end, it faftens into the nut of the bottom plate C. This nut of the plate turns independently of the piece that fupports it, and ferves to raife or deprefs the pincers $B$ at pleafure.

The upper extremity $a$ of the hair is held by the under chaps of the double pincers $a$, reprefented afide at A. Thefe pincers faten the hair below, and above faftens a very fine narrow nip of filver, carcfully annealed, which rolls round the arbor or cylinder $d$, a feparate figure of which is nown at DF. This arbor, which carries the ncedle or index $e \ell$, or $E$ in the feparate figure, is cut in the fhape of a forew; and the intervals of the threads of this forcw have their bafes flat, and are cut 〔quarely fo as to receive the flip of filver that is faftened to the pincers $a$, and joined in this manner with the hair. M. Sauffure obferves, that hair alone fixed immediately to the arbor would not do; for it curled upon it, and acquired a ftiffnefs that the counterpoife was not able to furmount. The arbor was cut in a fcrew form, in order that the flip of filver in winding upon it thould not increafe the diameter of the arbor, and never take a fituation too oblique and variable. The תip is tixed $t$, the arbor by a fmall pin $F$. The other extremity of the arbor $D$ is fhaped like a pulley, flat at the tottom fo as to teceive a fine fupple filken Atring, to which is fufpended the counterpoife $g$ in the large figure, and $G$ in the fide one. This counterpoife is applied to diftend the hair; and acts in a contrary direction to that of the hair, and the moveable pincers to which the hair is fixed. If then the hair fhould be loaded with the weight of four grains, the counterpoife muld weigh four grains more than the incers. The arbor at one end paffes through the centre of the dial, and turns therein, in a very fine hole, on a pivot made very cylindrical and well polithed: at the other end is alfo a fimilar pivot, which turns in an

## H Y G

 H I. This cock is fixed betind the dial by means of the frew I.The dial kee $k$, divided into 360 degrees, is fupported by two arms $l l$; thefe are foldered to two tubes, which inclofe the cylindrical columns $m m m m$. The fetting fcrews $n n$ move upon thefe tubes, and ferve thereby to fix the dial and arbor to any height required. The two columus which fupport the dial are fimly fatiened to the cafe of the hygrometer, which reft upon the four fcrews $0000 ;$ by the affittance of thefe fcrews, the inftrument is adjuted, and placed in a vertical fituation.

The fquare column $p p$, which refts upon the bafe of the hygrometer, carrics a box $q$, to which is fixed a kind of port-crayon $r$, the aperture of which is equal to the diametcr of the sounterpoife $g$. When the hygrometer is to be moved from one place to another; to prevent a derangement of the inftrument from the offillations of the counterpoife, the box $q$, and the port-crayon $r$, mult be raifed up fo as the counterpoife may fall into and be fixed in it, by tightening the fcrew $s$ and the box and counterpoife together by the fcrew $t$. When the hygrometer is intended for ufe, the counterpoife mult be difengaged by lowering the box, as may be conceived from the figure.
Lailly, at the top of the inflrument is a curved piece of metal $x, y, z$, which is faftened to the three colunnus ju! defcribed, and keeps them together. It has a Equare hole at $y$, which ferves to hang up the hygrometer by when required.
The variations of whicl this hygrometer is capable, are (all things beficts equal) as much greater as the arbor round which the 隹 of filver winds is than a fmaller diameter, and as the inftrument is capablic of receiving a longer hair. M. Sauffure has had hygrometers made with hairs 14 inches long, lut he tinds one foot fufficient. The arbor is three-fourths of a line in diameter at the bafe between the threads of the fercw or the part on which the lip winds. The variations, when a hair properly prepared is applied to it , are more than an entire circumference, the index defcribing about 400 degrees in moving from extreme drynefs to extreme humidity. M. Sauffure mentions an inconvenience attending this hygrometer, viz. its not returning to the fame point when moved from one place to another; becaufe the weight of three grains that keeps the filver fip extended, cannot play fo exaetly as to act always with the fame precifion againft the arbor round which it winds. But this weight cannot be fenfibly increafed without fill greater inconveniences: he therefore obferves, that this hygrometer is well calculated for a fixed fituation in an obfervatory, and for varioushygrometrical experiments; fince, inftead of the hair, there may be fublitituted any other fubflance of which a trial may be wanted; and it may be kept extended by a counterpoife more or lefs heavy as they may require : but the inftrument will not admit of being moved, ror ferve even for experiments which may fubject it to agitation.
To obviate the ohjection above mentioned, M. Sanffure has contrived another apparatus more portable and convenient, and which, if not fo extenfive in its variations, is in fact very frm, and not in the leall liable to be deranged by carriage and agitation. Fig. 8. is a
reprefentation of this hygrometer, which he calls the Hy gromao portable bygrometer, in diltinction from the preceding, ter. which he calls the great bygrometer or the byrrometer quith the arbor. The material part of this inflrument is its index abce; an horizontal view of which, and the arm that carries it, is feen in the feparate figure GRDEF. This index carries in its centre D a thin tube hollow throughout, and projects out on each fide of the needle. The axis which paffes through it, and round which the index turns, is made thin in the middle of its length and thick at the cnds; fo that the cylindrical tube which it paffes through touches it only at two points, and acts upon it only at its extremities.

The part $d e \mathrm{DE}$ of the index ferves to point out and mark on the dial the degrees of moifture and drynefs ; the oppolite part $d b \mathrm{DB}$ ferves to fix both the hair and counterpoife. This part, which terminates in a portion of a circle, and is about a line in thicknefs, is cut on its edge in a double vertical groove, which makes this part fimilar to the fegment of a pulley with a double neck. Thefe two grooves, which are portions of a circle of two lines radius, and have the fame centre with that of the index $d$, ferve in one of them to contain the hair, and in the other the filk, to the end of which the counterpoife is fufpended. The fame index carries vertically above and bclow its centre two fmall fcrew-pincers, fituated oppofite to the two grooves : that above at $a$, oppofite to the hindmoft groove, ferves to fix the filk to which the counterpoife is fufpended; and that below at $b$, oppofite to the hithermoft groove, ferves to hold one of the ends of the hair. Each of thefe grooves has its partitions cut, as feen in the fection $B$, and its bottom made flat, in order that the hair and filk may have the greatef freedom poffible. The axis of the needle DD goes thro' the arm $\sigma f \mathrm{GF}$, and it is fixed to this arm by the tightening fcrew $f \mathrm{~F}$. All the parts of the index fhould be in perfect equilibrium about its centre; fo that when it is on its pivot without the counterpoife, it will reft indifferently in any pofition it may be placed in.
It muft be underftood, that when the lair is fixed by one of its extremities in the pincers e, and by the other end on the pincers $y$ at top of the inftrument, it paffes in one of the necks of the double pulley $\ell$, whilit the counterpoife to which the filk is fixed in a paffes in the other neck of the fame pulley: the counterpoife ferves to keep the lair extended, and acts always in the fame diretion and with the fame force, whatever the fituation of the index may be. When therefore the drynefs contracts the hair, it overpowers the gravity of the counterpoife, and the index defcends: when, on the contrary, the humidity relaxes the hair, it gives way to the counterpoife, and the index afcends. The counterpoife fhould weigh but three grains; fo that the index fhould be made very lisht and very eafy in its motion, in order that the leaft poffible force may move it and bring it back again to its point when drawn afide.
The dial beb is a circular arch, the centre of which is the fame with that of the index. This arch is divided into degrees of the fame circle, or into the hundredths of the interval which is found between the limits of extreme drynefs and extreme humidity. The interior edge of the dial carries at the ditance bia $\mathrm{E}_{2}$ kind

Hygrome kind of projecting bridle or Itay $i i$, made of brafs wire, ter. curved to the arch, and fised in the points $i i$. This bridle retains and guards the index, at the fame time leaving it to play with the requifite freedom. The fcrew pincers $y_{0}$ in which is faltened the upper extremity of the hair, is carried by a moveable arm, which afcends and defeends at pleafure the length of the framee KK. This frame is cylindrical every where elle, except its being here flattened at the hinder part to about half its thicknefs, in order that the piece with the forew which carries the arm fhould not project out underneath, and that the arm may not turn. The anm may be flopped at any defired height by means of the preffing ferew $x$. But as it is of ufe fometimes to be able to give the influment a very fmall and accurate motion, fo as to bring the index exactly to the part that may be wanted, the flide piece $l$, which carties the pincers $y$, to which the hair is fixed, is to be moved by the adjufting ferew $m$.

At the bafe of the inftrument is a great lever nop $q$, which ferves to fix the index and its counterpoife when the hygrometer is to be moved. The lever turns an axis $n$, terminated by a fcrew which goes into the frame; in tightening this forew, the lever is fixed in the defired pofition. When the motion of the index is to be ftopped, the intended pofition is given to this lever, as reprefented in the doted lines of the figure. The long neck $p$ of the lever lays hold of the doubie pulley $b$ of the index, and the fhort neck of the counterpoife: the tightening forew $q$ faltens the two necks at once. In confining the index, it mut be fo placed, that the hair be very flack; fo that, if whilf it is moved the hair thould get dry, it may have room to contract itfelf. Afterwards, when the inftrument is placed for ufe, the firft thing to be done is to relax the fcrew $n$, and turn back the double lever with great care, taking equal caution at the fame time not to Atrain the hair. It is better to apply one hand to the index near its centre, whilf the other hand is difengaging the pulley and the counterpoife from the lever that holds them fteady. The hook $r$ ferves to fufpend a thermometer upon; it fhould be a mercurial one, with a very fmall naked bulb or ball, fo as to fhow in the moft fenfible manner the changes of the air: it fhould be mounted in metal, and guarded in fuch a manner as not to vibrate fo as to break the lair. Laftly, a notch is made under the top of the frame $s$, to mark the point of fufpenfion, about which the inflrument is in equilibrium, and keeps a vertical fituation.

All the inllrument fhould be made of brafs : though the axis of the index and its tube work more pleafantly together if made of bell metal.

The extent of this hygrometer's variations is not more than the fourth or fifth part of the hygrometer with the arbor. It may be augmented by making the fegment of the pulley to which the hair is fixed of a fmaller diameter; but then the hair, in moving about it, would fret and contract a fliffefs, which would caufe it to adhere to the bottom of the neck. M. Sauffure is of opinion, that the radius of this pulley fhould not be lefs than two lines, at leaft that there fhould be adapted a plate of filver or fame other contrivance; but then the hygrometer would be ioodifficult to conftact, and it would require too much atiention and care on the part of thofe who ufe it: his object was,
to make an inftrument generally ufeful, and eafy and convenient in its ufe. The hygrometer with the arbor may be ufed for obfervations which require an extreme fenfhility.

The variations of this inftument may be augment ed by making it higher, becaufe in that cale longer latarsmiphi be adapted: but. it would be then lefs portahle. Beffes, if the hair is too long when obfervations are made in the open air, the wind has too great an effect upon it, and thus commmicates to the index inconvenient vibrations. It is not proper therefure to make it more than a foot in height. When it is of this dimenfion, an hair properly prepared call be apwhid to it, and its varintions from exureme drynefs to extreme humidity are So or even 100 degrecs; whick on a circle of 3 inches radius forms an exrent fufficient for oblervations of this kind. M. Situffure has evea? made fmaller infruments that may he carried conveniently in the pocket, and to make experiments with under fmall receivers: they wete but feven inches high by two inches of breadth; wheh, notwithaanding their variations, were very fenfible.

Thus much for the conllruction of the various parts cf the inftrument. The limits of this work will not admit of our inferting the whole of M. Sau!lure's fubs fequent account of the preparation of the hair, the manner of determining the limits of extreme humidity and of extreme drynefs, the pyrometrical vaiations of tic hair, and the graduation of the hygrometer. The following abftract mult therefore fuffice.

In the preparation of the hair, it was found neceffary to free it of a certain unctuofity it always has in its natural Aate, which in, a great meafure deprives it of its hygrometrical fenfibility A number of hairs are boiled in a lye of vegetable alkali; and among thefe are to be chofen for ufe fuch as are moft tranfparent, bright, and foft: particular precautions are neceflary for preventing the ftraining of the hair, which renders it. unfit for the intended purpofe.

Thie two fixed points of the hygrometcr are the extremes both of moillure and drysefs. The former is obtained by expofing the inftrument to air completely faturated with water; and this is effected by placing it in a glafs receiver ftanding in water, the fides of which are kept continually moillened. The point on the dial, at which the hand after a certain interval remains ftationary, is marked 100 . The point of extreme drynefs, not abfolute drynefs, for that does not exift, but the greateft degree of it that can be obtained, is produced by introducing epeatedly into the fame receiver containing the inftrument, and ftanding now upon quickfilver, certain quantities of deliquefcent alkaline falts, which abforb the moiture of the air. The higheft point to which the hand can be brought by this operation, not only when it will rife, no higher, but when it becomes retrograde from the dilatation oceafioned by heat, is called o; and the arch between thefe two points is divided into 100 equal parts, being degrees of the hygrometer. The arch $p p$, upon which the fcale is marked in the inftrument (reprefented in fig. 2.) being part of a circle of three inches diameter ; hence every digree meafures about $\frac{2}{3}$ of a line. In the ftationary hygrometer, fig. 1. the fcale upon the complete circular dial is fo much larger, that every
degree

Hyprome- degree meafures about five lines: but this M. Sauffure ter. confiders as far from being a perfection, that it is ra- ther an inconvenience; fince the inftruntent becomes thereby fo very fufceptible of the leaft impreffion, that there is even no approaching it without a fenfible variation. The thermometer, adapted as before mentioned, ferves to correct the changes of temperature: towards the extreme drynefs, $1^{\circ}$ of the thermo. meter produces on the hair an effect of $\frac{1}{2}$ deg. of the hygrometer ; but towards the extreme of moiture, the fame difference of temperature caufes an effect no lefs than $3^{\circ}$ on the hygrometer. He conftrueted two tables, that gave the intermediate hygrometrieal variations for fingle degrees of the thermometet at different parts of the icale.

The whole range of the atmofpherical variations takes in about $75^{\circ}$ of this feale; a drynefs of more than $25^{\circ}$ being alxays the effect of art. The fenfibi. lity of this inftrument is fo very great, that being ex. pofed to the dew, he mentions that it varies above $+0^{\circ}$ in about 20 minutes of time. Being removed from a very moift into a very dry ais, it varied in one inflance no lefs than $35^{\circ}$ in three minutes. He fays that its variations were always found uniform in different inftruments fufpended in diffirent parts of the fame atmofphere. This hygrometer is confidered by the author as poffeffed of all the properties requifite in fuch an inftrument. Thefeare, r . That the degrees in the fcale be fufficiently large, and to point out even the lealt variation in the drynefs or moillure of the atmofphere. 2. That it be quiek in its indications. 3. That it be at all times confiftent with itfelf; viz. that in the fame thate of the hair it always points to the fame degree.. 4. That feveral of them agree with one another. 5. That it be affected only by the aque. ous vapours. 6. That its variations be ever proportionate to the changes in the air.

Not many of thefe hygrometers have yet been made in London. A confiderable degree of trouble and delicacy is requifite in the preparation of the hair, and it is very fragile; circumftances which may prevent it from coming into general ufe among common obfervers, although probably it may be the beft in principle of any yet made.

Ih. On the fecond general principle, namely, that of the fwelling of folid bodiez by moiture, and their contraction by drynefs, M. De Luc's inftrument is the bett. He makes choice of ivory for the conftruction of his hygrometer, becaufe he finds, that, being once wetted, ivory regularly fwells by moifture, and returns exactly to the fame dimenfions when the moifure is evaporated, which other bodies do not. This hygrometer is reprefented in fig. 9 . whele $a a b$ is an ivory tube open at the end $a a$, and clofe at $b$. It is made of a piece of ivory taken at the diftance of fome inches from the top of a pretty large elephant's tooth, and likewife at the fame diftance from its furface, and from the canal which reaches to that point. (This particular dircetion is given, that the texture of the ivory in all different hygrometers may be the fame, which is of great importance.). This piece is to be bored exactly in the direction of its fibres; the hole muft be very.ftraight, its dimenfions $2 \frac{1}{2}$ lines in diameter, and 2 inches 8 lines in depth from a $a$ to $c$. Its bore is then to be exactly filled with a brafs cylinder, which, however, mult pro-
ject fomewhat beyond the ivory tube; and thus it is to Hygromebe turned on a proper machine, till the thicknefs of the ivory is exactly ${ }^{\frac{3}{5}}$ of a line, except at the two extremities. At the bottom $b$ the tube ends in a point ; and at the top $a$ a it muft for about two lines be left a little thicker, to enable it to bear the preflure of another piece put into it. Thus the thin or hygrometrical part of the tube will be redueed to $2 \frac{1}{2}$ French inches, including the concavity of the bottom. Before this piece is ufed, it mull be put into water, fo thaz the external part alone may be wetted by it ; and here it is to remain till the water penetrates to the infide, and appears in the form of dew, which will happen in a few hours. The reafon of this is, that the ivory tube remains fomewhat larger ever after it is wetted the firft time.
For this hygrometer, a glafs tube mult be provided about 14 inches long, the lower end of which is flown in $d d e e$. Its internal diameter is about $\frac{7}{4}$ of a line. If now the ivory tube is exactly filled with mereury, and the glafs one affixed to it, as the capacity of the former decreafes by being dried, the mercury will be forced up into the glafs one.

The piece $f f g g$ g is intended to join the ivory with the glafs tube. It is of brafi, thaped as in the figure. A cylindrical hole is bored through it, which holds the glafs tube as tight as poffible without danger of breaking it; and iss lower part is to enter with fonse degree of difficulty into the ivory pipe. To hinder that part of the tube which inclofes the brafs piece from being affected by the variations of the moilture, it is covered with a brafs verrel reprefented in $b b ; i$. The pieces mult be united together with gum lac or maftic.
The introduction of the mercury is the next opera. tion. For this purpofe, a חlp of paper three inches wide is firt to be rolled over the glafs tube, and tied faft to the extremity neareft the ivory pipe. A horfehair is then to be introduced into the tube, long enough to enter the ivory pipe by an inch, and to reach three or four inches beyond the extremity of the glafs one. The paper which has been fhaped round the tube mult now be raifed, and ufed as a furnel to pour the mercury into the inftrument, which is held upright. The pureft quick filver is to be ufed for this purpofe, and it will therefore be proper to ufe that revived from cinnabar. It eafly runs into the tube ; and the air efcapes by means of the horfe-hair, aflited with fome gentle hakes. Freth mercury muft from time to time be fupplied, to prevent the mercurial tube from being totally emptied; in which cafe, the mereurial pellicle which always forms by the contact of the air would run in along with it.
Some air-bubbles generally remain in the tube; they may be feen through the ivory pipe, which is thin enough to have fome tranfparency. Thefe being collected together by fhaking, muft be brought to the top of the tube, and expelled by means of the horiehair. To facilitate this operation, fome part of the mereury mult be taken out of the tube, in order that the air may be lefs obllucted in getting out, and the horfe-hair have a free motion to affilt it. Air, however, cannot be entirely driven out in this manner. It is the weight of the mercury with which the tuoe is for that reafon to be filled, which in time completes

## H Y G

Hygrome its expulfion, by making it pafs through the pores of 'ter the ivory. To hatten this, the hygrometers are put into a proper box. This is fixed nearly in aryertical direction to the faddle of a horee, which is fet a trotting for a few houre. The fhakes fometimes divide the column of mercury in the glafs tube, but it is eafily re-united with the horfe-hair. When, upon Shaking the hygrometer vertically, no fimall tremulous motion is any longer perccived in the upper part of the column, one may be fure that all the air is gone out.

The feale of this hygrometer may be adju.ted, as foon as the air is gone out, in the following manner. The inftrument is to be fufpended in a veffel of water cooled with ice, fref quantities of which are to be added as the former melts. Here it is to remain till it has funk as low as it will fink by the enlargement of the capacity of the ivory tube, owing to the moillure it has imbibed. This ufually happens in feven or eight hours, and is to be carefully noted. In two or three bours the mercury begins to afcend, becaule the moifture paffes into the eavity, and forces it up. The loweft fation of the mercury is then to be marked 0 ; and for the more accurate marking the degrees on the fcale, M. De Lue always chofe to have his hygıometrical tube made of one which had formerly belonged yo a thermometer. The reafon of this is, that in the thermometer the expanfion of the mercury by heat had been already determined. The dillance between the thermometrical points of melting ice and boiling water at 27 French inches of the barometer was found to be 1937 parts. The bulb of this preparatory thermometer was broke in a bafon, in order to receive carefully all the mercury that it contained. This being weighed in nice fales amounted to 1428 grains. The hygrometer contained 460 grains of the fame mercury. Now it is plain, that the extent of the degrees on the hygrometer, ought to be to that of the degrees on the preparatory thernometer as the different weights of the mercury contained in each; confequently $1+28: 460$ : 1937: 624 nearly ; and therefore the correfponding intervals ought to follow the fame proportion: and thus the length of a feale was obtained, which might be divided into as many parts as he pleafed.

Fig. 10. is a reprefentation of De Luc's hygrometer when fully conitructed. In elegance it far exceeds Smeaton's or any other, and probably alfo in accuracy ; for by means of a fmall thermometer fixed on the board along with it, the expantion of the mercury by heat may be known with great accuracy, and of confequence how much of the height of the mercury in the hygrometer is owing to that caufe, and how much to the mere moifture of the atmofphere.
M. De Luc having continned his inquiries further into the modifications of the atmofphere, mentions in his İée fur la Métcorologie another hygrometer, which hefinds to be the beft adapted to the meafure of local humidity. Of all the hygrofcopic fubitances which he tried for this purpofe, that whichanfwers the beft is a nip of whalebone cut tranfverfely to the direction of the fibres, and made extremely thin; for on this depends its fenfibility. A nip of 12 inches in length and a line in breadth, he has made fo thin as to weigh only half a grain; and it may be made ftill thinner, but is then of too great fenfibility, being affected even by the approach of the obfer-
ver This flip is kept extended by a finall fpring, Hygrom and the variations in its length are meafured by a ter. vernier divifion, or by, which is perhaps better, an index on a dial plate: the whole variation from extreme drynefs to extreme moifture is about $\frac{7}{8}$ of its length.

Thefe hygrometers are made by Mr Adams, and MrW. Jones, London. The flip of whalebone is mounted in a frame very fimilar to that belonging to M . Saufture's hygrometer before deferibed (fee fig.7.) The only material difference is, that a fimall concentric wire fpring is ufed, inftead of a counterpoife, to keep the flip of whalebone extended. M. Sauffure had tried fuch a fpling applied to his hairs; but the weakeft fpring he found too ftrong for the hair; and he was further apprehenfive, that the variations which the cold, heat, and the weather infallibly make, would fuffer from the force of the fprings.
M. de Luc, in the hygrometers he formerly made, as before defcribed (made of wory), had graduated them from one fised point only, that of extreme moiflure, which is obtained by foaking them in water. He has now very ingenioully contrived to fix the other extreme, that of drynefs : but this being producible only by means of itrong fires, fuch as liygrometers cannot fupport, he ufes an intermediate body, quicklime; which after having been deprived, by force of fire, of all its own humidity, has the property of nluwly imbibing humidity again from the bodies in its neighbouthood; and whofe capacity is fuch, that all the vapour that can be contained in a quantity of air equal to its own bulk, can give it no fenfible humidity. Thefe hygrometcrs, inctofed with a large quantity of frefh burnt lime in lumps, aequire in three weeks the fanc degree of drynefs with the linse, which cannot differ fentibly from extreme drynefs
$M$ de Sauffure makes choice of hairs, prepared by maceration in alkaline lye. M. de Luc'fhows that hairs, and all other animal or vegetablefubitances, takenlengtbwife, or in the direction of their fibres, undergo contrary changes from diffcrent variations of humidity; that, when immerfed in water, they lengthen at firt, and afterwards fhorten; that when they are near the greatelt degree of humidity, if the moifture is increafed, they fhortenthemfolves; if it is diminifhed, they lengthen themielves firft before they contract again. Thefe irregularities, which obvioully render them incapable of being true meafures of humidity, he fhows to be the neceffary conSequence of their organic reticular ftructure.
M. de Sauffure takes his point of extreme moifture from the vapours of water under a glafs bell, keeping the fides of the bell continually moiltened: and affirms. that the humidity is there conitantly the fame in all temperatures; the vapours even of boiling water having no more effect than thofe of cold. M. de Luc thows, on the contrary, that the differences of humidity under the bell are very great, though M. Sauffure's hygrometer was incapable of difcovering them; and that the real un iecompofed sapour of boiling water has the sirectly oppofite effect to that of cold, the effect of catreme drynefs: and on this point he mentions an intertiling fact, communicated to him by Mr Watt, viz. inst woos cannot be employed in the tteam engine for ary of thofe parts where the vapour of the boiling water is confined, becaufe it dries
yerroue- fo as to crack, juft as if expoled to the fire. In M. de Luc's work above mentioned there are friking inflances relited, in which the imperfection of M. Sauflure's, bygrometer led him into falfe conclufions refpecting phenomena, and into erroncous theories to account for them.
III. On the third principle, namely, the alteration of the weight of certain fubllances by their attracting the moifture of the air, ftw attempts have been made, nor rlo they feem to have been attended with much fuccefs. Sponges dipped in a folution of alkaline falts, and fome kinds of paper, have been tried. Thefe are fuf. pended to one end of a very accurate balance, and counterpoifed by weights at the other, and fow the degrees of moifture or drynefs by the afcent or defcent of one of the ends. But, befides that fuch kinds of higgrometers are deftitute of any fixed point from whence to begin their fcale, they have another inconvenience (from which indeed Smeaton's is not free, and which has been found to render it erroneous), namely, that all faline fubflances are deftroyed by long continued expofiure to the air in very fmall quanticies, and therefore can only imbibe the moillure for a certain time. Oil of vitriol has therefore been recommended in preference to the alkaline or neutral falts (fee Chemistry, $n^{\circ} 6$ If $^{\prime}$ ); and, indeed, for fuch as do not chufe to be at the trouble of conftructing a hygrometer on the principles of Mr Smeaton or De Luc, this will probably be found the moft cafy and accurate. Fig. 11. reprefents an hygrometer of this kind. A is a frall glafs cup containing a fmall quanticy of oil of vitriol, B an index counter poifing it, and C the fcale; where it is plain, that as the oil of vitriol attracts the moifture of the air, the fcale will defcend, which will raife the index, and vice verfa. This liquid is exceedingly fenfible of the incleafe or decreafe of moilure. A fingle grain, after its full increafe, has varied its equilibrium fo fenfibly, that the tongue of a balance, only an inch and a half long, has defcribed an arch one third of an inch in compars (which arch would bave been almoft thrce inches if the tongue had been one foot), even with fo fmall a quantity of liquor; confequently, if more liquor, expanded under a large furface, were ufed, a pair of fcales might afford as nice an hygrometer as any kind yet invented.-A great inconvenience, however, is, that as the air mult have fnil accefs to the liquid, it is impoffible to keep out the dult, which, by continually adding its weight, nouf render the hygronctier falfe; add to this, that even oil of vitriol itfelf is by time deftroyed, and changes its nature, if a fmall quantity of it is continually expofed to the air.
The beft hygrometer upon this principle, and for afcertaining the quantity as well as the degree of moifture in the variation of the hygrometer, is of the contrivance of Mr Coventry, Southwark, London. The account he has favoured us with is as follews. "Take two fheets of fine tiffue paper, fuch as is ufed by hatters; dry them carefully at about two feet diftance from a tolerably good fire, till after repeatedly weighing them in a good pair of fcales no moilture remains. When the fheets are in this perfectly dry flate, reduce them to exactly 50 grains; the hygrometer is then fit For ufe. The fheets mult be kept free from dut, and
expoied a few minutes in the open air; after which it may be always known by weighing them the exact quantity of moilture they have imbibed.
"For many years the hy grometer has (fays Mr Coventry) engroffed a confiderable flare of my attention; and every advantage propofed by others, either as it refpected the fubftances of which the infliument was compofed, or the manner in which its operations were to be difcerned, has been impartially cxamined. But (adds he) I have never feen an hygiometer fo fimple in itfelf, or that would act with fuch certainty or fo equally alike, as the one I have now defcribed. The materials of which it is compofed being thin, are eatily deprived wholly of their moiture ; which is a circumflance effentially neceffary in fixing a dutum from which to reckon, and which, I think, cannot be faid of any fubfance hitherto employed in the conAr ruction of hygrometers: with equal facility they imbihe or impart the humidity of the atmofphere, and fhow with the greatell exact nefs when the leaft alte. ration takes place."

When the paper is prepared, as already deferibed, it will ferve, without the trouble of drying, as a flandard for any number of heets intended for the fame purpofe. But then the fheets muft be kept together in the open air for a few hours; becaufe whatever alteration may take place by this expofure, the paper already weighed mult have undergone the fame; being confequently in the fame Itate, they muft be cut to the fance weight.

For eafier weighing the paper, take a piece of round tin or brafs the fize of a ciown-piece, through the centre of which drill a hole, and alfo threc others round it at equal difances: then cut about one hundred papers; and after putting them under the tin or brals, drive through each hole a ftrong pin into a board, in order to round them to the hape of the plate: the papers mult be then feparated and expofed to the air a few hours with that already weighed, and fo many of thens taken as are equal to the weight already fpecified. This done, threadle them together thrcugh thofe holes made hy the pins, putting between every paper on each thread a fmall bead, in order to preverit the papers from touching each other, and alfo that the air may be more readily admitted. The top of the hygrometer is covered with a card cut to the fame fize ; and which, by reafon of its Itiffnefs, fupports all the papers, and keeps them in proper hlape. Before the papers are threaded, the bcads, filk, card, and a thin piece of brafs about the fize of a fixpence, which nouft be placed at the bottom, and through which the cintre ftring paffes, muft be weighed with the greateft exactnefs, in order to bring them to a certain weight, fuppofe 50 grains; now the paper in its drieft flate being of equal weight, they will weigh together 100 grains, confequently what they weigh more at any time is moilure.

To obviate the trouble and difficulty of trying expcriments with weights and fcales, Mr Coventry contrived a machine or fcale by which to determine at. one view the humidity or drynefs of the atmofphere. This, with its cafe, is reprefented by fig. 12 . The front and back of the cafe are glafs; the fides fine gauze, which excludes the duat and admits the air ;i

Hygrote the cale is about 10 inches ligh, 8 inches broad, and ₹er. which, at about $\hat{3}_{2}^{\frac{1}{2}}$ inches diftance, is another; thefe
fupport the axis of the index E, alfo of the beam D , and another which fupports the ftem B, to which the ivory feale of divilions C is fixed. G , a brafs fcale fufpended in the ufual manner to the end of a beam D , and weighing exactly 100 grains. This fcale is an cxact counterpoife to the papers $I$ and the differen: apparatus. The paticular manner of fufpenfion in this balance is, from the conftruction, as fullows: The axis of the beamg, which is made of brafs, inftead of hanging on pivots as in common feales, turns with two theel edges $k k$, fixed in the extremities of the brais axis: thefe edges are flaped like the edge of a knife, and act on two lteel concave edges $l l$, in order to render the friction as fmall as poffible. $D$ is a fine feale bram fixed at right angles with the axis $g$. E, the Acel index fixed to the under fide of the fame axis. F, a brafs fliding weight: $b$ is the axis that holds the ftem $B$ to which the fealc of divifuns $C$ is fixed. A A, the brafs brackets which fupport the whole by four fcrews, two of which are feen at $i$, that forew the brackets to the top of the cafe. The axis of the feale of divifions is hung on pirots, onc of which is feen at $m$, that, fhould the cafe not ftand level, the flem B may always be in a perpendicular fituation.

The hygrometer, before ufe, thould be adjufted as sollows: To the end of the beam where the hygrometer is fuspended, hang a weight of 100 grains, which is equal to the weight of the fale; then move the clliding weight $F$ up or down the index $E$, till one grain will caufe the index to traverfe ncither more nor lefs than the whole feale of divifions; then add half a grain to the fcale, in order to bring the index to 0 ; and the initrument, after taking off the 100 grain weight and hanging on the papers, is fit for ufe; then put grain weights in the fale till the index is hrought within compals of the fcale of divifions. Example: II is 3 grains on the brafs feale, and the index points at 10; confequently there is 3 grains and 10 hundredths of a grain of moifture in the papers. If four grain-weights are kept, viz. 1, 2, 4, and 5, they will make any number from 1 to 9 , which are as many as will be wanted. Sometimes the index will continue traverfing within the fcale of divifions for many days without fhifting the weights; but if otherwife, they muft be changed as occafion may require.
" One gieat advantage of this hygrometer above all others that have attracted my notice is (fays MrCo ventry), that it acts from a certain dutum, namely, the diy-txtreme; from which all the variations towards moift are calculated with certainty: and if conftructed with that precifion reprefented by the drawing, it will afford pleafure to the curious in oblerving the almont perpetual alteration of the atmofphere, even in the molt fettled weather. In winter it will be conltantly fraverfing from about eight in the morning till four or five in the afternoon, towards dry; and in fummer, from about four in the morning till fis or feven in the fvening, when the weather is hot and gloomy, the bygrometer difcovers a very great change towards moitture ; and when clear and frofty, that it contains p much greater quantity of moilture than is generally inegint."

No 16 !.

HYGROSCOPE. The fame with HyGrome. Hygrofe TER.

HYLA (anc. geog.), a river of Myfia Minor, fa. noous for Hylas the favourite boy of Hercules, who was carried down the ftream and drowned. It is faid to run by Prufa; whence it feems to be the fame with the Rbyndacus, whicts runs north-wett into the Propontis.

HYLAS, in fabulous hitory, fon of Theod mus, was ravifhed by the nymphs of a fountain as he was taking out fome water for Hercules, by whom he was beloved.

HYLOZOISTS, formed of unn matter, 「am life, the name of a fect of atheilts among the ancient Greck philofophers, who held matter to be animated ; maittaining that matter had fome natural perception, without animal fenfation, or reflection in iffelf confidered; but that this imperfect life occafioned that organization whence fenfation and reflection afterwards arofe. Of thefe, fome held only nne life, which they called a plastic nature, prefiding regularly and invariably over the whole corporeal univerfe, which they reprefented as a kind oflarge plant or vegetable: thefe were called the cofmoplatlic and foocal atheits, becaufe the Stoics held fuch a nature, though many of them fuppofed it to be the inftrument of the Deity. Others thought that every particle of matter was endued with life, and nade the mundane fytlem to depend upon a certain mixture of chance and plaftic or orderly nature united together. Thefe were called the Stratonici, from Strato Lampracenus, a difciple of Theophrattus, called alfo Phyficus. (Cicero, De Nat. Deor. lib. i. cap. 13.) who was firlt a celebrated Peripatetic, and afterwards formed this new fyttem of atheifm for himfrlf Befides thefe two forms of atheifm, fome of the ancient philofophers were Hylopathians, or Anaximandrians, deriving all things from dead and ftupid matter, in the way of qualitits and forms, generable and corruptible ; and others again adopted the aromical or Democritical fyftem, who alcribe the production of the univerfe to atoms and figures. See on this fubject Cudworth's Intellectral Sylem, bouk i. chap. 3 .

HYMEN, or Hymeneus, a fabulors divinity, the fon of Bacchus and Vrnes Uraria, was fuppofed by the ancients to prefide over mariages; and accordingly was invoked in epithalamiums, and other matrimonial ceremonies, under the formula, $\mathrm{Hymen}^{2}$, or Hymenac!

The poets generally crown this deity with a chaplet of rofes; and reprefent him, as it were, diffolved and enervated with pleafures ; dreffed in a yellow robe, and fhoes of the fame colour; with a torch in his hand.-Catullus, in one of his epigrams, addreffes him thus:

## Cinge tempora floribus, Suaveolentis an.zraci.

It was for this reafon, that the new-married couple bore garlands of flowers on the wedding-day: which cuftom allo ohtained among the Hebrews, and even among Chriftians, during the firtt ages of the church, as appears from Tertullian, De corona militari, where he fays, Coronant Es mupte fponfos. - S. Chryfoltom likewife mentions thefe crowns of flowers; and to this day the Greeks call marriage sє甲avo $\mu \alpha_{1}$ in refpect of this crowa or garland.

## H Y M $\quad\left[\begin{array}{ll}4^{\mathrm{r}}\end{array}\right] \quad \mathrm{H} \mathrm{Y}$ M

Hymen, 'r ${ }_{\beta m v}$, in anatomy, a thin membrane or fkin, fometimes circular, of different breadths, more or lefs fmooth, and fometimes femilunar, formed by the union of the internal membrane of the great canal with that on the infide of the alx, refembling a piece of fine parchment. This membrane is fuppofed to be ftretched in the neck of the womb of virgins, below the nymphe, leaving in fome fubjects a very fmall opening, in others a larger, and in all rendering the external orifice narrower than the reft of the cavity, and to be broke when they are deflowered; an effufion of blood following the breach.

This membranous circle may likewife fuffer fome diforder by tuo great a flux of the menfes, by imprudence, levity, and other particular accidents.

The hymen is generally looked upon as the teft of virginity ; and when broise, or withdrawn, Shows that the perfon is not in a ftate of innocence. This notion is very ancient. Among the Hebrews, it was the cuftom for the parents to fave the blood thed on this occafion as a token of the virginity of their daughter, and to fend the fheets next day to the hufband's relations. And the like is faid to be ftill practifed in Portugal, and fome other countriss.

And yet anthors are not agreed as to the exiftence of fuch a membrane. Nothing, Dr Drake obferves, has employed the curiofity of anatomilts, in diffecting the organs of generation in women, more than this part : they have differed not only as to its figure, fubflance, place, and perforation, but even its reality; fome pofitively affirming, and others flatly denying it.

De Graaf himfelf, the moft accurate inquirer into the Anructure of thefe organs, c. nfeffes he always fought it in vain, though in the molt unfufpected fubjects and ages : all he could find was, a different degree of itraitnefsor widenefs, and different corrugations, which were greater or lefs according to the refpective ages; the aperture being ftill the lefs, and the rugotities the greater, as the fubject was younger and more untouched.

Dr Drake, on the other hand, declares, that in all the fubjects he had opportunity to examine, he docs not remember to have miffed the livemen fo much as once, where he had reafon to depend on finding t. The faireft view he ever had of it was in a maid who died at thirty years of age; in this he found it a membrane of fome ftrength, furnihed with flethy fibres, in figure round, and perforated in the middle with a fmall hole, capatle of admitting the end of a woman's little finger, and focuated a little above the orifice of the urinary paffage, at the entrance of the vagina of the womb.

In infant a , it is a finethin membrane, not very confpicunns, becaufe of the natural flraitnefs of the paffage itfelf, which does not admit of any great expanfion in fo little room ; which might lead De Graafinto a notion of its being no more than a corrugation.

This membrane, like moft others, does probably grow more difinet, as well as firm, by age. That it not only exifts, but is fometimes very ftrong and impervious, may be collected frim the hiftory of a cale reported by Mi Cowper. In a married voman, twenty years of age, whofe hymen was found altogether impervious, fo as to detain the menfes, and to be driven out by the preffure thereof beyond the labia of the pudendum, not unlike a prolaplus of the uterus; on divi-

Vol. IX. Part. I.
ding it, at leaft a gallon of grumous blood canse forth. Hymertes It feems the hufband, being denied a paffage that way, had found another though the meatus urinarius; which was found very open, and its fides extruded like the anes of a cock.

Upon a rupture of the hymen, after the confummation of marriage, and cfpecially delivery, its parts, frinking up, are fuppofed to form thofe little flefhy knots, called CARUNCULA myrtiformes.

HYMENAEA, the bastard locust tree: A genus of the monogynia order, belonging to the decandria clafs of plants; and in the natural method ranking
under the 33 d order, Lomentaces. The calys is quindria class of plants; and in the natural method ranking
under the 33 d order, Lomentacex. The calyx is quinquepartite; there are five petals, nearly equal ; the
ftyle is intorted; the legumen full of meally pulp. quepartite; there are five petals, nearly equal ; the
ftyle is intorted; the legumen full of meally pulp. There is but one fpecies, the courharil, which is a large tree, growing naturally in the Spanifh Weft Indies. The trunk is covered with a light afh coloured bark, is often more than 60 feet high and three in diameter, The branches are furnifhed with dark green leaves, which ftand by pairs on one common foottalk, diverging from their bafe in manner of a pair of thears
when opened. The flowers come out in loofe fpikes ging from their bafe in manner of a pair of thears
when opened. The flowers come out in loofe fpikes at the ends of the branches, and are yellow, flriped with purple. Each confifts of five petals, placed in a duuble calys, the outer leaf of which is divided into duuble calyx, the outer leaf of which is divided into
five parts, and the inner one is cut into five tecth at its bim. In the centre are ten declining itamina, longer than the petals, furrounding an oblong germen, which becomes a thick, Acfly, brown pod, four men, which becomes a thick, feflyy, brown pod, four
or five inches long and one broad, with a future on both edges, and includes three or four purplifh feeds, fomewhat of the thape of Windfor beans, but fmaller. The feeds are covered with a light brown fugary fubftance, which the Indians fcrape off and eat with great avidity, and which is very pleafant and agreeable. $\rightarrow$ At the principal roots inder gr und, is found collected in large lumps a yellowith red tranfparent gum, which diffolved in rectified fpirit of wine affords a moft
excellent varnifh, and is the gum anime of the fhops. which diffolved in rectified fpirit of wine affords a moft
excellent varnifh, and is the gum anime of the fhops.

HYMEN $\mathbb{E A L}^{2}$, fomething belonging to marriage; fo called from Hymen.
HYMENOPTERA (derived from vunv nembrane, and artpoy wing ), in the Linnean fyitem of natural hiftory, is an order of infects, having four membranaceous wings, and the tails of the fernales are furnifhed ceous wings, and the tails of the females are furnifhed
with ltings, which in fome are ufed for inftilling poifon, and in others for merely piercing the bark and fun, and in others for merely piercing the bark and
leaves of trees, and the bodies of other animals, in which they depofit their eggs.

HYMETTUS (anc. geng.), a monntain of Attica near Athens, famous for its marble quarries, and for its excellent honcy. Hymettius the epithet. 1hiny fays that the orator Craffus was the firlt who had marble columns from this place.

HYMN, a fong or ode in honour of God; or a poem, proper to be fung, compofed in honour of fome dcity. - The ward is Greek, v $\mu \mathrm{G}$, hym", furmed of the verb vi. celelro, "I celebrate."-Ifiodore, on this word, remarks, that bymn is proper-
ly a fong of joy, full of the praifes of God : by dore, on this word, remarks, that bymn is proper-
ly a fong of joy, full of the praifes of God: by which, according to him, it is diftinguifhed from threna, which is a mourning fong, full of lamentation.

St Hilary, bifhop of Poictiers, is faid to have beent ted in large lumps a yellowith red tranfparent gum,

## H Y O

Hyobanche the firft that compofed hymns to be fung in churches, and was followed by St Ambrofe. Mort of thofe in the Roman Breviary were compofed by Pruden- tius. They have been traullated into French verfe by Meffieurs de Port Royal.-In the Greek Liturgy there are four kinds of hymus; but the word is not taken in the fenfe of a praife offercd in verfe, but fimply of a laud or praife. The angelic hymn, wi Gloria in excelfis, makes the firt kind; the trifagion the fecond; the Cberubic bymn, the third; and the hymn of viarory and triumph called trineor, the lait.

The hymns or odes of the ancients generally confilted of three forts of flanzas; one of which, called grophe, was fung by the band as they walked from ealt to weft ; another, called antiffrophe, was performed as they returned from welt to ealt ; the third part, or epode, was fung before the altar. The Jewifh hymns werc accompanied with trumpets, drums, and cymbals, to affift the voices of the Levites and people.

HYOBANCHE, in botany: A genus of the angiofpermia order, belonging to the didynamia elafs of plants. The calyx is heptaplyylous; the corolla ringent, with no under lip. The capfule bilocular, and poly(permous.

HYOIDES, in anatomy, a bone placed at the root of the tongue. See Anatomy, $\mathrm{n}^{\circ} 2 \%$.

HYOSCYAMUS, henbane: A genus of the monogynia order, belonging to the pentandria clafs of plants; and in the natural method ranking under the 28th order, Lurida. 'The corolla is funnel-fhaped and obtufe; the flamina inclining to one fide; the capfule covered and bilocular. There are feveral fpecies, one of which, viz. the niger, or common henbane, is a nazive of Britain. It grows on road-fides, and among subbih. It is a biennial plant, with long flefly roots which ftrike deep into the ground, lending out feveral large foft leaves, deeply flathed on their edges; the following fpring the ftalks come up, which are about two feet high, garnihed with flowers flanding on one fide in a double row, fitting clofe to the flalks alternately. They are of a dark purplifh colour, with a black bottom; and are fucceeded by roundifh capfules which open with a lid at the top, and have two cells filled with fmall irregular feeds. -The feeds, leaves, and roots of this plant, as well as of all other fpecies of this genus, are poifonous: and many well attefted inflances of their bad effects are recorded; madnefs, convulfions, and death, being the common corifequence. In a fmaller dofe, they occafion giddinofs and flupor. It is faid that the leaves fcattered about a houfe will drive away mice. - The juice of the plant evaporated to an extract is preferibed in fome cafes as a narcotic; in which refpect undoubtedly it may be a powerful medicine if properly managed. The dofe is from half a fcruple to half a dram. The roots are ufed for anodyne necklaces.-Goats are not fond of the plant ; horfes, cows, fheep, and fwine, refufe it.

HYOSERIS, in botany: A genus of the polygamia æqualis order, belonging to the fyngenefia clafs of plants; and in the natural method ranking under the 49th order, Compgitita. The receptacle is naked, the calyx nearly equal; the pappus hairy, or fcarce perceprible.
HYO-THYROIDES, in anatomy, one of the

Table of ibe Mufcles.
HYPALLLAGE, among grammariane, a fpecies of hyperbaton, confifting in a mutual permutation of one cafe for another. Thus Virgil fays, Dare chafibus aufros, for dare clafes aulris; and again, Necdum illis labra adnovi, for necdum illa hubris admovi.
hypante, or Hyperpante, a name given by the Greeks to the feaf of the prefentation of Jefus in the temple.-This word, which fignifies lowly or bumblie meeting, was given to this fealt from the inecting of old Simeon and Anna the prophetefs in the temple when Jefus was brought thither.

HYPATIA, a learned and beautiful lady of antiquity, the daughter of Theon a celebrated phitefopher and mathematician, and prefident of the famous Alexandrian fchool, was born at Alexandria about the end of the fourth century. Her father, encouraged by her ex. traordinary genius, had lier not only educated in all the ordinary qualifications of her fex, but inftructed in the moft abitrufe fciences. She made fuch great progrefs in philofophy, geometry, aftonomy, and the mathematics, that the paffed for the molt learned perfon of her time. At length fhe was thought worthy to fuccecd her father in that diftinguifhed and important employment, the govcrnment of the fchool of Alexandria; and ta teach out of that chair where Ammonius, Hierocles, and many other great men, had taught before; and this at a time too when men of great learning abounded both at Alexandria and in many other parts of the Roman empire. Her fame was fo extenfive, and her worth fo univerfally acknowledged, that we cannot wonder if the had a crowded auditory. "She explained to her hearers (fays Socrates) the feveral Fciences that go under the general name of philofophy; for which reafon there was a confluence to her, from all parts, of thofe who made philofophy their delight and ftudy." One cannot reprefent to himfelf without pleafure, the flower of all the youth of Europe, Afra, and Africa, fitting at the feet of a very beautiful lady. (for fuch we are aflured Hypatia was), all greedily fwallowing inftruction from her mouth, and many of them, doubtlefs, love from lher eyes; though we are not fure that fhe evcr liftened to any folicitations, fince Suidas, who talks of her marriage with Ifiodorus, yet relates at the fame time that fhe died a maid.
Her fcholars were as eminent as they were numerous; one of whom was the celebrated Syncfus, who was afterwards bikhop of Ptolemais. This ancient Chriftian Platonift every where bears the ftronget, as. well as the moft grateful, teftimony of the virtue of his tutorefs; and never mentions ler without the moft profound refpect, and fomecimes in terms of affection coming little fhort of adoration. But it was not Synefius only, and the difciples of the Alexandrian fchool, who admired Itypatia for her virtue and learning: never was woman more caseffed by the public, and yet never woman had a more unipotted character. She was held as an oracle for her wildom, which made her confulted by the magiftrates in all important cafes; and this frequently drew her among the greateft concourfe of men, without the leaft cenfure of her manners. In a word, when Nicephorus intended to pafs the highen compliment on the princefs Eudocia, he
of the verb which completes the fentence, as in the fol-Hyperbola, lowing example from Virgil:

Interea Reges: ingenti mole Latinus
शuadrijugo vehitur curru, cui tempora circum
Aurati bis fex radii fulgentia cingunt, Solis avi fpecimen: bigis it Turnus in albis, Bina manu lato crippans bagilia ferro: Hinc Pater Eneas, Romane fiirpis orim, Sidereo furgrans clypeo et celefilus armis;

- Et juxta Afcanius, magna jpes aitera Rorio: Procedunt caltris.
HYPERBOLA, a curve formed by cuttiag a cone in a direction parallel to its axis. Sce Contc. Secions.

HYPERBOLE, in rhetoric, a figure, whereby the truth and reality of things are excelfively either cnlarged or diminimed. Sec Oratory, n ${ }^{\circ}$; 8.

An object uncommon with refpect to fize, either Elements very great of its kind or very little, flrikes us with Criticifro. furprife; and this emotion forces upon the mind a momentary conviction that the object is greater or lefs than it is in reality : the fame effect, precifely, attends figurative grandeur or littlenefs; and bence the hyperbole, which expreffes this momentary conviction, A writer, taking advantage of this natural delulion, enriches lis defcription greatly by the hyperbole : and the reader, even in his coolett moments, relifhes this figure, being fenfible tha: it is the operation of nature upon a warm fancs:

It cannot have efcaped obfervation that a writer is generally more fuccefsful in magnifying by a hyperbole than in diminifhing. The reafon is, that a minute object contracts the mind, and fetters its powers of imagination; but that the mind, dilated and iuflamed with a grand object, moulds objects for its gratification with great facility. Longinus, with refpect to a diminifhing hyperbole, cites the following ludicrous thought from a comic poet: "He was owner of a bit of ground not larger than a Lacedemonian letter." But, for the reafon now given, the hyperbole has by far the greater force in magnifying objects; of which take the following examples:

For all the land which thou feeft, to thee will I give it, and to thy feed for ever. And I will make thy feed as the dult of the carth: fo that if a man can number the duft of the earth, then thall thy feed alfo be numbered.

Ger. xiii. 15. 16.

F 2 -Whea

Now fhield with fhield, with helmet helmet clos'd, To armour armour, lance to lance oppos'd, Holt againl hoft with fhadowy fquadrons drew, The founding darts in iron tempelts flew, Viftors and vanquifl'd join promifcuous cries, And frilling thouts and dying groans arife; With freaming blood the flipp'ry ficlds are dy'd, And flaughter'd heroes fwell the dreadful tide.

Iliad iv. 508.
Quintilian is fenfible that this figure is natural: "For (fays he), not contented with truth, we naturally incline to augment or diminifh beyond it; and for that reafon the hyperbole is familiar even among
"That the hyperbole is then proper, when the object of itfelf exceeds the common meafure." From thefe premifes, one would not expect the following inference, the only reafon he can find for jultifying this figure of fpeech, "Conceditur enim amplius dicere, quia dici quantum eft, non poteft : meliufque ultra quam citra ilat oratio." (We are indulged to lay more than enough, becaufe we cannot fay enough; and it is beter to be above than under.) In the name of wonder, why this flight and childith reafoning, when imnediately before he had obferved, that the byperbole is founded on human nature? We could not relift this perfonal Itroke of criticifm; intended not againft our author, for no human creature is exempt from error; but againft the blind veneration that is paid to the ancient clafic writers, without dillinguifhing their blemihhes from their beauties.

Having examined the nature of this figure, and the principle on which it is erected; let us proceed to the rules by which it ought to be governcd. And, in the firt place, it is a capital fault to introduce an hyperbole in the defcription of an ordinary object or event; for in fiach a cafe, it is altogether unnatural, being deflitute of furprife, its only foundation. Take the following inftance, where the fubject is extremely familiar, viz. fiwimming to gain the fhore after a fhipwreck.

I faw hiun heat the furges uncer him,
And ride upon their backs: he trod the water ; Whofe enmity he flung afide, and breafted
The furge molt fivoln that met him : his boid head
'Bove the contentious waves he kept. and oar'd
Himfelf with his good arms, in lufty Atrokes
To th' foore, that o'er his wave-born bafis bow'd, As flooping to relieve him. Tempeft, af 2. fc. I.
In the next place, it may be gathered from what is faid, that an hyperbole can never fuit the tone of any difpiriting paftion: forrow in particular will never prompt fuch a figure, and for that reafon the fullowing liyperboles mult be condemned as unnatural:
K. Rich. Aumerle, thou weep't, my tenderbearted coulin!
We'll make foul weather with defpifed rears; Our fighs, and they, fhall lodge the fummer-corn, And make a dearth in this revolving land.

Richard II. ad 3. J6. 6.

## H Y P

Draw them to Tyber's bank, and weep your tears Hyperbole Into the channel, till the loweft ftream
Do kifs the moft exalted fhores of all.
Fulius Cafar, aat 1. jc. 1.
Thirdly, A writer, if he wifh to fucceed, ought always to have the reader in his cye: he ought, in particular, never to venture a bold thought or expreflion, till the reader be warmed and prepared. For this rexfon, an hyperbole in the beginning of a work can never be in its place. Example:

Jam pauca aratro jugera regix
Moles relinquent. Horat. Carm. lib. 2. ode 15.
In the fourth place, The niceft point of all, is to afcertain the natural limits of an hyperbole, beyond which being overftrained, it has a bad cffect. Longinus (chap. iii.), with great propriety of thought, enters a caveat againtt an hyperbole of this kind: he compares it to a bow-fling, which relaxes by overAraining, and produceth an effect directly oppolitc to what is intended. To afcertain any precife boundary, would be difficult, if not impracticable. We fhall therefore only give a Cpecimen of what may be reckoned overftrained hyperboles. No fault is more common among writers of inferior rank; and inflances are found even among thofe of the fineft tafte; witnefs the following liyperbole, too bold even for an Hotipur.
Hotfpur talking of Mortimer:
In fingle oppofition hand to hand, He did confound the beft part of an hour
Jn changing hardiment with great Glendower.
Three times they breath'd, and three times did they drink,
Upon agreement, of fwift Severn's flood;
Who then affrighted with their bloudy looks,
Ran fearfully among the trembling teeds, And hid his crifp'd head in the hollow bank,
Blood-ttained with thefe valiant combatants.
Firf Part Henry IV. and 1. fo.4
Speaking of Henry V.
England ne'er had a King until his time.
Virtue he had, deferving to command:
His brandiff'd fword oid blind men with its beamss
His arms fpread wider than a dragon's wings:
His fparkling eyes, replete with anful fire, More dazzled, and drove back his enemies, Than mid-day fun fierce bent againft their faces. What fhould I fay ? his deeds exceed all fpeech:
He never lifted up his hạnd, but conquer'd.
Firt Part Henry VI. act I. fo. I.
Lally, An hyperbole, after it is introduced with all advantages, ought to be comprehended within the fewett words poffible : as it cannot be relifhed but in the hurry and fwelling of the mind, a leifurely view diffolves the charm, and difcovers the defcription to be extravagant at leaft, and perhaps alfo ridiculous. This fault is palpable in a fonnet which pafteth for one of the molt complete in the French language: Plillis, in a long and florid defcription, is made as far to outfhine the fun as he outhines the fars:

Le filence regnoit fur la terre et fur l'onde,
L'air devenoit ferain et l'Olimp vermeil,

## H Y P

Et l'amourex Zeplis afranchi du fomeil, Reffufcitoit les fleurs d'une haleine feconde.
L'Aurore deployoit l'or de fa treffe blonde, Eet femoit de rubis le chemin du foleil; Enfin ce Dieu venoit au plus grand appareil Qu'il foit jamais venu pour eclairer le monde:
Quand la jeune Philis au vifage riant, Sortant de fon palais plus clair que l'orient, Fit voir une lumiere et plus vive et plus belle.
Sacre Flambean du jour, n'en foiez point jaloux, Vous parutes alors auffi peu devant elle, .
Que les feux de la nuit avoient fait devant vous.
Malleville.
There is in Chaucer a thought expreffed in a fingle line, which fets a young beauty in a more advanta. geous light than the whole of this much laboured poem :

## Up rofe the fun, and up rofe Emelie.

HYPERBOREAN, in the ancient geography. The ancients denuminated thofe people and places $H_{y}$ perborean which were to the northward of the Scythians. They had but very little acquaintance with thefe Hyperborean regions; and all they tell us of them is very precarions, much of it falfe. Diodorns Siculus lays, the Hyperboreans were thus called by reaton they dwelt beyond the wind Boreas; verp fig. nilying "abuve, or beyond," and Bopras, Boreas, the "north wiuc." This etymology is very natural and plauible; notwithfanding all that Rudbeck has faid againt it, who would have the word to be Gothic, and to fignify nobility. Herodotus doubts whether or no there were any fuch nations as the Hyperborean. Strabo, who profeffes that he believes there are, does not take byperborean to fignify beyond Boreas or the north, as Herodotus underfood it: the prepofition vare, in this cafe, he fuppofes only to help to form a fuperlative; fo that byperborean, on his prin. ciple, means no more than mof/ northern: by which it appears the ancients fearce knew themfelves what the name meant. - Motl of our modern geographers, as Hoffman, Cellarius, sec. have placed the Ityperboreans in the northern parts of the European continent, among the Siberians and San:oieds: according to them, the Hyperboreans of the ancients were thofe in general who lived fartheft to the north. The Hyperboreans of our days are thofe Ruffians who inhabit between the Volga and the White fea. According to Cluvier, the name Celtes was fynonymous with that of Hyperboreans.

HYPERCATALECTIC, in the Greek and La. tin poetry, is applied to a verfe that has one or two fyllables too much, or beyond the regular and jult meafure ; as,

 " I judge."

Hyperi.
HYPERDULIA, in the Romith theology, is the worhip rendered to the holy virgin. The word is Greek, vтepivicix, compofed of utif, above, and visx, worfhip, fervice. The worhip offered to faints is called cluliz; and that to the mother of God, byperdulia, as being fuperior to the former.

HYPERIA (anc. geog.) the feat of the Phæacians near the Cyclops, (Homer): fome commentators take it to be Camarina in Sicily; but, according to others, is fuppofed to be an adjoining ifland, which they take to be Melita, lying in fight of Sicily. And this feems to be confirmed by Apollonius Rhodius. Whence the Phracians afterwards removed to Curcyra, called Scheria, Pbacaia, and Macris; having been expelled by the Phocnicians, who fettled in Melita for commerce, and for commodious harbours, before the war of Proy. (Diodorus Siculus.)

HYPERICUM, St Johs's wort: A genus of the polyandria order, belonging to the polyadelphia clais of plants; and in the natural method ranking under the 2oth order, Rotacer. The calyx is quinquepartite; the petals five ; the filaments many, and coalited at the bafe into five pencils; the feed-veffel is a pencil.

Species. Of this genus there are 29 fpecies, moft of them hardy deciduous fhrubs, and under. fhrubby plants, adorned with oblong and oval fimple foliage, and pentapetalous yellow flowers in clufters. The moft remarkable are, I. The bircinum, or Ainking St John's-wort. This rifes three or four feet high, with feveral flrubby two-edged flalks from the rout, branching by pairs oppofite at every joint; oblong, oval, clofe-fitting oppofite leaves; and at the ends of all the young houts, clufters of yellow flowers. Of inis there are three varieties; one with flrong ftalks, fix or eight feet high, broad leaves, and large flowers; the other with frong ftalks, broad leaves, and without any difagreeable odour; the third hath variegated leaves. All thefe varieties are fhrubby ; and flower in June and July in fuch numerous clufters, that the fhrubs appear covered with them; and produce abundance of feed in autumn. 2. The canarienfis hath fhrubby falks, dividing and branching fix or feven feet high; oblung, clofe-fitting leaves by pairs; and, at the ends of the branclues, clullers of ytllow flowers appearing in June and July. 3. The afcyron, or dwarf American St Jobn's-wort, hath fpreading roots, fending up numerous, flender, fquare ikalks, a foot long; oval, fpear-fhaped, clofe-litting, fnooth leaves by pairs oppolite; and, at the end of the ltalks, large yellow flowers. 4. The audrofamum, commonly called tuffan, or park-leazes, hath an upright uuderflurubby Italk, two fett high, branching by pairs oppofie: and at the ends of the flalks, clulters of imall ydlow flowers appedring in July and Auguft, and fucceeded by rounduh berry-like black capfules. This grows naturally in many parts of Britain. 5. The balcaricun, or wart-leaved 'st John's-wort, is a native of Majorca ; and hath a thrubby lialk, branching two feet high, with reddifh fearilied brancbes, fmall oval. leaves warted underneath, and large yellow llowers appearing great part of the year. 6. The monogynum, or one flyleu Cbina bypericun, hath a fhrubbs purplifn. flalk, about two fect high; oblong, froooth, litil, clofedittug:

Sypericumfitting leaves, of a mining green above, and white II underneath ; clufters of fmall yellow flowers, with co-Hyproti- lonred cups, and only one flyle, flowering the greateft
cus $\underbrace{\text { chs }}$ part of the year.

Culture. The four firf fpecies are hardy, and will grow in any foil or fituation; the threc laft muft be potted, in order to have fhelter in the green-houfe in winter. The two firft fpecies propagate very faft by fuckers, which are every year fent up plentifully from the ront ; and in autumn or fpring may be readily 月lip. ped off from the old plants with roots 10 each, or the whole plant may be taken up and divided into as many parts as there are fuckers and flips with roots, planting the Arongell where they are to remain, and the weakelt in nurfery-rows, where they are to remain a year in order to acquire frength. They may alfo be propagated by feeds fown in antumn, in a bed of common earth, in drills an inch deep. The other two hardy ferts are alfo propagated by flipping the roots in autumn, or easly in the fpring ; and may likewife be raifed in great plenty from feeds. The three other fpecies are propagated by layers and cuttings, planted in pots, and plunged in a hot beri.

Properties. The tutfan hath long held a place in the modicinal catalogues; but its ufes are very much undetermined. The leaves given in fubtance are faid to deftroy worms. By dillillation they yield an efiential oil. The flowers tinge fpirits and oils of a fine purple colour. Cows, goats, and fheep, eat the plant; horfes and fwine refufe it. The dried plant boiled in water with alum, dyes yarn of a yellow colour ; and the Swedes give a fine purple tinge to their fpirits with the flowers.

HYPERIDES, an orator of Greece, was the difciple of Plato and Ifocrates, and governed the republic of Athens. He defended with great zeal and courage the liberties of Grecce; but was put to death by Antipater's order, 322 13 . C. He compofed many orations, of which only one now remains. He was one of the ten celebrated Greek orators.

HYPERMNESTRA, in fahulous biftory, one of the 50 daughters of Danaus king of Argos. She alone refufed to obey the cruel order Danaus had given 10 all his daughters, to murder their hufbands the firf night of their marriage ; and therefore faved the life of I,ynceus, after the had made him promife not to violate her virginity. Danaus, enraged at her difobedience, confined her clofely in prifon, whence Lynceus delivered her fome time after.

HYPERSARCOS1S, in medicine and furgery, an cxceis of flefh, or rather a fiefhy excrefcence, fuch as thofe generally rifing upon the lips of wounds, \&c.

HYPHEN, an accent or character in grammar, implying that two words are to be joined, or connected into one compound word, and marked thus -; as fre-chablifhed, five-leaved, Eic. Hyphens alfo ferve to connect the fyllables of fuch words as are divided by the end of the line.

HYPNOTIC, in the materia medica, fuch medicines as any way produce fleep, whether called narcotics, lypnotics, opiates, or foporifics.

HYPNOTICUS serpens, the Sleep-fnake, in zoology, the name of an Eaf-Indian fpecies of ferpent, called by the Ceylonefe nintisolong, a word importing the fame fenfe. It is of a deep blackifh brown, varie-
gated with fpots of white, and is a very fatal kind in its poifon; its bite always bringing on a fleep which ends in death.

HYPNUM, feather-moss, in botany: A genus of the natural order of mufci, belonging to the cryptogamia clafs of plants. The antheræ is operculated, or covered with a lid; the calyptra fmooth; the filament lateral, and rifing out of a perichætium, or tuft of leaflets different from the other leaves of the plant. There are 46 fpecies, all of them natives of Great Britain; none of them, however, laave any remarkable property, except the proliferum and parietinum. The firt is of a very fingular ftructure, one thoot growing out from the centre of another; the veil is yellow and thining; the lid with a kind of long bill: the leaves not thining; fometimes of a yellowith, and fometimes of a deep green. 'This mofs covers the furface of the earth in the thickeft fhades, through which the fun never fhines, and where no other plant can grow. The fecond hath fhoots nearly flat and winged, undivided for a confiderable length, and the leaves fhining; but the old fhoots do not branch into new ones as in the preceding fpecies. It grows in woods and thady places; and, as well as the former, is ufed for filling up the chinks in wooden houles.

HYPO, a Greek particle, retained in the compofition of divers words borrowed from that language; literally denoting ander, beneath. - In which fenfe it flands oppofed to vaip fupra, " above."

HYPOBOLE, of SUBJECTION, (from vero, and $3 \times \lambda \lambda \omega$. $I$ cafl), in thetoric, a figure; fo called, when feveral things are mentioned, that feem to make for the contrary fide, and each of them refuted in order. This figure, when complete, confilts of three parts; a propofition, an enumeration of particulars with their anfwer, and a conclufion. Thus Ciccro, upon his return from banifhment, vindicates his conduct in withdrawing fo quietly, and not oppofing the faction that ejected him. Sec Oratory, n² 8.

HYPOCATHARSIS (compounded of vaounder, and $\times$ asatfa $I f$ furge ), in medicine, a too faint or feeble purgation.

HYPOCAUSTUM, among the Greeks and Romans, a fubterraneous place, where was a furnace to hea. the baths. 'The word is Greek, formed of the prepofition v.то under; and the verb xats, to lurn.Another fort of hypocauftum was a kind of kiln to lieat their winter parlours. 'I'he remains of a Roman hypocauftum, or fiveating-room, were difcovered under ground at Linceln in 1739 . We have an account of thefe remains in the Philofophical Tranfactions, $n^{2} 461$. § 29.-Among the modenus, the hypocautum is that place where the fire is kept which warms a flove or hot-houfe.

HYPOCHIERIS, haw K's-eye, in botany: A genus of the polygamia requalis order, belonging to the fyngenefia clafs of plants; and in the natural method ranking under the 4 gtl order, Compofite. The recep. tacle is paleaceous; the calyx a little imbricated; the pappus glumy. There are four fpecies; none of which have any remarkable property, except the maculata, or fpotted kawk's-eye. It is a native of Britain, and grows on high grounds. The leaves are oblong, eggthaped, and toothed; the ftem almont naked, generally with a fingle branch; the bloffoms yellow, opening at

HYPOSTASIS, a Greek term, literally fignifying noon. The leaves are boiled and eaten like cabbage. Horfes are fond of this plant when green, but not when dry. Cows, goats, and fwine eat it; theep are not fond of it.

HYPOCHONDRIA, in anatomy, a fpace on each fide the epigaltric region, or upper part of the abdomen. See Anatomy, $n^{\circ} 88$.

HYPOCHONDRIAC PAssion, a difeafe in men, fimilar to the hylteric affection in women. See (the Index fubjoined to) Medicine.
HYPOCISTIS, in the materia medica, an infpiffated juice obtained from the feflile afarum, much refembling the true Egyptian acacia. They gather the fruit while unripe, and exprefs the juice, which they revaporate over a very gentle fire, to the confilitence of an extract, and then form into cakes, and expofe them to the fun to dry. It is an alfringent of confiderable power ; is good againt diarrhceas and hxmorihages of all kinds; and may be ufed in redellent gargarifms in the manner of the true acacia; but it is very rarely met with genuine in our fhops, the German acacia being ufually fold under its name.

HY POCRISY, vroxplest, in cthics, denotes dififimu. lation with regard to the moral or religious charater. In other words, it fignifies one who fcigns to be what he is not; and is generally applied to thofe who affume the appearances of virtue or religion, without having any thing in reality of either.

HYPOGEUM, veoytan, formed of uzo under, and rauc earth, in the ancient architecture, is a name common to all the parts of a building that are under ground; as the cellar, butteries, and the like places. The term bypogaum was ufed by the Greeks and Romans for fubterraneous tombs in which they buried their dead.

Hypogeus, Tofrav, in aftrology, is a name given to the celettial houfes which are below the horizon: and efpecially the imum cali, or bottom of heaven.

HYPOGASTRIC, an appellation given to the internal branch of the iliac artery.

HYPOGASTRIUM, in anatomy, the middle part of the lower region of the belly. See Anatomy, n 88.
hypoglonsi, externi, or majores, inanatomy, the ninth pair of nerves, called alfo linguales $\xi \mathcal{F}$ gufatorii. See Amatomy, p. 760 . col. 1 .

HYPOGLOTTIS, or Hyroglossis, (compofed of vao under, and raorix tonsue), in anatomy, is a name given to two glands of the tongue. There are four large glands of the tongue; two of them called bypoglottides, fituated under it, neat the venx ranulares; one on each fide of the tongue. They ferve to filtrate a kind of ferous matter of the nature of faliva, which they difcbarge into the mouth by little ducts near the gums.

Hyroglottis, or Hyraglufis, in medicine, denates an inflammation or ulceration under the tongue; called alfo ranula.

HYPOPYON, in medicine, a collection of purulent matter under the corner of the eye.

HYPOSCENIUM, in antiquity, a partition under the pulpit or logeum of the Greek theatre, appointed for the mufic,
fubfance, or fubfifence; uled in theology for ferfon.The word is Greek, v70,sarts; compounded of nio fub, " under;" and $15 n, 4$, , ho, exifon " I ftand, I exill ;" q. d. fub fiflentia. Thus we hold, that there is but one nature or effence in God, but three lyyp pofis or perfons.

The term bypofafis is of a very ancient itanding in the church. St Cyril repeats it feveral times, as alfo the phrafe union according to bypphafis. The irft time it occurs is in a letter from that father to Nellorius, where he ufes it inftead of apooworo, the word we commonly render ferfon, which did not feem expreflive enough. "The philofophers (fays St Cyril) have allowed three bypofafes: They have extended the Divinity to three loypoflafes: They have even fometimes ufed the word trinity: And nothing was wanting but to have admitted the confubltantiality of the cliree $b y$. foflafes, to thow the unity of the divine nature, exclufive of all triplicity in refpect of dillinction of nature, and not to hold it neceflary to conceive any refpective inferiority of hypoflafes."

This term occafioned great diffentions in the ancient church; firtt a mong the Greeks, and afterwards alio among the Latins. In the council of Nice, lypoflugis was defined to denote the fame with effence or fubflance; fo that it was herefy to fay that Jefus Chrif was of a different bypofafis from the Father; but cutlom altered its meaning. In the necenfity they were under of exprefing themfelves thonsly againft the Sabellians, the Greeks made choice of the word hypghafis, and the Latins of ferfona; which charge proved the occafion of endlefs difagreement. The plirafe teats vasacus, uficd by the Greeks, fcandalized the Latins, whofe ufual way of rendering viosacos in their language was by fubflantia. The barrennefs of the Latin tongue in theological phrafes, allowed them but one word for the two Greek ones, vera and vtosacts; and thus difabled them from dittinguifing effence from bytophisis. For which reafon they chofe rather to ufe the term tres perfone, and tres hypofafis. - An end was put to logonachias, in a fynod held at Alexandria about the year 362, at which St Athanafius affifted; from which time the Latins made no great fcruple of faying tre byfoffes, nor the Greeks of three perfons.

HYPOTHECA, in the civil law, an obligation, whereby the effects of a debtor are made over to his creditor, to fecure his debt. The word comes frome the Greek verosnxn, a thing fuljeat to fome obligation; of the verb veotionuxi, fupponor, "I am fubjected ;" of vaco under, and 7 tinnes pono, "I put."

As the hypotheca is an engagement procured on purpofe for the fecurity of the creditor, valious means have been made wife of to fecure to him the benefit of the convention. The ure of the pawn or pledge is the moll ancient, which is almolt the fame thing with the hypotheca; all the difference confifing in this, that the pledge is put into the creditor's hands; whereas, in a fimple hypotheca, the thing remained in the poffefion of the debtor. It was found more eafy and commodious to engage an eftate by a civil covenant than by an actual delivery: accordingly the expedient was firlt practifed among the Grteks; and from them the Romans borrowed both the name and the thing : only the Greeks, the better to grevent frauds, ufed to fix fome

Trretice- vifible niark on the thing, that the public might know nuic, A3ypothef: it was liypothecate or inortgaged by the proprietor ; but the Romans, looking on fuch advertifements as in- jurious to the debtor, furbad the ufe of them.

The Ruman lawyers diftinguithed four kinds of hypothecas: the conventional, which was with the will and confent of both parties; the legal, which was appointed by law, and for that reafon called tacit; the pretor's pledge, when by the Alight or non-appearing of the debtor, the creditor was put in poffefion of his effects; and the judiciary, when the creditor was put in poffeffion by virtue of a fentence of the court.

The conventional hypotheea is fubdivided into general and fpecial. The hypotheca is general, when all the debtor's effects, both prefent and future, are engaged to the creditor. It is fpecial, when limited to one or morc particular things.

For the tacit hypotheca, the civilians reckon no lefs than twenty-fix different fpecies theroof.

HYPOTHENUSE, in geometry, the longett fide of a right-angled triangle, or that which fubtends the right angle.

HYPOTHESIS, (formed of vao "under," and 2cors pofitio. of ritnus pono, " 1 put"), is a propolition or principle which we fuppofe, or take for granted, in order to draw conclufions for the proof of a point in quettion.

In difputation, they frequently make falfe hypothefes, in order to draw their antagonifts into abfurdites; and even in geometry truths are often deducible from fuch falfe hypothefes.

Every conditional or hypothetical propofition may be dirtinguifhed into hypothefis and thefis: the firft rehearfes the conditions under which any thing is af firmed or denied; and the latter is the thing itfelfaffirmed or denied. Thus, in the propofition. a triangle is half of a parallelogram, if the bafes and altitndes of the two be equal; the latter part is the hypothefis, "if the bafes," \&c and the former the thefis, "a a triangle is half a parallelogram."

Ia trict logic, we are never to pafs from the hypothefis to the thefis; that is, the principle fuppofed mult be proved to be true, before we require the consiquence to be allowed.

Hyrothesis, in phyfics, \&c. denotes a kind of $f_{y}$ tem laid down from our own imagination, whereby to ascount for fome phenomenon or appearance of nafure. Thus we have hypothefis to account for the tides, for gravity, for magnetifm, for the deluge, \&c.

The real and fcientific caufes of natural things generally lie very deep: oblervation and experiment, the proper means of arriving at them, are in moft cafes extremely flow; and the human mind is very impatient: hence we are frequently driven to feign or invent fomething that may feem like the caufe, and which is calculated to anfwer the feveral phenomena, fo that it may poffibly be the true caufe.

Philofophers are divided as to the ufe of fuch fictions or hypothefes, which are much lefs current now than they were formerly. The lateft and beft writers are for excluding hypothefes, and flanding wholly on obfervation and experiment. Whatever is not deduced frem phenomena, fays Sir lface Newton, is an hypothefis; and hypothefes, whether metaphyfical, or phyfical, or mechanical, or of occult qualities, have no place in experimental philofophy.
$\mathrm{N}^{3} 162$.

## H Y P

The Cartefians take upon them to fuppofe what af Hypothe fections in the primary particles of matter they pleafe; juft what figures, what magnitudes, what motions, and what fituations, they find for their purpofe. They alfo feign certain unfeen, unknown fluids, and endue them with the mof arbitrary properties; give them a fubtilty which enables them to pervade the pores of all bodies, and make them agitated with the mont unaccountable motions. But is not this to fet afide the real contlitution of things. and to fubfitute dreams in their place? Truth is fearce attainable even by the fureft obfervations; and will fanciful conjectures ever come $3 t$ it? They who found their fpeculations on hypothefes, even though they argue from them regularly, according to the ftricteft laws of mechanics, may be faid to compofe an elegant and artful fable; but it is fill only a fable.

Hypothesis is more particularly applied in aftronomy to the feveral fyftems of the heavens; or the different ways in which different allronomers have fuppofed the heavenly bodies to be ranged, moved, \&c.

The priscipal hypothefes are the Ptolemaic, Copernican, and Tychonic. The Copernican is now become fo current, and is to well warranted by obfervation, that the retainers thereto hold it injurious to call it an lypotbefis. See Astronomy.
hytotiposis. See Oratory, nopr.
HYPOXIS in botany: A genus of the monogynia order, belonging to the hexandria clafs of plants; and in the natural method ranking under the loth order, Coronaric. The corolla is divided into fix parts, and perfifting, fuperior; the capfule narrowing at the bafe; the ralyx a bivalved glume.

HYPSISTA RII, ( formed from vit505 "highelt), a fect of heretics in the fourth century; thus called from the profeffion they made of worfhipping the moft high God.

The doctrine of the Hypfiftarians was an affemblage of Paganifm, Judaifm, and Chrifianity. They adored the moft high God with the Chriftians; but they alfo revered fire and lamps with the heathens ; and obferved the fabbath, and the diftinction of clean and unclean things with the Jews.

The Hypfiftarii bore a near refemblance to the Eus clites, or Maffalians.

HYRCANIA (anc. geog.), a country of the farther Afia, lying to the fouth-eaft of the Mare Hyrcanum or Cafpium; with Media on the weft, Parthis on the fouth, and Margiana on the weft. Famous for its tygers (Virgil) ; for its vines, figs, and olives, (Strabo).

Hyrcania (anc. gcog.) ; a town of Lydia, in the campus Hyrcanus, near Thyatira; fo called from colonifts brought from Hyrcania, a country lying to the fouth of the Carpian fea. The people called $H_{y r}$ cani Macedones, becaufe a mixed people (Pliny).-Another Hyrcania, the metropolis of the country called Hyrcania. Thought to be the Tape of Strabo, the Syrinx of Polybius, the Zeudracarta of Arrian, and the A faac of Ifidorus Characenus. - A third, a Arong place of Judea, built by Hyrcanus.

HYSSOP. See Hyssopus.
Hedge-Mrssop. See Gratiola.
HYSSOPUS, hyssop: A genus of the gymnofpermia order, belonging to the didynamia clafs of plants. There are three fpecies; but only one of them,

$$
4
$$

- 

teric viz. the officinalis, or common hyfop, is cultivated for ufe. This hath under-fhrubby, low, bufthy ftalks, growing a foot and an half high ; fmall, fpear-fhaped, clofe-fitting, eppofite leaves, with feveral imaller ones rifing from the fame joint; and all the ftalks and branches terminated by erect whorled fpikes of fowers, of different colours in the varieties. They are very hardy plants; and may be propagated either by flips or cuttings, or by feeds. The leaves have an aromatic fimell, and a warm pungent talle. Befides the general virtues of aromatics, they are particularly recommended in humoural afthmas, conghs, and other diforders of the brealt and lungs; and are faid notably to promote expectoration.

Hyffop was generally made ufe of in purifications amonglt the Jews by way of a fprinkler. Sometimes they added a little wool to it of a fcarlet colour; for example, they dipped a bunch of hyflop, fome branches of cedar and red wool, in water mingled with the blood of a bird, in the purification of lepers. Hyffop, it is probable, grew to a confiderable height in Judæa, fince the gorpel informs us that the foldiers filled a fponge with vinegar, put it upon a reed (or long ftem) of hyfop, and prefented it to our Saviour upon the crofs.

HYSTERICaffection, or Pafron, (formed of usipa " womb") ; a difeafe in women, called alfo fuffocation of the won:b, and vulgarly fits of the mother. It is a fpafmodico-convulfive affection of the nervous fyftem, proceeding, from the woinb; for the fymptoms and cure of which, fee Medicine

HYSTERON PROTERON, in grammar and rhetoric, a fpecies of the liyperbaton, wherein the proper order of conftruction is fo inverted, that the part of any tentence which fhould naturally come firtt is placed laft: as in this of Terence, Valet et rivit, for vivit et valet; and in the following of Virgil, Moriamur, \&g in media arma ruamus, for In media arma ruanus, $\mathcal{F}$ morianate.

HYSTRIX, in zoology, a genus of quadrupeds belonging to the order of glires, the characters of which are thefe: They liave two fore-teeth, obliquely divided both in the upper and under jaw, befides eight griseters; and the body is covered with quills or prickles. There are four fpecies, viz.

1. The criffata, or crefted porcupine, has four toes on the fire-feet, five toes on the hand-fect, a crefted head, a fhort tail, and the upper lip is divided like that of a hare. The length of the body is about two feet, and the height about two feet and an half. The porcupine is covered with prickles, fome of them nine or ten inches long, and about $\frac{x}{4}$ th of an inch thick. Like the hedge-log, he rolls himfelf up in a globular form, in which pofition he is proof againft the attacks of the molt rapacious animals. The prickles are exccedingly fharp, and each of them las five large black and as many white rings, which fucceed one another alternately from the root to the point. Thefe quills the animal can ertet or let down at pleafure; when irritated, he beats the ground with his hind-feet, erects his quills, thakes his tail, and makes a confiderable rattling noife with his quills.-Moft authors have afferted that the porcupine, when irritated, darts his quills to a confiderable diflance againtt the enemy, and that he will kill very large animals by this means. But
M. Buffon and fome other late naturalifs aflure us, that fiyerix. the animal poffeffes no fuch power. M. Buffon frequently irritated the porcupins, but never faw any thing like this darting of his quills. He fays indeed, that when the creature was much agitated with paffion, fome of the quills which adhered but flightly to the flin would fall off, particularly from the tail; and this circum?tance, he imagines, has given rife to the miftake. The porcupine, though originally a native of Africa and the Indies, can live and multiply in the more temperate climates of Spain and Italy Pliny, and every other natural hiftorian fince the days of $A$. riftotle, tells $u$, that the porcupine, like the bear, conn ceals itlelf during the winter, and that it brings forth its young in 80 days. But thefe circumftances remain to this day uncertain. It is remarkable, that although this animal be very common in Italy, no perfon has ever given us a tolerable hillory of it. We only know in general, that the porcupine, in a domeItic llate, is not a fierce or ill natured animal ; that with his foreteeth, which are ftrong and fharp, he can cut through a ltrong board; that he eats bread, fruits, roots, \&c.; that he does confiderable damage when he gets into a gardeu; that he grows fat, like moft animals, about the end of fummer ; and that his Reh is not bad food.
2. The prebenfilis, or Brafilian porcupine, has four toes on the fore fect, five on the lind-feet, and a long tail. It is confiderably lefs than the former fpecies; being only 17 inches long from the point of the muzzle to the origin of the tail, which is nine mehes long; the legs and feet are covered with long brownifle hair; the relt of the body is covered with quills inter-〔perfed with long hairs; the quills are about five inches long, and about $\frac{1}{x_{2}}$ th of an inch in diameter. He feeds upon birds and fmall animals. He heeps in the day like the hedge-h.g, and learelies for his food is the night. He climbs trees, and fupports himfelf by twiting lis tail round the branches. He is generally found in the high grounds of America from Brafil to Louifiana, and the fouthern parts of Canada. His fle/h is efteemed very good eating.

A varicty of this fpecies is the Hoitzlacuatsin, or Mexican porcupine, (le Coendou de Buffon). It is of a dufky colour, with very long briftles intermixed with the down: the fpines three inches long, flender, and varied with white and yellow; fcarce!y apparent except on the tail, which is, according to Hernandez, thicker and fhorter than that of the preceding foecies. He adds, that the tail from the midde to the end is free from fpines; and that it grows to the bulk of a middle fized dog. M. de Buffon fays, its length is 16 or 17 inches from the nofe to the tail; the tail 9 French meafure, but taken from a mutilated @kin. It inhabits the mountains of Mexico, where it lives on the fummer fruits, and may be eafily made tame. The Indians pulverife the quills, and fay they are very efficacious in gravelly cafes; and applied whole to the forchead, will relicve the moft violent headach. They adhere tiil filled witb blood, and then drop off.
3. The dorfata, or Canada porcupine (l'Urfon de Buffon), has four toes on the fore-feet, five on the hind-feet; and las quills only on the back, which are flort, and almoft hid among the long hair. He is about two feet long. This fpecies inhabits North

G
America

## H Y S

rlyftris．America as high as Hudion＇s Bay；and makes its neft under the roots of great trees．It will alfo climb among the boughs，which the Indians cut down when one is in them，and kill the animal by friking it over the nofe．They are very plentiful near Hudfon＇s Bay； and many of the trading．Indians depend on them for food，efteeming them both wholefome and pleafant． ＂Chefe animals feed on wild fruits and bark of trees， efpecially juniper ：eat fnow in winter，and drink wa－ ter in fummer；but avoid going into it．When they cannot avoid their purfuer，they will fidle towards him， in order to touch him with the quills，which feem but
weak weapons of offence；for on ftroaking the hair， they will come out of the fkin，Aticking to the land． The Indians ftick them in their nofes and ears，to make holes for the placing their ear－rings and other finery： they alfo trim the edges of their deer．lkin habits with fringes made of the quills，or cover with them their bark－boxes．

4．The nacroura，has five toes both on the hind and fore feet ；his tail is very long，and the prickles are elevated．He inhabits the ifles of the Indian Archi－ pelago，and lives in the fore！ts．

Ior $i$ ，the ninth letter and third vowel of the al－ ，phabet，is pronounced by throwing the breath fuddenly againt the palate，as it comes ont of the ta－ rynx，with a frnall hollowing of the tongue，and nearly the fame opening of the lips and talk as in promoun－ $\operatorname{cing} a$ or $c$ ．Its found varies：in fome words it is long as bigh，mind，\＆c．；in others fhort，as bid，bid， fin，\＆e．；in others，again，it is pronounced like $y$ ，as in colleer，onion，\＆ec．；and in a few，it founds like ee， as in macline，magazine，\＆c．No Euglifh word ends in $i$ ，$e$ being either added to $i$ ，or elfe the $i$ turned into $y$ ．
But befides the vowel，there is the jod confonant； which，becaufe of its different promunciation，has like－ wife a difierent form，thus J， j ．In Englifh，it has the foft found of $g$ ；nor is ufed，but when $g$ foft is required before vowels，where $g$ is ufually hard ：thus we fay，juck，jut，join，\＆cc．initcad of gack，get，goin， \＆c．which would be contrary to the genius of the Englifh language．
$I$ ，ufed as a numeral，fignifies one，and ftands for fo many unites as it is repeated times：thus I，one； II，two；Ill，three，\＆c．；and when put before a higher numeral，it fubtracts iffelf，as IV，four ；IX， rine，\＆cc．But when fet after it，fo many are added to the higher numeral as there are I＇s added：thus VI is $5+1$ ，or fix ；VII， $5+2$ ，or feven；VIII， $5+3$ ， or eight．The ancient Romans likewife ufed IJ for 500 ，CIJ for 1000 ， 100 for 5000 ，CCIJO for 10，000，Iวつ）for 50,000 ，and CCCIJつ）for 100,000 ．Farther than this，as Pliny obferves，they did not go in their rotation；but，when neceffary， repeated the laft number，as CCCIOวว，CCCIวつ） ， for 200,000 ；CCCIOJJ，CCCIOコJ，CCCIJコJ， fur 300,000 ；and fo on．

The ancients fometimes changed $i$ into $u$ ；as decu－ тnus for decimes；maxumas for maximus，\＆c．

According to Plato，the vowel $i$ is proper to exprefs delicate，but humble things，as in this verfe in Virgil which abounds in i＇s，and is generally admired：

A．uipuxt inimicum imbrem，rimifgue fatifunt．
$I$ ，ufed as an abbreviature，is often fubllituted for the whole word Jusus，of which it is the firth letter．

JABBOK，a brook on the other file of the Jordan， the fpring whereof is in the mountains of Gilead．It falls into Jordan pretty near the fea of Tiberias，to the fouth of this fea．Near this brook the patriarch Jd－ cob wreltled with the angel（Gen．xxxii．22）．The Jabbok feparated the land of the Ammonites from the Gaulanitis，and the territories of Og king of Bafhan．

Jabesh，or Jabesh－gilead，was the name of a city，in the half tribe of Manaffeh，beyond Jordan． The fcripture calls it generally Jabefl－Gilead，becaule it lay in Gilead，at the foot of the mountains which go by this name．Eufebius places it fix miles from Pella，towards Gerafa；and confequently＇it mult be eaftward of the fea of Tiberias．

Jabiru．See Mycteris．
JABLONSKI（Daniel Ernetr），a learned Pulim Proteftant divine，born at Dantzick in 1660 ．Hé be－ came fucceffively minifler of Magdcharg，Liffa，Ko－ ningberg，and Berlin ；and was at length ecclefiallical counfellor，and prefident of the academy of fciences at the latter．He took great paina to effect an union－ between the Lutherans and Calvinits；and wrote fome works which are in good efteem，particularly Medita－ tions on the origin of the Scriptures，\＆c．He died in $17+1$ ．

Jablonski（Theodore），counfellor of the court of Pruffia，and fecretary of the royal academy of fciences at Berlin，was alfo a man of ditinguifhed merit．He loved the fciences，and did them honour，without that ambition which is generally feen in men of leara ing：it was owing to this modefty that the greatelt part of his works were publified without his name． He publifhed，in 1711，a French？and German Dic－ tionary；a Courfe of Morality，in 1713 ；a Diction－ ary of Arts and Sciences，in 1721 ；and tranflated Tacitus de moribus Germanorum into High Dutch，is 1724.

JABNE：

## J A C

JABNE (anc. geog.), a town of Paleftine, near Joppa; called Famnia or Famnial, by the Greeks and Romans. In jorhua xv. it feems to be ealled $\mathcal{F}$ abneel; but in 2 Chrun. $x$ xvi. Fabne. It was taken from the Philiftines by Uzziah, who demolifhed its fortifications. Its port, called Jamnitarum portus, lay between Joppa and Azotus.

JACAMAR, in ornithology. See Alcedo.
JACCA, an ancient town of Spain, in the kingdom of Arragon, with a bihhop's fee, and a fort; feated on a river of the fame name, among the mountains of Jacca, which are part of the Pyrenees. W. Long. 0 . 19. N Lat 44. 22.

JACK, in meehanies, a well-known inftrument of common ufe for raifing great weights of any kind.

The common kitchen-jack is a enmpound engine, where the weight is the power applied to overcome the friction of tbe parts and the weight with which the fpit is charged; and a fteady and uniform motion is obtained by means of the ATy.

Jack, in the fea-language, a fort of flag or colours, difplayed from a malt erected on the outer end of a thip's bowfprit. In the Britifh nary the jack is no. thing more than a fmall union flag, compoled of the interfection of the red and white croffes; but in mer-chant-fhips this union is bordered with a red field. See the article Union.

Jack is ufed alfo for a horfe or wooden frame to faw timber upon; for an inftrument to pull off a pair of boots; for a great leathern pitcher to carry drink in; for a fmall bowl that ferves as a mark at the exercife of bowling; and for a young pike.

Fscs. Flug, in a fhip, that hoifted up at the fpritfail top maft head.
नुack-Darw, the Englifh name of a fpecies of corvus. See Corvus.

This bird is very mifchievous to the farmer and gardener ; and is of fuch a thitvith difpofition, that he will carry away much mere than lie can make ufe of. There is a method of deflroying them by a kind of fprings much ufed in England; and is fo ufeful, that it ought to be made univerfal. - A flake of about five feet long is to be driven tirmly into the ground, and made fo falt that it cannot move, and fo hharp in the point that the bird cannor fettle upon it. Within a foot of the top there mult be a hole bored through it, of three quarters of an ineh diameter; through this hole is to be put a flick of about eight incties long; then a horfe-hair fpringe or noofe is to be made fatt to a thin hazel-wand, and this brought up to the place where the fhort flick is placed, and carried with it through the bole, the remainder being left open un der that Hick. The other end of the hazel rod is to be put through a hole in the take near the ground, and faltened there. The ltake is to be planted among the jick-daw's fcod, and he will maturally be led to fettle on it; but findin the poine too fharp, he will defcend to the litule crofs tick. This will fink with his weight, and the ipringe will recrive liis leg, and hold him fart.

JACKAl,L, in zoology. See Cans.
JACKSON (Thomas), an eminent Euglifh divine, was burn at Witton in the tifhupric of Durhans in 1579, of a good fanuly. He conmenced doctor of
divinity at Oxford in 1622; and at laft was made chaplain in ordinary, prebendary of Winchefter, and dean of Peterborough. He was a very great fcholar ; and died in 1640. His performance upon the Creed is a learned and valuable piece; whieh, with his other works, was publifhed in 1673 .

JACOB, the fon of lfaac and Retockah, was born in the year of the world 2168, before Jefus Chriat 1836. The hiftory of this patriarch is given ar large in the book of Genefis. He died in Egypt in the 147th year of bis age. Jofepls dirteted that the body Thould be embalmed, after the manner of the Egyptians; and there was a general mourring for lim throughout Egypt for feventy days. Afier this, Jofeph and his brethren, accompanied with the principal men of Egypt, carried him, with the king of Egypt's permiffion, to the burying-place of his fathers near Hcbron, where his wife Leah had been interred. When they were come into the land of Canaan, they mourned for him again for feven cays; upon which occafion the place where they ftaid was called Abelmifraim, or the mourning of the Egyptians.

Jacob (Ben Hajim), a rabbi fanous for the collection of the Maiorah in 1525 ; together with the text of the bible, the Chaldaic paraphrafe, and Rabbinical commentaries

Jacob (Ben Naphthali), a famous rabbi of the 5 th century: he was one of the principal mafforts, and bred at the fchool of Tiberias in Palettine with Ben Afer, another principal mafforet. The invention of points in Hebrew to ferve for vowels, and of accents to facilitate the reading of that language, are afcribed to thefe two rabbis; and faid to be done in an affembly of the Jews held at Tiberias, A. D. 476.

Jacob (Giles), an eminent law-writer. born at Romfey in the county of Southampton, in 1686 . He was bred under a confiderable attorney; and is principally known for his Law Dictionary in one vol. folio, which has been often printed; a new and inıproved edition having been lately given by counfellors Ruffhead and Morgan. Mr Jaenb alfo wrote two dramatic picces; and a Poetical Regiffer, containing the lives and characters of Englifh dramatic poets. The time of his death is not known.

JACOBJEUS (Oliger), a celebrated profeflor of phylic and philofophy at Copenhagen, was born in 1651 at Arhulen in the peninfula of Jutland, where his father was bifhop. Cliritian V. incrulled him with the management of his grand eabinet of curiofities; and Frederic 1V. in 1698 , made him esunfellor of hus eourt of juttiee. He wrote many medical works, and fome excellent poems.

JiCOBINE moxes, the fame with Dominicans.
JAC BI'CE , a term of reproach beflowed on the perfons who, vindieating the doctrines of paflive obedience and non refiftance with re!pcet to the arbotary proceedings of princes, difavew the revalution in 1688 , and affert the fuppoled rights and adhere to the interefts of the late abdicated King Janes and his family.
Jacobites, in church hiftory, a fect of Chriltians in Syrid and Mefupotamia; fo called, either from Jacob a Syrian who lived in the reign of the emperor

Jacebus Mauritius, or from one Jacob a monk who flourihed It in in the year 550 .
$\underbrace{\text { Jaffatete. The Jacobites are of two fects, fome following the }}$ rites of the Latin church, and others continuing feparated from the church of Rume. There is alfo a divifion among the lattcr, who have two rival patriarchs. As to their belief, they hold but one nature in Jefus Chrift; with refpe $\mathfrak{C l}$ to purgatory and prayers for the dead, they are of the fance opinion with the Grecks and other eaftern Chriltians: they coufecrate unleavened hread at the eucharift, and are againft confeflion, believing that it is not of divine inflitution.
JACOBUS, a gold coin, worth 25 flillings; fo called from King Janes I. of England, in whofe reign it was fruck. Ste Cons.

We ufually diftinguith two kinds of Yacobus, the old and the necu; the former valued at 25 fhillings, weighing fix penny weight ten grains ; the latter, called alfo Carolus, valued at 23 flillings, in weight five pennyweight twenty grains.

JACQUINIA, in botany: A genus of the monogynia order, belorging to the hexandria clafs of plants: and in the natural method ranking with thofe of which the order is douhtful. The corolla is decemfid; the flamina inferted into the receptacle; the berry monofpermous.
JÁCULATOR, or shooting-fish. See Chetodan.
JADDESSES is the name of an inferior order of priefts in Ceylon, who have the care of the chapels appropriated to the genii, who form a third order of gods among the Ce idolaters. Thefe priefts are applied to by the people in a time of difeafe or calamity, who offer a cock on their behalf to appeafe the anger of the dæmons.

Jade-stone, Lapis nephriticus, or Fafpachates, a genus of filiceons earths. It gives fire with Heel, and is femitranfparent like fint. It does not harden in the fire, but melts in the focus of a burning glafs into a tranfparent green glafs with fome bubbles. A kind brought from the iiver of the Amazons in America, and called circoncifion fone, melts more eafily in the focus into a brown opaque glafs, far lefs hard than the tone itfelf. The jade-fone is unctuous to the touch; whence Mr liirwan feems to fufpect, that it contains a portion of argillaceous earth, or rather magnefia. The rpccific graviry is from 2.970 to 3.389 ; the toxture granular, with a greafy look, but exceedingly hard, being fuparior in this refpect even to quartz itfelf. It is infurible in the fire, nor can it be diffolved in acids without a particular management; though M. Sauffure feems to have extracted iron from it. Sometimes it is met with of a whitifh milky colour from China; but moftly of a deep or pale:green from America. The common lapis nepluriticus is of a grey, yellowifh, or olive colour. It has its name from a fuppofition of its being capahle of giving eafe in nephritic pains, by being applied externally to the loins. It may be diflinguifhed from all other fones by its hardmefs, femipelhucidity, and fpecific gravity.
JAFFA, the modern name of the city of Jopra in Judea.

JAFFATEEN 1slands, the name of four inands in the Red Sea, vifited by Mr Bruce in his late travels.

They are joined together by thoals or funk rocks; are crooked or bent like half a bow; and are dangerous for fhips in the night-time, becaufe there feems to be a paffage between them, to which while the pilots are paying attention, they neglect two fmallfunk rocks which lie almoft in the middle of the entrance in deep water.

JAFNAPATAN, a fea port town, feated at the north-eaft end of the inand of Ceylon in the Ealt Indies. The Dutch took it from the Portuguefe in 1658, and have continued in the pofieflion of it fince that time. They export from thence great quantities of tobacco, and fome elephants, which are accounted the mott docile of any in the whole world. E. Long. 80. 25. N. Lat. 9.30 .

JAGENDORF, a town and cafte of Silefia, capital of a province of the fame name, feated on the river Oppa. E. Long. 17. 47. N. Lat. 50.4 .

JAGGERNAUT, a black pyramidal fone worfhipped by the Gentoos, who pretend that it fell from heaven or was miraculoufly prefented on the place where their temple ftands. There are many other iduls of this figure in India; which, however, are all but accounted copies from the Jaggernaut. According to the belt information Mr Grofe could obtain, this fone is meant to reprefent the power prefiding over univerfal generation, which they attribute to the general heat and influence of the fun acting in fubordination to it. Domellic idols of the form of the Jaggernaut, and dittinguiflaed by the fame name, are made by the Gentoos. Thefe are niched up in a kind of triumphal car, decorated with gilding and tinfel; which for fome days they keep in the beft apartment in their houfe. During this time their devotion conlifts in exhibiting the mofl obfcene pollures, and acting all manner of lafcivioufnefe, in fight as it were of the idol, and as the molt acceptable mole of worfhip to that deity it reprefents; after which they carry it in its gilded car in proceffion to the Ganges, and throw in all together as an acknowledgnent to that river of its congenial fertilization with that of the fun. Formerly this machine was decorated with jewels and other expenfive ornaments; but the Indians are now betome lef; extravagant, as they found that the Moors. and Chrillians, watching the places where they threw in their idols, dived for them for the fake of the jewels with which they were adorned.

Our author conjectures, that this pyranidal form of the Gentoo idol was originally taken from that of flame, which always inclines to point upwards. From this Indian deity he fuppofes the fhape of the Paphian Venus to have been derived, for which Tacitus could not account. This image had nothing of the human form in it, but rofe orbicularly fronia broad bafis, and in the nature of a race goal tapering to a narrow convex a-top; which is exactly the figure of the idol in India, confecrated to fuch an office as that heathendeity was fuppofed to prefide over, and to which, on the borders of the Ganges efpecially, the Gentoo virgins are brought to undergo a kind of fuperficial defioration before they are prefented to their hufbands.

JAGO (Richard), an ingenious poet, was vicar of Snitterfield in Warwick Shire, and rector of Kimcote in Leicefterfhire. He was the intimate friend and correfoondent of Mir Shentone, contemporary with him at Oxford, and, it is believed, his fchoolfellow ; was of U -
go. niverfity College; took the degree of M. A. July 9. 1739; was author of feveral poems in the 4 th and 5 th volumes of Dodiley's Poems; publifhed a fermon, in 1755 , on the Caufes of Impenitence confidered, preached May 4. 1755, at Harbury in Warwick Thire, where he was vicar, on occuifion of a converfation faid to have paffed bctween one of the inhabitants and an apparition in the church-pard there; wrote "Edge-hill,", a poem, for which he obtained a large fubfeription in 1767 ; and was alfo author of "Labour and Genius," 1768, 4 to ; of "The Blackbirds," a beautiful elegy in the Adventurer: and of many other ingenious performan-. ces. He died May 28. 1781 .

St Jago, a large river of South America, which rifes in the audience of $Q u i t o$ and Peru. It is navigable; and falls into the South Sea, after having watered a fertile country abounding in cotton-trees, and inlabited by wild Americans.

St $\mathcal{F}_{\lambda 60}$, the largeft, molt populous and fertile of the Cape Verd iflands, on the coalt of Africa, and the refidence of the Portuguele viceroy. It lies about 13 miles eaftward from the ifland of Mayn, and abounds with high barren mountains; but the air, in the rainy feafon, is very unwholeforne to flrangers. Its praduce is fugar, cotton, wine, and fome excellent fruits. The animals are black cattle, horfes, affes, deer, goass, hogs, civet-cats, and fome very pretty green monkeys with black faces.

St $\mathcal{F}_{A G O}$, a handfome and confiderable town of South America, the capital of Chili, with a good harbour, a biflop's fee, and a royal audience. It is feated in a large and beantiful plain, abounding with all the neceflaries of life, at the foot of the Cordilleras, on the river Mapocho, which runs acrofs it from eaft to weft. Here are feveral canals and a dyke, by means of which they water the gardens and cool the ftreets.- It is very much fubjeet to earthquakes. W. Long. 69. 35. S. Lat. 33. 40.

St $F A G O$ do Cuba, a town in North America, fituated on the fouthern coalt of the ifland of Cuba, in the bottom of a bay, with a good harbour, and on a river of the fame name. W. Long. 76. 44. N. Lat. 20. 0.

Fiso de los Cavalleros, a town of America, and one of the principal of the ifland of Hifpaniola. It is feated on the river Yague, in a fertile foil, but bad air. W. Long. 70. 5. N. Lat. 19. 4 .

St $\mathrm{F}_{A G 0}$ del Entero, a town of South America, one of the mof confiderable of Tucuman, and the ufual refidence of the inquifitor of the province. It is feated on a large river, in a flat country, where there is game, tygers, guanacos, commonly called camel. אkeep, \&c.

Fico de la Vega, otherwife called Spanibhtoryn, is the capital of the inland of Jamaica, in the Well Indies; and ftands in $18^{\circ}{ }^{1 \prime}$ ncrth latitude, and $76^{\circ}+5^{\prime}$ well longitude. It is about a mile in length, and little more than a quarter of a mile in breadth; and contains between 500 and 600 houfes, with about 4000 inhabitants of all colours and denominations. This town is fituated in a deligheful plain, on the banks of the Rio Cobre, 13 miles from Kingiton, and 10 from Port Royal. It is the refidence of the commander in chief: and here the fupreme court of judicature is held, four times in the year, viz. on the laft Tuefdays of February,

May, Auguft, and November, and fits three weeks. St Jago de la Vega is the county-town of Middlefex, and belongs to the parifh of St Catharine; in which parih there are 11 fugar-plautations, 108 pens, and other fettlements, and about 10,000 flaves.

JAGUAR, or Jacuar, a name given to the Brafilian once, a fpecies of Prlis. See Felis, fpec. vi.

JAGUEEK, in Eaft Iudia affairs, any pention from the Grand Mogul, or king of Delhi; generally fuch as are affigned for military fervices.

JAGUEERDAR, the holder or poffeflor of a jagueer. It comes from three Perfian words, $J_{a}$ "a place ;" guerifturn "to take;" and da/btun "to hold;" quafi "a place holder or penfioner." in the times of the Mogul empire, all the great officers of the court, called omrabs, vere allowed jagueere, eitber in lands of which they collected the revenues, or affignments upon the revenues for fpecified fums, payable by the lord lientenant of a provirice: which fums were Cor their maintenance, and the fupport of fuch troops as they were ncceffitated to bring ir.to the field when demanded by the emperor, as the condition of their jagueers, which were always revokable at pleafure.

JAIL-FETER, a very dangerous ditemper of the contagious kind, ariling from the putrefeent difpofition of the blood and juices. See (the Irdex fubjoined tu) Medicine.
JALAP, in botany and the materia medica, the root of a fpecies of couvolvulus or bind-weed. See Convolvulus.

This root is brought to us in thin tranfverfe fices from Xalapa, a province of New Spain. Such pieces fhould be chofen as are moft compact. hard, weighty, dark-coloured, and abound moft with black circular ftrix. Slices of bryony root are faid to be fometimes mixed with thofe of jalap : thefe may be cafily diftinguifhed by their whiter colour and lefs compaet rexture. This root has no fmell, and very little talle upon the tongue; but when fwallowed, it affects the throat with a denfe of heat, and occafions a plentiful difcharge of faliva. Jalap in fubftance, taken in a dofe of about half a dram (lefs or more, according to the circumftances of the patient) in plethoric, or cold phlegmatic habits, proves an effectual, and in general a fafe purgative, performing its office mildly, feldom occafioning naufea or gripes, which too frequently accompany the other flroug cathartics. In hypochondriacal diforders, and hot bilious tempcraments, it gripes violently if the jalap be good; but rarely ta'ses due effect as a purge. An extract made by water purges almof univerfally, but weakly ; and at the fame time has a confiderable effect hy urine. The root remaining after this proceis gripes violently. The pure refin, prepared by fpirit of wine, occafions moft viclent gripings, and other ditreffing fymptoms, but fcarce proves at all cathartic: triturated with fugar, or with almonds into the form of an emulfion, or diflolved in fpirit, and mixed with fy-rups, it purges plentifully in a fmall cofe, without occafioning much diforder : the part of the jalap remaining after the feparation of the refin, yields to water an extract, which has no effect as a cathartic, but operates powerfully by urine. Its officinal preparations are an extract made with water and fpirit, a fimple tinclure, and a compound powder. - Frederick Hoffman particularly:

## J A M 「 54 1 J A M

Jatemus eularly cautions againit giving this medicine to children ; and affurcs us, that it will deftroy appetite, weaken the body, and perlaps occafion even death. In
this point, this celebrated practitioner was probably deceived : children, whore veffels are lax, and the food foft and lubricating, bear thefe kinds of medicines, as Geoffroy obferves, better than adults; and accordingly inoculators make much ufe of the tincture mixed with finple fyrup. 'The compnond powder is employed in droply, as a hydragogne purge; and where ftımulus is not contraindicated, jalap is confidered as afafe cathartic.

JALEMUS. in antiquity, a kind of mournful fong, ufed upon occafion of death, or any other affecting accident. Hence the Greek proverbs had their
 coller than a jalemus, zas tys tapidus iglgavtios, worthy to be ranked among jalemufes.
$J A M A D \perp R: A n$ officer of horfe or foot, in Hindolfan. Alfo the head or fuperintendant of the Peons in the Sewaury, or train of any great man.

J AM.IIC A, an uland of the Weft Indies, the largeft of the Antilles, lving betwern $17^{\circ}$ and $19^{\circ}$ N. Lat. and between $76^{\circ}$ and $79^{\circ} \mathrm{W}$. Long.; in length near $7^{\circ}$ miles, and about 60 in bieadth. It approaches in its figure to an oval. The windward paftage right before it luath the inand of Cuba on the welt, and Hifpaniola on the eaft, and is about 20 leagues in breadth.

This inand was difcovered by admiral Chritopher Columbus in his fecond voyage, who landed upon it May 5. 1494; and was fo much charmed with it, as always to prefer it to the rell of the inands: in confequence of which, his fon chofe it for his dukedom. It was fettled by Juan d' Efquivel A. 1) 1509, who built the town, which, from the place of his birth, he called Seville, and it leagues farther to the eaft flood Melilla. Otillon was on the fouth fide of the ifland, leated on what is now called Blue Fields River. A II thefe are gone to decay; but St Jago, now Spanih Town, is ttill the capital. 'The Spaniards held this country 160 years, and in their time the principal commodity was cacao; they had an immerfe tiock of horfes, affes, and mules, and prodigious quantities of cattle. The Englifh landed here under Penn and Venables, May 11. 1654 , and quickly reduced the inhond. Cacao was alfo their principal commodity till the old trees decay. ed, and the new ones did not thrive; and then the planters from Barbadoes introduced fugar-canes, which hath heen the great ftaple ever fince.

The profpect of this ifland from the fea, by reafon of its contlant verdure, and many fair and fafe bays, is wonderfully pleafant. The cuatt, and for fome miles within, the land is low; but removing farther, it rifes and becomes hilly. The whole ifle is divided by a ridge of mountains running eaft and well, fome rifing to a great height : and thefe are compofed of rock and a very hard clay; through which, however, the rains that Sall inceffantly upon them have worn long and deep cavities, which they call gullies. Thefe mountains, however, are far from being unpleafant, as they are crorned even to their fummits by a variety of fine trees. 'l'here are alfo about a hundred rivers that iffue from them on hoth hides; and, thoush nune of them are navigable for any thing but canoes, are both pleafing and profitable in many other refpects. The cli-
mate, like that of all countries between the tropics, is Jamsies very warm towdr's the fea, and in mathy places unhealtly ; but in more elevated fituations, cooler; and, where people live temperately. to the full as wholefome as in any part of the Weft Indies 'f'he rains fall heavy for about a lortnight in the monihs of May and October: and, as they are the caute of fertility, are Ayled feafons. Thunder is pretty frequent, and fometimes Showers of hail: but ice or fnow, except on the tops of the mountains, are never feen : but on them, and at no very great height, the air is exceedingly cold.

The moft eattern parts of this ridge are famous under the name of the Blue Mrountains This great chain of rugged rocks defends the fouth fide of the illand from thofe boilterous north weft winds, which might be fatal to their produce. Their flreams, though fmall, fupply the inhabitants with good water, which is a great hlefling, as their wells are :senerally brackith. The Spaniards were perfuaded that thefe hills abounded with metals: but we do not find that they wrought any mines ; or if they did, it was only copper, of which they faid the bells in the church of St Jago were made. lhey have feveral hot fprings, which have done great cures. The climate was certainly more teniperate before the great earthquake; and the inland was fuppofed to be out of the reach of hurricanes, which fince then it hath feverely felt. The heat, however, is very much tempered by land and fea brecoes; and it is afferted, that the hottef time of the day is about eight in the morning. In the night, the wind blows from the land on all lides, fo that no thips can then enter their ports.

In an inland fo large as this, which contains above five millions of acres, it may be very reafonably conceived that there are great varitety of foils. Some of thefe are deep, black, and rich, and mixed with a kind of potter's earth; others fhallow and fandy; and forne of a middle nature. There are many favannahs, or wide plains, without ftones, in which the native Indians had luxuriant crops of maize, which the Spaniards turned into meadows, and kept in them prodigious herds of cattle. Some of thefe favannahs are to be met with even amongt the mountains. All thefe different foilo may be juitly pronounced fertile, as they would certainly be found, if tolerably cultivated, and applied to proper purpofes. A fufficient proof of this will arife from a very curfory review of the natural and artificial produce of this fpacious country.

It abounds in maize, pulfe, vegetables of all kinds. meadows of fine grals, a variety of beautiful Howers, and as great a variety of oranges, lemons, citrons, and other rich fruits Úfful animals there are of all forts, horfes, affis, mules, black cattle of a large fize, and fheep, the flefh of which is well tafted, though their wool is hairy and bad. Here are alto goats and hogs in great plenty; fea and river fifh; wild, tame, and water fowl. Amongf other commodities of great value, they have the tugarecane, cacau, indigo, pimento, cotton, ginger, and coffee; trees for timber and other ufes fuch as mahogany, manch:neel, white word, which no worm will tuuch, cedar, ulives. and many more. Belides thefe, they have fultrck, red wood, and various other naterials for dyeing To thefe we man add a multitude o: valuable druss, fuch as guaiacum china furfaparilla, callia, tamarinds, vancllas, and the prickle jear
or opuntia, which produces the cochingal ; with no incon deable number of odoriferous gums. Near the coalt they have falt-ponds, with which they fupply their own confumption, and might make any quantity they pleafed.

As this ifand abounds with rich commodities, it is happy likewife in having a number of tine and fafe ports. Point Morant, the eaftern extremity of the ifland, tath a fair and commodious bay. Paffing on to the fouth, there is Port Royal : on a neck of land which forms one fide of ir, there food once the faireft town in the inland; and the harbour is as line a one as can be wifhed, capable of holding a thoufand large veffels, and titill the flation of our fquadron. Oid Harbour is alfo a convenient port fo is Maccary Bay; and there are at leaft twelve nore between this and the weftern extremity, which is point Negrillo, where our thips of war lie when there is a war with Spain. On the north fide there is Orange Bay, Cold Han bour, Rio Noro, Montego Bay, Port Antonio, one of the fineft in the ifland, and feveral others. The northwelt winds, which fometines blow furioully on this coaft, render the country on that frde lefs fit for canes, but pimento thrives wonderfully ; and certainly many other ftaples might be raifed in fmall plantarions, which are frequent in Barbadoes, and might be very advan. tageous liere in many refpects.

The town of Port Royal itood on a point of land running far out into the fea, narrow, fandy, and incapable of producing any thing. Yet the excellence of the port, the convenience of having thips of feven hundred tons coming clofe up to their wharfs, and other advantages, gradually attracted inlabitants in fuch a manner, that though many of their habitations were built on piles, there were near two thoufand houfes in the town in its moof flourihing ftete, and which let at high rents. The earthquake by which it was overthrown happened on the 7 th of June 1692, and numbers of people perifhed in it. This earthquake was followed by an epidemic difeafe, of which upwards of three thoufand died: yet the place was rebuilt; but the greatell part was reduced to athes by a fire that hap. pened on the gth of January 1703, ard then the inhabitants removed mofly to Kingfion. It was, however, rebuilt for the third time; and was railing towards its former grandeur, when it was overwhelned by the fea, Auguft 28.1723. There is, notwith? fanding, a firall town there at this day. Hurricanes fince that time have often happened, and occafioned terrible devattations.

The inand is divided into three counties, Middefex, Surry, and Cornwall; containing 20 parihes, over each of which prefides a magitrate fiyled a cufos; but thefe parihhes in point of fize are a kind of hundreds. The whole contain 36 towns and villages, 18 churches and chapels, and about 23.000 white inhabitants.
The adminittration of public aflairs is by a governor and conncil of royal appointment, and the reprefentatives of the people in the lower houfe of affembly. They meet at Spanifh Town, and things are corducted with great order and dignity. The lieutenant-governor and commander in clief has L. 5000 currency, or I. 35571 : $8: 6 \frac{3}{4}$, Sterl. befides which, he has a houfe in Spanith-town, a pen or a farm adjoining, and a polink or mountain for provifions; a fecretary, an under-fecreiary, and a domentic chaplain.

The honourable the council confifts of a prefident Jamaica. and 10 niembers; with a clerk, at L. 270, chaplain L. 100, ufher of the black rod and meffenger L. 250.

The honourable the affembly confits of 4.3 members, one of whom is chofen fpeaker To this alfembly belong a clerk, with L. 1000 falary; a chaplain, L. i50; meffenger, L. 700 ; deputy, L. t40; and printer, L. 200.

The number of members returned by each parifh and county are, for Middlefex $1^{1-}$, viz, St Catharine 3, St Dorothy 2, St John 2, St Thomas in the Vale 2, Clarendon 2, Vere 2, St Mary 2, St Ann 2: For Surry 16, viz. Kingfton 3, Port Royal 3, St Andrew 2, St David 2, St Thomas in the Eaft 2, Portland 2, St George 2: For Corrnwall jo, viz. St Elizabeth 2. Weflmoreland 2, Hanover 2, St James 2, Trelawney 2.
The high court of chancery confifts of the chancellor (governor for the time being), 25 matters in ordinary, and 20 maters extraordiuary ; a regitter, and clerk of the patents: ferjeant at arms, and mace-bearer. The court of vice atmiralty has a fole judge, judze furrogate, and commiflary, King's advocate, principal regiller, marhal, and a deputy-marhal. The court of ordinary, confifts of the ordinary (governor for the time beins), and a clerk. The fupreme court of judicature, has a chicf juftice, L. 120 , and 16 affinant judges; at-torney-general, L. 400 ; clerk of the courts, L. 100 ; clerk of the crown, L. 350; folicitor for the crown; 33 commiffioners for taking afilavits; a provoil-mar-hal-general, and eight deputies; is barriflers, befides the attorney-general and advocate-general; and upward of 120 practifing attornies at law.
The conmerce of Jamaica is very confidcrable, not only with all parts of Great Britain and 1 reland, but with A frica, North and $S$ suth America, the Wetl In.: dia illands, and the Spanifh main. The flips annually employed are upwards of 500 fail.

The following account of the exports of this inand in 1770, as given by Abbe Raynal, but which in feveral particulars appears to be under-rated, will contribute more than all that hath been faid, to fhow the importance of Jamaica. They confilted in $22+9$ bales of cotion, which at 10 pounds per bale, the price in the illand, amounts to 22,4901 .; 1873 hundred weight of coffee, at three pounds five fhillings per hundred, 60801.; 2753 bags of ginger, at two pounds five fhillngs per bag, $619+1 . \div 2211$ hides, at feven thillings per hide, 7731 I; 16,475 puacheons of rum, at 101. per puncheon, 164,7501 . Mahagany, 15,28z pieces and 8,500 fect, 50,0001 . Of pimento, $2,089,73+$ pounds weight, $52,2+3$ 1. Sugar, 57,675 hogheads, $\sigma_{425}$ tierces, 52 barrels, at feventeen pounds ten hilllings per hogfhead, twelve pounds per rierce, and four pounds per barrel, amounting in the whole to t,086,6201. Sarfaparilla, 205 bags, at ten pounds per bag, 2250 l . Exports to Great Britain and Ireland, $\mathrm{t}, 391,2$ :01. To North America, $146,32+1 \mathrm{i}$ To the orher iflands, 5951 . Tutal of the exports, $1,53^{8,7301}$.
The following is a general view of the property ando chief produce of the whole inland in 1786 , as prefixed by Mr Beckford to his deferiptive account of Jamaica

Countics.

| $\underbrace{\substack{\text { Jamaica } \\ \text { lambic. }}}$ |  | J | M |  |  | L 5 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Counties. | Sugar Eftates. | Other Settlements. | Slaves. | Produce. Hhds, of Sugar. | Cattle. |
|  | Middlefex | 323 | 917 | 87100 | 31500 | 75000 |
|  | Surry | 350 | 540 | 75600 | 34900 | 80000 |
|  | Cornwall | $3^{88}$ | 561 | 90000 | 39000 | 69500 |
|  | Total | 1061 | 2018 | 255700 | 105400 | $22+500$ |

It hoould be here obferved, that where' two hogg- Jamaic lieads of fugar are made, there is at leaft one puncheon it of rum ; but the proportion has been of late years $\underbrace{\text { ambolif }}$ more confiderable: the quantity of the latter will thercfore be 52,700 puncheons.

A comparative view between the years 1768 and ${ }_{7} 786$.

| Sugar Eftates | $\begin{aligned} & \text { Middlefex } \\ & \text { in } \end{aligned}$ |  | Surry <br> in |  | Cornwall in |  | Total in |  | $\left\{\begin{array}{c} \text { Amount } \\ \text { of } \\ \text { Incieale. } \end{array}\right.$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1768 | 1786 | 1768 | 1786 | 1768 | 1786 | 1768 | 1786 |  |
|  | 239 | 323 | $14^{6}$ | 350 | 266 | 388 | 651 | 1061 | 410 |
| Sugar Hhds. | 24050 | 31500 | 15010 | 34900 | 29100 | 39000 | 68160 | 105400 | 37240 |
| Negroes | 66744 | 87100 | 39542 | 75600 | 60614 | 93000 | 165900 | 255700 | 88800 |
| Cattle | 59510 | 75000 | $2 i 465$ | 80000 | 54775 | 69500 | 35750 | 224500 | 88750 |

From the above fcheme it appears, how confiderable has been the increafe of fugar-eftates, and confequently of produce of negross and cattle in eighteen years: and in the fame portion of time (it is faid), if proper encouragement were given, they might be augmented in a threefold proportion.

The common valuation of an eftate in Jamaica as follows:
Cane land (the canes upon it valued Sterling
(eparately) at - .22 per acre.

- 22 ditio Cane land, in ratoons and young plants 15 ditto. Paflure land - - - 8 ditto. Wood land - - - 4 ditto. Provifions - - - 14 ditto. Negrocs - - - 57 ditto. Mules - - . 22 ditto. Steers - - 10 ditto. Breeding cattle, \&c. - - 5 ditto. Works, water, carts, \&c. - - from 7 to 10,000 If a planter would wifh to leafe his eftate for a number of years, his income would be large if he could get only rod. fterling a day for his negroes (the lofs made good), without requiring any thing for his land or works.

JAMBI, or JAmbis, a fea-port town and fmall kingdom of Afia, on the eallern coalt of the ifland of Sumatra. It is a trading place. The Dutch have a fort here; and export pepper from thence, with the beft fort of canes. E. Long. 103. 55. S. Lat. o. 30. JAMBia Vicus. See Yameo.
IAMBIC, in ancient poetry, a fort of verfe, fo called from its corfifting either wholly, or is great part, of iambus's. See lambus.

Ruddiman makes two kinds of jambic, viz. dimeter and trimeter ; the former containing four feet, and the latter fix. And as to the variety of their feet, they $\mathrm{N}^{\circ} 162$.
confirt wholly of iambus's, as in the two following rerfes of Horace :
$\begin{array}{llllll}1 & 2 & 3 & 4 & 5 & 6\end{array}$
Trim. Suis $\mid$ E犬 i| p/a Ro|ma vi|ribus|ruit.
Or, a dactylus, fpondeus, anapeflus, and fometimes tribrachys, obtain in the odd places; and the tribrachys alfo in the even places, excepting the latt. Examples of all which may be feen in Horace ; as, Dimeter.

JAMBLICUS, the name of two celebrated Platonic philofophers, one of whom was of Colchis, and the other of Apamea in Syria. The firf, whom Julian equals to Plato, was the difciple of Anatolius and Porphyry, and died under the reign of the emperor Conflantine.-The fecond alfo enjoyed great reputation. Julian wrote feveral letters to him, and it is faid he was poifoned under the reign of Valens. - It is not known to which of the two we ought to attribute the works we have in Greek under the name of Gamblicus, viz. s. The hiftory of the life of Pythagoras, and the feet of the Pythagoreans. 2. An exhortation to the fludy of philofopty. 3. A piece againt Porphyry's letter on the myfteries of the Egyptians.
JAMBOLIFERA, in botany: A genus of the monogynia order, belonging to the octandria clafs of plants; and in the natural nethed ranking with thofe of which the order is doubtful. The calyx is quadridented; the corolla tetrapetalous, and funnel-haped; the filaments a little plane; the figma fimple.

IAMBUS,

## $J \mathrm{~A}$ M

IAMBUS, in the Greek and Latin profody, a poctical foot, confifing of a fhort fyllable followed by a leng one; as in

$$
\Theta_{s y} \lambda \varepsilon \gamma, D_{i}, \text { meas. }
$$

Syllata lonea brevi fubjecta roocatur iambus, as Horace exprefles it ; who alfo calis the iambus a fwift, rapid foot, pes citus.

The word, according to fome, took its rife from rambus, the fon of Pan and Echo, who inpented this foot; or, perhaps, who only ufed fharp biting expreffions to Ceres, when aflicted for the death of Profer pine. Others rather derive it from the Greet 10 , reenenum "poifon:" or from tzuetisw, maledico" I rail, or revile ;" becaufe the verfes compoled of iambus's were at firft only ufed in fatire.

JAMES (St ) cailed the Greater, the fon of Zebedee, and the brother of John the evangelift, was born at Dethfaida, in Galilee. He was called to be an apofite, together with St Juhn, as they were mending their nets with their father Zebedee, who was a bitherman; when Chift gave them the name of Boonertes, or Sons of Thunder. They then followed Chritt, were witneffes with St Peter of the transfiguration on mount Tabor, and accompanies our Lord in the garden of olives. It is believed that St James firf preached the gofpel to the difperfed Jews; and afterwards returned to Judea, where he preached at Jerufalem, when the Jews raifed up Herod Agrippa againt him, who put him to a cruel death about the year 4+., Thus St James was the firt of the apofles who fuffered martyrdom. St Clement of Alexandria relates, that his accufer was fo firuck with his conftancy, that he became converted and fuffered with him. There is a magnificent church at Jerufalem which bears the name of St Farnes, and belongs to the Armenians. The Spaniards pretend, that they had $S t$ James for their apofle, and boaft of poffeffing his body ; but Baronius, in his Aumals, refutes their pretenfions.

James (St.), called the Lefs, an apolle, the hrother of Jude. and the fon of Cleophas and Mary the fifter of the mother of our Lord, is called in Scripture the Thuf, and the trother of Jefus, who appeared to him in particular after his refurrection. He was the firt bifrop of Jerufalem, when Ananias II. high priell of the Jews, caufed him to be condemned, and delivered him into the hands of the people and the Pharifees, who threw tim down fiom the fleps of the temple, when a fuller dafhed out his brains with a club, about the year 62. His life was fo holy, that Jofephus confiders the ruin of Jerufalem as a punifhment inflicted on that city for his death. He was the author of the epiftle which bears his name.

St James of the Sword, (San Jago del Elpada), a military order in Spain, inlituteci in 1170 , under the reign of Ferdinand II. king of Leon and Gallicia, Its end was to put a flop to the incurfions of the Mocrs ; three knights obliging themfelves by a $v$ w to fecure the roads. An union was propofed and agreed to in 1 ig between thefe and the canons of St Sloy; and the order was confimed oy the pope in I 175 . The higheft dignity in that order is that of grand matter, which has been united to the crown of Spain. The knights are obliged to make procf of their de feent from families that have been roble for four gencrations on both fides; they muit aifo make it appear, that their Vol. IX. Part I.
faid anceitors have neither been Jews, Saracens, nor hertics; nor even to have been called in quertion by the inquifition. The novices are obliged to ferve fix months in the galleys, and to live a month in a monaftery. Heretofore they were truly religious, and took a vow of celibacy; but Alexander 111. gave them a permiffion to marry. 'They now make no wows but of poverty, obedience, and conjugal fidelity; to which, lince the year 1652, they have added that of defending the immaculate conception of the holy Virgin. Their habit is a white cloak, with a red crofs on the breatt. This is efteemed the moft confiderable of all the military orders in Spain: the king carefully preferves the office of grand maiter in his own family, on arcount of the rich revenues and offices, whereof it gives him the dif pofal. The number of knights is much greater now than formerly, all the grandees chooling rather to be received into this than into the order of the golden fleece ; inafmuch as this puts them in a fair way of attaining to commands, and gives them many confiderable privileges in all the provinces of Spain, but efpecially in Catalonia.
James, the name of feverat kings of Scotland and of Great Britain. Sce (Hifories of) Scotland and Britain.
James l. king of Scotland in 1423 , the fi:t of the houfe of ituart, was not only the molt learned king, but the moft learned man of the age in which he llourithed. This ingenious and amiable prince fell into the hands of the enemies of his country in his tender youth, when he was flying from the fnares of his unnatural ambitious uncle, who governed his dominions, and was fufpected of detigris againf his life. Having fecretly embarked for France, tile fhip was taken by an Englifh privateer off Flamborough head; and the prince and hus attendants (among whom was the earl of Orkney) were contined in a ncighburning cafte until they were tent to London. See (Hip,ry of ) Scotland.
The king of England knew the value of the prize he had obrained, and kept it with the moft anxious care. The prince was conducted to the Tower of London immediately after he was feized, April in. A. 1. 1405 , in the 13 th year of his age; and there kept a clofe prifoner till June 10. A. 1). 1407, when he was remuved to the caltle of Nuttingham, from whence he was brought back to tile Tower, March I. A. D. If 14, and there confined till Auguft 3. in the Came year, when he was conveyed to the caftle of Windfor, where he was detained till the fummer of A. D. 1417; when Henry V. for political reafons, carricd him with him into France in his fecond expedition. In all thefe fortreffes, his confinement, from his own account of it, was fo fevere and frict, that he was not fo much as permitted to take the air. In this melancholy fituation, fo unfuitable to his age and rank, books were his chief companions, and tudy his greatel tleafure. He rofe early in the mang, im. mediatrly applied to reading, to divert him from painful reflections on his misfortunes, and continued his fludies, with litele interruption, till late at night. James being naturally fentible, ingenious, and fond of knuwledge, and having received a good education in his carly youth, under the direction of Walter Wardlaw bithop of St Andrew's, by this clofe application to fudy, became an univerfal fcholar, an excellent

James. poet, and exquifite mufician. That he wrote as well as read much, we have his own teflimony, and that of all our hittorians who lived near his time. Bowmakcr, the cortinuator of Fordun, who was his contemperary, and perfonally acquainted with him, fpends ten chapters in his praifes, and in lamentations on his death ; and, amongt other things, fays, that his knowledge of the feriptures, of law, and philofophy, was incredible. Hector Boyfe tells us, that Henry IV. and V. furnifhed their royal prifoner with the beft teachers in all the arts and feicnces; and that, by their affiftance, he made great proficiency in every part of learning and the fine arts; that he became a perfect mafter in grammar, rhetoric, poctry, mufic, and all the fecrets of natural philofophy, and was inferior to none in divinity and law. He obferves further, that the poems he compofed in his native tougue were fo beautiful, that you might eafly perceive he was born a poet; but that his Latin poems were not fo faultlefs; for though they abounded in the molt fublime fentiments, their language was not so pure, owing to the rudenefs of the times in which he lived. This prince's fill in mufic was remarkable. Walter Bower abboi of Inch-colm, who was intimately acquainted with that prince, affures us, that he excelled all mankind in that art both vocal and inftrumental; and that he played on eight different inftruments (which he names), and efpecially on the harp, with fuch exquifite Rill, that he feemed to be

- Scoticron, iufpired *. King James was not only an excellent lit. 16. performer, but alfo a capital compofer, both of facred 5. 28. performer, but allo a capital compoer, both of fecular mufic; and his fame on that account was extenfive, and of long duration. Above a century after his death, he was celebrated in ltaly as the inventor of a new and pleafing kind of melody, which had been admired and imitated in that country. This appears from the following teftimony of Aleffandıo Taffoni, a writer who was well informed, and of undoubted credit. "We may reckon nmong us moderns, James king of Scotland, who not only compofed many facred pieces of vocal mufic, but alfo of himfelf invented a new kind of mufic, plaintive and m: lancholy, different from all other; in which he hach been imitated by Carlo Gefurldo prince of Venofa, who, in oar age, hath improved mufic with new and admi-
 ${ }^{T}$ Taf: Pern fiberino.Sir Joha Haw. kin' $s$, vol. 4 .
p. 5,6 . rable inventions." $\dagger$ As theprince of Venofa imitated king James, the other muficians of Italy imitated the prince of Venofa. "The moll noble Carlo Gefual. do, the priace of muficians of our age, introduced fuch a fyle of modulation, that other mufficians yielded the preference to him; and all fingers and players on Atringed inttuments, laying atide that of others, every $\ddagger$ 11. vol. 3 . where embraced his $\ddagger$. All the lovers, thenefore, of P. 222. latian or of Scotch mufic, are muel indebted to the admirable genius of king Janes I. who, in the gloom and folitude of a prifon, invented a new kind of mufic, plaintive indeed, and fuited to his fituntion, but at the fame time fo fweet and focthing, that it hath given pleafure to millions in every fucceeding age.

As Jomes I. of Scotland was one of the molt accomplifhed princes that ever filled a throne, he was alfo one of the moft unfortunate. After fpending al. mof 20 years in captivity, and encountering many diffeulties on his return into his native kingdom, he pras murdered by barbarous affaflins in the prime of
$8] \quad J$ A M
life. In the monuments of his genius, he hath becn almof equally unfortunate. No veftiges are now remaining of his fkill in architecture, gardening, and painting ; though we are affurcd hy one who was well acquainted with him, that he excelled in all thefe arts *. Many of the productions of his pen have alfo perih. ed; for he tells us himfelf that he wrote much $\dagger$; and we know of only three of his poems that are now ex- 2uai, tant, viz. Chrit's Kirk on the Green-Peebles at the canto Play-and the King's Quair, which was lately difco. ftan. vered by Mr Warton, and hath been publified by another gentleman $\ddagger$. Bur flender as the fe remains are, $\ddagger$ See they afford fufficient evidence, that the genius of this royal poct was not inferior to that of any of his contemporaries; and that it was equally fitted for the and gayef or the gravel itrains.

James II. king of Scothad, $1+37$, fucceeded his Poet father, being then not feven years of age; and was ${ }^{\text {p. } 12 .}$ killed at the fiege of Roxburgh in 1460, aged 29.

James III. king of Scothand, fucceeded his father, in 1460 , in the 7 th year of his age. The mon triking feature in the character of this prince, unjuftly reprefented as tyrannical by feveral hiftorians, was his fondnefs for the fine arts, and for thofe who excelled in them, on whom he befowed more of his company, confidence, and favour, than became a king in his circumftances. This excited in his fierce and haughty nobles diflike and contempt of their fovercign, and indignation againat the objects of his favourd; which produced the moft pernicious confequences, and ended in a rebellion that proved fatal to James, who was fain in $\{488$, aged 36 .

James IV. king of Scotland, fucceeded his father in 1488. Ife was a pious and valiant prince; fubdued his rebellious fubjects ; and afterwards, taking part with Lonis XII. againft Henry VIII. of England, he was Alain in the battle of Flouden. Field in 1513, agcd 41. -This king is acknowledged to have inad great accomplifhments both of mind and body. His Latin epilles are clafficai, compared with the barbarous Ayle of the foreign princes with whom he correfponded. Like his father, he had a talte for the fine arts, particularly that of fculpture. The attention he paid to the civilization of his people, and his ditribution of jultice, merit the highett praife. After all, the virtues of James appear to have been more fhining than folid ; and his character was that of a fine gentleman and a brave knight, rather than a wife or a great monarch. At the time of his death, he was only in his forty-firt year. Like all the princes of his family (to his great grandion James VI.) his perfon was handfome, vigorons, and adtive. From their coins it does not appear, that either he, or any of his predeceffors of the Stuart race, wore their beards, as did all his fucceffors, to the reign of Charles 11 .

Jases V. king of Scotland, in 15:3, was but is mon:hs old when his father lof his life. When of age, he affifted Francis I. king of France againft the empcror Charles lc Quint ; for which fervice Francis gave him his eldef daughter in marriage, in 1535 . This princefs died in two years ; and Janes married Mary of Lorraine, daughter of Claud duke of Guife, and widow of Louis d'Orleans, by whom he had only one clild, the unfortunate Mary queen of Scots, born only eight days before his death, which happened De-

## J A M

cember 13. $154^{2}$, in the 35 th year of his age. This was the firft prince of his family who died a natural death, fince its elevation to the throne. He died, bowever, of a broken heart, occafioned by differences with his barons. He was formed by nature to be the ornament of a throne and a bleffing to his people; but his excellent endowments were rendered in a great neafure ineffectual by an improper education. Like moft of his predecefifors, he was born with a vigorous, graccful perfon, which, in the early part of his reign, was improved by all the manly exercifes then in ufe. This prince was the author of a humourous comporition in poctry, which goes by the name of the Gaberdunzic Man.

James VI. king of Scotland in 1567, and of England in 1603 , was fon of Mary queen of Scots; whomhe fucceeded in Scotland, as he did Elizabeth in England. Strongly attached to the Proteflant religion, he fignalized limifelf in its fupport; which gave rife to the borrid confpiracy of the Papifs to deftroy him and all the Englifl nobility by the Gunpowder Plot, dif covered November 5.1605. The following year, a political toft of loyalty was required, which fecured the king's perfon, by clearing the kingdom of thofe difaffected Roman Catholic fubjects who would not fubmit to it. The chief glory of this king's reign confifted in the eflablifhment of new colonies, and the introduction of fome manufactures. The nation enjoyed peace, and commerce flourithed during his reign. Yet his adminiftration was defpifed bo:h at home and abroad: for, being the head of the Pruteflant caufe in Europe, he did not fuppurt it in that great crifis, the war of Bohemia; abandoning his fon-in-law the elecior Palatine; negotiating when he fhould have fought, deceived at the fame time by the courts of Vienna and Madrid ; continually fending illuftrious ambaffadors to foreign powers, but never making a fingle ally. He valued himfelf much upon his polemical writings; and fo fond was he of theological difputations, that to keep them alive, he founded, for this exprefs purpofe, Chelfea-college; which was converted to a much better ufe by Charles II. His Bafilicon Doron, Commentary on the Revelation, writings againft Bellarmine, and his Damonologia, or doctrine of witcheraft, are fufficietitly known. There is a collection of his writings and fpeeches in one folio volume. Several other pieces of his are extant; fome of them in the Caballa, others in manufcript in the Britifh Mufeum, and others in Howard's collection. He died in 1625 , in the 59 th year of his age, and 23 d of his reign.

James II. king of Eingland, Scotland, Sc. 1685, grandfon of James I. fucceeded his brother Char. II. It is remarkable, that this prince wanted neither courage nor political abilities whilt he was duke of York ; on the contrary, he was eminent for both: but wben he afcended the threne, he was no longer the fame man. A bigot from his infancy to the Romifh religion and to its hierarchy, he facrificed every thing to eftablifh them, in direct contradiction to the experience he had acquired, during the long reign of his brother, of the genius and character of the people he was to govern. Guided by the Jefuit Peterg his confeffor, and the infamous chancellor Jeffies, he violated every law enacted for the fecurity of the Proteflant religion; and then, unable to face the refentment of his
injured fubjects, he fled like a coward, inteed of difarming their rage by a difmifion of his Popifh minifters and pricts. He rather chofe to live and die a bigot, or, as he belicved, a faint, than to fupport the dignity of his anceltors, or peridi beneath the ruins of his throne. The confequence was the revolution in 1689. James II. died in France in 1710 , aged 68. He wrote Memoirs of his own life and campaigns ro the reftoration ; the criginal of which is preferved in the Scotch college at Paris. This piece is printed at the end of Ramfay's life of Marfhal Turenne. 2. Memoirs of the Englifh affairs, chiefly naval, from the year 1660 to 1673 . 3. The royal fufferer, king James II. confifting of meditations, foliloquies, vows, Ecc. faid to be compofed by his majefty at St Germains. 4. Three letters; which were publifhed by William Fuller, gent. in 1702, with other papers relating to the court of St Germains, and are faid in the title-page to be printed by command.

James (Thomas), a leamed Englifh critic and divine, born about the year 1571 . He recommended himfelf to the office of keeper of the public library at Oxford, by the arduous undertaking of publifhing a catalogue of the MSS in each college library at both univerfities. He was elected to this office in 1602 , and held it i 8 years, when he refigned it to profecuse his fludies with more freedom. In the convocation beld with the parliament at Oxford in 1625 , of which he was a member, he moved to have proper commiffioners appointed to collate the MSS of the fathers in a!l the libraries in England, with the Popifh editions, in order to deteet the forgeries in the latter; but this propofal not mecting with the defired encouragement, be engaged in the laborious tafk himfelf, which he continued until his death in 1629. He left behind him a grear number of learned works.

James (Richard), nephew of the forner, entered into orders in 1615 : but, being a man of hamour, of three fermons preached before the univerfity, one concerning the obfervation of Lent was without a text, according to the moft ancient mauner; another againt the text; and the third befide it. About the year 1619, he travelled through Wales, Scotland, Shetland, into Greenland and Ruffia, of which he wrote obfervations. He affifted Selden in compofing his Marmora Arundeliana; and was very ferviceable to Sir Robert Cotton, and his fon Sir Thomas, in difpofing and fettling their noble library. He died in 1638 ; and has an extraordinary character given him by Wood for learning and abilities.

James (Dr Robert), an Englifh phyfician of great eminence, and particularly dittinguifhed by the preparation of a moft excellent fever-powder, was born at Kinverfon in Staffordfhire, A. D. 1703 : his father a major in the army, his mother a filter of Sir Robert Clarke. He was of St John's.college in Oxford, where he took the degree of A. B. and afterwards practifed phyfic at Sheffield, Liclifield, and Birmingham fucceffively. Then he removed to London, and became a licentiate in the college of phyficians; but in what years we cannot fay. At London he applied himfelf to writing as well as practifing phyfic ; and in 1743, publifhed a Medicinal Dictionary, 3 vols folio. Soon after he publifhed an Englifh trannation, with a Supplement by himfelf, of Ramazzini de morbis artifo-

Janes's Powder
$\dagger$ Vol. I.

## p. 366 .

cum; to which he alfo prefixed a piece of Frederic Hoffman upon Endemial Diltempers, 8vo. In 1746, The Practice of Phyfic, 2 vols 8 vo ; in 1760 , On Ca nine Malnefs, 8 vo; in $1^{1764}$, A Difpenfatory, 8 vo. June 25. 1755, when the king was at Cambridre, James was admitted by mandamus to the doctorfhip of phylic. In 1778, were publifhed, A Differtation upon Fevers, and A Vindication of the Fever. Powder, 8 vo; with A fhort Treatife on the Diforders of Children, and a very good print of Dr James. This was the 8 th edition of the Differtation, of which the lirlt was printed in 1751 ; and the purpole of it was, to fet forth the fuccefs of this powder, as well as to deferibe more particularly the manmer of adminiftering it. The Vindication was pofthmmous and unfinifhed: for he died March 23.1776, white he was employed upos it.-Dr James was married, and left feveral fons and daughters.

Fames's Powder, a medicine prepared by the late Dr Robert James, of which the batis has been long known to chemills, though the particular receipt for making it lay concealed in Chancery till made public by br Monro in bis Medical and Pburmaceutical Cbemijiry $\dagger$. The following ( Dr Monro informs us) is a copy of the receipt, extracted from the Records of Chancery ; the inventor, when he took cut a patent for felling his powder, laving fworn, in the molt folemn manner, that it was the true and genuine receipt for preparing it :

- Take antimony, calcine it with a continued protracted heat, in a flat, unglazed, earthen veffel, adding to it from time to time a fufficient quantity of any animal oil and falt, well dephlegmated; then boil it in melted nitre for a confiderable time, and feparate the powder from the nitre, by diffolving it in water.'
This extract Dr Monro accompanies with the following obfervations. "When the Doctor firt adminiftered his powder, he ufed to join one grain of the following mercurial preparation to thirty grains of his antimonial powder; but in the latter part of his life he often declared that he had long laid afide the addition of the mercurial. His mercurial, which he called a pill, appears by the records of chancery to have been made in the following manner: ' Purify quicktilver, by diltilling it nine times from an amalgam, made with martial regulus of antimony, and a proportional quantity of fal ammoniac ; diffolve this purificd quickiliver in Spirit of nitre, evaporate to drynefs, calcine the powder till it becomes of a gold colour; burn Spirits of wine upen it, and keep it for ufe.' Dr James, at the end of the receipt given into chancery, fays, 'The dofe of thefe medicines is uncertain; but in general thirty grains of the antimonial and onc grain of the mercurial is a moderate dofe. Signed and fworn to, by Robert Fames.'
" I have frequently directed this powder to be giwen, and have often feen Dr James himfelf as well as other practitioners adminifter it, in fevers and in other complaints. Like other active preparations of antimony, it fometimes operates with great violence, even when given in fmall dofes; at other times a large dofe produces very little vifible effects. I have feen three grains operate brifkly, both upwards and downwards; and I was once called to a patient to whom Dr James had himfelf given five grains of it, and it purged and
vomited the lady for twenty-four hours, and in that time gave her between twenty and thirly flools; at othér times I have feen a icriple produce little or no viiuble effect.
"So far as I have obferved, I think that the dofe of this powder to an adule, is from live to twenty grains; and that, when it is adminitered, one cught to begin by giving fmall dofes.
"Where patients are Itrons, and a free evacuatior: is wanted, this is a ufeful remedy; and it may be given in fimall repeated dofes as an alterative in many cafes; but where patien:s are weakly and in low levers, it of ten acts with too great violence ; and I have myfelf feen inftances, and bave heard of others froun othor practitioners, where patients have been hariced to their graves by the ufe of this puwder in a very fhort time.
"It has been called Dr James's Ferer Poruder ; andmany have believed it to be a certain ermedy for fevers, and that Dr Jannes had curcd moll of the patient 3 whom lie attended, and who recovered, by the ufe of this powder. But the bark, and not the antimonial powder, was the remedy which Dr Janes almult always trutted to for the cure of fevers: he gave his powders only to clear the ftomach and bowels; and after he had effected that, he poured in the bark as freely as the patient could fwallow it. The Doctor belicved all fevers to be more or lefs of the intermitting kind; and that if there was a poffibility of curing a lever, the bark was the remedy to effectuate the cure; for if the fever did not yield to that, he was fure that it woull gield to no other remedy whatever, as he has more than once declared to me when I have attended patients in fevers along with him."

Fsmes Town, a berough and fair-town of Irelatid; in the county of Leirrim, and province of Connaught ; fituated 5 miles north-wefl of Carrick, on Shannon, and 73 north-weft of Dublin, in north lat. 53.44. welt long. 8. 15. It has a barrack for a company of foot, and returns two members to parliament ; patronage in the family of King. - It has three fairs.

St $\mathcal{F}$ ames Bay, a feftival of the Chriftian church, obferved on the 25 th of July, in honour of St James the greater, fon of Zebedee.

Epille of St Jiases, a canonical book of the New Teltament, being the firft of the catbolic or general epifles; which are fo called, as not being written to one but to feveral Cluriftian churches.

This general epitle is addreffed partly to the believing and partly to the infidel Jews; and is detigned to correct the errors, foften the ungoverned zeal, and reform the indecent behaviour of the latter; and to comfort the former under the great hardihips they then did, or fhortly were to fufter, for the fake of Chriftianity.

JAMESONE (George), an excellent painter, juftly termed the Vandyck of Scotland, was the fon of Andrew Jamefone, an architect ; and was born at Aberdeen, in 1586 . He Atudied under Rubens, at Antwerp; and, after his return, applied with indefatigable induftry to portraits in oil, though he fametimes practifed in miniature, and alro in hifory and landfcapes. His largett portraits were fomewhat lefs than life. His earlielt works are chicfly on board, afterwards on a fine linen cloth fmoothly primed with a

## $J \mathrm{~A} \mathbb{N} \quad\left[\begin{array}{ll}61 & ]\end{array}\right]$ A N

myn, proper tone to help the harmony of his fhadows. His excellence is faid to confir in delieacy and foftnefs, with a elear and beautiful colouring; his flades not eharged, but helped by varnifh, wich little appearance of the pencil. When king Charles I. vifited Scotland in 1633 , the magiftrates of Edinburgh, knowing his majelty's tafte, empleyed this artif to make drawings of the Scottifh monarchs; with which the king was fo pleafed, that, inquiring for the painter, he fat to him, and rewarded him with a diamond-ring from his own finger. It is obfervahle, that Jamefone always drew himfelf with his hat on, either in imitation of his mafter Rubens, or on having been indulged ir that liberty by the king when he fat to him. Mary of Jamefone's works ate in both the colleges of Aherdeen; and the Sybils thete he is faid to have drawn from living beauties in that city. His beft works are from the year 1630 to his death, which happened at Edinburgh in 1544.

JAMYN (Amadis), a celebrated French roet in the 16 th eencary. He is elteemed the rival of Ronfard, who was his cotemporary and friend. He was fectetary and chamber-reader in ordinary to Char. IX. and died about 1585. He wrote, 1. Portical works, 2 vols. 2. Philofophical difcourfes to Paficharis and Rodanthe, with feven academical difcourfes. 3. A tranflation of the Lliad of Homer, begun by Hugh Sabel, and finifhed by Jamyn; with a tranflation into French verfe of the three Girt books of the Odyfley.
JiANE of Flanders, a remarkable lady, who feems to have poffefied in her own perfon all the excellent qualities of both lexes, was the wife of John de Mount ort, a competitor for the dukedom of Britany upon the death of John III. This duke, dying without iflue, left his dominions to his niece Jane, married to Charles de Blois nephew to the king of France; but John de Mountfrt, brother to the late duke though by a.fecond marriage, claimed the duchy, and was received as fucceffor by the people of Nantes. The greatelt part of the nobility fwore fealty to Charles de Blois, thinking him beft fupported. This difpute oceafioned a civil war ; in the courfe of which John was taken prifoner, and fent to Paris. This misfortune would have entire. ly ruined his party, had not his intereft been fupported by the extraordinary abilities of his wife, Jane of Flanders. Bold, daring, and intrepid, the fought like a warrior in the field; fhrewd, fenfible, and fagacious, the fpoke like a politician in the council ; and endowed with the moft amiable manners, and winning addrefs, fie was able to move the minds of her fubjects by the force of her eloquence, and mould them exactly according to her pleafure. She happened to be at Rennes when the received the news of her hufband's captivity; but that difafter, inftead of depreffing her firits, ferved only to roufe her native courage and fortitude. She. forthwith affembled the citizens; and, holding in her arms her infant fon, reconmended him to their eare. and protection in the moft pathetic terms, as the male heir of their ancient dukes, who had always governed them with lenity and indulgence, and to whom they bad ever profeffed the moft zealous attachment. She declared herfelf willing to run all hazards with them in fo jult a caufe; pointed out the refourees that ftill remained in the alliance of England; earnelly befeech. ing them to make one vigorous effort againft an ufur.
per, who being forced upon them by the intrigues of France, would, as a mark of his gratitude, facritice the liberties of Brittany to his protector. The people,
moved by the affecting appearance, and animated by the noble conduct of the princefs, vowed to live and die with her in defending the rights of her family; and their example was followed by almolt all the Bretons. The conntefs went from place to place, encouraging the garrifons of the feveral fortrefles, and providing them with every thing neceflay for their fublittence: after which fhe thut herfelf up with her fon in Hennebon, where the refolved to wait for the fuccours which the king of England (Edward lII.) had promifed to fend to her aftitance. Charles de Blois, accompanied by the Dukes of Burguady and Bourhon, and many other neblemen, took the field with a numerous army, and having reiuced Rennes, laid liege to Hennebon, which was defended by the counters in perfon. This heroine repulfed the affalants in all their attacks with the nolt undaunted courage, and oblerving one day that their whole army had left the camp to join in a general form, the rufhed forth at a poltern-gate, with three hundred horfe, fet bire to their tents and baggage, killed their futlers and fervants, and raifed fuch a terror and confternation through all their quarters, that the enemy gave over their affault, and getting betwixt her and the walls, endeavoured to eut off her retreat to the city. Thus intercepted, the put the fpurs to her horfe, and, without halting, galloped directly to Breft, which lay at the dillance of two and twenty miles from the feene of action. There being fupplied with a body of five hundred horfe, the immediately returned, and fighting her way through one part of the French camp, was received into Hennebon, amidt the acelamations of the people. Soon after this the Englifh fuccours appeared, and obliged the enemy to raife the fiege.

JANEIRO, a province of Brafl in South America, feated between the tropic of Capricorn and $22^{\circ}$ of S . Lat. It is bounded on the north by the province of Spirito Sancto, on the eaft and fouth by the Atlantic Ocean, and on the weft by the mountains which feparate it from Guiara, in Spanifh Anserica. This is the moft valuable province which the Portuguefe are matters of ; for they import from thence yearly great quantities of gold and precions Itones, which they find in the mountairs, to a prodigious value.

JANICULUM, or Janicularis, a hill of ancient Rome, added by Ancus Martius; the burial place of Numa, and of Statius Cxcilius the poet : to the eaft and fouth, having the Tiber; to the weft, the fields; to the north, a part of the Vatican. So ealled, either from an ancient city, (Virgil); or becaufe it was a junua, or gate, from which to iffue out and make incurfions on the Tu[cans, (Verrius Flaccus.) Now called Mons. Aureus corruptly Montorius, from its fparkling fands. From this hill, on account of its height, is the molt. extenfive profpect of Rome: but it is lefs inhabited, becaufe of its grofs air; neither is it reekoned among the feven hills. Hither the people retired, and were hence afterwards recalled by 0 . Hortenlius the dictator, (Pliny.)

JANIZARIES, an order of infantry in the Turkink armies; reputed the grand feignior's foot-guards. Voffus derives the word from genizers, which in the

Janizzries Turkifh language fignifies novi bonines or milites. D' Herbelot tells us, that jenitcberi lignifies a neso band, or troop; and that the name was firft given by Amurath l. called the Conqueror, who choofing out onc fifth part of the Chriftian prifoners whom le had taken from the Greeks, and inftructing them in the difcipline of war and the doctrines of their teligion, fent them to Hagi Bektafche (a perfon whofe pectended piety rendered him cstremely revered among the Turks), to the end that he might confer his blefling on them, and at the fame time give them fome mark to diftinguifh them from the reft of the troops.-Dektalche, after bleffing them in his manner, cut off one of the fleeves of the fur gown which he had on, and put it on the head of the leader of this new militia; from which time, viz. the year of Chrilt 136I, they have fill retained the name jenitcheri, and the fur-cap.

As, in the Turkifh army, the European tronps are citiaguifhed from thofe of Afia; the janizaries are al fo dillinguifhed into janizariss of Confuntinople, and of Damafius. Their pay is from two afpers to twelve per dimm for when they lhave a child, or do any fignal piece of fervice, their pay is augmented.- Their drefs confifts of a dolyman, or long gown, with fhort fleeves, which is given them annually by the grand feignior on the firlt day of Ramazan. They wear no turbeau ; but, in lieu of that, a kind of cap, which they call zarcola, and a long hood of the fame fluff hanging on their floulders. On folemn days they are adorned with feathers, which are fuck in a little cafe on the fure-part of the honnet. - 'Their arms, in Europe, in time of war, are a fabre, a carabine or mulket, and a cartouch-box hanging on the left fide. At Conflantinople, in time of peace, they wear only a long ftaff in their hand. In Alia, where powder and firearms are more uncommon, they wear a bow and arrows, with a poingard, which they call baniare. Though the janizarie's are not prolibited marriage, yet they rarely marry, nor then but with the confent of their officers; as imagining a married man to make a worfe foldier than a bachelor.-It was Ofman, or Ottoman, or, as others will have it, Amurath, who firft inflituted the order of janizaries. They were at firlt called jaja, that is, foutmen, to dittinguifh them from the ocher Tiurks, the troops whereaf confifled moflly of cavalry. The number of janizaries is gencrally above 40,000; divided into 162 companies or ehambers called odas, in which they live together at Conftantinople as in a convent. They are of a fuperior rank to all other foldiers, and are alfo more arrogant and factious, and it is by them that the public tranquillity is motlly difturbed. The government may therefure be faid to be in the hands of the janizaries. They have, however, fome good qualities: they are employed to efcort travellers, and efpecially ambarfadors and perfons of high rank, on the road; in which cafe, they behave with the utmon zeal and fidelity.

Janizaries, at Rome, are officers or penfioners of the pope, called alfo participantes, on account of certain rites or dutics which they enjoy in the annates, bulls, or expeditions, and the Roman chancery.-Moft anthors are miftaken in the nature of their office: the truth is, they are officers of the third bench or college of the Roman chancery. The firf bench confifls of writers, the fecond of abbreviators, and the
third of janizuries; who are a kind of corre\&ors and revifors of the pope's bulls.
JANSEN (Cornelius), bifhop of Ypres, one of the mot learned divines of the 17 th century, and principal of the fect called from his name Fanfenifs. He was born in Holland of Catholic parents, and fludied at Louvain. Being fent to tranfact fume bufinefs of confequence relating to the univerfity, into Spain, the Catholic king, viewing with a jealous eye the intriguing policy of Prance, engaged him to write a book to expofe the French to the pope as no good Catholics, fince they made no fcruple of forming alliances with Proteflant ilates. Janfen performed this tafk in his Marrs Callicus; and was rewarded with a mitre, being promoted to the fee of Ypres in 1635 . He had, among other writings, bufore this, maintained a controverfy againt the Proteflants upon the points of grace and predeflination ; but his Ausuflinus was the principal labour of his life, on which he fipent above 20 years. See the next article.

JANSENIST'S, in church-hiftory, a fect of the Roman Catholics in France, who followed the opinions of Janfenius, bilhop of Ypres, and doctor of divinity of the univerfities of Louvain and Douay, in relation to grace and predeftination.

In the year $t 6+0$, the two univerfities juft mentioned, and particularly father Molina and father Leonard Celfus, thought fit to condemn the opinions of the Jefuits on grace and free-will. 'Ihis having fet the controverfy on foot, Janfenius oppofed to the doctrine of the Jefuits the fentiments of St Auguftine; and wrote a treatife on grace, which he intitled Auruflinus. This treatife was attacked by the Jefuits, who accured Janfenius of maintaining dangerous and heretical opinions; and afterwards, in $16+2$, obtained of pope Urban VIII, a formal condemnation of the treatife wrote by Jaulenius: when the partifans of Jankenius gave out that this bull was fpurious, and compofed by a perfon entirely devoted to the Jefuits. After the deatly of Urban VIII the affair of Janfenifm began to be more warmly contoverted, and gave birth to an infinite number of polemical writings concerning grace. And what occafioned fome mirth, was the titles which each party gave to their writings : one writer publifhed The lorch of St Augufine, another found Snuffers for St Augufine's torch, and father Veron formed $A$ gar for the Ganfenifts, \&c. In the year 1650, 68 bilhops of France fubicribed a letter to pope Innocent X. to obtain an inquiry into and condemnation of the five following propolitions, estracted from Janfenius's Auguftinus: 1. Some of God's commandments are impoflible to be obferved by the righteous, even though they endeavour with all their power to accomplifh them. 2. In the fate of cormpted nature, we are incapable of relilling inward grace. 3. Merit and demerit, in a flate of corrupted nature, does not depend on a liberty which excludes neceffity, but on a liberty which excludes conftraint. 4. The Semipelagians admitted the neceffity of an inward preventing grace for the perfurmance of each particular act, even for the beginning of faith; but they were heretics in maintaining that this grace was of fuch a nature, that the will of man was able either to refift or obey it. It is Semipelagianifm to fay, that Jefus Chrilt died, or fhed lis blood, for all mankind in general.

In the year 1652, the pope appointed a cougregation for examining into the difpute in relation to grace. In this congregation Janfenius was condemned; and the bull of condemnation, publined in May 1653, filled all the pulpits in Paris with violent outcries and alaums againit the herefy of the Janfenifts. In the year 1656, pope Alexander VII. iffued ont another bull, in which he condemned the five propofitions of Janfenius. However, the Janfenifts affirm, that thefe propofitions are not to be found in this book; but that fone of his enemies having caufed them to be printed on a fheet, inferted them in the book, and thereby deceived the pope. At laft Clement XI. put an end to the difpute by his conftitution of July 17 . 1705 ; in which, after laving recited the conflitutions of his predeceffurs in relation to this affair, he declares, "That in oider to pay a proper obedience to the papal conflitutions concerning the prefent queftion, it is neceflary to receive them with a refpecfful filence." The clergy of Paris, the fame year, approved and aceepted this bull, and nonc dated to oppofe it.

This is the famous hull Uuidenitus, fo called from its beginning with the words Unigenitus Dai Filius, $\& \mathrm{c}$. which has occafioned fo much confufion in Yrance.

JANSSENS(Abraham), hifory-painter, was born at Antwerp in 1569. He was cotemporary with Rubens, and alfo lis competitor, and in many of the fineft parts of the art was accounted not inferior to that celebrated malter. It is reported, that having wafted his time and his fublance by a life of diffipation and pleafure, and falling into neceflitous circumftances, which he imputed more to ill fortune than to his own neglect of his bufinefs, he grew envious at the grandeur hiwhich Rubens appeared, and impatient at his merit and fuccefs; and with pecvih infolence challenged him to paint a picture with hin only for fame, which he was willing to fubmit to impartial judges. But Rubens rejected the propofal, anfwering with modelly, that he freely fubmitted to him, and the world would certainly do juflice to them both.

Sandrart, who had feen feveral of his works, affures us, that he not only gave a fine 1 oundnefs and relief to his figures, but allo fuch a warmth and clearnefs to the carnations, that they had all the look of real flefh; and lis colouring was as durable as it was beautiful, retaining its original luftre for a number of years. His mof capital performance is faid to be a refurrection of Lazarus, which is in the cabinet of the clector Palaeine, and is an object of admiration to all who betold it.

Janssevs (Victor Honories), hifory-painter, was born at Bruffels in 1664, and was a difciple of one Volders, under whofe direction he continued for feven years; in which time he gave many proofs of a genius far fuperior to thofe who were initructed in the fame fchool. He afterwards went to Rome, where he attended particularly to the works of Raphael; he defigned after the antiques, and fketched the beautiful feenes around that city; and in a fhort time his paintings rofe in efteem, and the principal nobility of Rome were defirons to employ him. He affociated with Tempefta, the celebrated landfcape painter, for Several years, and painted the figures in the works of that great matter as long as they refided togetber.

Janflens compoled hiftorical fubjects, botit in a fimall Janflens, and a large fize; but he found the demand for his Janua ius. fmall pictures fo confiderable, that he was induced to paint moff frequently in that fize. During 11 years he continued at Rome, which barely fufficed for his finifting thofe pictures for which he was engaged; nor could he have been ewin then at his liherty, had he not limited himfelf to a number, and determined not to undertake more. - Returning to Bnuffils, his performances were as much admired there as they had before been in Italy ; but having marricd, and gradually become the father of 11 children, he twas compelled to change his manner of painting in fmall, and to undertake onIy thofe of the large kind, as being more lucrative, more expeditious, and alfo more agreeable to his genius and inclination. He adorned moft of the churches. and palaces of his owre country with his compofitions. -Tbe invention of this artilt was fruitful; he defign. (d correctly, his colouring is natural and pleafing, his fencil free, and the airs of his heads have beauty and clegance. As to the difference between his large and fmall paintings, it is obferved, that in correctnefs and tafte they had an equal degree of merit; but the colouring of the former appeass more raw and cold than the colouring of the latter; and it is agreed, that for fmall hiflorical pictures, he was preferable to all the painters of his time.

Jarssen (Conelius), called Tohnfon, an eminent painter of portraits, was born at Amiterdam (though in the Chronological tables, and in Sandrart, it is improperly afferted, that he was born in London), and lie refided in England for feveral years; where he was engaged in the fervice of king James I. and painted feveral excellent portraits of that monarch, as alfo of his children and of the principal nobility of his court. He had not the freedom of hand, nor the grace of Vandyck; but in other refpects he was accounted his. equal, and in the finihing his pictures fuperior. His paintings are eafily diftinguifhed by their finooth, clear, and delicate tints, and by that character of truth and nature with which they are ffrongly marked. He generally painted on board; and, for the moft fart, his draperies are black ; probably becaufe the oppofition of that tint made his fleth colours appear more beavifully bright, efpecially in his female figurces. It is faid that he ufed a quantity of ultra marine in the black colours, as well as in his carnations; which may be one great caufe of their preferving their originai halre even to this day. Frequently he painted in a fmall fize in oil, and often copied his own works in that mannier. His fame began to be fomewhat coffeured, on the arrival of Vandyck in Englard; and the civil war breaking out fome time after, induced him to return to his own country, where his paintings were in thehigheft clteem. He died in 1685 .
St JANUARIUS, the patron-faint of Naples, where his head is occafionally carried in proceffion, in order to ftay the eruption of Vefuvius. The liquafaction of his blood is a famous miracle at Naples. The faint fuffered martyrdom about the end of the third century. When he was beheaded, a pious lady of Naples caught about an ounce of his blood, which has been carefully preferved in a bottle ever fince. without having loft a fingle grain of its weight. This of itfelf, were it equally demonftrable, might be coa-

Innarius, fidered as a greater miracle than the circumfance on गJ nuary. which the Neapolitans lay the whole frefs, wiz. that the blood which has congealed, and acquired a folid form by age, is no fooner brought near the head of the faint, than, as a mark of veneration, it immediately liqurfies. This experiment is made three different times every year, and is confidered by the Neapolitans as a miracle of the firft magnitude.

The fubilance in the bottle, which is exhibited for the blond of the faint, has been fuppofed to be fomething naturally folid, but which melts with a fmall degree of heat. When it is firft brought out of the cold chapel, it is in its natural folid thate; but when brought before the faint by the prielt, and rubbed between his vaim hands, and breathed upon for fome time, it melts; and this is the whule myltery. But

- Travelt in Dr Moore *, though he confeffes himfelf unable to explain on what principle the uquetacion depende, is thinetd that it muft be fomething different from
their divinities, to whom they attributed two faces, becaufe on the one fide the firt day of January looked towards the new year, and on the other towards the old one. The word 7anuarius may alfo be derived from janua " gate ;" in regard this month being the firt, is, as it were, the gate of the year.
January and Eebruary were introduced into the year by Numa Pompilius; Romulus's year beginning in the month of March. - The kalends, or firft day of this month, was under the protection of Juno, and in a peculiar manner confecrated to Janus by an offering of a cake made of new meal and new falt, with new frankincenfe and new wine. On the lirit day of Januaty a heginning was made of every intended work, the confuls elect tonk poffeffion of their office, wha, with the llamens, offered facrifices and prayers for the profpenity of the empire. On this day all animofitied were fufpended, and friends gave and received newyear's gifts, called Strence. On this day too the Romans above all tbings took cate to be merry and divert themfelves, and oftentimes fuch a fcene of drunkennefs was exhibited that they might with propricty enough have diftinguithed it with the name of All-fools day.'

The Chriftians heretofore fafted on the tirlt day of January, by way of oppolition to the fupertitions and debaucheries of the heathens.

JANUS, in heathen worfhip, the firft king of Italy, who, it is faid, received Saturn into his dominions, after his being driven from Arcadia by Jupiter. He tempered the manners of his fubjects, and taught them civility; and from him they learned to improve the vine, to fow corn, and to make bread. After his death, he was adored as a god.

This deity was thought to prefide over all new undertakings. Hence, in all facrifices, the firt libations of wine and wheat were offered to Janus, all prayers prefaced with a thort addrefs to him; and the firt month of the year was dedicated to and named from Lim. See Javuary.

Janus was reprefented with two faces, either to denote his prudence, or that he views at once the pait and approaching years; he had a feeptre in his right hand, and a key in his left, to fignify his extenfive au thority, and his invention of locks.

Though this is properly a Roman deity, the abbé la Pluche reprefents it as derived from the Egyptians, who made known the rifing of the dog-ilar, which opened their folar year, with an image with a key in its hand, and two faces, one old and the other young, to tipify the old and new year.

Temple of 7 anvs, in ancient hiftory, a fquare build ing at Rome (as fome fay) of entire brafs, erected by Romulus, and fo large as to contain a Hatue of Janus five feet high, with brazeu gates on each fide, which were always kept open in time of war, and thut in time of peace. But the Romans were fo much engaged in war, that this temple was thut only twice from the foundation of Rome till the reign of Augultus, and fix times afterwards. It was firf hut during the long reign of Numa, who inflituted this ceremony. 2. In the year of the city 519 , after the end of the frit Punic var. 3. By Auguftus after the battle of Actium, in the year of Rome 725.4 . On Auçultus's retuin frnm the war which he had againft the Cantabrians in Spain, in the year of Rome 729. 5. Under the fame emperor, in
this: "For he had it (he infurms us) from the mol. fatisfactory authority, from tone who had opportan: ties of knowing, and who believe no more in the miracle than the Rauncheft Proteltant, that this congealed mafs has fumetimes been found in a liquid Rate in cold weather, before it was touched by the prictt, or brought near the head of the faint; and that, on other occafions, it has remained folid when brought before him, norwith tanding all the efforts of the prielt to melt it. When this happens, the fuperttitious, which, at a very moderate calculation, comprchends 29 in 100 of the inhabitants of this city, are thrown into the utmolt confternation, and are fomctimes wreught up by their fears into a flate of mind which is highly dangerous both to their civil and ecclefiafical governors. It is true, that this happens but feldom: for, in general, the fubitance in the plial, whatever it may be, is in a folid form in the chapel, and becones li-- quid when brought before the faint: but as this is not always the cafe, it affords reafon to believe, that whatever may have been the cafe when this miracle or trick, call it which you pleafe, was firft exhibited, the principle on which it depends has fomeh ow or other been loit, and is not now undertsod fully even by the priefts themfelves; or elfe they are not now fo expert as formerly, in prefaring the fublance which reprefents the faint's blood, fo as to make it remain folid when it ought, and ligucfy the inftant it is tequired." For the principle on which this pretended miracle is performed, or the compefition by which it is or may be purformed, fee Chemistry, $n^{\circ} 800$.
The head ard blood of the faint are kept in a kind of prefs, with folding doors of filver, in the chapel of St Januarius belonging to the cathedral church. The real head is poobably not fo frcth, and well preferved, as the blood Ori that accourt, it is not expofed to the cyes of the public : but is inclofed in a large filver buft, gilt and enriched with jewels of high value. This being what appears to the people, their idea of the faint's features and complexion are taken entirely from the buft. -The blood is kept in a fmall repofitory by itferf.
$J \leadsto$ NUARY, the name of the firft month of the year, according to the computation now ufed in the weft. The word is derived from the Latin Ganuarius, a name given it by the Romans from Janus, one of

744 , about five years before the birth of Chrit, when there was a general peace throughout the whole Ro. man empire. whinch lafted 12 years. 6. Under Nero, 811. 7. Under Vefpafian, S24. 8. Under Contantius, when. upan Magnentius's death, he was left fole poffeflor of the empire, 1105. Some difpute the authority on which it is faid to have been fhut by Conflatitius, and fay that the laft time of its being thut was under Gordian, about the jear of Rome 994. Virgil gives us a noble defcription of this cultom,在n. lib. iii. ver. $607,8 \mathrm{c}$. The origin of this cultom is not certainly known.

Janus was alfo the name of a freet in Rome, ioa bited for the molt part bs bankers and ufurers. It was fo called from two llatues of Jonus which were erected there, one at the top, the other at the bottom, of the Areet. The top of the freet was therefore called $7 a$ nus Summus, the bottom Janas Imus, and the middle Janus Medius. Hence Horace, lib. . . Epif. I.

Hac Janus fummers ab imo prodocet.
and Sat. 3. Lib. 2.-- Pofquam

## omnis res mea Ganlm

Ad mediam frata et. -
JAPAN, a general name for a great number of ifiands lying between the eaftern coatt of A fia and the weltern one of America, and which all together form a large and potent empire. They extend from the 30 th to the fl: degree of latitude, and from the 130 th to the 147 th of eall longitude.

Were South and North Britain divided by an arm of the fea, Japan might be moft aptly compared to Engrland, Scotland, and Ireland, with their refpective fmaller ifiands, peninfulas, bays, channels, \&c, all under the fame monarch.

The Europeans call the empire Fapan; but the inhabitants Nipbon, from the greatelt illand belonging to it; and the Chinefe Ciphen, probably on account of its eaftern lituation; thele names lignifying, in both languages, the Bofis or Foundation of the Sun. It was finf difcovered by the Portugnefe about the year of Chrilt is 42.

Moft of the iflands which compofe it are furrounded with fuch high craggy mountains, and fuch fhallow and boilterous feas, that failing about them is extreme1 y dangerous; and the creeks and bays are choaked up with fuch rocks, fhelves, and fands, that it looks as if Providence had defigned it to be a kind of little world by itfelf. Thefe feas have likewife many dangerous whirlpools, which are very difficult to pals at low water, and will fuck in and fwallow up the largeft veffels, and all that comes within the reach of their vortex, dafhing them againft the rocks at the bottom ; infomuch that fome of them are never feen again, and others thrown upon the furface at fome miles diftance. Some of thefe whirlpouls alfo make a noife terrible to bear.

The Chinefe pretend that the Japan illands were firt peopled by themflelves: but it is more probable that the original inhahitants were a mixture of different nations, driven thither by thofe tempeltuous feas, and at different times.

As thele illands lie in the fifth and firth climates, they would be much hotter in fummer than England, were not the heats refrefhed by the winds which continually blow from the fea around them, and to which they are much expofed by the beight of their fitua.

Vol. IX. Part I.
tion: this circumitance, however, not only renders their winters exceffive cold, but the feafons mere in. conftant. They have great falls of fnow in winter, which are commonly followed. by hard frofts. The rains in fummer are very violent, efpecially in the months of June and July, which on that account are called fat fuli, or water monks. The country is alfo much fubject to dreadful thunders and lightnings as well as forms and hurricanes, which frequently do a great deal of damage.

The foil, though naturally barren and mountainons. by the indutry of the inhabitants, not only fupplies them with every neceflary of life, but alfo furnithes other countries with them; froducing, befides corn. the fineft and whitelt rice and other grains, with a great variety of fruits, and valt numbers of cattle of all forts. Befides rice, and a fort of wheat and barley, with two forts of beans, they have Indian wheat, millet, and feveral other kinds in great abundance. Their feas, lakes, and rivess, abound with fifh ; and their mountains, woods, and forells, are well focked with horfes, elephants, decr, oxen, buffalocs, theep, hogs, and other ufeful animals. Some of their monn. tains alfo are enriched with nines of gold, filver, and copper, exquifitely fine, befides tin, lead, iron, and rarious other minerals and foffls; whilit others abound witl feveral forts of marble and precious fones. Of thele monntains, fome nay be jully ranked amomg the natural rarities of this country ; one, in particular, in the great ifland of Niphon, is of fuch prodigious height as to be eafily feen forty leagues of at fea, though its ciftance from the thore is about eigho teen. Sonne authors think it exceeds the famous Peak of Teneriffe; but it may rather be called a clufter or group of mountains, among which are no lefs than eight dreadful volcanoes, burning with ineredible fury, and often laying wate the country round about them: but, to make iome amends, they afford great variety of medicinal waters, of different degrees of heat; one of thefe, mentioned by Varen:es, is faid to be as hot as burning oil, and to fcorch and confume every thing
thrown into it. thrown into it.

The many brooks and rivers that have their fources anong the mountains, form a great number of delightful cafcades, as well as fome dreadful cataracts. A. mang the great variety of trees in the farefts herc, the cedars exceed all of that kind through India, for ftraightnefs, height, and beauty. They abound in moft of the illands, efpecially the largelt.

Their feas, befides fifh, furnifh them with great quantities of red and white coral, and fome pearls of great value, befides a variety of fea-plants and fhells; which lat are not inferior to thofe that are brought from Amboyna, the Milucca and other eallerly ifiands.

The vaft quantity of fulphur with which moft of the Japan inlands abound, makes them fubject to frequent and dreadful earthquakes. The inhabitants are fo accultomed to them, that they are fcarcely alarmed at any, unlefs they chance to be very terrible indeed, and lay whole towns in ruins, which very often proves the cafe. On thefe occafions, they have recourfe to extraordinary facrifices, and acts of worlhip, to their deitics or demons, according to the different notions of each fect, and fometimes even proceed to offer human victims: but in this cafe they only take fome of the vileft and moft abandoned fellowa they can meet

Japan. with, becaufe they are only facrificed to the malevolent deities.

The religion throughout Japan, it is well known, is Pagan, fplit into feveral fects, who live together in the greatef harmony. Every fect has its own temples and priefts. The fpiritual emperor the Dairi, is the chief of their religion. They acknowledge and honour a Supreme Being. The author of this relation (Dr Thunberg) faw two temples of the God of gods of a majellic height. The idol that reprefented this god was of gilded wood, and of fo prodigious a fize, that upon bis hands fix perfons might fit in the Japanefe falhion ; his floulders were five toifes broad. In the other temple, the infinite power of this god was reprefented by little gods to the number of 33,333 , all fanding round the great idol that reprefented God. The priefts, who are numerous in every temple, have nothing to do but to clean the pavement, light the lamps, and deefs the idol with flowers. The temples are open to every body, even to the Hollanders; and in cale they are in want of a lodging in the fuburbs, when they go to the court of Jedo, they are entertained with hofpitality in thefe temples.

Chriftianity, if Popery deferves that name, had once made a confiderable progrefs in this country, in confequence of a miffion conducted by the Portuguefe and Spanifh Jefuits; amongtt whom the famous faint Francis Xavier was employed, but foon relinquifhed the fervice. There were alfo fome Francifcan friars of Spain engaged at lait. The Jefuits and friars were fupplied from Goa, Macao, and the Manilhas. At firt the undertaking proceeded with the mott rapid fuccefs, but ended at laft in the mof tragical manner, all owing to the pride and haughtinefs, the mifconduct, rapacity, and fenfelefs extravagant confpiracy of the fathers againot the thate. This folly and madnefs produced a perfecution of 40 years duration, terminated by a moft horrible and bloody maffacre, not to be paralleled in hiftory. After this the Portuguefe, as likewife the Chriftian religion, were totally expelled the country, and the moft effectual means taken for preventing their rezurn. The natives are for this purpofe prohibited from going out of the country; and all foreigners are excluded from an open aod free trade; for as to the Dutch and Chinefe, under which laft name fome other eaftern nations go thither, they are fhut up whilft they remain there, and a moft frict watch is fet upon them, infomuch that they are no better than prifoners; and the Dutch, it is faid, to obtain a privilege even fo far, declared themfelves to be no Cbrifians, but Dutchmen. This calumny, however, Dr Kempfer has endeavoured to wipe off, but not altogether to fatisfacton.

It was about the year of Chrift 1549, or fix years afser the firl difcovery, that the fathers of the fociety arrived there, being induced by the favourable reprefentations of a young Japanefe who had fled to Goa. Till the year 1625 , or near 1630 , the Chriftian religion fpread through molt of the provinces of the empire, many of the princes and lurds openly embracing it; and " there was very good reafon to hope, that within a fhort compals of time the whole empire would have been converted to the faith of our Saviour, had not the ambitious views, and the impatient endeavours of the fathers to reap the temporal as well as the fpiritual fruits of their care and labour, fo provoked the fupreme majetty of the empire as to raife againlt themfelves and
their converts a perfecution which hath not its parallel in hiftory, whereby the religion they preached, and all thofe that profeffed it, were in a few years time entirely exterminated." The fathers had made a progrefs fo great, that the princes of Bungu, Arima, and Omura, who had been baptized, "fent, in the year 1582 , fome of their nearelt relations, with letters and prefents, to pay homage to the then pope, Gregory XIII. and to affure his holinefs of their filial fubmifion to the church; an account of which moft celebrated embafy hath been given in the works of that incomparable hiftorian Thaunus, and by many other Roman catholic writers."

But notwithtanding this pleafing profpect, the emperor, anno 5586 , iffued proclamations for the fuppreffion of the religion, and the perfecution began. This, however, at firlt had not that effect which the government expected; for though, according to the letters of the Jefuits, 20,570 perfons fuffered death for the faith of Chrift in the year 1590 only, yet in 1591 and 1592, when all the churches were actually fhut up, they made 12,000 new converts. The bufinefs was finally concluded by the maflacre at Simabara, about the year 1640. The reafons of the emperor's proclamations, making it death to embrace the religion, were as fullows: 1. The new religion occafioned confiderable alterations in the Japanefe church, and was prejudicial in the higheft degree to the heathen clergy. 2. It was feared the innovation in religion might ise attended. with fatal confequences even in regard to the fick; bat what more immediately gave rife to them was, as the Japanefe of credit confeffed to Dr Kempfer, pride and covetoufnefs; pride among the great ones, and covetoufnefs in people of lefs note; the fpiritual fathers aiming not only at the falvation of their fouls, but having an eye alfo to their money and lands, and the merchants difpofing of their goods in the mot ufirious and unreafonable manaer. To confine ourfelves to the clergy here : they " thought it beneath their dignity to walk on foot any longer; nothing would ferve them but they muft be carried about in flately chairs, mimicking the pomp of the pope and his cardinals at Rome. They not only put themfelves on an equal foot with the greateft men of the empire, but, fwelled with ecclefiatical pride, fancied that even a fuperior rank was nothing but thcir due. It one day happened, that a Portuguefe bilhop met upon the road one of the counfellors of flate on his way to court. The haughty prelate would not order his chaife to be ftopped, in order to alight and to pay his refpects to this great man, as is ufual in that country; but, without taking any notice of him, nay indeed without fhowing him fo much as common marks of civility, he very contemptuoufly bid his men carry him by. The great man, exafperated at fo fignal an affront, thenceforward bore a mortal hatred to the Portuguefe, and, in the height of his juft refentment, made his complaint to the emperor himfelf, with fuch an odious picture of the infulence, pride, and vanity of this nation, as he expected could not but raife the emperor's utmoft indignation." This happened in 1566. The next year the perfecution began anew, and 26 perfons, of the num. ber whereof were two foreign Jefuits, and feveral other fathers of the Francifcan order, were executed on the crofs. The emperor Jiojas had ufurped the crown on his pupil Tidajori, who, as likewife the greater part of his court and party, had been either Chriftians themfelves, or at leaft very favourably inclined to that peli-
gion, fo that reafons of flate mightily co-operated to forward the perfecution.
Some Francifcan friars, whom the governor of the Manilhas had fent as his ambaffadors to the emperor of Japan, were guilty at this time of a moft imprudent thep : they, during the whole time of their abode in the country, preached openly in the ftreets of Macao where they refided; and of their own accord built a church, contrary to the imperial commands, and contrary to the advice and earneft folicitations of the Jefuits.

Some time after, a difcovery of a dangerous confpiracy, which the fathers, and the yet remaining adherents of their religion, entered into againtt the perfon of the emperor, as a heathen prince, put a finifhing Atroke to the affair, and hattened the fentence which was pronounced foon after, that the Portuguefeßould for ever be banifhed the emperor's dominions; for till then the ftate feemed defirous to fpare the merchants apd fecular perfons, for the purpofe of continuing trade and commerce with them, which was looked upon as an affair independent of religion. The affair of the confpiracy was as follows: the Dutch had had an eye to the trade of Japan before 1600 , and in 1611 had liberty of a free commerce granted them by the imperial letters patent, and had actually a factory at Firando. The Dutch were then at war with Spain, which was then fovereign of the Portuguefe dominions; fo that it was natural for then to be trying to fupplant them. The Porruguefe, on their part, made ufe of all malicious inventions to blacken their characters, calling them rebels and pirates, whence it was natural for the Dutch to endeavour to clear, and even to revenge, themfelves. Now they "took an homeward-bound Portuguefe fhip near the Cape of Good Hope, on board of which they found fome traiterous letters to the king of Portugal, written by one captain Moro, who was chief of the Portuguefe in Japan, himfelf a Japanefe by birth, and a great zealot for the Chrifian religion. The Dutch took fecial care to deliver the faid letters to their proteetor the prince of Firando, who communicated them without lofs of time to the governor of Nagafaki, a great friend to the Portuguefe. Captain Moro having been taken up, boldly, and with great affurance, denied the fact, and fo did all the Portuguefe then at Nagafaki. However, neither the governor's favour, nor their conflant denial, were able to clear them, and to keep off the clond which was ready to break over their heads. Hand and feal convinced them; the letter was fent up so court, and captain Moro fentenced to be burnt alive on a pale, which was executed accordingly. This letter laid open the whole plot which the Japanefe Chriftians, in conjunction with the Portuguefe, had laid againit the emperor's life and throne ; the want they food in of thips and foldiers, which were promifed them from Portugal ; the names of the Japanefe princes concerned in the confpiracy; and lafty, to crown ail, the expectation of the papal bleffing. This difcovery made by the Dutch was afterwards confirmed by another letter written by the faid captain Moro to the Portuguefe government at Macao, which was intercepted and brough to Japan by a Japanefe flip."

Confidering this, and the fufpicions which the court had then already conceived againft the Portuguefe, it was no difficult matter thorongb'y to ruin the little credit and favour they had as yet been able to preferve;

## 67 J A P

and the rather, fince the Ariet inperial orders notwith. Japan. flanding, they did not leave off privately to bring over more ecclefiaitics. Accordingly, in the year 1637, an imperial proclamation was fent to the governors of Na gafaki, with orders to fee it put in execution. It was then the empire of Japan was thut for ever both to foreigners and natives.

Now, although the governors of Nagafaki, on receipt of thefe commands, took care they fhould be obeyed, yet the directors of the Portuguefe trade maintained themfelves in Japan two years longer, hoping to obtain leave to flay in the ifland of Defima, and there to continue their trade. But they found themfelves at laft wholly difappointed; for the emperor was refolved to get rid of them ; and on affurance given him by the Dutch Eaft India company that they would fupply for the future what commodities had been imported by the Portuguefe, he declared the Portuguefe and the Caftilians, and whoever belonged to them, enemies of the empire, forbidding the importation of even the goods of their country, Spanih wines only excepted, for the ufe of the court. And thus the Portuguefe lolt their profitable trade and commerce with Japan, and were totally expelled the country before the latter end of the year 1639 or 1640 ; and thus ended the fruitlefs popifh miffion in this empire, for the Portuguefe have never been able to retore themfelves; and the Dutch have it not in their power to do any one thing in favour of religion, were they fo inclined; but, as it appears, they are very indifferent as to tbat, and are in but little credit with the Japanefe.

According to Dr Thunberg's refearches, the Japanefc lave never been fubdued by any foreign power, not even in the moft remote periods; their chronicles contain fuch accounts of their valour, as one swould rather incline to confider as fabulous inventions than actual occurrences, if later ages lad not furnihed equal ftriking proofs of it. When the Tartars, for the firt time in 799, had over-run part of Japan, and when, after a confiderable time had elapfed, their fleet was deAtroyed by a violent ftorm in the courfe of a fingle night, the Japanefe general attacked, and fo totally defeated his numerous and brave enemies, that not a fingle perfon furvived to return and carry the tidings of fuch an unparalleled defeat. In like manner, when the Japanefe were again, in 1281, invaded by the warlike Tartars, to the number of 240,000 fighting men, they gained a vi\&ory equally complete. The extirpation of the Portuguefe, and with them of the Chritian religion, towards the beginning of the 17 th century, as already mentioned, was fo complete, that fcarce a veftige can now be difcerned of its ever having exitted there.
With refpect to the government of thefe iflands, it is and has been for a loug time monarchical; though formerly it feems to have been fplit into a great num. ber of petty kingdoms, which were at length all fwallowed by one. The imperial dignity had been enjoyed, for a confiderable time before the year 1500 , by a regular fucceffion of princes, under the title of dairos, a name fuppofed to have been derived from Dairo the head of that family. Soon after that epoch, fuch a dreadful civil war broke out, and lafted fo many years, that the empire was quite ruined. During thefé diftractions and confufions, a common foldier, by name Tayckoy, a perfon of obfcure birth, but of an enterprifing genius, found means to raife himfelf to the imperial dignity; having, in little more than three years time, by an uncommon thare of good fortune, fubdued all tris competitors and opponnets, and reduced all their cities and catles. The dairo, not being in a condition to obtruct or put a ftop to his progrefs, was furced to fubmit to his terms; and might perhaps have been condemned to much harder, had not Tayckoy been apprehenfive left his foldiers, who fill revered their ancient natural monarch, fhould have revolted in bis favour. To prevent this, he granted hin the fupreme power in all religious matters, with great privileges, honours, and revenues annexed to it; whill himfelf remained invelted with the whole civil and military power, and was acknow. ledged and proclaimed king of Japan. This great revolution happened in 1517 , and Tayckoy reigned feveral years with great wifdom and tranquillity; during which he made many wholefome laws and regulations, which fill fubfilt, and are much admired to this day. At his death, he left the crown to his fon Tayckoffama, then a minor; but the treacherous prince under whofe guardianfhip he was left deprived him of his life before he came of age. By this murder, the crown paffed to the family of Jejaffama, in which it Atll continues. Tayckoy and his fucceffors have contented themfelves with the tile of cubo, which, under the dairos, was that of prime minitter, whofe office is now fuppreffed; fo that the cubo, in all fecular concerns, is quite as abfolute and defpotic, ard las as extenfive a power over the lives and fortunes of all his fubjects, from the petty kings down to the lowelt perfons, as ever the dairos had. The dairo relides conftantly at Meaco, and the cubo at Jeddo.

The inhabitants of Japan are well-grown, agile, and active, and at the fame time flout limbed, thongh they do not equal in Arength the northern inhabitants of Europe. The colour of the face is commonly yellow; which fomctimes varies to brown, and fometimes to white. The inferior fort, who during their work in fummer have often the upper parts of the body naked, are fun burnt and browner; women of diftinction, who never go uncovered into theopen air, areperfectly white.

The national character confifts in intelligence and prudence, fianknefs, obedience, and politenefs, goodnature and civility, curiofity, induttry, and dexterity, economy and fubricty, hardinefs, cleanlinefs, juftice, and uprightnefs, honefty and fidelity; in being alfo miltrultful, fuperflitious, haughty, refentful, brave, and invincible.

In all its tranfactions, the nation fhows great intelligence, and can by no means be numbered among the favage and uncivilized, but rather is to be placed among the polihed. The prefent mode of government, admirable 0kill in agriculture, fparing mode of life, way of trading with foreigners, manufactures, \&cc. afford convincing proofs of their cunning, firmaefs, and intrepid courage. Here there are no appearances of that vanity fo common among the $A$ fiatics and $A$ fricans, of adorning themfelves with fhells, glafs-beads, and polifhed metal plates: neither are they fond of the ufelefs European ornaments of gold and filver lace, jewels, \&c. but are careful to provide themfelves from the productions of their own country with neat cloaths well tafted food, and good weapous.

## ] J A P

Their curiofity is exceffive; nothing imported by the Europeans efcapes it. They afk for information concerning every article, and their queftions continue till they become wearifome. It is the phyfician, among the traders, that is alone regarded as laarned, and particularly during the journey to court and the refidence at Jeddo, the capital of the empre, that he is regarded as the oracle, which they trutt can give refponfes in all things, whether in mathematics, geography, phytics, chemitry, pharmacy, zoology, botany, incdicine, \&c.

Economy has its peculiar abode in Japan. It is a vitue admired as well in the emperor's pralace as in the meanelt cottage. It makes thufe of fmall poffefions content with their little, and it prevents the abundance of the rich from overflowing in excefs and voluptuouf. nefs. Hence it bappens, that what in other countries is called fearcity and farnine, is unknown here; and that, in fo very populous a flate, fcarce a perfon in neceffity, or a beggar, thould be found.

The names of families, and of fingle perfons, are under very different regulations from ous. The family name is never changed, but is never ufed in ordinary converfation, and only when they lign fome writing; to which they alfo for the molt part affix their feal. There is alfo this peculiarity, that the furname is always placed firit ; juft as in botanical books the generic name is always placed before the fpecilic ame. The prenomen is always ufed in ad. dreffing a perfon; and it is changed féveral times in the courfe of life. A child receives at birth from its parents a name, which is retained till it has itfelf a fon arrived at maturity. A perfon again changes his name when he is invelted with any office; as allo when lie is advanced to an higher trult: fome, as emperors and princes, acquire a new name after death. The names of women are lefs variable ; they are in general borrowed from the moft beantiful flowers.

After maniage, the wife is confined to her own apartment, from whence the hardly ever flirs, except once a-year to the funeral-rites of her family; nor is The permitted to fee any man, except perhaps fome very rear relation, and that as feldom as can bc. The wives, as well as in China and other parts of the calt, bring no porion with them, but are rather bought by the hußand of their parents and relations. The bridegroom moft commonly fees his bride for the firft time upon her being brought to his houfe from the place of the nuptial ceremony: for in the temple where it is perforined fhe is covered over with a veil, which reaches from the head to the feet. A hufoand can put his wives to a more or lefs fevere death, if they give lim the leaft caufe of jealoufy, by being feen barely to converfe with. another man, or fuffering one to come into their apartment.

The drefs of the Japanefe deferves, more than that of any other people, the name of national ; fince they. are not only different from that of all other men, but are alfo of the fame form in all ranks, from the monarch to his meaneft fubject, as well as in both fexes; and what exceeds all credibility, they have not been. altered for at leaft 2444 years. They univerfally confilt of night-gowns, made long and wide, of which feveral are worn at once by all ranks and all ages. Themore diftinguihed and the rich have them of the Enet

## $\begin{array}{llll}\text { J A P } & {\left[\begin{array}{ll}69\end{array}\right] \quad \text { J A P }}\end{array}$

Gueft filk; the poorer fort of cotton. Thofe of the women rach down to the grouil, and fometimes have a train; in the men, they reacb down to the heels: travellers, foldiers, and labourers, either tuck them up, or wear them only down to the knees. The habit of the men is generally of one colour; the women have theirs variegated and frequently with flowers of gold interwoven. In fummer, they are either without lining, or have but a thin one; in winter they are tuffed to a great thicknefs with cotton of filk. The men feldom wear a great number; but the women thisty, fifty, or more, all fo thin, that they fearce together amount to five pounds. The undermoll ferves for a thirt, and is therefure either white or blue, and for the moft part thin and tranfparent. All thefe gowns are faftened round the waift with a belt, which in the men are about a hand's bread'th, in the women abont a foot; of fuch a length that they go twice round the wailt, and aftervards are tied in a knot with many ends and bows. The knot, particularly among the fair fex, is very confpicuous, and immediately informs the fpectator whether they are married or not. The unmarried have it behind, on their back; the married before. In this belt the men fix their fabres, fans, pipe, totacco, and medicine boxes. In the neck the gowns are always cut round, without a collar; they therefore leave the neck bare; nor is it covered with cravat, cluth, or any thing elfe. The feeves are always ill-made, and out of all proportion wide: at the opening before, they are half fuwed up, fo that they form a fack, in which the hands can be put in cold weather; they alfo ferve for a pocket. Girls in particular have their neeves fo long that they reach down to the ground. Such is the limplicity of their habit, that they are foon dreffed; and to undrefs, they need only open their girdle and draw in their arms.

As the gawns, from their length, keep the thighs and legs warm, there is no occafion for ftockings; nor do they ufe them in all the empire. Among poorer perfons on a journey, and among foldiers, who bave not fuch long gowns, one fees bukins of cotton. Shoes, or, more properly fpeaking, fippers, are, of all that is worn by the Japanefe, the fimpleft, the meaneft, and the moft miferable, though in general ufe among high and low, rich and poor. They are made of interwoven rice fraw; and fometimes, for perfons of diftinction, of reeds fplit very thin. They confift only of a fole, without upper-leathers or quarters. Before, there paffes over, tranflerfely, a bow of linen, of a finger's brearth : from the point of the fhoe to this bow goes a thin round band, which running within the great toe, ferves to keep the fhoe fixed to the foot. The fhoe being without quarters, fides, during walking, like a flipper. Travelfers have ihree bands of twitted fraw, by which they faften the fhoe to the foor and leg, to prevent its falling off. The Japanefe never enter their houfes with thoes, but put them off in the entrance. This precaution is taken for the fake of thcir neat carpets. During the time the Dutch refide in Japan, as they have fometimes occafion to pay the natives vifits in their houfes, and as they have their own apartment at the factory covered with the fame fort of carpets, they do not wear Euro. pean fhoes, but have in their ftead red, green, or black
hippers, which can eafily be put off at entering in. Japan. They, Lowever, wear fockings, with floes of cotton, faftened by buckles. Thefe hoes are made in Japan, and may be wathed whenever they become dirts

The way of dreffing the hair is not lefs peculiar to this people, and $l=$ fs univerfally prevalent among them, than the ufe of their long gowns. The men fhave the head from the forehead to the neck; and the hair remaining on the temples, and in the nape, is well befineared with oil, turned upwards, and then tied with a white paper thread, which is wrapped round feveral times. The ends of the hair beyond the head, are cut crofways, about a finger's length being lefc. This part, after being pafted rogether with oil, is bent in fuch a manner that the point is brought to the crown of the head; in which fitnation it is fixed by pafing the fame thread round it once. Women, except fuct as happen to be feparated from their hufbands, fhave no part of their head.

The head is never covered with hat or bonnet in winter or in fummer, except when they are on a journey; and then they ofe a cunical hat, made of a fort of grafs, and fixed with a ribband. Some travelling women, who are met with on the roads, have a bonnet like a fhaving bafon inverted on the head, which is made of cloth, in which gold is interwoven. On other occations, their naked heads are preferved, both from rain and the fun, by umbrellas. Travellers, moreover, have a fort of riding-coat, made of thick paper oiled. They are worn by the upper fervants of princes, and the fuite of other travellers. Dr Thunberg and his fellow-travelless, during their journey to court, were obliged to provide fuch for their attendants when they pafied through the place where they are made.

A Japanefe always has his arms painted on ore on more of his garments, efpecially on the long and fhort gowns, on the fleeves, or between the fhoulders; fo that nubody can feal them; which otherwife might eafily happen in a couatry where the clothes are fo much alike in Ituff, flape, and fize.

The weapons of the Japanefe confift of a bow and arrow, fabre, halbert, and mufket. The bows are very large, and the arrows long, as in China. When the bows are to be bent and dificharged, the troop always refts on one knee, which hinders them making a fpeedy difcharge. In the fpring, the troops aficmble to practife fhooting at a mark. Mufkets are not general; Dr Thunberg only faw them in the hands of perfons of diftinction, in a feparate and elevated part of the andience room. The barrel is of the common length; but the ftock is very fhort, and there is a match in the lock. The fabre is their principal and beft weapon, which is univerfally worn, except by the peafants. They are commonly a yard long, a little crooked, and thick in the back. The blades ate of an incomparable goodnefs, and the old ones are in very high efteem. They are far fuperior to the Spanifh blades fo celebrated in Europe. A tolerably thick nail is eafily cut in two without any damage to the edge; and a man, according to the account of the Ja. panefe, may be cleft afunder. A feparate fafh is never ufed, but the fword is ftuck. in the belt, on the left tide, with the edge upwards, which to a European ap. pears ridiculuns. All perfons in office wear two fuch labres, one of their own, and the other the fourd of 4. difpofed as to crofs each other. When they are fitting, they lave their fword of office laid on one fide or before them.

The fciences are very far from having arrived at the fame height in Japan as in Europe. The liitory of the country is, notwithflanding, more authentic, perhaps, than that of any other country ; and it is thudied, without diftinction, by all. Agriculture, which is confidered as the art moft neceflary, and moft conducive to the fupport and profperity of the kingdom, is no where in the world brought to fuch perfection as here; where neither civil nor foreign war, nor emigration, diminifhes population; and where a thought is never entertained, either of getting poffeflion of other countries, or to import the ufelefs and often hurtful productions of foreign lands; but where the utmoft care is taken that no turf lies uncultivated, and no produce of the earth unemployed. Aftronomy is purfued and refpected; but the natives are unable, without the aid of Clinefe, and fometimes of Dutch almanacks, to form a true kalendar, or calculate an eclipfe of the fun or moon within minutes and feconds. Medicine has neither arrived, nor is it likely to arrive, at any degree of perfection. Anatomy is totally unknown; the knowledge of difeafes imperfect, intricate, and often fabulous. Botany, and the knowledge of medicines, conftitute the whole of their kill. They ufe only fimples; and thefe generally in diuretic and diaphoretic decoctions. They are unaequainted with compound medicines. Their plyyficians always indeed feel the pulfe; but they are very tedious, not quitting it for 3 quarter of an hour ; befides, they examine firt one, and then the other arm, as if the blood was not driven by the fame heart to both pulfes. Befides thofe difeafes which they have in common with other coun. tries, or peculiar to themfelves, the venereal difeafe is rery frequent, which they only undertood how to alleviate by decoctions, thought to purify the blood. Salivation, which their phyficians have heard mentioned by the Dutch furgeons, appcars to them extremely formidable, both to conduct and to undergo; but they have lately learned the art of employing the fublimate with much fuccef3. - Jurifprudence is not an extenfive fudy in Japan. No country has thinner law-books, or fewer judges. Explanations of the law, and advocates, are things altogether unknown; but no where, perhaps, are the laws more certainly put in force, without refpect to perfons, without partiality or violence. They are very tria, and law-fuits very flort. The Japanefe know little more of phyfies or chemiflry than what they liave learned of late years of the Europeans.

Their computation of time takes its rife from Min-0, or 660 years before Chrif. The year is divided according to the changes of the moon; fo that fome years conift of twelve, and others of thirteen months; and the beginning of the year falls ont in February or March. They have no weeks confifting of feven days, or of fix working days and a holiday; but the firft and fifteenth day of the month ferve for a holiday. On thefe days no work is done. On new-year's-day they go rouod to with one another a new year, with wheir whole families, clad in white and blue chequered,
their holiday drefs; and they reft almoft the whole of the firt month. The day is divided only into twelve hours; and in this divifion they are directed the whole year by the rifing and fetting of the fun. They reckon fix o'clock at the rifing, and fix likewife at the fetting of the fun. Mid-day and mid-night are always at nine. Time is not meafured by elocks or hourglaffes, but with burning matches, which are twifted together like ropes, and divided by knots. When the match is burnt to a knot, which indicates a certain portion of time elapfed, notice is given during the day, by friking the bells of the temples; and in the night, by the watchmen ftriking two boards againft one another. A child is always reckoned a year old at the end of the year of his birth, whether this happen at the beginning or the clofe. A few days after the beginaing of the year, is performed the horrid ceremony of trampling on images reprefenting the crofs and the Virgin Mary with her child. The images are of melted copper, and are faid to be fcarce a foot in height. This ceremony is intended to imprefs every individual with hatred of the Chrittian doctrine, and the Portuguefe, who attempted to introduce it there ; and alfo to difcover whether there is any remnant of it left among the Japanefe. It is performed in the places where the Chrittians chiefly refided. In Nagafaki it lafts four days ; then the images are conveyed to the circumjacent places, and afterwards are laid afide againft the next year. Every perfon, except the Japanefe governor and his attendants, even the fmallefl child, muft be prefent ; but it is not true, as fome have pretended, that the Datch are alfo obliged to trample on the image. Overfeers are appointed in every place, which aftemble the people in companies in certain houfes, call over the name of every one in his turn, and take care that every thing goes on properly. The children, not yet able to walk, have their feet placed upon it ; older perfons pafs over it from one fide of the room to the other.

The Japanefe are much addieted to poetry, mufic, and painting ; the firf is faid to be grand as to the Atyle and imagery, loftinefs, and cadence; but, like that of the Chinefe, is not eafily underflood or relifhed by the Europeans. The fame may be faid of their mufic, both vocal and infrumental ; the beft of which, of either kind, would hardly be tolerable to a nice European ear.

They pretend, like the Chinefe, to have been the inventors of printing from time immemorial, and their method is the fame with theirs, on wooden blocks; but thcy excel them in the neatnefs of cutting them, as well as in the goodnefs of their ink and paper. They likewife lay elaim to the invention of gunpowder ; and are vaftly fuperior to the Chinefe in the ufe of all forts of fire-arms, efpecially of artillery, as well as the curioufnefs of their fire-works.

Their manner of writing is much the fame as that of the Chinefe, viz. in columns from top to bottom, and the columns beginning at the right and ending at the left band. Their characters were alfo originally the fame, but now differ conliderably.

Their language hath fome affinity with the Chinefe, though it appears from its various dialects to have been a kind of compound of that and other languages, derived from the various nations that fift peopled thofe iflands.
iflands. It is not only very regular, polite, elegant, and copious, but abounds with a great variety of fynonyma, adapted to the nature of the fubject they are upon, whether fublime, familiar, or low; and to the quality, age, and fex, both of the fpeaker and perfon fpoken to.

The Japanefe are commonly very ingenious in moft handicraft trades; and excel even the Chinefe in feveral manufactures, particularly in the beauty, goodnefs, and variety of their filks, cottons, and other fluffs, and in their japan and porcelain wares. No eaftern nation comes up to them in the tempering and fabricating of fcymitars, fwords, mukets, and other fuch weapons.

The Japanefe architecture is much in the fame tafte and A yle as that of the Chinefe, efpecially as to their temples, palaces, and other public buildings; but in private ones they affeet more plainnefs and neatnefs than flow. Thefe laft are of wood and cement, confifting of two fories: they dwell only in the lower; the upper chamber ferving for wardrobes. The roofs are covered with rufh-mats three or four inches thick. In every houfe there is a fmall court, ornamented with trees, fhrubs, and flower-pots; as likewife with a place for bathing. Chimnies are unknown in this country, although fire is needed from the cold month of OAOber till the end of March. They heat their rooms with charcoal contained in a copper flove, which they fit round. Their cities are generally fpacious, having each a prince or governor refiding in them. The capital of Jedo is 21 French leagues in circumference. Its freets are ftaight and large. There are gates at little diftances, with an extremely high ladder, which they afcend to difcover fires. Villages differ from cities in having but one freet; which often extends feveral leagues. Some of them are fituated fo near each other, that they are only feparated by a river or a bridge. The principal furniture of the Japanefe confits in Araw-mats, which ferve them for feats and beds; a fmall table for every one who choofes to eat is the only moveable. The Japanefe fit always upon their hams. Before dinner begins, they make a profound bow and drink to the health of the guefts. The women eat by themielves. During the courfes, they drink a glafs of fakki, which is a kind of beer made of rice kept conftantly warm; and they drink at each new morfel. Tea and fakkiare the moft favourite drink of this people; wine and firits are never uled, nor even accepted when offered by the Dutch. Sakki, or rice beer, is clear as wine, and of an agreeable talte : taken in quantity, it intoxicates for a few moments, and caufes headach. Both men and women are fond of tobacco, which is in univerfal vogue and fmoked continually. The gardene about their houfes are adorned with a variety of flowers, trees, verdure, baths, terraces, and other embellifhments. The furniture and decorations of the houfes of perfons of diftinction confift in japan-work of varinus colours, curious paintings, beds, couches, fkreens, cabinets, tables, a variety of porcelain jars, vales, tea-equipage, and other veffels and figures, together with fwords, guns, fcymitars, and other arms. Their retinues are more or lefs numerous and fplendid according to their rank; but there are few of the lords who have lefe than 50 or 60_men richly clad and armed, fome on foot, but moft
on horfeback. As for their petty kings and princes, they are feldom feen without 300 or 200 at leaft, when they either wait on the emperor, which is one half of the year, or attend him abroad.

When a prince or great man dies, there are com. monly about 10, 20, or more youths of his houfehold, and fuch as were his greatell favourites, who put themfelves to a voluntary death, at the place where the body is buried or burned: as foon as the funcral pile, confifting of odoriferous woods, gums, fpices, oils, and other ingredients, is fet on fire, the relations and friends of the deceafed throw their prefents into it, fuch as cloaths, arms, victuals, money, fweet herbs, lowers, and other things which they imagine will be of ufe to him in the other world. Thofe of the middle or lower rank commonly bury their dead, without any other burning than that of fome odoriferous woods, gums, \&c. The fepulchres into which the bones and athes of perfons of rank are depofited, are generally very magnificent, and fituated at fome diftance from the towns.
The Dutch and Chinefe are the only nations allowed to traffic in Japan. The Dutch at prefent fend but two fhips annually, which are fitted out at Batavia, and fail in June, and return at the cod of the year. The chief merchandife is Japanefe copper and raw camphor. The wares which the Dutch company import are, coarfe fugar, ivory, a great quantity of tin and lead, a little calt iron, various kinds of fine chintzes, Dutch cloth of different colours and finenefs, ferge wood for dyeing, tortife-fhell, and coffus Arabicus. The little merchandife brought by the officers on their own account, confifte of faffron, theriaca, fealingwax, glafs-beads, watches, \&c. \&c. About the time when the Dutch fhips are expected, fereral outpolts are Itationed on the highelt hills by the government; they are provided with telefcopes, and long before their arrival give the governor of Nagafaki notice. As foon as they anchor in the harbour, the upper and under officers of the Japanefe immediately betake themfelves an. board, together with interpreters; to whom is delivered a cheft, in which all the failors books, the multer-roll of the whole crew, fix fmall barrels of powder, fix barrels of balls, fix mufkets, fix bayoriets, fix piftois, and fix fwords, are depofited; this is fuppofed to be the whole remaining ammunition after the Imperial garrifon has been faluted. Thefe things are conveyed on . fhore, and preferved in a feparate warchoufe, nor are they returned before the day the fhip quits the harbour.

Dutics are quite unknown as well in the inland parts. as on the coalt, nor are there any cuftoms required, either for exported or imported goods; an advantage enjoytd by few nations. But, to prevent the importation of any forbidden wares, the utmon vigilance. is obferved; then the men and things are cxamined with the eyes of Argus. When any European goes on fhore, he is examined before he leaves the flip, and afterwards on his landing. This double fearch is exceedingly Itrict ; fo that not only the pockets and cloaths are Atroaked with the hands, but the pudenda of the meaner fort are preffed, and the hair of the Oaves. All the Japanefe who come on board are fearched in like manner, except only their fuperior officers: fo alfo are the wares either exported or in. ported, firt on board, and then at the factory, except
jaran, the great chetts, which are epened at the factory, and Jupanning. fo carefully examined that they ftrike the very fides left they hould be hollow. The bed clothes are often opened, and the feathers examined : rods of iron are run into the pots of butter and confections: a fquare hole is nade in the cheefe, and a long-pointed iron is thrut into it in all directions. Their fufpicion is carried fo far, that they take out and break one or two of the egga brought from Batavia.

The interpreters are all natives; they fpeak Dutch in different degrees of purity. The government permits no foreigner to learn their language, left they fhould by means of this acquire the knowledge of the manufactures of the country; but forty or lifty interpreters are provided to ferve the Dutch in their trade, or on any other occafion.

The interpreters are very inquifitive after Europcan books, and generally provide themfelves with fome from the Duteh merchants. They perufe them with care, and remember what they learn. They befides endeavour to get inllruction from the Europeans; for which purpole they afk numberlefs queftions, particularly refpecting medicine, plyyics, and natural hiftory. Molt of them apply to medicine, and are the only phyficians of their nation who practifc in the European manner, and with European medicines, which they procure from the Dutch phyficians. Hence they are able to acquire money, and to make themflves respucted.

Fapan Earth. See Mimosa and Terra Foponica.
JAPANNING, the art of varnifhing and drawing sigures on wood, in the fame manner as is done by the natives of Japan in the Eaft Indics.

The fubllances which admit of being japonned are almolt every kind that are dry and rigid, or not too flexible ; as wood, metals, leather, and paper prepared.

Weod and metals do not require any other preparation, but to have their furface perfectly even and clean: but leather fhould be fecurely ftrained either on frames or on boards; as its bending or forming folds would otherwife crack and force off the cuats of varnith : and paper fould he treated in the fame manner, and have a previous ftrong coat of fome kind of lize ; but it is rarely made the fubject of japanning till it is converted inso papier maclie, or wrought by other means into fuch form, that its original Aate, particularly with refpect to flexibility, is lott.

One principal variation from the method formerly ufed in japanning is, the ufing or omitting any priming or undercoat on the work to be japanned. In the older practice, fuch priming was always ufed; and is at prefent retained in the French manner of japanning coaches and fouff-hoxes of the papier mache; but in the Birmingham manufacture here, it has been always rejected. The advantage of uling fuch priming or undercoat is, that it makes a faving in the quantity of varnith ufed; becaufe the matter of which the priming is compofed fills up the inequalities of the body to be varnifhed; and makes it eafy, by means of rubbing and water-polifhing, to gain an even furface for the varnilh: and this was therefore fuch a convenience in the cale of wood, as the giving a hard. nefs and firmnefs to the ground was allo in the cafe of leather, that it became an eftablikhed method; and is $\mathrm{N}^{\circ}, 162$.
therefore retaincd even in the intance of the papier Japsnn mache by the French, who applied the received method of jupanning to that kind of work on its intro. duction. There is neverthelefs this inconvenience always attending the ule of an undercoat of fize, that the japan coats of varnilh and colour will be conitantly liable to be cracked and peeled off by any violence, and will not cndure near folong as the bodies japanned in the fame manner, but without any fuch priming: as may be eafily oblerved in comparing the wear of the Paris and Birmingham fnuff-boxes; which latter, when good of their kind, never peel or crack, or fuffer any damage, unlefs by great violence, and fuch a continued rubbing as waftes away the fulutance of the varnifh ; while the japan coats of the Parilian crack and fly off in flakes, whenever any knock or fall, purticularly near the edges, expofe them to be injured. But the Birmingham manufacturere, who originally practifed the japanning only on metals, to which the reafon above given for the ufe of priming did not extend, and who took up this art of themfelues as an invention, of courfe omitted at firt the ufe of any fuch undercoat ; and not finding it more neceffary in the inflance of papier mache, than on metals, continue ftill to reject it. On which account, the boxes of tbeir manufacture are, with regard to the wear, greatly better than the French.

The laying on the colours in gum-water, initead of varnifh, is alfo another variation from the mechod of japanning formerly practifed: but the much greater frength of the work, where they are laid on in varnith or oil, has occafioned this way to be exploded with the greateft reafon in all regular manafactures: however, they who may practice japanaing on cabinets, or other fuch pieces as are not expofed to much weear and violence, for their amufement only, and confequently may not find it worth their while to encumber themfelves with the preparations neceflary for the other methods, may paint with water-colours on an undercoat laid on the wood or other fubfance of which the picce to be japanned is formed; and then linifl with the proper coats of varniih, according to the methods below taught: and if the colours are tempered with the ftrengeft ifinglafs fize and honey, inftead of gumwater, and laial on very flat and even, the work will not be much inferior in appearance to that done by the other method, and will latt as long as the old japan.

Of $\mathrm{J}_{\text {APAN }}$ Grounds.-The proper grounds are either fucli as are formed by the varnifh and colour, where the whole is to remain of one fimple colour; or by the varnilh either coloured or without colour, on which fome painting or other decoration is afterwards to be laid. It is neceflary, however, before we proceed to \{peak of the parricular grounds, to fhow the manner of laying on the priming or uadercoat, where any fuch is ufed.

This priming is of the fame nature with that called clear coating, or vulgarly clear coaling, practifed erroneoully by the houle-painters; and confilts only in laying on and drying in the moft even manner a compolition of fize and whiting, or fometimes lime ioftead of the latter. The common fize has been generally ufed for this purpoie: but where the work is of a nicer
.kind.

## J A P

kind, it is better to employ the g!over's or the parch ment fire ; and if a third of ifinglafs be added, it will be nill better, and, if not laid on $t$ o thick, much lefs liable to pect and crack. The work thould be prepared for this priming, by being well fmocthed with the fiff-fkin or glafs-haver: and, being made thoroughly clean, flould be brufhed over once or twice with hot fize, diluted with two thirds of water, if it be of the common Ilrength. The priming fhould then be laid on with a brufh as even as poffible; and fhould be formed of a fize whofe conffitence is betwixt the common kind and ghe. mixed with as much whiting as will give it a fufficient body of colour to hide the furface of whatever it is laid upon, but not more.

If the furface be very clean on which the priming is ufed, two coats of it laid on in this manner will be fufficient ; but if, on trial with a fine wet rag, it will not receive a proper water polifh on account of any inequalities not fufficiently f!lled up and covered, two or more coats mult be given it ; and whether a greater or lefs number be uled, the work fhonld be finoothed, after the laft coat but one is dry, by rubbing it with the Duch rufhes. When the laft coat is dry, the water polifh fhould be given, by palfing over every part of it with a fine rag gently moiltened, till the whole appear perfectly plain and even. The priming will then be completed, and the work ready to rective the painting or coloured varnih ; the relt of the proceedings being the fame in this cafe as where no priming is vifed.

When wood or leather is to be japanned, and no priming is ufed, the beft preparation is to lay two or three coats of coarfe varnifh compofed in the following manner :
"Take of rectified fpirit of wine one pint, and of coarfe feed lac and refin each two ounces. Diffolve the feed lac and refin in the fpirit; and then ftrain off the varnifh."

This varnith, as weil as all others formed of fpinit of wine, mult be laid on in a warm place; and, if it can be conveniently managed, the piece of work to be varnifhed flould be made warm likewife: and for the fame reafon all dampnets flow be be avoided; for cither cold s:r moillure chills this kind of varnifh, and presents its taking proper hold of the fubflance on which it is laid.

When the wor's is fo prepared, or by the priming with the compufition of fize and whiting above deferibed, the proper japan ground mutt be laid on, which is much the beft furmed of fhell-iac varnifh, and the colonr defited, if white be not ill quellion, which demands a peculiar treatment, or great brightnefs be not required, when alfo other means mult be purfued.

The colours ufed with the fhell-lac varnith may be any pigmen:s whatever which give the teint of the ground defired; and they may be mised together to form brouns or any compound colours.

As metals never require to be undercoated with whiting, they may be treated in the fame manner as wood or leather, when the undercoat is omitted, except in the inftances particularly fpoken of below.

White $\mathscr{Y}_{A F A N}$ Grounds. - The forming a ground perfeetly white, and of the firf degree of hardnefs, reVol. IX. Part I.

## 73 ] J A P

main; hither a defideratum, ur matter fougit for, in anan. the a t of japanning, as there are no fubftances which form a very hard varnifh but what have tos much colour not io deprave the whitenefs, when laid on of a due thicknefs over the work.

The neareft approach, however, to a perfeet white varnih. already known, is made by the following compofition.
" Take flake white, or white lead, wafhed over and ground up with a fixth of its weight of Aarch, and then dried; and temper it properly for fpreading with the maltich varnifh prepared as under the article Varलish.
"Lay thefe on the body to be japanned, prepared cither with or without the undercoat of whiting, is the manner as above ordered; and then varnifh it over with hive or fix coats of the following varnifh:
"Provide any quantity of the belt feed-lac ; ang pick out of it all the cleareft and whitelt grains, refurving the more coloured and fouler parts for the coa le varnihes, fuch as that ufed for priming or preparing wond or leather. Take of this picked feed-lac two ounces, and of gum animi three ounces; and dif. folve them, being previoully reduced to a grofs powder, in about a quart of fpirit of wine ; and Arain off the clear varnifh."

The fecd-lac will yet give a flight tinge to this compolition; but cannot be omitted where the varnifh is wanted to he hard; though, when a fofter will anfwer the end, the propurtion may be diminified, and a litthe crude turpentine added to the gum-animi to take off the brittlenefs.

A very good varnifh, free entirely from all hrittlenefs, may be formed by dilfulving as much gum animi as the cil will take, in old nut or poppy oil ; which muit be made to boil gently when the gum is put into it. The ground of white colour itfelf may be laid on in this varnif, and then a coat or two of it inay be put over the ground; but it mut be well diluced with oil of turpentine when it is ufed. This, though free from brittlenefs, is neverthelefs liable to fuffer by being indented or bruifed by any flight frokes; and it will not well bear any polith, but may be brought to a very fmooth furface without, if it be judicioully managed in the laying it on. It is likewife fomewhat tedious in drying, and will require fome time where feveral cuats are laid on ; as the lalt onghi not to contain much oil of turpentine.

Bhue Jasan Grounds. - Biue japan grounds may be formed of bright Pruffian blue, or of verditer glazed over by Pruffian blue, or of fmalt. The coluur may be beft mixed with fhell-lac varnifh, and brought to a polithing fate by five or lix coats of varnith of feed. lac: but the varnilh, nevertheleis, will fumewhat injure the colour by giving to a true blue a calt of green, and fouling in fome degree a warm blue by the yellow it contains: where, therefore, a bright blue is required, and a lefs degree of hardnefs can be difpenfed with, the method before dirceted in the cale of white grounds mutt be purfued.

Red. \%ATAN Grounds. - For a fearlet japan ground, vermilion may be ufed : but the vermilion has a glaring effect, that $r \in n d e r s$ it much $l e f s$ beautiful than the crimfon produced by glazing it over with carmine or fine lake; or even with rufe-pink, which has a very I good

Japan. good effect ufed for this purpofe. Fur a very l, right crimfon, neverthelefs, inflead of glazing with carmine, the Indian lake fhould be ufed, diffolved in the fpirit of which the varnif is compounded, which it readily admits of when grood: and, in this eafe, intead of glazing with the thell lac varnifh, the upper or polifhing coats need only be ufed; as they will equally rec.ive ant convey the tinge of the Indian lake, which may be actually diffolved by fpirit of wine : and this will be found a much eheaper method than the uling carmine. If, neverthelefs, the higheft degree of brightnels be tuquired, the white varnifies mult be ufed.

Yellow $\neq$ fipan Grounds - For bright yellow grounds, the king's yellow, or the turpeth mineral, flould be employed, either alune or mixed with fine Dutch pink : and the cffect may be fiil more heightened by diffolving powdered turnerie root in the firit of wine of which the upper or polifhing coat is made ; which fpirit of wine mult be ftrained from off the dregs before the feed-lac be added to it to form the varnith.

The feed-lac varrifa is not equally injurious here, and with greens, as in the cafe of other colours ; becatef, being only tinged with a reedifh yellow, it is little more than an adoition to the force of the colouts.

Ydlow grounds anay be likewife formed of the Duteh pink only; which, when grood, will not be wanting in brightuefs, theugh extremely cleap.

Grach 7 APs.sN Grounds.-Green grounds may be produced by mixing the king's yellow and bright Pruffian blue, or rather the tuipeth mineral and Pruffian blue; and a cheap, but foulk kind, by verciegris with a little of the abovementioned yellows, or Dutch pink. But where a very bright giten is wanted, the cryftals of verdegris, called dijfilled verdegris, foould be emploged; and to heighten the effeet they fhould be laid on a ground of leaf-guld, which renders the colour extremdy brilliant and pleating.

They may any of them be ufed fuccefsfully with good feed-lac varnih, for the reafon before given; but will be fill brighter with white varnifh.

Orange colurred 'Y AP.an Grounds.-Orange-colomed japan grounds may be formed by mixing vermition or ied-lead with king's ycllow, or Dutch pink; or the orange-lae, which wilh make a brighter orange ground than ean be produced by any mixture.
Purple ${ }^{\text {FiPAN }}$ Grounds.- Purple japan grounds may be produced ly the mixture of lakeand Pruffian blue; or a fouler kind, by vermulion and Pruffian blue. They may be treated as the reft with refpect to the varnih.

Black $\mp$.ipan Grounds to be prolluced without Heat.Black grounds may be formed by either ivory-black or lamp-black: but the former is preferable where it is perfectly good.

Thefe mad be always laid on with fhell-lac varnifh; and have their upper or polifhing coats of common feed-lac varnifh, as the tinge or foulnefs of the varnifh can be here no injury.

Commion Black ${ }^{\text {Fatan }}$ Grounds on Iron or Copper, produced by means of Heat.- For forming the common black japan grounds by means of heat, the piece of work to be japanned muft be painted over with drying ciil; and, when it is of a moderate drynefs, munt be put into a flove of fich degree of heat as will change the oil to black, without burning it fo as to dellroy or yeraken its tenacity. The flove thould not be too hot
when the work is put into it, nor the heat increafed Jups too falt; either of which errors would make it blỉer : but the flower the heat is angmented, and the longer it is continued, provided it be reftrained within the due degree, the harder will be the coat of japan. This kind of varuith requires no polif, haviug received, when properly managed, a fufficient one from the heat.

The fine Tortoife- Ifell Fap AN $^{\text {Ground produced ly means }}$ of Heat. - The belt kind of tortoife-fhell ground produced by heat is not lefs valuahle for its great hardnefs, and enduring to be made hotter than boiling water without damage, than for its beautiful appearance. It is to be made by means of a varnifu prepared in the following manner:
" 'lake of good linfed oil one gallon, and of umbre half a pound: boil them together till the oil become very brown and thick: ftrain it then throurg a coarfe cloth, and fet it again to boil ; in which tlate it mult be continued till it acquire a pitchy condiftence; when it will be fit for ufe."

Having prepared thus the varnin, clean well the iron or copper plate or other pieces which is to be japanned; and then lay vermilies tempered with fh-11lac raruinh, or with drying wil diluted with oil of turpentine, very thinly, on the places intended to imitate the more tranfparemt parts of the tort oife thell. When the vermilion is dry, lorufh over the whole with the black varnih, tempered to a due confillence with oil of turpentine; and when it is fet and firm, put the work into a Alove, where it ray undergo a very ttrong heat, and mult be continued a conliderable time; if even three weeks or a month, it will be the better.
This was given amonglt other receipts by Kunckel; but appears to have been neglected till it was revived with great fuccefs in the Binningham manufactures, where it was not only the ground of fuuff-boxes, dref $f_{3}$ -ing-boxes, and other fuch leffer pieces, but of thofe beautiful tea-waiters which have been fo jultly enteemed and acmired in feveral parts of Europe where they have been fent. This ground may be decorated with pain ing and gilding, in the fame iratmer as any other varniflied furface, which had bell be done after the ground has been duly lardened by the hot tlove; but it is well to give a fecond annealing with a more gentle lieat after it is finifhed.

Metbod of painting $\tilde{J}_{\text {APAN }}$ IVork. - Japan work ought properly to be painted with colours in varnih; though, in order for the greater difpatch, and, in fome very nice works in fmall, for the freer ufe of the pencil, the colours are fometimes tempered in oil; which fhould previounly have a fourth part of its weight of gumanimi diffolved in it ; or, in default of that, of the gunis fandarac or maltich. When the uil is thus ufed, it thould be well diluted with fpirit of turpentine, that the colours may be laid more evenly and thin; by which means, fewer of the polining or upper coats of varnifh become neceffary.

In fome inflances, water colours are laid on grounds of gold, in the manner of other paintings; and are belf, when fo ufed, in their proper appearance, without any varnifh over them ; and they are allo fometimes fo managed as to lave the effect of emluffec work. The colours empluyed in this way, for painting, are bett

## J A P

above three parts. Add to it half an ounce of pearlafhes, falt of tartar, or any other alkaline falt, heated red-hot, and powdered, as well as it can be without much lofs of its heat. Shake the mixture frequently for the fpace of half an hour; before which time, a great part of the phlegm will be feparated from the fpirit, and will appear, together with the undiffolved part of the falts, in the bottom of the bottle. Let the Spirit then be poured off, or freed from the phlegm and falts, by means of a tritorium or feparating funnel; and let half an ource of the pearlafhes, hcated and powdered as before, be added to it, and the fame treatment repeated. This may be done a third time, if the quantity of phlegm feparated by the addition of the pearl-afles appear conliderable. An ounce of alum reduced to powder and made hot, but not burnt, mult then be put into the f(piric, and fuffered to remain fome liours ; the buttle being frequently faken: after which, the fpirit, being poured off from it, will be fit for ufe."

The addition of the alum is neceflary, to neutralize the remains of tbe alkaline falt or pearl-afhes; which would otherwife greatly deprave the fpirit with re pect to varnifhes and laquer, where vegctale colours are concerned; and mult confequently render anether ditililation neceffary.

The manner of ufing the feed lac or white varnifhes is the fame, except with regard to the fubitance uffd in polifhing; which, where a pure white or great clearaefs of other colours is in quettion, fhould be itfelf white : whereas the browner forts of polifhing duft, as being cheaper, and doing their bufinefs with greater difpatch, may be ufed in other cafes. The pieces of work to be varnithed flould be placed near a fire, or in a room where there is a flove, and made perfectly dry ; and then the varnifh may be rubbed over them by the proper brufhes made for that purpofe, bigisning in the middle, and paffing the bruth to one end; and then with anuther flroke from the iniddle, pafing it to the other. But no part mould be crofled or twice paffed over, in forming one coat, where it can poflibly be avoided. When one corit is dry, ariother mult be laid over it; and this mult be continued at leat five or fix times, or more, if on trial there be nut fufficient thicknefs of varnith to bear the poluh, without laying bare the painting or the ground colour underneath.

When a fufficient number of coats is thus laid on, the work is fit to be polithed : which mult be done, in common cafes, by rubbing it with a rag dippes in Tripoli or pumice-Itone, commonly called rittenfone, finely powdered: but towards the end of the rubbing, a little oil of any kind flould be ufed along with the powder; and when the work appears fufficiently bright and glofly, it fhould be well rubbed with the vil alune, to clean it from the powder, and give it a till brighter luthe.
In the cafe of white grounds, inftead of the Tripoli or pumice-fone, fine putty or whiting mult be ufed; both which fhould be wafhed over to privent the danger of damaging the work from any fand or cuither gritty matter that may lappen to be commixed with them.

It is a gieat improvement of a'l ... 's of ippa: work, to harden the yarn, if means ut heat; wat

## J A C [ $7^{6}$ ] J A R

Jatheth in every degree that it can be applied fhort of what
il
Jaquelot. more firm and flrong texture. Where metals form the body, therefore, a very hot fove may be ufed, and the pieces of work nar be continued in it a confiderable time; efpecially if the heat be gradually increafed: but where wood is in quelliun, heat mull be fparingly ufed, as it would otherwife warp or harink the body, fo as to injure the general ligure.

JAPHETH, the Ion of Noah. His defeendants poffeffed all Europe and the ifles in the Mediterranean, as well thofe which belong to Europe, as others which depend on Alia. 'Pliej' had all Afia Minor, and the northern paris of Afia above the fonrees of the Tigris and Euphrates. Noah, when he blefied Japheth, faid to him, "God hall ealarge Japheth, and be flall dwell in the tents of Shem; and Canam fhall he his fervant." This bleffing of Noah was accomplifhed, when the Greeks, and after them the Runans, carried their conquefts into Alia and Africa, where were the dwelling and dominions of Shem and Canaan.

The Cons of Japheth were Gomer, Magog, Madai, Javan, Tubal, Mefhech, and Tiras. The feripture fays, "that they peopled the ines of the Cenriles, and fettled in different countrics, each accurding to his language, family, and prople." It is fuppofed, that Gomer was the father of the Cimbri, or Cimmerians; Magog of the Seythians; Madai of the Macedonians or Medes ; Javan of the Ionians and Grecks ; Tubal uf the Tibarenians: Mefhech of the Mufovites or Ruf. fians; and 'liras of the Thracians. By the ines of the Gentiles, the Hebrews undertand the illes of the Mediterranean, and all the countries feparated by the fea from the continent of Paktine ; whither alfo the Hebrews could go by fia only, as Spain, Gaul, Italy, Greece, A lia Minor.

Japhetl! was known by profane authors under the name of Japetus. The poets make him the father of heaven and earth. The Greeks beleve that he was the father of their race, and aekouledged nothing more ancient than him. Befides the feven fons of Japlieth above mentioned, the Septuagint, Eufebius, the Alexandrian Chronicle, and St Aullin, give lim an eighth called Eliza, who is not mentioned either in the Hebrew or Chaidee, and the eallern people affirm that Jipheth had eleven children.

JAPYDIA (ane. geog. ), a weftern diftrict of Illyricum anciently threefold; the firl Fapyuitaextending from the forings of the '「imavus to litria; the fecond, from the river Arfia to tbe river Tedanius; and the third, salled Inalpina, fituated in mount Albius and the other Alps, which run out above Inria. Japodes, or Japydes, the people. Nuw conttituting the fouth part of Carniola, and the wefl of Aultrian Croatia.

JAPYGIA, Calabria, aneiently fo called by the Greeks. Japjges, the people.

JAPYGIUNi (anc. geog.), a promontory of Calabria; called alfo Salentinum. Now Capo di S. Maria di Leuca.

JAQUELOT (lfaac), a celebrated French Proteflant divine, born in 1647, at Valfy in Champagne, where his father was minitler. The revocation of the edict of Nantz obliging lim to quit France, he took sefuge fir't at Heidelberg, and then at the Hague, where he procured an appointment in the Walloun church. Here he continued till that capital was taken
by the king of Pruffia, who, hearing him preach, made him his French miniter in ordinary at Berlin ; to which city he removed in 1702 . While he lived at Berlin, he entered into a warm eontuverfy with M. Bayle on the doctrine advanced in his dictionary favouring manichæufu, which cuntinued until death impufed filence on both parties : and it was in this dif. pute that M. Jaquelot openly declared in favour of the Remonilrants. He wrote, among other works, $t$ Difertations fur l'exifence de Dieu. 2. Difertations fur le Meffie. 3. Lettres a Meffeures les Prelats de PEglife Gallicane. He was employed in tinithing an impoitant work upun the divine authority of the huly fcriptures, when he died fuddenly in 1708, aged 61.

JAR, or JARR, an earthen pot or pitcher, with a big belly and two handles. - The word comes from the Spanith jurra or jurro, which lignify the fame.

JaR is uied for a luse of mealure or fixed quantity of divers things.-. The jar of oil is from 18 to 26 gallons; the jur of grech ginger is about 100 pounds weight.

JARCHI (Solomon), otherwife Rufchi and Ifaaki Solomon, a famons rabbi, burn at l'royes in Champagne, who flourifhed in the 12 th century. He was a perfect matter of the talmud and gemara; and he filled the poftils of the bible with fo many talmudical reveries, as totally extimguithed both the literal and moral fenfe of it. A great part of his eommentaries are printed in Hebrew, and lome have been tranfated into Latin by the Chrittians. They are all greatly efteemed by the Jews, who have bettuwed on the author the title of prince of commentators.

JARDYN, or Jardin, (liarel du), painter of converfations, landfeapes, \&c. was born at Amfterdam in 1640 , and became a difaple of N•cholas Berchem. He travelled to Italy whilit he was yet a young man; and arrivingat Rome, hegave himftif up alternasely toltudy and dilfuation. Yet, amidn this irregularity of conduct, his pruticiency in the ant was furprifing ; and his paintings rofe into luch high repute, that they were exceedingly coveted in Rome, and bought up at great prices. With an intention to vilit his native city he at lalt left Rome; but paffing through Lyons, and meeting fome agreeable cumpanions, they prevailed on him ro flay there for fome time, and he found as much employment in that city as he could poffibly undertake or execute. But the profits which arofe from his paintings were not proportionable to his profufion; and in order to extrieate himfelf from the encumbrances in which his extra. vagance had involved him, he was induced to marry his hottefs, who was old and difagreeable, but very rich. Mortitied and afhamed of that adventure, he returned as expeditiounly as puffible to Amfterdam, aceompanied by lis wife, and there for fome time followed his prufeffion with full as much fuccefs as he had met with in Italy or Lyons. He returned to Rome the fecond time ; and after a year or two fpent there in his ufual exiravagant manner, he fettled at Venice. In that city his merit was well known before his arrival, which procured him a very honourable reception. He lived there highly careffed, and continually employed; but died at the age of 38 . He was fumptuoufly interred, out of sefpect to his talents; and although a Protellant, permitted to be laid in confecrated ground. This painter, in his colouring and touch, sefembled his mafter Ber-
chem: but he added to that manner a force which difinguifhes the great mafters of Italy; and it is obferved, that moit of his pietures feem to exprefs the warmth of the fun, and the light of mid day. His pictures are not much encumbered; a few figures, fome animals, and a little landicape for the back-grounds, generally comprife the whole of his compofition. However, fome of his fubjects are often more extenfive, containing more objects, and a larger defign. His works are as much fought after, as they are difficule to be met with.

JARGON, a kind of precions tone, of the nature of the diamond, but fofter; found in Brafil according to M. de Enmare ; but in Ceylon, according to M. Rome de L'Ifle. Its fpecific gravity is nearly equal to that of the ponderous fpar, beine $4+16$. Its cryltals confit of two tetrahedral pyramids of equal lides, feparated by a hort prifm ; fo that che jargon is properly of a :.odecahedral form. According to Come lapidaries, the jargon comes nearelt to the fapphire in hardnefs; and as they have when cut and polifihed a great refemblance to the diamond, they are alfo called by fome Joft diamonds ; and one may be eafily impofed upon in purchafing thefe for the true kind, when they are made up in any fort of jewellery work. Ori expoling this flone to a violent fire, MI. D'Arcot found the furface a little vitrified where it fluck to the porcelain tefl in which it was fet ; whence it appears, that the jargon has not the lealt refemblance to the diamond, which is dettructible by fire. See Diamond.

JaRIMUTH, Jarmuth, or Ferimoth, Jofh. xv. a town reckoned to the tribe of Judah, four miles from Eleutheropolis, weflward, (Jerome). Thought to be the fame with Ramoth and Remeth, Jofhua xix. and Nelen. x. 2. (Reland).

JARNAC, a town of France, in Orleanois and in Angumois, remarkable for a victory gained by Henry III. over the Huruenots in 1569 . It is feated on the river Charente, in W. Long. 0.13. N. Lat. 45. 40.

JAROSLOW, a handfome town of Poland, in the palatinate of Ruffia, with a Arong citadel. It is remarkable for its great fair, its handfome buildings, and a battle gained by the Swedes in $16 ; 6$, after which they took the town. It is feated on the river Saine, in E. Long. 22. 23. N. Lat. 49. ;8.

JASHER (The book of). This is a book which Jothua mentions, and refers to in the following paffage: "Ard the fun flood fill, and the moon flayed, until the people had avenged themfelves upon their enemies: is not this written in the book of Jafner ?"'

It is difficult to determine what this book of "Fuber, or "the upright," is. St Jerom and the Jew's believed it to be Genefis, or lome other boos of the Pentatuch, wherein God foretold he would do wonderful things in favour of his people. Huctius fuppofes it was a book of morality, in which it was laid that God would fubvert the courfe of nature in favour of thofe who put their trun in him. Others pretend, it was public annals, or records, which were Ityled jufice or upriobt, becaufe they contained a faithful account of the hifory of the Ifraelies. Grotius believes, that this book was nothing elle but a fong, made to celchrate this miracle and this victory. This feems the more probable opinion, becaufe the
words cited by Jofna as taken from this work,
"Sun, fland thon till upon Gibeon, and thou moon in the valley of Ajalon," are fuch poetical exprefions as do not fuit with hiftorical memuirs; befides that in the 2 d book of Samuel (i. 18.) mention is made of a hook under the fame title, 012 account of a fong made on the death of Saul and Jouathan.

JASIONE, in botany : A genus of the monogamia order, belonging to the fyngenefia clats of plants; and in the natural method ranking under the $29^{\prime} / 1$ order, Camparacea. The common caly: is ten-leaved; and the corolla has five regular petals; the caplule bentath, two celled.

JASMiNE. See Jasmintir.
Arabian folsura:e. See Nyctanthes.
J $\ddagger$ SMINUM, Jasminf, or Fofflainine-tree, in botany:A genus of the monozynia urder, belonging to the diandria clafs of plants; and in the natural method ranking under the 4 th order, Sepiaricie. The corolla is quinquefid, the berry dicoccous; the feeds arillated, the antherse within the tube.

Species. 1. The officinalis. or common white jafmine, hath flarubby loug ilender italks and branches, rifing upon fupport 15 or 20 feet laigh, with numerous white flowers from the joints and ends, of a lery fragrant odour. There is a valiety with white-Ariped, and another with yellow- Ariped leaves. 2. The fruticans, or flarubby yellow jafinine, hath frrubby, anguldr, trailing flalks and branclies, rifing upom fupport eight or ten feet high; trifoliate and timple alternate leaves; with yellow flowers from the fides and ends of the branches, appearing in June; frequently producing berries of a black colour. This fpecies is remarkable for fending up many luckers from its roots; often fo plentifully as to overfpread the ground, if not taken up annually. 3. The humulis, or dwarf yellow jafmint, hath fhrubby firm flalks, and ansular branches, of low, fomewhat robult and bufhy growth; broad, trifuliate, and pinnated leaves; and large yellow flowers in July, fometimes fucceeded by berries. 4. The grandiforum, or great.flowered Catalonian jafmine, hath a flrubby firm upright Item, branching out into a fpreading head from about three to fis or eight feet high, with large flowers of a bluhtred colur without, and white within, appearing from July to November. Of this there is a variety with femi-double flowers, having two feries of petals. 5. The azoricum, or azorian white j ffine, hath frubby, long flender flalks and brauches, rifing upon Suppoit 15 or 20 feet high, with pretty large flowers of a pure white colour: coming out in loofe buncbes from the ends of the branches, and appearing molt part of the fummer and zutumn. ©. The odoratifimum, or moll fiveet-fented yellow Indian jafmine, hath a fhrubby upright flatk branching erect, without fupport, fix or eight feet high, with bright yellow flowers in bunches from the ends of the branches; flowering from July till OEtober, and emitting a molt fragrant odour.

Cullure. The three forft fpecies are fufficiently hardy to thrive in this climate without any felter. They may be eafily propagated by layers and cuttings; and the Atriped varities by grafting or budding on. Alocks of the common kind. - The wher three fpecies, which are tender, may alfo be increafed by layers, or 5. Seeds,

## J A S [ 78 [ $] \quad \mathrm{J}$ A T

 feeds, or by grafing and budding them upon the common white and firubby yello:s jafmine. They require flelter in a green houfe in winter, and therefore mult always be kept in pots to move them out and in occafioually. 'The pots mult be filled with light, rich earth, frequently watered in fummer, and abont once a week in winter, but always moderately during that feafont. Prune off all the decayed wood at any time when it appears, and fhorten or retrench the rambling fhoots as you fee occafion, to preferve the heads fonewhat regular; managing thein in other refpects as the common green-houfe plants.JA ON, the Greck hero who undertook the Argonantic expedition, the hiftory of which is obfcured by fabulous traditions, flourifhed about 937 B. C. See Arguiauts.
J Spachates. See Jade stose.
JASPER, in natural hillory, a genus of Rones belonging to the filiceous clafs. According to Cronttedt, all the opaque flints are called by this name whofe texture refembles dry clay, and which cannot be any other way diltinguifhed from fints, except that they are more catily melted; which perhaps may alfo proceed from a mixture of iron. The fpecies are,

1. Pure jafper; which, Cronftedt informs us, cannot be decompounded by any means hitherto known; tho' Mr Kirwan fays that it contains 75 per cent. of filex ; 20 of argil, and about live of calx of iron. The fpecific gravity is from 2680 to 2778 . It is found of different colours: viz. green with red dots from Egypt, called alfo the beliolrope, or blood fone; quite green from Bohemia; red from italy, called there dispro rolfo, or yellow, called melites by the ancients; a name, according to Pliny, of the fame import with male coloris. It is alfo found red with yellow fpots and veins, in Sicily, Spain, and near Conftantinople, called by the Italians diaffro florido; or black from fome places in Sweden, called by the Italians faragone antico.
2. Jafpis martialis, or finople, containing iron. This is a dark red flone containing 18 or 20 per cent. of metal. Near Chemnitz, where it forms very confiderable veins, as Brunnich informs us, it has Srequently fpecks of marcafite, cubic lead ores, and blend. It has likewife fo much gold as to be worth working: there is likewife a Itriped finople of various colours. Theie are feveral varieties differing in the coarfenefs and finenefs of their texture, as well as the fhade of their colour ; varying from a deep brown to a yellow. The latt is attracted by the magnet after calcination.

Cronftedt obferves that jafper, when frefh broken, fo nearly refembles a bele of the fame colour, that it can only be diflinguifhed by its hardnefs. In the province of Dalarne in Sweden, it is found in a kind of hard fand -ftene: in other places it is found within fuch unctuous clefts as are ufually met with in Colnifl clay, red chalk, and other fubflances of that kind. There are likewife fome jafpers that imbibe water; from whence, and other confiderations, our author is of opinion that they have clay for their bafis, notwithfanding their hardtefs. Aceording to Magellan, it refilts the blowpipe per $\int$ c, and is only partially foluble with the mineral aikali; leparating into fimall particles with effervefeence: with borax or microcofmic falt it melts without any ef. jervefence. Bergman, in his Sciagraphia, informs -a, that it is compofed of filicenus earth united to a
clay very fuil of iran. The mineral acids have no ef. Jafinnyx, fect upon it in a fhort time, but corrode it by fume Jato $\mathrm{o}_{i}$ ha. monthis iminerfion. On treating a fmall piece of green jafper with vitriol:c acid, fome cryftals of alum and green vitriol were obtained; which fhows that iron and clay are ingredients in its compofition. M. Daubenton mentions is varicties of this fubftance, 1. Green, from Bohemia, Silefia, Siberia, and the fhores of the Cafpian feã; which feems to be the pavoniunn of Aldrovandus. 2. The diafpro roffo, or red jafper ; lefs common, and in fmaller maffes, than the green. 3. Yellow from Freyberg and Rochtliz; fometimes of a citron colour, and appearing as if compofed of filky filaments; commonly called the filk jafper. 4. Brown from Dalecarlia in Finland and Sweden. 5. The violet from Siberia. 6. The black from Sweden, Saxony, and Finland. 7. The bluith grey, a very rare fpecies. 8. The milky white mentioned by Pliny, and found in Dalecarlia. 9. The variegated with green, red, and yellow clouds. 10. The blood itone, green with red fpecks, from Egypt, which was fuppofed to thop the blood. 11. The veined with various colours. Sumetimes thefe veins lave a dillant refemhlance to various letters, and then the jafper is named by the French ja/pe grammatique. Some of thefe found near Rochelle in France, on account of their curious variety in this refpect, are named polysrammatigues. 12. The jafper with various coloured zones. 13. That called forito by the Italians; which has various colours mixed promifcuoufly without any order. 14. When the jafper has many eolours together, it is then (very improperly) called univerfal. 15. When it contains fome particles of agate, it is then called agatifcd jafper.

JASPONYX, in natural hittory, the puret horncoluured onyx, with beautiful green zones, which are compoied of the genuine matter of the finelt jafpers. See Jasper and Onyx.

Jatropha, the cassada plant: A genus of the monodelphia order, belonging to the monœecia clafs of plants; and in the natural method ranking under the 38 ih order, Tricoccu. There is no male calyx ; the corolla is monopetalous, and funnel-haped; therc are ten flamina, one alternately longer than the other. There is no female calyx ; the corolla is pentapetalous, and patent ; there are three bifid flyles; the cappule is trilocular, with nue feed in each cell. There are nine

Species. Of thefe the moft remarkable are the following: 1. The curcas, or Englifh phyfic-unt, with leaves cordate and angular, is a knotty fhrub growing about 10 or 12 feet high. The extremities of the branches are covered with leaves; and the flowers, which are of a green herbaceous kind, are fet on in an umbel faflion round the extremities of the branches, but efpecially the main ftalks. Thefe are fuccieded by as many nuts, whofe outward tegument is green and hufky; which being pected off, difeovers the nut, whefe fhell is black, and eafily cracked: This contains an almond-like kernel, divided into two parts; between which feparation lie two milk white thin membranactous leaves, eafily feparable frum each other. Thefe have not only a bare refemblance of perfect leaves, but have, in particular, every part, the ftalk, the middle rib, and tranfuerfe ones, as vifible as any leaf whatfoever. 2. The guffypifolia, cotton-leaved jatropha, or belly-ach bufh, the leaves of which are quiriqueparite, with lobes ovate

Jatropha. ovate and entire, and glandular branchy briftles. The ftem, which is covered with a light greyifh bark, grows to about threc or four feet high, foon dividing into feveral wide extended branches. Thefe ate neither decorated with leaves nor fowers till near the top, which is then furrounded by the former: Their foot-flall-, as well as the young buds on the extremity of the branches, are guarded round with flifi hairy bifths, which are always tipt with glutinous liquid drous. From anong thefe rife feveral fmall deep.red pentapetalous llowers, the pillil of each being thick fet at the top with yellow farinaceous dult which blows off when ripe : thefe flowers are fucceeded by hexagonal hufky blackifl berries, which when ripe open by the heat of the fun, emitting a great many fmall dark coloured fceds, which ferse as food for grounddoves. The leaves are few; but feldem or never drop off, nor are eaten by vermin of any kind. 3 . The mul. tilida, or French phyfic-nut, with leaves many parted and polifhed, and ftipules britly and multind, grows to be ten fect high. "The main Halls divides into very few brancles, and is covered with a greyith white bark. The leaves fland upon fix-inch footfalks, furrounding the main flalk, generally near the top, in an irregular order. The flowers grow in bunches, unbel fafhion, upon the extremitits of each large ltalk, vory much refombling, at their firlt appearance, a bunch of red coral: thefe afterwards open into finall five laaved purple fowers, and are fucceeded by nuts, which refemble thole of the firf species. 4. The manihot, of bitter caftada, lias palmated leaves; the lobes lanceolate, very eitire; and polithed. 5. The janipha, or fureet cafficia, has palmated leaves, with lobes very eatire; the intermedate leaves lobed vith a finus on buth fides. 6 . The cialtica, with ternate leaves, clliptic, very entise, hoary underncath, and longly petioled. See ligures of the wo lant on Plates CCXLVIII. and CCXL.IX. which renders a more particular cefcription unneceftiry.

Pruperties, \&c. The fart fpecies, a native of the Welt Inoies, is flanted round negro gadens. A decuction of the leaves of $i$, and of the fecond fpecies (which grows wild), Dr Wright informs us, is otten ufed with advantage ir fafmodic belly-ach attended will vomiting: it fits eafier on the fomach than any thing tlie, and feldom fails to bring about a difcharge by fool. The third fpecits, a native of the fame countries, is cultimated these as an ornamental forub. The feeds of all the threc are dratlic purgatives and emetics; ard they yield. by decoction, an oil of the fame ufes and virtues as the oleum ricini. See Ricisus.

The 4 th and 5 thi frecies, she janiplia and manihot, are natives of Africa and the Weft indies, where they are cultisated as articles of food. It is difficult, Dr Wright fays, to diftinguifh the bitter from the fwett caflada by the rocts: but it will be beft to avoid thefe of the caffada that bears flowers, 20 it is the bitter, which is poifonous when raw.

The root of bitter caffada has no fibrous or woody filaments in the heart, and neither boils nor roafts foft. The fweet caflada has all the oppufite qualities. The bitter, however, nay be deprived of its noxious qualities (which refide in the juice) by heat. Caflada bread, therefore, is made of both the bitter and fweet, thus:- The rocts are wafted and feraped clean; then
grated into a tub or trough : after this they are put into a hair bag, and Atrongly preffed with a view to §queeze out the juice, and the meal or farina is dried in a hot ftone-balon over the fire: it is then made into cakes. It alfo makes excellent puddings, equal to millet. - The forapings of frefl bitter caffada are fuccefsfully applied to ill-difpofed ulcers.-...Caffada roots yield a great quantity of tlarch, which the Brafilians export in little lumps under the mame of tapicac. According to Father Labat, the fmall bits of manise which have efcaped the grater, and the clods which have not pafted the fieve, are not ufelefs. They are dried in the flove after the flour is roafted, and then pounded in a mortar to a fine white powder, with which they make foup. It is likewife ufed for making a kiud of thick coarfe caffada, which is roafted till ahnoit burnt ; of this, feimented with molaffes and Weft-Lndia potatoes, they prepare a much elteemed drink or beverage called ouycou. This liquor, the favourite driak of the natives, is fometimes made extremely itron: efpecially on any great occafion, as a feaft: with this they get intoxicated, and, remembering their nld quarrels, maffacre and murder each other. Such of the inhabitants and workmen as have not wine, drink ouycou. It is of a red-colour, ftrong, nourifhing, refrething, and eafly inebriates the inhabitants, who foun accuftom themfelves to it as eatily as beer.

The 6th fpecies is the Feved Guthenfis of Aublet $\dagger$, + Hifoire or tree which yields the elatlic retin called caunthouc des Plantes or India rubber; for a particular account of which, fee de la Guiang the article Caoutchouc. Our figure is copied from Frungoifeo Aublet's tab. 335. and not from the erroneous plate ${ }^{\text {P. } 57 .}$ given in the Ala Pariftata.

JAVA, a large ifland of the Eall Indies, lying between $105^{\circ}$ and $116^{\circ} \mathrm{E}$. Long. and from $6^{\circ}$ to $8^{\circ} \mathrm{S}$. Lat. extending in length 700 miles, and in breadth abcut 100 . Is is fituated to the fouth of Borneo, and fouth eafl from the peninfula of Malacca, having Sumatra lying before it, from which it is feparated by a narrow pallage, now fo famons in the world by the name of the Siruits of Sunda. The country is mountainous and woody in the middle; but a flat coatt, full of bogs and marfles, rerders the air unhealthiul. It produces pepper, iudigo, lugar, tubacco, rice, coffee, cocoa-suts, plantains, cardamoms, and other tropical fruits. Gold allo, but in no gieat quantities, hath been found in it. It is diverfified by many noountains, woods, and rivers; in all which ndinre has very tountifully beftowed her treafires. The mountains are many of them fo high as to be fetn at the diflance of three or four leagues. 'Inat which is called the Blue Mountrin is by far the highelt of them all, and feen the farthcil off at fea. They have frequent and very terrible earthquakes in this if.and, which flake the city of Batavia and places adjacent, to fuch a degrec, that the faht of the lioufes is expected every moment. "The waters in the road are exceffictly agtated, infomuch that their motion relembles that of a boiling pot; and in fome places the earth opene, which affords a ftrange and terrible fpectacie. The inhabitants ane of opinion, that thelc earthquakes pruceed from the nountain Parang, which is full of fulphur, faltpetre, and bitunen. The fruits and plants of this inand are dt] in their feveral kinos excellent, and almoft out of number. There are abundance of forelts fcattered over it, in which are all kinds of will beals, fuch as buffaloes, variety of ferpots, oine of them $o$ an enirmeus fize. Crocodiles are prodigiouny large in Java, and are found chiefly about the m. nthe of rivers; for, teing amphibious animals, they delight molly in marthes and favannahs. This creature, like the tortoife, lays it eggs in the hot fan's, without taking any further care of them; and the fun hatches them at the proper feafon, when they run inflantly int the water. There is, in flort, no kint of animal wauting here: fowl; they have of all forts, and exquifitely gond, efpeeially peacocks, partridgrs, pheafants, wond-pigenns: and, for curiofty, they have the Indian bat, which differs lirtle in form from ours; but its wings, when extended, meafire a full yard, and the body of it is of the fize of a rat. They lave filh in great plenty, and very good; fo that for the value of three pence there may be enough bought to dine fix or feven men. They have likewife a multitude of tortuifes, the fleth of which is very little inferior to veal, and there are many who think it better.

It is faid, that there are in the ifland upwards of 40 great towns, which, from the number of their inhabitants, would, in any other part of the world, merit the title of cities; and more than 4500 villages, befides hamlets, and Atraggling houles, lying very near each other, upon the fea-coalt, and in the neightbourhood of great towns: hence, upon a fair and moderate computation, there are within the bounds of the whole illand, taking in perions of both fexes, and of all ranks and ages, more than thirty millions of fouls; fo that it is thrice as populous as France, which, though twice as big, is not computed to have more than twenty millions of inhabitants.

There are a great many princes in the inand, of which the moft confiderable are, the emperor of Materan, who relides at Katalura, and the kings of Bantam and Japara. Upon the firlt of thefe many of the petty princes are dependant; but the Dutch are abfolute mafters of the greatelt part of the inland, particularly of the north coalt, though there are fome of the prinees beyond the monntains, on the fouth coalt, who ftill maintain their independency. The natives of the country, who are ellablifhed in the neighbourhood of Batavia, and for a tract of about 40 leagues aloug the mountains of the country of Bantam, are immediately fubject to the governor-general The company fend droffards, or commiftaries, among them, who adminifter juttice and take care of the public revenues.

The city of Batavia is the capital not only of this illand but of all the Duteh dominions in India. It is an exceeding fine city, fituated in the latitude of $6^{\circ}$ fouth, at the mouth of the river Jucatra, and in the bofom of a large commodious bay, which may be confidered not only as one of the fafeft harbours in India, but in, the world. The city is furnounded by a rampart 21 feec thick, covered on the outtide with itone and fortified with 22 ballions. This rampart is environed by a ditch 45 yards over, and full of water, efpecially when the tides are ligh, in the fpring. The avenues to the town are defended by feveral forts, each of which is well furnifhed with excellent brafs cannon: no perfon is fuffered to go beyond thefe forts without a paffport. The river Jucatra paffes through
$N^{\circ} 162$.
the midlt of the town, anc forms 15 canals of run nin wat r. all faced with fre Hone, and alorned with trees that are ever gretn: over thefe canals are 56 brideres, befides thofe which lie withont the town. The Itrects are all perfectly ftraight and each, generally \{peaking, 30 feet broad. The houfes are buit of Itone, after the manner of thofe in Holland. The eity is about a league and a half in cireumference, and luas five gates ; but there are ten times the number of houfes without that there are within it. There is a very fine town-houfe, four Calvinitt churches, helides other places of worfhip for all forts of religions, a fpin-huys or houfe of correction, an orphan-houfe. a magazine of fea-ftores, feveral for fpices, with wharfs and cord manufactures, and many other public buildings. 'The garrifon ennfits eommonly of betweel 2000 and 3000 men. Befides the forts mentioned above, there is the citadel of Batavia, a very fine regular fortification, fituated at the mouth of the river, and flanked with four battions; two of which command the fea, and the other two the town. It is in this citadel that the governor general of the Jndies has his palace; over againlt which is that of the director general. who is the next perfon to the governor. The counfellors, and other prineiple officers of the eompany, lave alfo their apatments there: as have likewife the phyfician, the furgeon, and the apotheeary. There are in it, befides, arfenals and magazines furnihed with ammunition for many years. The city of Latavia is not only inhabited by Dutch, French, Portugucfe, and other Europeans, eltablified here on account of trade; but alfo by a valt number of Indians of different nations, Jarancle, Chinefe, Malayane, Negroes, Amboynefe, Armenians, natives of the ife of Bali, Mardykers or Topaffes, Macaffers, Timors, Bougis, \&c. Of the Chinefe, there are, it is faid, about 100,000 in the iffand; of which near 30,000 refided in the eity till the year $17 \% 0$, when the Dutch, pretending that they were in a plot againt them, fent a body of troops into their quarter, and demanded their arms, which the Chinefe readily delivered up; and the next day the governor fent another body, with orders to murder and maffacre every one of the Chintfe, men, women, and children. Some relate there were 20,000 , others 30,000 , that were put to death, without any manner ol trial: and yet the barbarous governor, who was the inftrument of this cruel proceeding, had the affurance to embark for Europe, imagining he had amafled wealth enough to fecure him againtt any profecution in Holland : but the Duteh, finding themfelves detefted and abhoried by all mankind for this piece of tyranny, endtavoured to throw the odium of it upon the gavernor, though he had the hands of all the council of Batavia, except one, to the order for the maffacre. The ttates, therefore, difpateled a packet to the Cape of Good Hope, containing orders to apprehend the governor, and fend him back to Batavia to be tried. He was accordingly apprehended at the Cape; but has never been heard of fince. It is fuppofed he was thrown over-board in his paffage to Batavia, that there might be no farther inquiries into the matter; and it is faid, all the wealth this merciful gentleman had amafled, and fent over before him in fout thips, was caft away in the paflage.

## J A Z

Befides the girrifon here, the Dutch, it is faid. have about 15,000 men in the ifland, either Dutch, or formed out of the feveral nations they lave enflaved; and they have a fleet of between 20 and 30 men of war, with which they give law to every power on the coalt of Afia and A frica, and to all the European powers that vifit the Indian Occan, unlefs we fhould now cxcept the Britih: it was, howeves, but a little before the revolution that they expelled us from our fettlement at Bantam.

JAVELIN, in antiquity, a fort of fpear five feet and an half long; the fhaft of which was of wood, with a fteel peint.- Every foldier in the Roman armics had feven of thefe, which were very light and nender.
JAVELLO (Chryfoftome), a learned Italian Do. minican of the 16 th century, taught philofophy and theology at Bologna, and died about the year 1540 . He wrote a work on philofoply, another on politics, and another on Chriftian ceconomy, which are efteemcd; with notes on Pomponatius, and other works, printed in 3 vols folio.
JAWER, a city of Silefia, capital of a province of the fame name, with a citadel, and a large fquare furrounded with piazzas. It is 12 miles fonthe eaft of Lignitz, 30 fouth-weft of Breflau, and 87 eall of Prague. E. Long. 16 29. N. Lat. 50. 56.

JAUNDICE (derived frum the French jaunife "Jellownefs," of jaune "yellow"); a difeafe confitting in a fufution of the bile, and a rejection thercof to the furface of the body, whereby the whole cxte rior habit is difcoloured. Dr Maclurg is of opinion, that the bile returns into the circulation in this difor-der-hy the courfe of the lymphatics. See MedicineIndex:

## JAWS. See Maxilla.

Locked Fins $_{\text {AF }}$, is a fpafmodic contraction of the low. er jaw, commonly produced by fome external injury affecting the tendons or ligaments. See Medicine. Inder.

## JAY, in ornithology. See Corvus.

Jay (Guy Michael le), a French gentleman, who diltinguithed himfelf by caufing a polyglot bible to be printed at his own expence in 10 vols folio: but he ruined himfelf by that impreflion, firt becaufe he would not feffer it to appear under the name of cardinal Richelieu, who, after the example of cardinal Ximenes, was ambitious of eternizing his name by this means; and next, becaufe he made it too dear for the Englifh market ; on which Dr Walton undertook his polyglot bible, which, being more commodious, reduced the price of M. le Jay's. After the death of his wife, M. le Jay took orders, was made dean of Vezelay in the Nivernois, and Louis XIV. gave him the poit of counfellor of ftate.
JAZER, or Jaser (anc. geog.), a Levitical city in the territory of the Amorrhites beyond Jordan, 10 miles to the weft, or rather fouth-wef, of Philadclpliia, and 15 miles from Efebon; and therefore fituated betweers Philadelphia and Heflbon, on the ealt border of the tribe of Gad, fuppofed to be the 7azorem of Jofephus. In Jeremiah xlviii. mention is made of the fea of Jazer, that is a lake; taken either for an effufion or overflowing of the A rnon, or a lake through which it paffes, or from which it taks its rife.

Yol. IX, Pa:t I.

IBERIA (Spain), fo called by the ancients from the friver Iberus. Iberes the people, from the nominative Iber. See Hispania.

Iberia was alfo the name of an inland country of Afia, having Colchis to the weft, with a part of Pontus; to the north mount Caucafus; on the ealt Albania; and on the fouth Armenia Magna: Now the wellern part of Gcorgia (fee Georgia). Iberia, according to Jofephus, was firt peopled by Twbal, the brother of Gomer and Magog. His opinion is confirmed by the Septuagint; for Meflech and Tubal are by thefe interpreters rendered $M$ Ofochi and Ibcrians. We know little of the hiltory of the country till the reign of Mithridates, when their king, named Artocis, fiding with that prince againft Lucullus, and afterwards againt Pompey, was defeated by the latter with great flaughter; but afterwards obtained a peace, upon delivering up his fons as hoftages. Litle notice is taken of the fucceeding kings by the ancient hiltorians. They were probably tributary to the Romans till that empire was ove:turned, when this, with the other countries in Afia bordering on it, fell fucceflively under the power of the Saracens and Turks.
iberis, sclatica Cresses, or Candy-tuft: Agenus of the filicuofa order, belonging to the tetradynamia clafs of plants; and in the natural method ranking under the 39 th order, Siliquofre: The corolla is irregular; the two exterior petals larger than the interior ones; the filicula poly fpermous, emarginated.

Species. 1. The umbellata, or common candy-tuft, hath herbaceous, fhort, round, and very branchy talks of tufty growth. from about fix to eight or ten inclies high; finall fpear-flaped leaves, the lower ones ferra$t \in d$, the upper entire; and all the falks and branches terminated by umbellate clufters of fowers of different colours in the varieties. 2. The amara, or bitter can-dy-tuft, hath flalks branching like the former, which rife from eight to ten or twelve inches high; fmall, fpear-fhaped, and flighttly indented leaves; and all the branches terminated by racemofe bunches of white flowers in June and July. 3. The fempervircns, commonly called tree candy-tuft, hath low under ीirubby Italks, very branchy and buifhy, rifing to the leight of 10 or 12 inches, with white flowers in umbels at the ends of the brarches, appearing great part of the fismmer. 4. The femperflotens, or ever-flowering flirubbe iberis, hath low underflirubby ftalks "ery branchy', growing to the heiglit of 18 inches, with white flowers in umbels at the ends of the branches, appearing at all times of the year.

Culture. The turo firl kiads, being hardy annuals, may be fowed in any common foil in the month of March, or from that time till inidfummer, and will thus afford a fucceffion of flowers froni June to September, which are fucceeded by great plenty of feeds. The other two are fomewhat teloder; and therefore muft be planted in pnts, in order to be fheltered from the winter-frofts. They ate eafly propagated by flips or cuttings.

IBEX, in zoology. See CApra.
1BIS, in ornithology. See Tantalus.
1BYCUS, a Greek lyric poet, of whofe works there are only a few fragments renaining, flourifled 550 B . C. It is faid, that he was affaffinated by rubbers; and that, when dying, he called upon fome

Beria
Ibycus. one of the murderers fecing fome cranes, faid to his companions, "There are the witneffes of Ibycus's death:" which being reported to the maritrates, the aflaffins were put to the torture, and having confeffed the fact, were hanged. Thence arofe the proverb Ibyci Grues.
ICE, in phyfiology, a folid, tranfparent, and brittle body, formed of fome fluid, particularly water, by means of cold. See Frót.

The younger Lemery obferves, that ice is only a re-eftablifnment of the parts of water in their natural fate; that the mere abfence of fire is fufficient to account for this re-eltablifhment; and that the fluidity of water is a real fufion, like that of metals expofed to the fire; differing only in this, that a greater quantity of fire is neceffery to the one than the other. Gallileo was the firt that obferved ice to be lighter than the water which compofed it: and hence it happeus, that ice floats upon water, its fpecific gravity being to that of water as eight to nine This rarefaction of ice feems to be owing to the air-bubbles produced in water by freezing; and which, being conliderably large in proportion to the water frozen, render the body fo much fpecifically lighter: thefe air-bubbles, during their production, acquire a great expanfive power, fo as to burll the containing veffels, though ever fo ftrong. Sec Congelation, Cold.
M. Mairan, in a differtation on ice, attributes the increafe of its bulk chiefly to a different arrangement of the parts of the water from which it is formed; the icy fkin on the water being compofed of filaments which, according to him, are found to be conftantly and regularly joined at an angle of $60^{\circ}$; and which, by this angular difpofition, occupy a greater volume than if they were parallel. He found the augmentation of the volume of water by freezing, in different trials, a 14 th, an 18 th, a 19 th, and when the water was previoufly purged of air, only a 22 d part: that ice, even after its formation, continues to expand by cold; for, after water had been frozen to fome thick. nefs, the fluid pare being let ont by a hole in the botzom of the veffel, a continuance of the cold made the ice convex ; and a piece of ice, which was at firt only as $1 t^{\text {th }}$ part fpecifically lighter than water, on being expofed fome days to the froft, becane a sith part lighter. To this caufe he attributes the burfing of ice on ponds.

Wax, refins, and animal fats, nade fluid by fire, in. flead of expanding like watery liquors, florink in their return to folidity: for folid pieces of the fame bodies fink in :lhe buttom of the refpective fluids; a proof that thefe bodics are more denfe in their folid than in their fluid fate. The oils which congeal by cold, as oil-olive, and the effential oil of anifeeds, apoear alfo to Arink in their congelation. Henct, the different difpofitions of different kinds of trees to be burtt by, or to refilt, Arong frolts, are by fome attributed to the juices with which the tree abounds; being in the one cafe watery, and in the otherrefinous or oily.

Though it has been generally fuppofed that the natural cryftals of ice are ftars of fix rays, forming angles of $60^{\circ}$ with each other, yet this cryltallization of water, as it may properly be called, feems to be as much affeced by cireumitances as that of falts. Hence we
find a conficuerable difference in the accounts of thofe who have undertaken to deferibe thefe cryltals. M. Mairan informs us, that they are flars with fix radii; and his opinion is confirmed by obferving the figure of froit on glafs. M. Rome de L'Ine determines the form of the folid cryftal to be an equilateral octaedron. M. Haflenfratz found it to be a prifmatic hexaedron; but M. d'Antic found a method of reconciling thefe feemingly oppofite opirions. In a violent hail-form, where the hailtones were very large, he found they had tharp wedre--like angles of more than half an inch; and in thefe he fuppofed it impofible to fee two pyramidal tetraedra joined laterally, and not to conclude that each graia was compofed of octaedrons converging to a cenire. Some had a cavity in the middle; and he faw the oppofite extremities of two oppofite pyramids, which conllitute the octaedron; he likewife faw the oftaedron entire united in the middle; all of them were therefore fimilar to the cryitals formed upon a thread immerfed in a faline folution. On thefe principles M. Antic conftructed an artificial octaedron refembling one of the largett hailfones; and found that the angle at the fummit of the pyramid was $45^{\circ}$, but that of the junction of the two pyramida $145^{\circ}$. It is not, however, eafy to procure regular cryftals in haiftones where the operation is con. ducted with fuch rapidity: in fnow and hoar-frofl, where the crytallization gocs on more flowly, our author is of opinion that he fees the rudiments of octaedra.

Ice, as is explained under the article Frost, forms generally on the furface of water: but this too, like the cryftallization, may be varied by an alteration in the circumfances. In Germany, particularly the northern parts of that country, it has been obferved that there are three kinds of ice. I. That which forms on the furface. 2. Another kind formed in the middle of the water, refembling nuclei or fmall lail. 3. The ground ice which is produced at the bottom, efpecially where there is any fibrous fabllance to which it may adhere. This is full of cells like a wafp's neft, but lefs regular; and performs many flrange effects in bringing up very heary bodies from the bottom, hy means of its inferiority in fpecific gravity to the water in which it is formed. The iec which forms in the middle of the water rifes to the top, and there unites into large maftes; but the formation both of this and the groundice takes place only in violent and fudden colds, where the water is fhallow, and the furface dillurbed in fuch a manier that the congelation cannot take place. The ground ice is very deftructive to dykes and other aquatic works. In the more temperate European climates thefe kinds of ice are not met with.

In many courtries the warmth of the climate renders ice not oaly a defirable, but even a neceffary article; fo that it becomes an object of fome confequence to fall upon a ready and cheap method of procuring it. Though the cheapeft merhod hitherto difcovered feems to be that related under the article Cold, by means of fal ammoniac or Glauber's falt, yet it may not be amifs to take notice of fome attempts made by Mr Cavallo to difcover a method of producing a fufficient degree of cold for this purpofe by the evaporation of volatile liquors. He found, however, in the courfe of thefe experiments, that ether was in-•

## I C E

(lig. 1.), terminating in a eapillary aperture, which is to be fixed upon the bottle eontaining the ether. Romid the lower part of the nick at $A$ fome thread is wound, in order to let it the the neek of the bottle. When the experiment is to be made, the itopper of the botle containing the ether is to be removed, and the tube julf mentioned pat in its room. The thread round the tube ought atio to be previonfly moifteaed with water or fpittle before it is pur into the neek of the botile, in order the more effectually to prevent the efcape of the ether betwixt the neck of the vial and tube. Holding then the bottle by its bottom FG (fig. 2.), and beeping it inclined as in the figure, the fimall ftream of ether ifluing out of the aperture D of the tube DE, is directed upon the ball of the thermometer, or upon a tube containing water or other li. quor that is required to be congealed. As ether is very volatile, and has the remarkable property of increaling the bulk of air, there is no aperture requifite to allow the air to enter the botte while the liquid flows out. The heat of the hand is more than fufficient to force out the ether in a continued flrean at the aperture D.

In this manner, throwing the fream of ether upon the ball of a thermometer in fuch a quantity that a drop might now and then, every 10 feconds for inftanee, fall from the bulb of the thermoneter, $\mathrm{Mr} \mathrm{Ca}-$ vallo brought the mercury down to $3^{\circ}$, or $29^{\circ}$ below the freezing point, when the atmofphere was fomewhat lotter than temperate. When the ether is very good, i.e. capable of diffolving elaftic gum, and has a finall buib, not above 20 drops of it are required to produee this effect, and about two minutes of time ; but the common fort muft be ufed in greater quantity, and for a longer time; though at laft the thenometer is brought down by this very nearly as low as by the belt fort.

To freeze water by the evaporation of ether, Mr Cavalle takes a thin glafs tube about four inches long, and one-fifth of an inch diameter, hermetically fealed at one end, with a little water in it, fo as to take up about half an inch of the cavity, as is thown at CB in fig. 3. Into this tube a flender wire H is affo introduced, the lower extremity of which is twifted into a fpiral, and ferves to draw up the bit of iee when formed. He then holds the glafs tube by its upper part A with the fingers of the left hand, and keeps it continually and gently turning round its axis, firft one way and then the other; whilt with the right hand he holds the phial containing the ether in fuch a manner as to direet the flream on the outfide of the tube, and a little above the furface of the water contained in it. The eapillary aperture D fhould be kept almoft in contact with the furface of the tube containing the water; and by continuing the operation for two or three minutes, the water will be frozen as it were in an intlant; and the opacity will afeend to C in lefs than half a feeond of time, which makes a beautiful appearance. This congelation, however, is only fuperficial ; and in order to congeal the whole quantity of water, the operation muft be continued a minute or two longer; after which the wire $H$ will be found kept very tight by the ice. The hand mult then be applied to the outfide of the tube, in order to foften

## 1 C E [84] I C E

Ice. the furface of the ice; which would otherwife adhere very firmly to the glafs; but when this is done, the wire H eafily brings it out.

Sometimes our anthor was aceuftomed to put into the tube a fmall thermometer inttead of the wire $H$; and thes he had an opportunity of obferving a very curions phenomenon unnuticed by others, vic. that in the winter time water requires a falaller degree of cold to congeal it than in the fummer. In the winter, for inftance, the water in the tube AB will freeze when the thermometer ftands about $30^{\circ}$; but in the fummer, or cyen when the thermometer flands at $60^{\circ}$, the quickfilver mufl be brought down 10,15 , or even more do. grees below the freezing peint before any congelation can take place. In the fummer time therefore a greater quantity of ether, and more time, will be required to congeal any given quanticy of water than in vinter. When the temperature of the atmolphere has been about $40^{\circ}$, our author has been able to congeal a guantity of water with an equal guantity of grood cther ; but in funner two or three times the quantity are requird to perform the effet. "Ihere feens (fays he) to be lumething in the air, which, befides lieat, intericics with the freezing of water, and perliaps of all huids; thungh I cannot fay from my own experience whether the above mentioncd difference between the fieczing in winter and fummer takes place with other Aluids, as milk, oils, wines," \&c.
'I'he proportion of cther requifite to congeal water feems to vary with the quantity of the latter; that is, a large quantity of water feems to require a proportionably lefs quantity of ether to freeze it than a finaller one. "In the beginning of the fpring (fays Mr Cavallo), I fioze a quarter of an ounce of water with about lialf an ounce of ether; the apparatus being larger, though fimilar to that deferibed above. Now as the price of ether, fufficiently good for the purpole, is.generally about 18 d , or 2 s . per onnce, it is plain, that with an expence under two fhillings, a quarter of an ounce of ice, or ice-cicam, may be made, in every climate, and at any time, which may afford gr at fatiofaction to thofe perfons, who, living in thofe places where no natural ice is to be had, never faw or tafled any fuch delicious refreftment. When a fmall piece of ice, for inftance, of about ten grains weight, is required, the neceflay apparatus is very fmall, and the expence not worth mentioning. I have a fmall box four inches and a half long, two inches broad, and one and a half deep, containing all the apparatus neceffary for this purpole; viz. a bottle capable of containing about one ounce of ether ; two pointed tubes, in cafe one fhould break; a tube in which the water is to be frozen, and a wire. With the quantity of cther contained in this fmall and very portable appayatus, the experiment may be repeated about ten times. A pelfon who wifhes to perform fuch experiments in hot climates, and in places where ice is not eafily procured, requires only a larger bottle of ether befides the whole apparatus deferibed above." Electricity increafes the cold produced by means of evaporating ether but very little, though the tffect is perceptible. Having thrown the clectrified and alfo the unelectrified Aream of ether upon the bulb of a thermometer, the mercury was brought down two degrees lower in the former than in the latter cafe.

Our author oblerves, for the fake of thofe who may be inclined to repeat this experiment, that a cork confines this volatile fuid much better than a glafs flopile, which it is almoft impoffible to gind with fuch exact. nefs as to prevent entirely the evaporation of the ether. When a llopple, made very nicely out of an uniform and clofe piece of cork, whic'1 goes rather tight, is put upon a bottle of ether, the fonell of that lluid cannot be perceived through it ; but he never faw a glafs flopple which co:ld produce that effect. In this mannet, ether, fpirit of wine, or any other volatik Buid, may be pecferved, which docs not corrode cork by its fumes. Vihen the llopple, henefver, is very often taken out, it becomes luofe, as it will alfo do by long keeping; in either of which cales it mul be changed.

Blink of the $I C E$, is a name given by the pilots to a bright apnearance near the horizon occafoned by the ice, and obferved befure the ice itfelf is feen.

ICE-Boats, boats fo condrueted as to fail upon ice, and which are very common in Holland, particularly upon the river Maefe and the lake Y. See Pate CCL. 'l'hey go with incredible fwiftnefs, fometimes fo quick as to affect the breath, and are found very uleful in conveying goods and palfengers over lakes and great rivers in that country. Boats of dilferent lizes are placed in a tranfverfe form upon a $2 \frac{3}{2}$ or 3 inch deal board; at the extremity of each end are fixed irons, which turn up in the form of flazits; upon this plank the boat rells, and the two ends feem as uut-riggers to prevent overfetting; whence ropes are faftened that lead to the head of the malt in the nature of fhrowds, and others pafted through a block acrofs the bowiprit: the rudder is made fomewhat like a hatche: with the head placed downward, which being preffed down, cuts the ice, and ferves all the purpofes of a rudder in the water, by enabling the helmiman to fteer, tack, \&cc.

Methol of making IcE-Creum. ' Take a fufficient quantity of crram, and, when it is to be mixed with ra\{pberry, or currant, or pine, a quarter part as much of the juice or jam as of the cream: after beating and flraining the mixture through a cloth, put it with a little juice of lemon into the mould, which is a pewter. veftel, and varying in fize and thape at pleafure; cover the mould and place it in a pail about two-thirds full of ice, into which two handfuls of fatt have been thrown; turn the mould by the hand-hold with a quick motion, to and fro, in the manner ufed for milling chocolate, for eight or ten minutes; then let it reft as long, and turn it again for the fame time; and having left it to tland half an hour, it is fit to be turned out of the mould and to be fent to table, Lemon juice and fugar, and. the juices of various kinds of fruits, are frozen without cream; and when cream is ufed, it fhuuld be well. mixed.

IcE-Hills, a fort of ftructure or contrivance common. upon the river Neva at Peteriburgh, and which afford a perpetual fund of amufement to the populace. They are conftructed in the following manner. A fcaffolding. is raifed upon the river about 30 feet in height, with a. landing place on the top, the afcent to which is by a ladder. Frons this fummit a floping plain of boards about four yards broad and 30 long," defcends to: the fuperficies of the river: it is fupported by ftrong poles gradually decreafing in height, and its, fides aro defended by a parapet of planks. Upon thefe boards are

Plate CCL

## IC E $\left[8_{j}\right] \quad 1 \mathrm{C}$ E

Tee. laid fquare maftes of iee about four inches thick, which being firft fmoothed with the axe and laid clofe to each other, are then fprinkled with water: by thefe neeans ther coalefce, and, adhering to tbe boards, immediate$\mathrm{I}_{\mathrm{y}}$ form an inclined plain of pure ice. lyon the bottom of this plain the fnow is ciaared away for the length of 200 gards and the breadrl of four, upout the level ted of the river; and the fides of this courfe, as well as the fodes and top of the feafiolding, ate ormmented with firs and pines. Eacls perfon, being provided with a fiedge, mounts the ladder; and having att:sincd the fanmit, he fets himete upon his fledre at the apper sitremity of the inclined plain, down which lie fiffers it to ghde with conliderable rapidity, poifing it as he gees down; when the velocity acquired by the defeent carries it ajove 100 yards upon the level ice of the liver. At the end of this coure, ihcre is ufually: a fimilar iee-hill, nearly parailel to the former, which begins where the other erds; fo that the perfon immediately mounts again, and in the fame manner glides down the other inclined plain of ice. This diverfion he repeats as often as he pleafes. The boys alfo are contipually employed in flaiting down thefe hills: they glide chicfly upon one fiait, as they are able to poife ticmeleres better upos one leg tian upon two. Thefe ice-hills exhibit a plating appearance upon the river, as well from the trees with which they are ornamented, as from the moving objects which at particular times of the day are defcending without intermiffion.

ICE.Honfe, a repofitory for ice during the fummer months. The afpect of ice-houfes fhould be towards the eall or fouth-eaft, for the advantage of the morning fun to expel the damp air, as that is more pernicious than warmeth; for which reafon trees in the vicinity of an ice howfe tend to its difadvantage.

The beft foil for an ice-houfe to be made in is chalk, as it conveys away the wafle water withont any artificial drain; next to that, loofe tony earth or gravelly foil. Its ficuation fhould be on the fide of a bill, for the advantage of entering the cell upon a level, as in the drawing, Plate CCL.

To confluct an ice-houíe, firf choofe a proper place at a convenient diltance from the dwelling-houfe or bouffà it is to ferve : dig a cavity (iffor one family, of the dimenfions fpecified in the defign) of the figure of an inverted cone, finking the bottom, concave, to form a refervoir for the walle water till it can draiu off; if the foil requires it, cut a drain to a confiderable di. fance, or fo far as will come out at the fide of the hill, or into a well, to make it communicate with the fprings, and in that drain form a flink or air-trap, marked !, by finking the drain fo much lower in that place as it is high, and bring a partition from the top an inch or more into the water, which will confequently be in the trap; and will keep the well air-tight. Work up a fufficient number of brick piers to receive a cart. wheel, to be laid with its convex fide upwards to receive the ice; lay hurdles and Itraw upon the wheel, which will let the melted ice drain through, and ferve as a floor. The fides and dome of the cone are to be nine inches thick - the fides to be done in fteened brickwork, i.e. without mortar, and wrought at right angles to the face of the work: the filling in behind fhould be with gravel, loofe flones, or brick-bats, that the water which drains through the fides may the more
cafily efcape into the well. The doors of the ice-
houfe flould be made as clofe a houfe frould be made as clofe as poffiste, aind buncles of Atraw placed always before the inner door to keep out the air.

Defcription of the parts referred to by the ?cttere. a The line firt dug out. Whe brick circumference of the cell. © The diminution of the cell downwards, d The leficr diameter of the co!l. e The cart wheel or joills and hurdles. f The piers to receive the wheel or f.oor. g The principal receptacle for thraw. I. The inncr paffage, i the firtt entrance, $A$ the outer door, pailderes baving a feparate door each. I An air trap, in The well. 8 The profle of the piers. o The ice fillech in. f 'lhe hicight of the cone. $y$ The dome worked in two half brick arches. ${ }^{\prime}$. The arched $p^{2}$ fo fage. sthe door-waysinferted in the walls, $t$ The Auor of hic paftugc. uAn aperture ithough which the ice may be pat into thic coll ; chis mall be covered next the crown of the dome, and than filled in with earth. a The fuping door, againlt which the flraw flould be laid.

The ice when to be put in noould be collected du. ring the front, broken into fimall picces, and rammed. down hard in lldaia of not more than a foot, in order to make it one complete body; the care in putting it in, and well rainming it, tends much to its preferva. tion. In a feafon when ice is not to be had in fufficient quantities fnow may be fubflituted.
Ice may be preferved in a dry place under ground, by covering it well with chaff, ftraw, or reeds.

Great ufe is mace of cheff in funne places of Italy to preferve ice: the ice-houfe for this purpofe need only be a deep hole dug in the ground on the fide of a hill, from the bottom of which they can eafily carry out is drain, to let out the water which is feparated at any time from the ice, that it may not melt and fonoil the reft. If the ground is tolerably dry, they do not line the fides with any thing, but leave them naked, and on ly make a covering of thatch over the top of the hole: this pit they fill e:ther with pare fnow, or elfe with ice taken from the pureit and clearcft water; becaufe they. do not ufe it as we do in Eugland, to fet the bottles in, but really mix it with the wine. They firf cover the bottom of the hole with chaff, and then lay in the ise, not letting it any where touch the lides, but ramming in a large bed of chaff all the way bet wete : they thus carry on the filling to the top, and then cover. the furface with chaff; and in this manner it will keep as long as they pleafe. When they take any of it out for ufe, they wrap the lump up in chaff, and it may then be carricd to any diftant place without wafte or running.

ICE-I/lund, a name given by failors to a great quan tity of ice collected into one hage folid mafs, and floating about upon the feas near or within the Polar circles. -Many of thefe fluctuativg inands are met with on the coafts of Spitzbergen, to the great danger of the fhipping employed in the Greenland fifhery. In the mid it of thofe tremendous maffes navigators have been arrelled and frozen to death. In this manner the brave Sir Hugh Willoughby perithed with all his crew in 1553; and in the year 1773, Lord Mulgrave, after every Ef , fort which the molt finifhed feaman could make to accomplifh the end of his voyage, was caught in the ice, and was near expetiercing the fame unhappy fate. Ses

## IC E [ 86 ] I C E

「ce. the account at large in Phispsso: Woyage to the North Pol: $A_{3}$ there defcribed, the feene, divefted of the lurror from the eventful expectation of change, was the moll beautiful and pieturefque:-Two large hips becalined in a vall bafun, furrounded on all filles by illands of various forms: the weather clear: the fun gilding the circumambient ice, which was luw, fmooth, and evert; covered with frow, excepting where the pools of water on part of the furface appearcd cryftal. line with the yourg ice: the fmall fpace of fea they were confined in perfenty frooth. After fruitlefs attempts to force a way through the fields of ice, their limits were perpetually contracted by its clofing; till at length it befer each veftel till they became immoveably fixed. The frooth extent of furface was foon ioll : the preffure of the pieces of ice, by the viclence of the fwell, caufed them to pack : fragment rofe upon fragment, tili they were in many places higher than the main-yard. The movements of the fhips were tremendous and involentary, in conjunction with the furroundin; ice, achuated by the currents. The water Thoaled to $1 \%$ fathoms. The grounding of the ice or of the fhips would bave been equally fatal: The foree of the ice might have crufled them to atoms, or have lifted them out of the water and overfet them, or lave left them fufpended on the fummits of the pieces of ice at a tremendous height, expofed to the fury of the winds, or to the rifk of being daffod to pieces by the failure of their frozen dock. An attempt was made to cut a paffare through the ice; after a perfeverance worthy of Britons, it prowed fruiticfs. The commander, at all times mafler of himfelf, direited the boats to be made ready to be hauled over the ace, till they arrived at mavigable water (a tafi alone of feven days), and in them to make their soyage to England. The bunts were drawn progreffively three whole days. At length a wind Sprung up, the ice feparated tufficicutly to gield to the preffure of the full- Failed Ships, which, after labouring againt the refilting felds of ice, arrived on the roth of Augult in the harbour of Smeeringberg, at the weft end of Spitzbergen, betweell it and Hackluyt's Headland.

The forms affumed by the ice in this chilling climate are extremely pleafing to even the mof incurious eye. The furface of that which is congealed from the fea-water (for we mult allow it two origins) is flat and even, hard, opake, refembling white furar, and incapable of being fid on, like the Britifl ice. The greater pieces, or fields, are many leagues in length : the leffer are the meadows of the feals, on which thofe animals at times frolic by hundreds. The motion of the leffer pieces is as rapid as the currents: the greater, which are fometimes 200 lcagues long, and 60 or 80 broad, move flow and majeftically; often fix for a time, imnoveable by the power of the ocean, and then produce the horizon that bright white appearance called the blind. The approximation of two great fields produces a moft fingular phenomenon; it forces the leffer (if the term can be applied to pieces of feveral acres fquare) out of the water, and adds them to their furface: a fecond and often a third fucceeds; fo that the whole forms an aggregate of a tremendous height. Thefe float in the fea like fo many rugged mountains, and are fometimes 500 or 600 yards thick; but the §ar greater part is coneealed beneath the water. Thefe
are continally increafed in height by the freezing of the fpray of the fea, or of the metting of the fnow, which falls on them. Thofe which remain in this frozen clinate receive continual growth; others are gradually wafted by the northern winds into fouthern latitudes, and melt by degreen, by the heat of the fun, till they wafle away, or difappear in the boundlefs element.

The collifion of the great fields of ice, in high latitudes, is often attenced with a noife that for a time takes away the fenfe of hearing any thing elfe; and the leffer with a grindiug of unfpeakable horror. The water which dathes againft the mountainous ice freezes into an infinite variety of forms; and gives the voyager ideal towns, Atreets, churches, fteeples, and every fhape which imagination can frame.

Ice-Plant. Sec Mesembryanthemum.
ICEBERGS, are large bodies of ice filling the valleys between the high mountains in northern latitudes. Amons the moll remarkable are thofe of the caft coaft of Spitzbergen; (fee Greenland, no 10.) They are feven in number, but at confiderable diftances from each other: cach fills the valleys for tracts unknown, in a region totally inacceffible in the internal parts. The glaciers * of Switzerland feem contemptible to - See thefe; but prefent often a fimilar front into fome lower ciers. valley. The laft exhibits over the fea a front 300 feet high, emulating the emerald in colonr: cataracts of melted fnow precipitate down various parts, and black ipiring mountains, llreaked with white, bound the fides, and rife cragabove crag, as far as eye can reach in the back ground. See Plate CCLI. At times immenfe fragments break off, and tumble into the water, with a moll alarming dathing. A piece of this vivid green fubftance lias fallen, and grounded in 24 fathoms water, and fpired above the furface 50 feet $\dagger$. Simi- $\dagger$ rhip lar icebergs are frequent in all the Aretic regions; and $F^{\prime}$ oyuge to their lapres is owing the folid mountanous ice which P . 70. infells thofe feas. - Frolt fports wonderfully with thefe icebergs, and gives them majeltic as well as other moft fingular forms. Maffes have been feea affuming the mape of a Gethic church, with arched windows and doors, and all the rich drapery of that fyyle, compofed of what an Arabian tale would fcarcely dare to relate, of cryflal of the richef fapphirine blue : tables with one or more feet ; and ofien immenfe flat-roofed temples, like thofe of Luxxcr on the Nile, fupported by round tranfparent columns of cecrulean hue, float by the aftonifhed fpectator. - Thefe icebergs are the creation of ages, and receive annually additional hei, ht by the falling of fnows and of rain, which cften inftantly freczes, and more than repairs the lofs occafioned by the influence of the melting fun.

ICELAND, a large ifland lying in the northern part of the Atlantic Ocean, between 63 and 68 degrees of north latitude, and between 10 and 26 degrees of weft longitude, its greatef length being about 700 miles, and its breadth 300 .

This country lying partly within the frigid zone, and Gener being liable to be furrounded with vaft quantities of ice count which come from the polar feas, is on account of the the ce coldnefs of its climate very inhofpitable; but much ${ }^{\text {try }}$. more fo for other reafons. It is exceedingly fubject to earthquakes; and fo full of volcanoes, that the little part of it which appears fit for the habitation of man

## I C E

land. feems almoft totally laid watte by then. The belt account that hath yet appeared of the illand of Iceland is in a late publication intitled, " Letters on Iceland, Esc. written by Uno Von Troil, D. D. Airlt chaplain to his Swedif majely." This gentleman failed from I.ondon on the t2th of July 1772, in company with Mr Banke, Dr Solander, and Dr Janies Lind of E dinburgh, in a thip for which L. 100 Sterling was paid every month. After viliting the weflern ines of Scotland, they arrived on the 23 th of Augult at Iceland, vilere they caft anchor at Beffeftedr or Beffafladr, lying in about $6 \psi^{\circ} 6^{\prime} \mathrm{N}$. Lar. in the weitern part of the ifland. The country had to them the mon difmal apparance that can be conceived. "Imagine to yourfelf (fays Dr Troil) a country, which from one end to the other prefents to your view only barren mountains, whofe fummits are covered with eternal fnow, and between them fields divided by virrified cliffs, whofe high and fharp points feem to vie with each other to deprive you of the fight of a little grafs which fcantily fprings up among therm. Thefe fame dreary rocks likewife conceal the few fcattered habitations of the natives, and no where a fingle tree appears which might afford fielter to friendflip and innocence. The profpect before us, thongb not pleafing, was uncommon and furprifing. Whatever prefented itfelf to our view bore the marks of devaftation; and our eyes, accuftomed to behold the pleafing coafts of England, now faw nothing but the veftiges of the operation of a fire, Heaven knows how ancient !

The climate of Iceland, however, is not unwholefome or naturally fubject to exceffive colds, notwithflanding its northwardly fituation. There have been initances indeed of Falirenheit's thermometer linking to $24^{\circ}$ below the freezing point in winter, and rifing to $104^{\circ}$ in fummer. Since the year 1749 , obfervations have been made on the weathcr; and the refult of thefe obfervations hath been unfavourable, as the coldnefs of the climate is thought to be on the increale, and of confequence the country is in danger of becoming unfit for the habitation of the human race. Wood, which formerly grew in great quantities all over the inland, cannot now be raifed. Even the hardy firs of Noruay cannot be reared in this ifland. They feemed indeed to thrive till they were about two feet high; but then their tops witherct, and they ceafed to grow. This is owing chiefiy to the forms and hurricanes which frequently happen in the months of May and June, and which are very unfavourable to vegetation of every kind. In $177^{2}$, governor Thodal fowed a little barley, which grew very brikly; but a fhort time before it was to be reaped, a violent form fo effectually deflroyed it, that only a few grains were found fcattered about. Befides thefe violent winds, this inand lies under anather difadvantage, owing to the floating ice already mentioned, with which the coafts are often befet. This ice comes on by degrees, always with an eaferly wind, and frequently in fuch quantities as to fill up all the gulphs on the north-weft fide of the ifland, and even covers the fea as far as the eye can reach; it alfo fometimes drives to other hores. It generally cornes in January, and goes away in March. Sometimes it only reaches the land in April; and, remaining there for a long time, does an incredible deal of mifchief. It conEtts partly of mountains of ice, faid to be fometimes 60
fathoms in height; and partly of feld.ice, which is feceacic. neither fo thick nor fo much dreaded. Somerimes thefe enormous maffes are grounded in fhoal-water; and il thefe cafes they remain for many months, nay years, undififolved, chilling the atmofphere for a great way round. When many fuch bulky and lofty ice-maftes are floating together, the wood which is often found drifting between them, is fo much chafed. and prefled with fuch viofence together, that it fometimes takes fire : which circumftance has occafioned fabulous accounts of the ice being in flames.

In 1753 and 1754, this ice occafioned fuch a violent cold, that hoifes and fieep dropped down dead by reafon of it, as welt as for want of food; horfes were obferved to feed upon dead cattle, and the theep eat of each other's wool. In 1755, towards the end of the month of May, the watcrs were frozen over in one right to the thicknefs of an inch and five lines. In 1756, on the $26 \div \mathrm{h}$ of Jure, fnow fell to the depth of a yard, and continued falling through the months of July and Auguft. In the year following it froze very hard towards the end of May and beginning of June, in the fouth par: of the ifland, which occafioned a great fcarcity of grafs. Thefe frofts are generally followed by a famine, many examples of which are to be found in the Iceiandic chronicles. Befides thefe calamities, a number of bears annually arrive with the ice, which commit great ravages among the theep. The Icelanders attempt to deflroy thefe intruders as foon asthey get fight of them. Sometimes they alTemble together, and drive them back to the ice, with which they often float off again. For want of fire-arms, they are obliged to ufe fpears on thefe occafions. The government alfo encourage the deftruction of thefe animals, by paying a premium of 10 dollars for every bear that is killed, and purchafing the fk in of him who killed it.
Notwithfanding this difmal picture, however, taken from Von Troil's letters, fome tracts of ground, in . high cullivation, are mentioned as being covered by the great eruption of lava in 1783 . It is poffible, therefore, that the above may have been fomewhat exaggerated.

Thunder and lightning are feldom heard in Iceland, except in the neighbourhood of volcanoes. Aurora Borcalis is very frequent and Arong, It molt commonly appears in dry weather; though there are not wanting inflances of its beiag feen before or after rain, or even during the time of it. The lunar halo, which prognosticates had weather, is likewife very frequent here; as are alfo parthelions, which appear from one to nine in number at a time. 'Thefe parhelions are ob. ferved chiefly at the approach of the Greenland ice, when an intenfe degree of frot is produced, and the frozen vapours fill the air. Fire-balls, fometimes roundand fometimes oval, are ohferved, and a kind of isnis futulus which attaches itfelf to men and bealts; and comets are alifo frequently mentioned in their chronicles. This lat circumftance deferves the attention of aftronomers.
Iceland, befides all the inconveniencies already mentioned, has two very terrible ones, called by the natives /krida and fnicfodi: the name of the firt imports large pieces of a mountain tumbling down and deftroying the lands and houfes which lie at the foot of it : this happened in 5554 , when a whole farm was ruinella

The nape was now for the firf time full of water, which ren flomly into the bafon.

| $9-1 \mathrm{IK} .25$ | 48 | 110 |
| :---: | :---: | :---: |
| $10-\mathrm{K} .16$ | 24 | 100 |

At 35 minutes after twelve we heard as it were fliree difcharges of a gun under ground, which made it Gake: the water flowed over immediately, but inThantly funk again. At eight minutes after two, the *ater flowed over the border of the balon. At 15 mi nutes after three, we again heard feveral fubterranean noifes, though not fo ftrong as before. At 43 mi nutes after four, the water flowed over very Atrongly during the fpace of a minute. In fix minutes after, we heard many loud fubterrancous difcharges, not only near the fpring, but alfo from the neighbouring ridge of rocks where the water fpouted. At 5 r minutes after fix, the fountain fpouted up to the height of 92 feet, and continued to do fo for four minutes. After this great effort, it funk down very low into the pipe, and was entirely quiet during feveral minutes; but foon began to bubble again: it was not, however, thrown up into the air, but only to the top of the pipe.
"The force of the vapours which throw up thefe waters is exceffive: it not only prevents the flones which are thrown into the opening from finking, but even throws them up to a very great heigbt, together with the water. When the bafon was full, we placed ourfelves before the fun in fuch a manner that we could fee our thadows in the water; when every one oblerved round the fhadow of his own head (though not round that of the heads of others, ) a circle of almof the fame colours which compofe the rainbow, and round this another bright circle. This molt probably proceeded from the vapours exhaling from the water.
" Not far from this place, another fpring at the foot of the neighbouring ridge of rocks fpouted water to the height of one or two yards each time. The opening through which this water iffued was not fo wide as the other: we imagined it poffible to fop up the hole entirely by throwing large fones into it, and even flattered ourfelves that our attempts had fucceeded: but, to our aftonihment, the water guthed forth in a very violent manner. We haftened to the pipe, and found all the fones thrown afide, and the water playing freely through its former channel. In thefe large 〔prings the waters were hot in the higheft degrec, and tatted a little of fulphur; but in other refpects it was pure and clear. In the fmaller fprings of the neighbourhood the water was tainted: in fome, it was as muddy as that of a clay-pit : in others, as white as milk; and in fome few, as red as blood. nt of "I Iceland abounds with pillars of bafaltes, which the lower fort of people imagine have been piled upon each other by the giants, who made ufe of fupernasural force to effect it. They have generally from three to feven fides; and are from four to fix feet in thicknefs, and fiom 12 to 16 yards in length, without any horizontal divifions. Dut fometimes they are only - Vol. IX. Part. L.

89 I C E
from fix inches to one foot in height, and they are focland. then very regular, infomuch that they are fometimes $\underbrace{\text { rars }}$ made ufe of for windows and door-pofts. In fome places they only peep out here and there among the lava, or more frequently among the tufa; in other places they are quite overthrown, and pieces of brokea pillars only make their appearance. Sometimes they extend withont interruption for two or three miles is length. In one mountain they have a fingular appearance: on the top the pillars lie horizontally, in the middle they are noping; the lowent are perfectly perpendicular ; and in fome parts they are bent into a femicircular figure. The matter of the Iceland bafaltes feems to be the fame with that of Staffa; though in fome it is more porous, and inclines to a grey. Some we obferved which were of a blackifh grey, and compofed of feveral joints. Another time we obferved a kind of porous glaffy fone, confequently a lava, which was fo indiftinctly divided, that we were for fome time at a lofs to determine whether it was bafaltes or not, though at lalt we all agreed that it was."

Iron ore is found in fome parts of the inland, and that beautiful copper ore called Malachites. Horrebow fpeaks of native filver. A Atratum of iulphur is found near Myvatu from nine inches to two feet in thicknefs; partly of a brown colour, and partly of a deep orange. Immediately over the fulphur is a blue earth; above that a vitriolic and alumincus one; and beneath the fulphur a reddifh bole.

At what time the ifland of Iceland was firt peopled Hifory of is uncertain. An Englifh colony indeed is faid to the illaod have been fettled there in the beginning of the fifth century; but of this there are not fufficient proofs. There is, however, reafon to fuppofe that the Englift and Irifh were acquainted with this country under another name, long before the arrival of the Norwegians; for the celebrated Bede gives a pretty accuratc defcription of the inland. But of thefe original inhabitants we cannot pretend to fay any thing, as the Iceland chronicles go no farther back than the arrival of the Norwegians. What they relate is to the following purpofe.
Naddodr, a famous pirate, was driven on the coaft of Iceland in 861, and named the country Suis.lands "Snow-land," on account of the great quantities of fuow with which he perceived the mountains covcred. He did not remain there long; but on his return ex. tolled the country to fuch a degree, that one Garder Suafarfon, an enterprifing Swede, was encouraged by' his account to go in fearch of it in $8 \sigma_{4}$. He failed quite round the inland, and gave it the name of Gardayforlmur, or Garden's-ifland. Having remained in Iceland during the winter, he returned in the fpring to Norway, where he defcribed the new-difcovered ifland as a pleafant well-wooded country. This excited a defire in Floke, another Swede, reputed the greateft narigator of his time, to undertake a voyage thither. As the compars was then unknown, he took three ravens on board to employ them on the difcovery. By the way he vifited his friends at Ferro; and having failed farther to the northward, he let fly one of his ravens, which returned to Ferro. Same time after, he difmiffed the fecond, which returned to the fhip again, as he could find no land. The latt trial proved more fuccefsful; the third raven took his flight to Iceland,

M
wherc where the flip arrived a few days after. Floke ftaid here the whole winter with his company ; and, becanfe he found a great deal of floating ice on the north fide, he gave the country the name of Iceland, which it has ever fince retained.

When they returned to Norway in the following fpring, Floke, and thofe that had been with him, made a very different defeription of the country. Floke defcribed it аб а wretched place; while one of his companions, named Thorulfr, praifed it fo highly, that he affirmed butter dropped from every plant ; which extravagant commendation procured him the name of Thorulfr-fmior, or Butter-Thorulfr.

From this time there are no accounts of any voyages to Iceland, till Ingolif and his friend Leifr undertook one in 874 . They fpent the winter on the ifland, and deternined to fettle there for the future. Ingolfr returned to Norway, to provide whatever might be neceffary for the comfortable eftablifhment of a colony, and Leifr in the mean time went to affitt in the war in England. After an interval of four years, they again met in Iceland, the one bringing with him a conliderable number of people, with the neceffary tools and inftruments for making the country habitable; and the other imported his acquired treafures. After this period many people went there to fettle; and, in the Ppace of 60 years, the whole illand was inhabited. The tyranny of Harold king of Norway contributed not a little to the population of Iccland; and fo great was the emigration of his fubjects, that he was at laft obliged to iffue an order, that no one fhould fail from Norway to Iccland without paying four ounces of fine filver to the king.

Befides the Norwegians, new colonies arrived from different nations, between whom wars foon commenced; and the Icelandic hiftories are full of the accounts of their bateles. To prevent the fe conflicts for the future, a kind of chief was chofen in 928 , upon whom great powers were conferred. This man was the fpeaker in all their public deliberations; prononnced fentence in difficult and intricate cafes; decided all difputes; and publifhed new laws, after they had been received and approved of by the people at large: but he had no power to make laws without the approbation and confent of the ref. He thercfore affembled the chiefs, whenever the circumftances feemed to require it ; and, after they had deliberated among themfelves, he reprefented the opinion of the majority to the people, whofe aflent was neceflary before it could be confidered as a law. His authority among the chiefs and leaders, however, was inconfiderable, as he was chofen by them, and retained his place no longer than while he preferved their confidence.

This inftitution did not prove fufficient to reltrain the turbulent fpirit of the Icelanders. They openly waged war with each other; and, by their inteftine confliets, fo weakened all parties, that the whole bccame at laft a prey to a few arbitrary and enterprifing men; who, as is too generally the cafe, wantonly abufed theirapower ta the opprefion of their countrymen, and the difgrace of humanity. Notwithftanding thefe troubles, however, the Icelanders remained free from a foreign yoke till $\mathbf{1 2 6 1}$; when the greatelt part of them put themfelves under the protection of Hakans king of Norway, promifing to pay him tribute upon
certain conditions agrced on between them; and the Icelan reft followed their example in 1264 . Afterwards, Iceland, together with Norway, became fubject to Denmark. For a long time the care of the ifland was committed to a governor, who commonly went there once a-year; though, according to his inftructions, he ought to have refided in Iceland. As the country fuffered incredibly through the abfence of its governors, it was refolved a few years ago that they fhould refide there, and have their feat at Beffeffedr, one of the old royal domains. He has under him a bailif, two laymen, a fherif, and 21 fyfelmen, or magiftrates who fuperintend fmall diftricts; and almoit every thing is decided according to the laws of Denmark.
At the firf fetlement of the Norwegians in Iceland, Manne they lived in the fame manner as they had done in theit \&e. of own country, namely, by war and piracy. Their 1 celand fituation with regard to the kings of Norway, however, foon obliged them to apply to other flates, in order to learn as much of the knowledge of government and politics as was neceffary to preferve their colony from fubjugation to a forcign yoke. For this purpofe they often failed to Norway, Denmark, Sweden, England, and Scotland. The travellers, at their return, were obliged to give an account to their chiefs of the ltate of thofe kingdoms through which they paffed. For this reafon, hiftory, and what related to fcience, was held in high repute as long as the republican form of goverument lafted; and the great number of hiflories to be met with in the country, fhow at leaft the defire of the Icelanders to be initructed. To fecure themfelves, therefore, againt their powefful neighbours, they were obliged to enlarge their hiftorical knowledge. They likewife took great pains in ftudying perfectly their own laws, for the maintenance and protcction of their internal fecurity. Thus Iceland, at a time when ignorance and obfcurity overwhelmed the rell of Europe, was enabled to produce a confiderable number of poets and hiftorians. When the Chriftian religion was introduced about the end of the 1oth century, more were found convcrfant in the law than could have bcen expected, confidering the extent of the country, and the number of its inhabitants. Fifhing was followed among them ; but they devoted their attention confiderably more to agriculture, which has fince entirely ceafcd.

Two things have principally contributed towards producing a great change both in their character and way of life, viz. the progrefs of the Chriftian religion, and their fubjection firft to Norway, and afterwards to Denmark. For if religion, on one fide, commanded them to defift from their ravages and warlike expedi. tions; the fecular power, on the other, deprived them of the neceflary forces for the execution of them: and, fince this time, we find no farther traces of their heroic detds, except thofe which are preferved in their hiftories.

The modern Icelanders apply themfelves to fifhing and breeding of cattle. They are middle-fized and well-made, though not very 1 lrong; and the women are in general ill-featured. Vices are much lefs common among them, than in other parts where luxury and riches have corrupted the morals of the people. Though their poverty difables them from imitating

## IC E

they continue to Show their inclination to it: they cheerfully give away the little they have to fare, and exprefs the utmof joy and fatisfaction if you are pleafed with their gift. "They are uncommonly obliging and faithful, and extremely attached to government. They are very zealous in their religion. An Icelander never pains a river or any other dangerous place, without previoully taking off his hat, and imploring the divine protection ; and he is always thankful for the protection of the Deity when he has paffed the danger in fafety. They have an inexpreffible attachment to their native country, and are nowhere fo happy. $A_{n}$ Icelander therefore rarely fettle in Copenhagen, though ever foch advantageous terms should be offered him. On the other hand, we cannot ascribe any great indultry or ingenuity to the fe people. They work on in the way to which they have all along been accuftomed, without thinking of improvements. They are not cheerful in conversation, but dimple and credulous ; and have no averfion againf a bottle, if they can find an epportunity. When they meet together, their chief paftime confifts in reading their hiftory. The rafter of the boule makes the beginning, and the reft continue in their turns when he is tired. Some of them know there florists by heart; others have them in print, and others in writing. Betides this, they are great players at chefs and cards, but only for their amufement, lance they never play for money: which, however, feems to have been formerly in ufe among them; fine, by one of their old laws, a tine is inpoled upon thole who play for money.

The modern Icelanders have made very little aleration in their drefs from what was formerly in ifc. The men all wear a linen fist next to the fin, with a hort jacket, and a pair of wide breeches over it. When they travel, another hort coat is put over all. The whole is made of coarfe black cloth, called quadmat ; but lome wear clothes of a white colour. On their head they wear large three-cornered hats, and on their feet Iceland foes and worited flockings. Some of them indeed lave foes from Copenhagen; but, as they are rather too dear for them, they generally make their own floes, fometimes of the hide of oxen, but more frequently of fheep's leather. They make them by cutting a fquare piece of leather, rather wider than the length of the font; this they few up at the toes and behind at the heel, and tie it on with leather thongs. Tl.efe floes are convenient enough where the country is level; but it would be very difficult for us who are not accultomed to walk with them among the rocks and tones, though the Icelanders do it with great cafe.

The women are likewife dreffed in black wadmal. They wear a bodice over their shifts, which are sewed up at the bofom; and above this a jacket laced before with long narrow fleeces reaching down to the writs. In the opening on the fide of the fleeve, they have buttons of chafed fiver, with a plate fixed to each button; on which the lover, when he buys them in order to present them to bis miltrefs, takes care to have lis name engraved along with hers. At the top of the jacket a little black collar is fixed, of about three inches broad, of velvet or fils, and frequently trimmed with gold cord. The petticoat is likewife of
wadmal, and reaches down to the ankles. Round the top of it is a girdle of filver or lome other metal, to which they fatten the apron, which is alpo of wadmal, and ornamented at top with buttons of chafed fiver. Over all this they wear an upper-drefs nearly referbling that of the Swedish peafants; with this difference, that it is wider at bottom : this is clofe at the neck and writs, and a hand's-breadth florter than the petticoat. It is adorned with a facing down to the bottom, which looks like cut velvet, and is generally wove by the Icelandic women. On their fingers they wear gold, filver, or brafs ring 3. Their head-dref 3 confirts of Several cloths wrapped round the head atmolt as high again as the face. It is tied fat with a handkerchief, and ferves more for warmth than orn3mint. Girls are not allowed to wear this head-drefg till they are marriageable. At their weddings they are adorned in a very particular manner: the bride wears, clofe to the face, round her head drefs, a crown of filver gilt. She has two chains round her neck, one of which bangs down very low before, and the other reft on her fhoulders. Betides thee, the wears a lefter chain, from whence generally hangs a little heart, which may be opened to put forme kind of perfume in it. This drefs is worn by all the Icelandic women without exception : only with this difference, that the poorer fort have it of coarse wadmal, with ornaments of brafs; and thofe that are in eafier circumfances have it of broad cloth, with fiver ornaments gilt.
The houses of the Icelanders are very indifferent, but the wort are fail to be on the fouth fide of the inland. In forme parts they are built of drift-wond, in others of lava, almoft in the fame manner as the ftonewalls we make for inclofures, with mors duffed between the pieces of lava. In forme houses the walls are wainscoted on the infide. The roof is covered with Cods, laid over rafting, or fometimes over the ribs of whales; the walls are about three yards high, and the entrance somewhat lower. Inftead of glass, the windaws are made of the chorion and amnios of hep, or the membranes which furround the womb of the ewe. There are Aretched on a hoop, and laid over a hole in the roof. In the poorer fort of houfes thicy employ for the windows the inner membrane of the fomach of animals, which is left tranfparent than the others.

As the inland of Iceland produces no kind of grain, the inhabitants of coufequence have no bread but what is imported; and which being too dear for common ufe, is referved for weddings and other entertainments. The following lift of their viands is taken from Troll's Letters.
" 1. Flour of falgras, (lichen inlandicus, or rock. graft. The plant is first wafted, and then cut into frail pieces by come; though the greater number dry it by fire or in the fun, then put it into a bag in which it is well beaten, and lafly work it into a flour by tamping.
" 2. Flour of komfyrg, (polygonum biforta), is prepared in the fame manner, as well as the two other forts of wild corn melur (Arundo arenaria, and Arundo foliorum lateribus convolutis), by Separating it from the chaff, pounding, and tally grinding it.
" 3. Surf finer, (four butter). The Icelanders felcom make ufe of fresh or fall butter, but let it grow M 2
four .

Iteland.
four before they eat it. In this manner it may be kept for 20 years, or even longer; and the felanders look upon it as more wholefome and palatable than the butter ufed among other nations. It is reckoned better the older it grows; and one pound of it then is valued as much as two of frefl butter.
" 3. Striug, or whey boiled to the confiftence of four milk, and preferved for the winter.
" 4. Fifh of all kinds, both dried in the fun and in the air, and either falted or frozen. Thofe prepared in the laft manner are preferred by many.
" 5. The flefh of bears, fleep, and birds, which is partly falted, partly hung or fmoked, and fome preferved in eafks with four or fermented whey poured over it.
" 6. Mijoff, or whey boiled to cheefe, which is very good. But the ait of making other kinds of good checfe is loft, theugli fome tolerably palatable is fold in the ealt quarter of Ieeland.
" 7. Beina friug, bones and cartilages of beef and mutton, and likewife bones of cod, boiled in whey till they are quite diffulved: they are then left to ferment, and are cat with milk.
"8. Skyr. The curds from which the whey is fqueezed are preferved in eafks or other veffels; they are fometimes mixed with black crow-berries or juniper berries, and are likewife eat with new milk.
" 9. Syra, is four whey kept in cafks, and left to ferment ; which, however, is not reckoned fit for ufe till a year old.
" 10 . Blandu, is a liquor made of water, to which a twelfth part of fyra is added. In winter, it is mixed with the juice of thyme and of the black crowberries.
"s 5 . They likewife eat many vegetables, fome of which grow wild, and fome are cultivated; alfo fhellfifh and muhrooms."

The Icelanders in general eat three meals a day, at feven in the morning, two in the afternoon, and nine at night. In the morning and evening they commonly eat curds mixed with new milk, and fometimes with juniper or crow berries. In fome parte, they alfo have pottage made of rock.grafs, which is very palatable, or curclled milk boiled till it becomes of a red colour, or new milk boiled a long time. At dinner, their food contiits of dried finh, with plenty of Sour butter; they alfo fometimes eat frefh finh, and, whon poffible, a little bread and cheefe with them. It is reported by fome, that they do not eat any firh till it is quite rotten; this report perhaps proceeds from their being fond of it when a little tainted: they however frequently eat fifh which is quite frefh, though, in the fame manner as the reft of their food, often without falt.

Their common beverage is milk, either warm from the cow or cold, and fometimes boiled: they likewife ufe butter-milk with or without water. On the coafts they generally drink blanda and four milk; which is fold after it is flimmed at two-fifths of a rixdollar per eafl: fome likewife fend for beer from Copenhagen, and fome brew their own. A few of the principal inhabitants alfo have claret and coffee. The common people fometimes drink a kind of tea, which they make from the leaves of the dryas octopetala, and the veronica officinalis

1 I C E
On the coafts the men employ themelves inf fifl ing, both fummer and winter. On their return home, when they have drawn and eleaned their fifh, they give them to their wives, whofe care it is to dry then. In Empluy the wirter, when the inclemency of the weather pre- nufut, rents them from fifhing, they are obliged to take care $\&:$. of their cattle, and fpin wool. In fummer, they mow the grafs, dig turf, provide fuel, go in fearch of thcep and goats that were gone aftray, and kill cattle. They prepare leather with the Jpiruca ulmaria inlead of bark. Some few work in gold and filver; and others are inftructed in mechanic3, in which they are tolerable proticients. The women prepare the tifh, take care of the eattle, manage the milk and wool, few, fpin, and gather eggs and down. When they work in the evening, they ufe, intead of an hour-glafs, a lamp with a wiek made of epilobium dipt in train oil, which is contrived to burn four, lix, or eight hours.

Among the common people of Iceland, time is not reckoned by the courfe of the fun, but by the work they have done, and which is prefcribed by law. According to this prefeription, a man is to mow as much hay in one day as grows on 30 fathoms of manured foil, or 40 fathoms of land which has not been manured; or he is to dig 700 pieces of turf eight feet long and three broad. If as much fnow falls as reaches to the horfes bellies, a man is required daily to clear a piece of ground fufficient for 100 Theep. A woman is to rake together as much hay as three men can mow, or to weave three yards of wadmal a.day.

The wages of a man are fixed at four dollars and 12 yards of wadnal; and thofe of a woman at two dollars and five yards of wadmal. When men are fent a-fifhing out of the country, there is allowed to each man, by law, from the 25 th of September to the 14th of May, fix pounds of butter, and 18 pounds of dried fifh every week. This may feem to be too great an allowance; but it mult be remembered that they lave nothirg elfe to live upon. When they are at home, and can get milk, \&cc. every man reccives only five pounds of dried fifh and three quarters of a pound of butter a-week.

The food and manner of life of the Icelanders by no Difeafe means contribute to their longevity. It is very rare indeed to fee an inhabitant of Iceland exceed the age of 50 or 60 ; and the greater part are attacked by. grievous difeafes before middle age. Of thefe the fcuryy and elephantialis or leprofy are the wort. They are alfo fubject to the gout in their hands, oxing to their frequent employment in fifhing, and handling the wet filhing-tackle in cold weather. St Anthony's fire, the jaundice, pleurify, and lownefs of fpiriss, are frequent complaints in this country. The fmall-pox alfo is exceedingly fatal, and not long ago deftroyed 16,000 perfons. By thefe difeafes, and the frequent famines with which the country has been afficted, the inhabitants are reduced to a much fmaller number than they formerly were, infomuch that it is computed they do not in all exceed 60,000 .

The exports of Iceland confift of dried firt, falted comni mutton and lamb, beef, butter, tallow, train-oil, and re coarfe woollen eloth, ftoekings, gloves, raw wool, veoue. fheep-finins, lamb-fkins, fox-turs of various colours, eider down, feathers, and formerly fulphur; but there is

Iceland. no longer a demand for this mineral. O. 1 the other hand, the Icelanders import timber, filhing lines and hooks, tobacco, breal, horfe-fhoes, brandy, wine, falt, linen, a little filk, and a few other neceffaries, as well as fuperfluities for the better fort. The whole trade of Iceland is engroffed by a monopoly of Danes, indulged with an excluive charter. This company maintains factories at all the harbours of Iceland, where they exchange their foreign goods for the merchandize of the country; and as the balance is in favour of the Icelanders, pay the overplus in Danifh money, which is the only current coin in this illand. All their accounts and payments are adjufted according to the number of fin: two pounds of filh are worth two killings in Specie, and 48 fifh amount to one rixdollar. A Danifh crown is computed at 30 fifh: what falls under the value of 12 fifh cannot be paid in money; but muft be bartered either for fifh or roll-tobacco, an ell of which is equal to one filh. The weights and meafures of the Icelanders are nearly the fame with thofe ufed in Denmark. The Icelanders being neither numerous nor warlike, and altogether unprovided with arms, ammunition, garrifons, or fleets, are in no condition to defend themfelves from invafon, but depend entirely on the protection of his Danih majelly, to whom they are fubject. The revenues which he draws from this ifland confilt of the income of divers eftates, as royal demefne, amounting to about $8 c o o$ dollars per annum; of the money paid by the company for an excluive trade, to the value of 20,0co dollars; and of a fixed propoltion in the tythes of filh paid in fome particular difticts.
Ilcasces Iceland is noted for the voleanoes with which it Iccland. abounds, as already mentioned, and which feem tu be more furious than any yet difoovered ia the other parts of the glabe. Indeed, from the lateit accounts, it would feem that this miferable country were little other than one continued rolcano. Mount Hecla has been commonly fappufed to be the only burning mountain, or at leatt the principal one, in the illand: (fee Hecla). It has indeed been more taken notice of than many others of as great extent, partly from its having had more frequent cruptions than any fingle one, and partly from its fituation, which expofes it to the fightit of fhips failing to Greenland and North America. But in a litt of eruptions publifhed in the appendix to Pennant's Arttic Zoology, it appears, that out of 51 remarkable ones, only one third have proceeded from Hecla, the other mountains it feems being no lefs active in the work of deftruction than this celebrated one. Thefe eruptions take place in the mountains covered with ice, which the inhabitants call Jokuls. Some of thefe, as appears from a large map of Iceland made by order of his Danifh Majelty in 1734 , have been fwallowed up. Probably the great lakes met with in this country may have been occafioned by the finking of fuch mountains, as feveral inflances of a fimilar nature are to be met with in other parts of the world. The great Icelandic lake called Myratu may probably have been one. Its bottom is entirely formed of lava, divided by deep cracks, which Shelter during winter the great quantity of trouts which inhabit this lake. It is now only 30 feet deep; but originally was much deeper ; being nearly filled up in the year 1728 by an eruption of the great mountain

Krafe. The fiery fream took its couffe towards Iceland. Myyatu, and ran into it with an horrid noife, which continued till the year 1730 .
" The monatains of Iceland (fays Mr Pennant) are of two kinds, primitive and pollerior. The former confif of Arata ufually regular, but fometimes confufed. They are formed of different furts of itone without the lealt appearance of fire. Some are compofed of fand and free ftone, petrcfilex or chirt, flaty or dinile flone, and various kinds of ea:th or bole, and Iteatite; different forts of breccia or conglutinated nones; jaipers of different kinds, Iceland cryital ; the common rhomboid fpathum, chalcedonies Aratiined, and botryoid; zeolites of the molt elegatit kinds; cryitals, and va. rious other fubflances that have no rilation to volcanoes. Thefe primitive mountains are thofe called Fokuls. and are higher than the others. One of them, called 无fian or Rias, is 6000 feet high. It feems to be compofed of great and irregular rocks of a darls. grey colour, piled on each other. Another, cailed Enneberg, is about 3000 feet high; the Snafeld Fukut; 2287 yards; the Sraffuclduas or promontory of Suafeld is from 300 to 400 fathoms. Horiffrand or the coalt by the north Cape Nord is very high, fiom 300 to 400 fathoms. The rocks of Drago arc feven in number, of a pyramidal figure, rifing out of the fea at a fnall diltance from the cliffs, four of which are of a vall height, and have a moft magnificent appearance.
". Ealtward from the Suxfeld begins the Eifberge, foaring to a vaft beignt; many pats of which have felt the effiects of fire, and in fome of the melted rocks arc large cavities. Budda-lekkur, a rock at one end of this mountain, is alfo volcanic, and has in it a great. cavern hang with fala fitia. The name of Solvalamar is given to a tremendous range of volcanic rocks, compofed entirely of flags, and covered in the feafon with fea-fowl. It would be endiefs, however, to mention all the places which bear the marks of fire in varioun. forns, either by having been vitrifed, clanged into a fiery colour, ragged and hlack, or bear the marks of having run for miles in a noping courfe towards the
fea." fea.'

Thefe volcanoes, though fo dreadful in their effects, feldom begin to throw out fire without giving warning. A fubterraneous rumbling noife heard at a confiderable diffance, as in other volcanoes, prccedes the erup. tion for fevcial days, with a roaring and cracking in the place from whence the fire is about to burit forth; many fiery meteors are obferved, but generally unattended with any violent concuffion of the earth, though fometimes earthquakes, of which feveral in. flances are recorded, have accompanied thefe dreadful conflagrations. The drying up of fmall lakes, freams, and rivulets, is alfo confidered as a figa of an impending eruption; and it is thought to halten the eruption when a mountain is fo covered with ice, that the holes are ftopped up through which the exhalations formerly found a free paffage. The immediate fign is the burting of the mafs of ice with a dreadful noife : flames then iffue forth from the earth, and lightuing and fire balls from the fmoke; flones, athes, \&c. are thrown ont to vatt diffances. Egbert Olaffen relates, that, in an eruption of Kattle gida in 1755, a flone weighing 290 ponnds was thrown to the diftance of $2+$ Englifh miles. A quantity of white pumice fone is

Tceland. Tceland. thrown up by the boiling waters; and it is conjectured with great probabilicy, that the latter proceeds from the fea, as a quantity of falt, fufficient to load feveral horles, has frequently been found after the mountain has ecafed to burn.

To enumerate the ravages of fo many dreadful volcanoes, which from time immemorial have contributed to render this dieary country fill lefs habitable than it is from the climate, would greatly exceed our limits. It will be fufficient to give an account of that which happened in 1783 , and which from its violence feems to have been unparalleled in hiftory.

Its firl figns were cbferved on the 1 it of June by a trembling of the earth in the wettern part of thie province of Sbapterfiall. It increafed gradually to the ifth, and became at laft fo gieat that the inhabitants quitted their houles, and lay at night in tents on the ground. A continual fmoke or fleam was perecivel rifing out of the earth in the northern and uninhabited parts of the courtry. Three fire-fpouts, as they were called, broke out in different places, one in Ulfarfild, a little to the ealt of the river Slapta; the other two were a little to the weltward of the river called Ilwerfisfiot. The river Skafta takes its rife in the northeatt, and running firft weltward, it turns to the fouth, and falls into the fea in a foutheaft direction. Past of its channel is confined for about 24 Englifh miles in length, and is in fome places 200 fathoms deep, in others 100 or 150 , and its breadth in come places 100,50 , or 40 fathoms. Along the whole of this part of its courle the river is very rapid, though there ase ло conliderable cataracts or falls. There are feveral other fuch confined channels in the country, but this is the molt confiderable.

The three fire- โpouts, or freams of lava, which had broke out, united into one, after having rifen a confiderable height into the air, arriving at lalt at fuch an amazing altitude as to be feen at the diftance of mure than 200 Englifh miles; the whole country, for double that diflance, being covered with a finoke or Heam not to be defcribed.

On the Sth of June this fire firt became vifible. Vat quantities of fand, athes, and other volcanic natters were ejected, and fcattered over the country by the wind, which at that time was very high. The atmofphere was filled with fand, bimflone, and ahes, in fuch a manner as to occafion continual darknefs; and confiderable damage was done by the punice flones which fell, red hot, in great quantities. Along with thefe a tenacious fubltance like pitch fell in valt quantity; \{cmetimes rolled "p like balls, at other times like rings or garlands, which proved no lefs delluctive to vegetation than the other. This fhower having continued for three days, the fire became very vifible, and at laft arrived at the amazing height already mentioned. Sometimes it appeared in a continued Aream, at others in flafhes or flames feen at the diftance of 30 or 40 Danifh miles ( 180 or $24^{\circ}$ of ours), with a continual roife like thunder, which latted the whole fummer.
'I'he fame day that the fire broke out there fell a valt quantity of rain, which running in Atreans on the hot ground tore it up in large quantities, and brought it down upon the lower lands. This rain water was much impregnated with acid and other falts, fo as to be
highly corrofive, and occalion a painful fenfation when it fell on the hands or face. At a greater diltance from the fire the air was exceffively cold. Snow lay upon the ground three feet deep in fome places; and in others there fell great quantities of hail, which did very much damage to the cattle and every thing without doots. Thus the grals and every kind of vegctation in thofe places nearelt the fire was dellroyed, being covered with a thick cruft of fulphureous and footy matter. Such a quantity of vapour was railed by the conteit of the two adverfe clements, that the fun was darkened and appeared like blood, the whole face of nature feeming to be changed; and this obfcurity leems to have reached as far as the inand of Britain; for during the whale fummer of 1783 , an obfcurity reigned throughout all parts of this inand; the atmofphere appearing to be covered with a continual haze, which prevented the fun from appearing with his ufual folendor.

The dreadful fcene above defcribed lafted in Iceland for feveral days; the whole country was laid watte, and the inhabitants fled every where to the remoteft ${ }^{-}$ parts of their miferable country, to feek for fafety fiom the fury of this unparalleled tempett.

On the firlt breaking out of the fire, the river Skapta was confiderably augmented, on the ealt fide of which one of the fire fpouts was fituated; and a fimilar overflow of water was obferved at the fame time in the great river Piorfa, which runs into the fea a little to the eattward of a town called Orrebakka, and into which anotber river called Tuna, after having run through a large tract of barren and uncultivated land, empties itfelf. But on the tith of June the waters of the Skapta were leffened, and in lefs than 2.4 hours totally dried up. The day following, a prodigious Atram of liquid and red-hot lava, which the fire-fpout had difcharged, ran down the channel of the river. This burning torrent ant only filled up the deep ehannel above mentioned, but, overflowing the banks of it, [pread itfelf over the whole valley, covering all the loiv grounds in its neighbourhood; and not having any fufficient outlet to empty itfelf by, it rofe to a valt height, fo that the whole adjacent country was overflowed, infinuating itfelf between the hills, and covering fome of the lower ones. The hills here are not continued in a long chain or feries, but are feparated from one another, and detached, and between them run little rivulets or brooks; fo that, befides filling up the whole valley in which the river Skaptu ran, the fiery ftream fpread itfelf for a confiderable diftance on each fide, getting vent between the above mentioned hills, and laying all the neighbouring country under fire.
The fpouts fill continuing to Cupply frefh quantities of inflamed matter, the lava took its courfe up the channel of the river, overflowing all the grounds above, as it had done thofe below the place whencc it iffued. The river was dried up before it, untul at laft it was flopped by the hill whence the Shapta takes its rifc. Finding now no proper outlet, it rofe to a prodigious height, and overflowed the village of Buland, confuming the houfes, church, and every thing that flood in its way; though the ligh ground on which this village ftood feemed to enfure it from any danger of this kind.

## I C E

Iceland. The fiery lake fill inercafing, fpread itfelf out in length and breadth for about 26 Englifh miles; and having converted all this tract of land into a fea of fire, it flretched itfelf towards the fouth, and getting vent again by the river Skapta rufhed down its channel with great impetuofity. It was fill corfined between the narrow banks of that river for about fis miles ( Lngli ) ; hat coming at laf into a more open flace, it poured forth in prodigions torrents with amazing velocity and force; fpreading itfelf now towards the fouth, tearing up the earth, and carrying on its furface fisming woods and whatfoever it met with. In its courfe it laid wafte another large diftrict of land. The ground where it came was cracked, and fent forth great quantities of ftram ling before the fire reached it ; and every thing near the lake was either burnt up or reduced to a fluid flate. In this fituation matters remained fiom the 12 th of June to the 13 th of Augult ; after which the fiery lake no longer fpread itfelf, but neverthclefs continued to burn ; and when any part of the furface aequired a cruft by couling, it was tuickly broken by the fire from below; and this tumbling down anong the melted fublance, was rolled and toffed about with prodigious noife and crackling ; and in many parts of its furface, fmall \{pouts or at leaft ebullitions were formed, which continued for fome length of time.

In other directions this dreadful inundation proved no lefs deftructive. Having run through the narrow part of the ehannel of Skapta as early as the 12 th of June, it fretched ont itfelf towards the wett and fouthweft, overflowing all the flat country, and its edge being no lefs than ;o fathoms high at the time it got out of the channel of the river. Continuing its deftructive courfe, it overflowed a number of villages, junning in every direction where it could find a vent. In one place it came to a great catarate of the river Skapta, about 14 fathoms in height, over which it was precipitated with tremendous noife, and thown in great quantities to a very confiderable diflance. In another place it ftopped up the channel of a large river, filled a great valley, and dellroying $t$ wo villages by approaching only witlin 100 fathoms of them. Others were overflowed by inundations of water proceeding from the rivers which had been ftopped in their courfes; until at laft all the paflages on the fouth, ealt, and wefl, being ftopped, and the fpouts fill fending up incredible quantities of frefh lava, it burft out to the north and northeaft, Spreading over a tract of land 48 miles long and 36 broad. Here it dried up the rivers Tuna and Axafyrdi; but even this vaft effufion being infufficient to exhauft the fubterrancous refources of liquid fire, a new branch took its courfe for about eight miles down the channel of the river Ilwererfyfliot, when coming again to an open country, it formed what our author calls a finall lake of fire, about twelve miles in length and fix in breadth. At laft, however, this branch alfo flopped on the 16 th of Auguft; the fiery fountains erafed to pour for thoew fupplies, and this moft aftonifting cruption came to a period.

The whole extent of ground covered by this dreadful inundation was computed at no lefs than 90 miles long and 42 in breadth; the Jepth of the lava being from 16 to 20 fathoms. Twelve rivers were dried up, 20 or 21 villages were defroyed, and 224 people loft

## 95 ] I C E

their lives. Thie extent above mentioned, however, is Iceland: that only on the fouth, ear, and weff; for that towaids the nurth being over uninhatited land, where no body carcd to venture thenfelves, was not exaetly known. Some hills were covered by this lava; others were melted down by its heat ; fo that the whole had the appearance of a fea of red hot and melted metal.

After this cruption two new illands were thrown up from the bottom of the fea. One, about three miles in circumference, and about a mile in height, made its appearance in the month of February $17^{4}$, where therc was formerly 100 fathoms water. It was about 100 miles fouthwct from Ictiand, and 48 from a cluster of fmall iflands called Gierfugla. It continued for fome time to burn with great violence, fending forth prodigious quantities of pumice ftones, fand, \&̌c. like other volcanoes. The other lay to the northweft, between Iceland and Greenland. It burnt day and night without intermifion for a confiderable time; and was alfo very high, and larger than the former. Since that time, however, one or both of thefe illands have been fwallowed up.

All the time of this great eruption, and for a confiderable time after, the whole atmofphere was loaded with fmoke, ftean, and fulphureous vapours. The fun was fometimes wholly invifible; and when it could be feen was of a reddifh colour. Moll of the finhe. rics were deftroyed; the banks where the fifh ufed to refort being fo changed, that the finermen could not know them again ; and the fmoke was fo thick, that they could not go far out to fea. The rain water, falling through this frioke and fteam, was fo impreg. nated with falt and fulphureous matter, that the hair and cven the fkin of the eattle were deflroyed; and the whole grafs of the ifland was fo covered with foot and pitchy matter, that what had efcaped the dellructive effeets of the fire became poifonous; fo that the cattle died for want of food, or perihhed by tating thofe unwholefome vegetables. Nor were the inhabitants in a much better fituation; many of them having loft their lives by the poifonous qualities of the fmoke and fleam with which the whole at mofphere was filled; particularly old people, and fuch as had any complaint in the breatt and lungs.
Before the fire broke out in Iceland, there is faid to have been a very remarkable eruption in the uninhabited parts of Greenland; and that in the northern parts of Norway, oppofite to Greenland, the fire was vifible for a long time. It was alfo related, that when the wind was in the north, a great quantity of afies, pumice, and brimftone, fell upon the north and well coafts of Iecland, which continued for the whole fummer whenever the wind was in that quarter; and the air was always very much impregnated with a thick fmoke and fulphureous fmell.
During the fall of the fharp rain formerly mentioncd, there was oblerved at Trondheim, and other places iu Norway, and likewife at Faw, an uncommon fall of fharp and falt rain, which totally detlroyed the leaves of the trees, and every vegetable it fell upon, by fcorching them up, and caufing them to wither. A. confderable quantity of athes, fand, and ot her voleanic matters, fell at Faro, which covered the whole furface of the ground whenever the wind blew from Iccland ${ }_{2}$ though the difance betreen the two places is not
lefs than 480 miles. Ships that were failing betwist Copenhagen and Norway were frequently covered with athes and fulphureous matter, which tuck to the malts, fails, and decks, hefmearing them all over with a black and pitchy fubflance. In many parts of Holland, Germany, and other northern countries, a fulphmenus vapour was obferved in the air, accompanied with a thick fmoke, and in fome places a light grey-coloured fubflance fell upon the earth every night; which, by yielding a bluifh flame when thrown into the fire, evidently flowed its fulphureous nature. On thofe nights in which this fubflance fell in any quantity, there was little or no dew oblerved. Thefe appearances continued, more or lefs, all the months of July, Auguft, and September.

Some curious particulars relative to the ancient flate of this inland have lately been publifhed by a Mr Vhorkelyn, a native of the country. From his work it appears that Iceland, for a very confiderable fpace of time, viz. from the beginning of the roth to the middle of the $13^{\text {th }}$ century, was under a republican form of government. At firlt the father, or head of cvery family, was an abfolute fovereign; but in the progrefs of population and improvement, it became neceffary to form certain regulations for the fettlement of difputes concerning the frontiers of different eftates. For this purpofe the heads of the families concerned affembled themfilves, and formed the outhines of a republic. In the mean time they carried on a profperous trade to different parts; fending hips even to the Levant, and to Conftantinople, at that time celebrated as the only feat of literature and humanity in the wolld. Deputies were likewife fent from this inland over land to that capital, for the improvement of their laws and civilization ; and this a whole century before the firlt crufade. In thefe ancient Icelandic lawe, there* fore, we meet with evident traccs of thofe of the Greeks and Romans. For example, befides a body of written laws which were written every third year to the people, they had two men chofen annually by the heads of families, with confular power,' not only to enforce the laws then in being, but when thefe proved deficient, to act as neceffity required.

Thefe laws do not appear to have inflicted capital punifhments upon any perfon. Murderers were banifhed to the roood; that is, to the interior and uncultiva. ted parts of the inand; where no perion was allowed to approach them within a certain number of fathoms. In cafes of banifhment for leffer crimes, the friends of the offender were allowed to fupply him with neecffaries. The culprit, however, might be killed by any perfon who found him without his bounds; and he might even be hunted and deftroyed in kis fanctuary, provided he did not withdraw himfelf from the inand within a twelvemonth after his fentence, which it was fuppofed he might accomplifh by means of the annual arrival and departure of fhips. Every man's perfon was free until he had forfeited his rights by fome clime againit fociety; and fo great was their refpeet for independence, that great indulgence was allowed for the power of pafion. If any provaking word or behavioul had been ufed, no punifment was inflicted on the party who refented it, even though he fhould have killed his adverfary.
$\mathrm{N}^{2} 1 \mathrm{bug}_{2}$.

By the laws of Iceland, the pnor were committed Iccland to the protection of their nearell kindred, who had a right to their labour as far as they were able to work, and afterwards to indemnitication if the poor perfon fhould acquire any property. Children were obliged to maintain their parents in their old age: but if the latter had ncglected to give them good education, they were abfolved from this duty.

Whilc the republic of Iceland continued free and independent, fhips were fent from the illand to all parts of the world. Till very lately, however, not a fhip belonged to it, the little commerce it enjoyed being monopolized by a Danith company, until in 1786 it was laid open to all the fubjects of Denmark. "There is at prefent (fays Mr Pennant *) a revival of the cod "Afoendi: fifhery on the coalt of Iceland from our kingdom. A- to Arcitic bout a dozen of veffels have of late failed from the ifle of Thantt, and a few from other parts of Great Britain. They are either floops or brigs from 50 to 80 tons burden. A lugfail boat, fuch as is ufed in the herring-filhery, failed laft feafon from Yarmouth thus equipped. The crew confilted of five men from the tow'n, and five more taken in at the Orkneys. They had twelve lines of 120 fathoms each, and 200 or 300 hooks; fix heading knives, twelve gutting and twelve fplitting knives. They take in 18 tons of falt at Leith, at the rate of three tons to every thoufand fifh; of which fix or feven thouland is a load for a veffel of this kind, They go to fea about the middle of April ; return by the Orkneys to land the men; and get into their port in the latter end of Auguft or beginning of September. Pytheas fays, that Iceland lies fix days failing from Great Britain. A veffel from Yarmonth was, in the laft year, exactly that time in its voyage from the Orkneys to Iceland. With a fair wind it might be performed in far lefs time; but the winds about the Ferroe inles are generally changeable."

Ioeland Agate; a kind of precions ftone met with in the iflands of Iceland and Afcenfion, employed by the jewellers as an agate, though too foft for the purpofe. It is fuppofed to be a volcanic product; being folid, black, and of a glafty texture. When held between the eye and the ligbt, it is femitranfparent and greenifh like the glafs bottles which contain much iron. In the iflands which produce it, fuch large pieces are met with that they cannot be equalled in any glars-honfe.

Iceland (or Ifland) Cryfal. See Crystal (Iceland).

ICENI, the ancient name of the people of Suffulk, Nor folk, Cambridgeflire, and Huntingdonfhire, in England.

ICH-dien. See Heraldry, cliap. iv. fect. 2.
ICHNEUMON in zoology. See Viverra.
Ichneumon, is alfo the name of a genus of flies of the hymenoptera order. The mouth is armed with jaws, without any tongue; the antenur have above 30 joints; the abdomen is generally petiolated, joined to the body by a pedicle or lalk; the tail is armed with a fting, which is inclofed in a dcuble valved cylindrical theath; the wings are lanceolated and plain. This genns is exceedingly numerous. In Gmelin's or the 13 th edit. of the $S_{y j f i c m a}$ Natura, no fewer than 415 fpecies are enumerated. They are divided into
neumon. families, from the colour of their fcutellum and antennx, as follow : 1. Thofe with a whitifh fcutcheon, and antennx annulated with a whitifh band. 2. Thofe which have a white efcutcheon, and antenux entirely black. 3. With a fcutcheon of the fame colour as the thorax; the antenne encompaffed with a fillet. 4. With a fcutcheon of the fame colour as the thorax; and antenne black and fetaceous. 5. Wilh fetaceous clay. coloured antennæ. 6. With fmall filiform antenne, and the abdomen oval and flender.

One dittinguifhing and Atriking character of thefe fpecies of flies is the almoft continual agitation of their antennx. The name of Ichneumon has been applied to them, from the fervice they do us by deftroying caterpillars, plant-lice, and other infects; as the ichneumon or mangoufte deftroys the crocodiles. The variety to be found in the fpecies of ichneumons is prodigious : among the fmaller fpecies there are males who perform their amorous preludes in the mott parfionate and gallant manner. The pofterior part of the females is armed with a wimble, vifible in fome fpecies, no ways difcoverable in others; and that inftrument, though fo firte, is able to penetrate through mortar and plafler : the fructure of it is more eafily feen in the long-wimbled fly: The food of the family to be produced by this fly is the larva of wafps or mafonbees: for it no fooner efpies one of thofe nefts, but it fixes on it with its wimble, and bores through the mortar of which it is built. The wimble itfelf, of an admirable ftrueture, confifts of three piects; two collateral ones, hollowed out into a gutter, ferve as a fheath, and contain a compact, folid, dentated fem, along which runs a groove that conveys the egg from the animal, who fupports the wimble with its hinder legs, left it fhould break, and by a varicty of movements, which it dexterouny performs, it bores through the building, and depofits one or more eggs, according to the fize of the ichneumon, though the largett drop but one or two. Some agglutinate their eggs upon caterpillars; others penetrate through the caterpillar's eggs, though very hard and depofit their own in the infide. When the larva is hatched, its head is fo fituated. that it pierces the caterpillar, and penetrates to its very entrails. Thefe larve pump out the nutritious juices of the caterpillar, without attacking the vitals of the creature; who appears healthy, and even fometimes transforms itfelf to a chryfalis. It is not uncommon to fee thofe caterpillars fixed upon trees, as if they were fitting upon their eggs, and it is afterwards difcovered that the larver, which were within their bodies, have fpun their threads, with which, as with cords, the caterpillars are fattened down, and fo perifh miferably. The ichneumons performed Peceial fervice, in the years $773^{1}$ and $173^{2}$; by multiplying in the fame proportion as did the caterpillats, their larvx deftroyed more of them than could be effected by human induftry. Thofe larve, when on the point of turning into chryfalids, fpin a filky cod. Nothing is more furprifing and fingular than to fee thofe cods leap when placed on the table or hand. Plant-lice, the larvx of the curculiones, and fpider's eggs, are alfo fometimes the cradle of the ichntumon-AY. Carcafes of plant-lice, void of motion, are often found on rofe-tree leaves; they are the habitation of a fratl larva, which, after having eaten up the entrails, deVol, IX. Part I.

Aroys the fprings and inward economy of the plant- Ichnogzasloufe, performs its metamorphofis under fhelter of the pellicle which enfolds it, contrives iteflf a fmall circular outlct, and fallies forth into open air. There

Ichthyo. colla. run them through with their Aing, tear then to pieces, and thus avenge the whole nation of flies of fo formidable a foe: others, deltitute of wings (and thofe are females), depolit theireggs in (piders nefts. The ichneumon of the bedeguar, or fweet briar fponge, and that of the rofe-Eree, pertraps only depofit their egge in thofe places, becaufe they find other infects on which they feed. The genus of the ichneumon flies might with propriety be termed a race of diminutive canibals.

ICHNOGRAPHY, in perfpctive, the view of any thing cut off by a plane, parallel to the horizon, jult at the bafe of it.- The word is derived from the Greek 'xuc foothep, and rpapa $I$ write, as being a defcription of the footiteps or traces of a work.

Among painters it fignifies a defcription of images or of ancient ftatues of marble and copper, of butts and femi-bults, of paintings in frefco, mofaic works, and ancient pieces of miniature.

ICHOGLANS, the grand Gignior's pages ferving in the feraglio. Thefe are the children of Chriftian parento, either taken in war, purchafed, or fent in prefents from the viceroys and governors of dillant provinces; they are the moft fprightly, beauciful, and well-made that can be met with; and are always reviewed and approved of by the grand fignior himfelf before they are admitted into the feraglios of Pera, Conftantinople, or Adrianople, being the three colleges where they are educated, or fitted for employments, according to the opinion the court entertains of them.

ICHOR, properly fignifies a thin watery humour like ferum; but is fometimes uftd for a thicker kind flowing from ulcers, called alfo fanies.

ICH'THYOCOLLA, Isinglass, a preparation from the fifh known by the name of bufo. Sce Accipenser. The word is Greek, formed of - $x^{\beta u s}$ ffh, and xonso glue.-The method of making Ifinglafs was long a fecret in the hands of the Ruf. fians; but hath lately been difcovered, and thefcllowing account of it publifhed by Humphrey Jackfon, Efq; in the 63 d volume of the Philofophical Tranfactiuns.
"All authors who have hitherto delivered pro. ceffes for making ichthyocolla, fifh ylue, or ifinglafs, have greatly mittaken both its conftituent matter and preparation.
"To prove this affertion, it may not be improper to recite what Pomet fays upon the fubject, as he appears to be the principal author whom the relt have copied. After defcribing the fifh, and referring to a cut engraved from an original in his cuftody, he fays: - As to the manner of making the ifinglafs, the finewy parts of the fifh are boiled in water till all of them be diffolved that will diffolve; then the gluey liquor is Itrained, and fet to cool. Being cold, the fat is carcefully taken off, and the liquor itfllf boiled to a juit confittency, then cut to pieces, and made into a twilt, bent in form of a crefcent, as commonly fold; then hung upon a ftring, and carefully dried.'
"From this account, it might be rationally con. N cluded,
cluded, that every fpecies of fift which contained gelatinous principles would yield ifinglafs: and this parity of reafoning feems to have given-rife to the haty conclutions of thofe whu thenuouly vouch for the extraction of ilinglafs from flurgeon; but as that bifh is eafily procurable, the negligence of afcertaining the fact by experiment feems incecuiable.
" ln my firlt attempt to difcover the conllituent parts and manufacture of ifinglafs, relying too much upon the authority of forme chenical authors whofe veracity I had experienced in many other inlances, I found myfelf conllantly difappointed. Glue, not ifinglafs, was the refult of every procefs: and although, in the fame view, a journey to Rufin proved fruitefs, jet a fteady prefeverance in the refearch proved not only fuccelsful as to this object, but, in the purfuits to difcover a relinous matter plentifully procurable in the Briaifh fifheries, which has been found by ample experience to anfwer limilar purpofes. It is now no longer a fecret, that our (A) lakes and rivers in North America are focked with immenfe quantitits of fith, faid to be the fame fpecies * with thofe in Mufcovy, and yiclding the fineft ifinglafs; the fifheries whereof, under due eneouragement, would doubtlefs fupply all Europe with this valuable article.
" No artiticial heat is neceflary to the production of ifinglafs, neither is the matter diffolved for this purpofe; for, as the continuity of its fibres would be deftroyed by folution, the mals would become brittle in drying, and frap thort alunder, which is always the cafe with glue, but never with ifinglafs. The latter, indeed, may be refolved into glue with boiling water; but its fibrous recompolition would be found impracticable afterwards, and a fibrous texture is one of the molt diltinguihing characteritics of genuine ifinglafs.
"A due confideration that an imperfect folution of ifinglafs, called fining by the brewers, poffeffed a peculiar property of clarifying malt-liquors, induced me to attemptits analyfis in cold fubacid menftroums. One ounce and an half of good ilinglafs, fteeped a few days in a gallon of ftale beer, was converted into good fining, of a remarkably thick confiftence: the tame quantity of glue, under fimilar treatment, yielded only a mucilaginous liquor, refembling dilated gumwater, which, inltead of elarifying beer, increafed both its tenacity and turbidnefs, and communicated other properties in no refpect correfponding with thofe of genuine fining. On commixing three fpoonfuls of the folution of ilinglafs with a gallon of malt liquor, in a tall cylindrical glafs, a valt number of curdly inaftes became prefently formed, by the reciprocal attraction of the particles of ifinglais and the feenlen. cies of the beer, which, increafing in magnitude and
fpecific gravity, arranged themfelves accordingly, and fell in a combined ftate to the bottom, through the well-k nown laws of gravitation; for, in this caie, there is no elective attraction, as fome have imagined, which bears the leaft affuity with what frequently occurs in chemical decompofitions.
" If what is commercially termed long or foort flapled $j$ inglafs be feetped a few hours in fair cold water, the entwitted membranes will expand, and reaflume their original beantiful (b) hue, and, by a dexterous addrefis, may be perfectly uufolded. By this fimple operation, we find that ilinglafs is nothing more than certain membranous parts of fihes, divetted of their native mncolity, rolled and twitted into the forms above mentioned, and dried in open air.
"The founds, or air-bladders, of freih water fifh in general, are preferred for this purpofe, as being the molt trinfparent, flexihle, delicate fubltances. Thefe conflitute the fineit forts of ilinglafs; thofe called book and ordinary flaple, are made of the inte?tines, and probably of the peritonxum of the fifl. The belluga yields the greateil quantity, as being the largelt and molt plentiful hifh in the Mufcovy rivers; but the founds of all frefl-water fifh yield, more or lefs, fine ilinglafs, particularly the fmaller forts, found in prodigious quantities in the Cafpian Sea, and feveral hundred miles beyond Aftracan, in the Wolga, Yaik, Don, and even as far as Siberia, where it is called kle or lha by the uatives, which implies a glutinous inatter; it is the bafis of the Ruffian glue, which is preferred to all other kinds for its Itrengeth.
"The founds, which yield the finer ifinglafs, confin of parallel fibres, and are eafily rent longitudinally: but the ordinary forts are found compofed of double membranes, whofe fibres crofs each other obliquely, refembling the coats of a bladder: hence the former are more readily pervaded and divided with fubacid liquors ; but the latter, through a peculiar kind of interwoven texture, are with great difficulty torn afunder, and long refift the power of the fame menllyum ; yet, when doly refolved, are found to act with equal energy in clarifying laquors.
"Ifinglafs receives its different Chapcs in the following manner:
" The parts of which it is compored, particularly the founds, are taken from the fifh while fweet and freft, hit open, wafted from their nimy fordes, divelted of ewery thin membrane which envelopes the found, and then expoled to ftiffen a little in the air. In this flate, they are formed into rolls about the thicknefs of a linger, and in length according to the intended fize of the flaple: a thin membrane is generally felected for the centre of the roll, round which the relt are folded alternately, and about half an inch of each extremity
(A) As the lakes of North America lie nearly in the fame latitude with the Cafpian Sea, particularly lake Superior, which is faid to be of greater extent, it was conjectured they might abound with the fame forts of fifh; and in confequence of public advertifements diftributed in various parts of North America, offering premiums for the founds of furgeon and other fifh, for the purpofe of making ifinglafs, feveral fpecimens of tine ifinglafs, the produce of fift taken in thefe parts, have been lately fent to England, with proper attellations as to the unlimited quantity which may be procured.
(B) If the tranfparent ifinglafs be held in certain pofitions to the light, it frequently exhibits beautiful prifmatic colours.
tremity of the roll is turned inwards. The due dimenfions being thus obtained, the two ends of what is called fiori flaple are pimed together with a fmall wooden peg; the middle of the soll is then preffed a little downwards, which gives it the refemblance of a hicart-fhape ; and thus it is laid on boards, or hung up in the air to dry. The founds, which compofe the long flaple, are longer than the former; but the operator lengthens this fort at pleafure, by interfolding the ellds of one ur more pieces of the found with each other. The extremities are fallened with a peg, like the former: but the middle part of the roll is bent more confiderably downwands; and, in order to preferve the fhape of the thice oltufe angles thas formed, a piece of round aick, about a quarter of an inch diameter, is faftened in each angle with fmall wooden pegs, in the fame manner as the ends. In this tlate, it is permitted to dry long enough to retain its form, when the pegs and flicks are taken out, and the dyying completed; laftly, the pieces of ifinglafs are colliggated in rows, by running packthread through the peg-holes, for convenience of package and exportation.
" I'he membranes of the book fort, being thick and reflactory, will not admit a fimilar formation with the preceding; the pitces, therefore, after their fides are folded inwardly, are bent in the centre, in fuch manner that the oppolite lides refemble the corer of a book, from whence its name; a peg, being run acrofs the middle, fattens the fides together, and thus it is dried like the former. This fort is interleaved, and the pegs rua acrofs the ends, the better to prevent its unfolding.
"That called cake-ifunglafs is formed of the bits and fragments of the ttaple forts, put into a Hat metalline pan, with a very little water, and heated juft enough to make the paits cohere like a pancake when in is dries; but fiequently it is overheated, and fuch pieces, as before obferved, are ufelefs in the bufinefs of tining. Experience has taught the confuners to reject them.
" Itinglafs is bert made in the fummer, as froft gives it a difagreeable colour, deprives it of weight, and impairs its gelatinous principles; its fafhouable forms are unneceifary: and frequently injurious to its native qualities. It is common to find oily putid matter, and exurip of infects, between the inplicated membranes, which, through the inattution of the cellarman, often contaminate wines and malt-liquors in the act of clarifieation. Thefe peculiar fhapes might, probably, be intreduced originally with a view to conceal and diffuife the real fubstance of iinglafs, end prelerve the inonopoly; but, as the makk is now taken off, it cannot be duubted to anfwer every purpofe more effectually in its native flate, withont any fubfequent manufacture whatever, efpecially to the principal confumer, who hence will be enabled to procure dufficient fupply from the Britill colenies. Until this laudable end can be fully accomplifhed, and as a ipecies of ifinglafs, more ealily produceable from the marine fifheries, may probably be more immediately encouraged, it may be manufachured as follows:
" I he founds of cod and ling bear great analogy with thofe of the accipenfor genus of Limmeus and Ar-
tedi ; and are in general fo well known as to require Ichtirm. no particular defcription. The Newfundland and Iceland fifhermen fplit open the fifh as foon as taken, and throw the back bones, with the founds annexed, in a heap; but previous to insipient putrefaction, the founds are cut out, wathed from their flines, and falted for ufe. In cutting out the founds, the intercoftal parts are left behind, which are much the befl ; the Iceland fifhermen are fo fenfible of this, that they beat the bone upon a block with a thick Hick, till the pockets, as they term them, come out eafily, and thus preferve the found entire. If the founds have beer cured with falt, that muft be diffolved by fteeping them in water before they are prepared for ifinglafs: the freth fonnd mutt then be laid apon a bluck of wood, whofe furface is a little elliptical, to the end of which a fmall hair-bruft is nailed, and with a faw knife the membranes on tach lide of the found mull be feraped off. The knife is rubbed upon the brulh occafionally, to clear its teeth; the pockets are cut open with fciflars, and perfectly cleanfed of the mucous matter witl a coarfe cloth; the founds are afterwards wafhed a few minutes in lime-water in order to abforb their oily principle, and lattly in clear water. They are then laid upon nets to dry in the air; but if intended to refemble the foreign ifinglafs, the founds of cod will enly admit of that called book, but thofe of ling both fhapes. The thicker the founds are, the beto ter the ilinglafs, colour excepted ; but that is immate. rial to the brewer, who is its chief confumer.
"This ifinglafs refolves into fining, like the other forts, in fubacid liquors, as flale beer, cyder, old hock, \&c. and in equal quantities produces fimilar effects upon turbid liquors, except that it falls fpeedier and clofer to the bottom of the veffel, as may be demonfrated in tall cylindrical flaffes; but foreign ifinglafs retains the confiltency of fining preferably in warm weather, owing to the greater tenacity of its native mucilage.
"Vegetable acids are, in every refpect, beft adapted to fining: the mineral acids are too corrofive, and even infalubrious, in common beverage.
" It is remarkable, that, during the converfion of ilinglafs into fining, the acidity of the mentruwn feems greatly diminifhed, at leatt to talle; noi on account of any alkaline property in the ifinglafs, probably, but by it inveloping the acid particles. It is likewife reducible into jelly with alkaline liquors, which indeed are folvents of all animal matters; even cold lime-water diffolves it into a pulpons magma. Nutwithflanding this is inadmiffble as lining, on account of the menltruum, it produces admirable effects in other refpects: for, on commisture with compolitions of plaHer, lime, \&cc. for ornamenting walls expofed to viciffitudes of weather, it adds firmmefs and permanency to the cement; and if common brick mortar be worked up with this jelly, it foon beconies almoft as hard as the brick itelif: but, for this purpofe, it is more commodiouly prepared, by diffolving it in cold water, acidulated with vitrolic acid; in which cafe, the acid quits the jelly, and forms with the lime a clenitic mafs, "hile, at the fame time, the jelly being deprived in fome meafure of its moillure, through the formation of an indilfoluble concrete amongit its parts, foou

3chthyo- driee, and hardens into a firm body; whence its fulory. perior frength and durability are eafily comprehended.
" It has long been a prevalent opinion, that fturgeon, on account of its cartilaginous nature, would yield great quantities of ifinglafs; but, on examination, no part of this fifh, except the iuner coat of the found, promifed the leaft fuccefs. This being full of ruye, adheres fo firmly to the external membrane, which is ufelefs, that the labour of reparating them fupcrfedes the advantage. The inteftines, however, which in the larger fifh extend feveral yards in length, being cleanfed from their mucus, and dried, were found furprifingly ftrong and claftic, refembling cords made with the inteftines of other animals, commonly called $c a t-$-rul, and, from Come trials, promifed fuferior advantages when applied to mechanic operations."

Ifinglafs is fometimes ufed in modicine; and may be given in a thin acrimonious flate of the jnices, after the fame manner as the vegetable gums and mucilages, regard being had to their different difpofition to putrefience.

ICHTHYOLOGY, the feience of finkes, or that part of zoology which treats of fihes. See Fish.

Fiflhes form the fourth clafs of animals in the L,inneau fyltein This clafs is there arranged into fix orders, buder three great divifions; none of which, however, include the cetaceons tribes, or the whale, dolphin, \&c. thefe forming an order of the clafs Mammalia in the fame fyftem. See Zoglogy.

Mr Pennant, in his Britifh Zoology, makes a dif-

Thoracic, Fugular, and Aldominal, he copies from Linnæus: who founds this fyitem on a comparifon of the ventral fins to the feet of land-aninals or reptiles; and either from the want of them, or their particular fituation in refpect to the other fins, eftablifhes his fections. - In order to render them perfectly intelligible, it is neefflary to refer to thofe feveral organs of movement, and tome other parts, in a perfect fifh, or one taken out of the three laft fections. In fig. 4. (the Haddock), $a$, is the pestoral lins ; $b$, ventral tins; $c$, anal fins; $d$, caudai fin, or the tail ; $e, e, c$, dorfal fins: $f$, bony plates that cover the gills ; $g$, branchiollegous rays and their membranes; $b$, lateral or ide line.

Sect. I. Aponal: The mof imperfect, wanting the ventral fins; illuftrated by the Conger, fig 3. This alfo expreffes the union of the dorial and anal fins with the tail, as is found in fume few fith --frenera: The Eel, Wolf-fifh, Launce, Morris, Swordfifh.

Sect. 2. Jugular: The ventral fins $l$, placed before the pectoral lias $a$, as in the Hadlock, fir. 4. - . Genera: The Draronct, Wecver, Cudifh, Blensy.

Sect. 3. Thoracic: The ventral fins $a$, place 1 beneath the pectural hims $l$, as in the Father Lather, fig. 5.-Genera: The Goly, Bull-head, Duees, Flounder, Gilt-head, Wrafic, Perch, Sticklebaik, M+ckarel, Sumbilet, Gurnard.
Sect. 4. Abdominal: ' The ventral fins placed behind the pectoral tins, as in the Minow, fig. 6.-Genera : The Luche, Salmon, Pike, Argentine, Atherine, Mullet, Flying tifh, Herring, Carp.
Naturalifts obferve an exceeding great degree of wifdom in the ftructure of fifhes, and in their conforma. tion to the element in which they are to live. Moft of them have the fame external form, Sharp at either end, and fwelling in the middle, by which they are enabled to traverfe the fluid in which they refide with greater velocity and eafe. This fhape is in fome meafure imitated by men in thofe veffels whieh they delign to fail with the greateft fivifnefs; but the progrefs of the fwifteft failing hip is far inferior to that of tifhes. Any of the large fiftes overtake a fhip in full fail with the greateft cafe, play romen it as though it did not move at all, and can get before it at pleafure.

The chief inftruments of a fifh's motion have been Utes of ${ }^{3}$ fuppofed to be the fins; which in fome are much more finsand numerous than in others. A fifh completely fitted for of filacs, fwimming with rapidity, is generally furnifhed with two pair of fins on the fides, and three fingle ones, two above, and one below. But it does not always hapsen that the fifh which has the greatef number of. fins is the fwifieft fiximmer. The fhark is thought to be one of the fwifteft fifles, and yet it has no tins on its belly ; the haddock feems to be more completely fitted for motion, and yet it does not move fo fwiftly. It is even obfervable, that fome fifhes which have no. fins at all, fuch as loblers, dart forward with prodigious rapidity, by means of their tail; and the inltrument of progreflive motion, in all Gifhes, is now found to be the tail. The great ufe of the fins is to keep the body in equilibrio : and if the firs are cut off, the fifin can itill fwim; but will turn apon its fides or its back, without being able to keep itfelf in an erect pofture as before. If the filh defines to turn, a blow

## I C H

from the tail fends it about in an inftant ; but if the tail Atrikes both ways, then the motion is progreffive.

All fithes are furnifhed with a flimy glutinous matter, which defends their bodies from the immediate contact of the furrounding fuid, and which likewife, in all probability, affits their motion through the water. Bentath this, in many kinds, is found a ftrong covering of fcales, which, like a coat of mail, defends it fill more powerfully ; and under that, before we come to the mufcular parts of the body, lies an oily fubftance, which alfo tends to preferve the requifite warmth and vigour. tuse very much infcrior to land animals, whether beafts or birds. 'Their fenfe of feeling, it is thought, muft be very obfcure on account of the fcaly coat of mail in which they are wrapped up. The fenfe of fmelling alfo, it is faid, they can have only in a very fmall degree All fihes, indeed, have one or more noftrils; and even thofe that have not the holes perceptible without, yet have the bones within, properly formed for fmelling. But as the air is the only mediam we know proper for the diflribution of odours, it cannot be fuppofed that thefe animals which iefide conftantly in the water can be affected by them. As to tafting, they feem to make very litule diftinction. The palate of moft lifhes is hard and buny, and confequently incapatle of the powers of relifhing different fubflances; and accordingly thefe voracious animals have often been ohferved to fwallow the fifherman's plummet inftead of the bait. Hearing is generally thought to be totally deficient in fifhes, notwithllanding the difcoveries of fome anatomits who pretend to have found out the bones defigned for the organ of hearing in their heads. They have no voice, it is faid, to communicate with each other, and confequently have no need of an organ for hearing. Sight feems to be that ferfe of which they are poffeffed in the greateft degree; and yet even this feems obfcure, if we compare it with that of other animals. The eye, in almoft all fifhes, is covered with the fame tranfparent fkin which covers the rell of the head, and which probably ferves to defend it in the water, as they are without evelids. The globe is mose depreffed anteriorly, and is furmond behind with a mufcle which ferves to lengthen or flatten it as there is occaion. The eryftalline humour, which in quadrupeds is flat, and of the fhape of a buttonmould, or like a very convex lens, in fithes is quite round, or fometimes oblong like an egg. Hence it is thought that fifhes are extremely near fighted; and that, even in the water, they can perceive objects only at a very fmall diftance. Hence, fay they, it is cvident how far fifhes are below terreftrial animals in their fenfations, and confequently in their enjoyments. Even their brain, which is by fome fuppofed to be of a fize with every creature's undertanding, fhows that fithes are very much inferior to birds in this refpect.

Others argue differently with regard to the bature of nifues. - With refpect to the fenfe of feeling, fay they, it cannot be juilly argued that fifhes are def. cient, mercly becanfe they are covered with fcales, as it is polfible thefe feales may be endued with as great a power of fenfation as we can inagine. The fenfe of feeling is not properly connected with fofire $/ s$ in any organ, more than with bardnefs in it. A fimilar.

101 ] I C H
argument may be ufed with regard to fmelling; for Ichthoy in though we do not know how imells can be propagated water, that is by no means a proof that they are not fo. On the contrary, as water is found to be capable of abforbing putrid effluvia from the air, nothing is more, probable than that thefe putrid effuria, when mixed with the water, would affect the olfafiory organs of fifhes, as well as they affect ours when mixed with the air. - With regard to tafte, it certainly appears; that fithes are able to diftinguith their proper fuod from what is improper, as well as other animals. Indeed, no voracions animal feems to be endued with much fenfibility in this refpect; nur would it probably be confiftent with that way of promifeuoufly devouring every creature that comes within its reach, without which thefe kinds of animals could not fabfift.

With refpect to the hearing of tifhes, it is urged, Serife o: that, when kept in a pond, they may be made to hearmg, anfwer at the call of a whifle or the ringing of a bell; and they will even be terrilied at any fudden and violent noife, fuch as thunder, the firing of guns, \&c. and thrink to the bettom of the water. Amons the ancients, many were of opiniun that fifhes had the fenfe of hearing, though they were by no means fatistied about the ways or paffages by which they heard. Placentini afterwards difcovered fome bones in the head of the pike, which had very muci the appearance of being organs of hearing, though he $\kappa$ uld never difcover any external paffages to them. Klein affirmed, from his own experiments and obfervations, that all fithes have the organs of hearing ; and have alfo palfages from without to thefe organs, though in many fpecies they are difficult to be feen; and that even the moft minute and obfcure of thefe are capable of communicating a tremulous motion to thofe organs, from founds ifluing from without. This is Itkenife afferted by M. Geoffroy $\dagger$, who gives a particular defcrintion of the + Difertizorgans of hearing belonging to leveral fpecies. Thefe tion fur boro. organs are a fet of little bones extremely hard, and rane de white, like fine porcelain, which are to be found in ${ }^{\text {loue }}$, p. $97_{0}$. the heads of all fithes: The external auditory paffages et teq. are very fmall ; being fcaree fufficient to admit a hog's britle; though with care they may be diftinguithed in almof all fifhes. It can by no means be thought that the water is an improper medium of found, feeing daily experience fhows us that founds may be conveyed not only through water, but through the moll fulid bodies $\ddagger$. It feems indeed very difificat to detrmine + See $A-$ the matter by experiment. Mr Couan, who kept coufics. forne gold fifhes in a vafe, informs us, that whatever noife he made, he could neither tearify nor diturb them ; he halloo'd as loud as he eould, putting a piece of paper between his month and the water, to prevent the subrations from affecting the fuface, and the fifhes Atll fecmed infenfible: but when the paper wab removed, and the found had its full effect on the water, the cale was then altered, and the filhos iution y fouk to the bottom. This experiment, however, or others fimilar to it, cannot prove that the filhes did not hear the founds before tlie paper was removed; it only fhows that they were not alamed till a fenfible vibration was introduced into the water. The call of a whillte may alfo be fuppefed to affect the water in a fih pond with a vibsatory motion: but this certainly mull be very obfcuse; and if fifhes can be affermbied in this maniter

Ichehro when no perfon is in fight, it amounts to a denmonitralary. tion that they actually do hear. See Comparative Axatomy, $1^{2} 167$.

The arguments ufed againit the fight of hifies are the weakelt of all. Many inflances which daily oceur, thow that fiflies have a very acute fight, not only of objects in the water, but of thofe in the air. Their jumping ont of the water in order to catch flies is an abundant proof of this; and this they will contime to do in a fine fummer evening, even after it is fo dark that we cannot dittinguifl the infeets they attempt to catch.

Thargh fifhes ate formed for living entirely in the water, yet they cannot fubfit without air. On this fubject Mr Hawkfore mare feveral experiments, which are recorded in the Philofophical Tranfactions. The fifles he employed were gulgeons; a fpecies that are very livily in the water, and can live a confiderable time out of it. Three of them were put into a glafs vefiel with about three pints of frefh water, which was defigned as a flandard to compare the others by. Into another glafs, to a like quantity of water, were put three more gudgeons, and thus the water filled the ghafs to the very brim. Upon this he ferewed down a brafs plate with a leather below, to prevent any communication between the water and the external air; and, that it might the better refemble a pond frozen over, he fuffered as little air as polfible to renain on the furface of the water. A third glafs had the fame quantity of water put into it ; which, finf by boiling, and then by continuing it a whole night in vacuo, was purged of its air as well as poffible; and into this alfo were put three gudgeons. In about half an hour, the fifhes in the water from whence the air had been exhaufted, began to difeever fome figns of uneafinefs by a more than ordinary motion in their months and gills. 'Thofe who had no communication with the external air, would at this time alfo frequently afcend to the top, and fuddenly fwim down again: and in this Itate they continued for a conliderable time, without any fenlible alteration. About five hours after this obfervation, the fifhes in the exhaulted water were not fo active as bcfore, upon thaking the glafs which contained them. In three hours more, the included fifhes lay all at the bottom of the glafs with their bellies upwards; nor could they be made to thake their fins or tail by any motion given to the glafs. They had a motion with their mouths, however, which fhowed that they were not perfectly dead. On uncovering the veffll which contained them, they revived in two or three hours, and were perfectly well next morning ; at which time thofe in the exhaufted water were alfo recovered. The veflel containing thefe latt being put under the receiver of an air-pump, and the air exhaufted, they all intlantly died. They continued at top while the air remained exhaufted, but funk to the bottom on the admiffon of the atmofphere.

The ufe of air to fifhes is very difficult to be explained; and indeed their method of obtaining the fupply of which they Itand conilantly in need, is not cafily accounted for. The motion of the gills in fifhes is certainly analogous to our breathing, and feems to be the operation by which they feparate the air from the water. Their manner of breathing is as follows. The fifh firf takes a quantity of water by the mouth,
which is driven to the gills ; thefe clole, and keep the water which is fwallowed from returning by the mouth, while the bony covering of the gills prevents it from going through them till the animal has drawn the pruper quantity of air from it : then the bony covers open, and give it 3 free paffage; by which means allo the gills are again opened, and admit a fref quantity of water. It the lifl is prevented from the fice play of its gills, it fuon falls into convulfions, and dies. But though this is a peety plaufible explanation of the re[piration of fithes, it remairs a difficulty not eafily folved what is done with this air. lhere loems to be no receptacle for contaning it, except the air-bladder or fwim; which, by the generality of modern philofopheis, is dellmed not to anfwer any vital purpofe, but only to enable the fifh to rife or limk at p.cafure.

The air-bladder is a bag lilled with air, compofed of the fometimes of one, fometimes of two, and fonctimes of f the a three divifons, lituated tuwards the back of the fith, flades, and opening into the maw or the gullet. The nfe of this in railing or deprefling the tifh, is proved by the folluwing experiment. A carp being put into the dirpump, and the air exhaultel, the bladder is laid to burt by the expantinn of the air contained in it; after which, the lifh can no more rife to the top, but ever afterwards crawls at the bottom. The fame thing alfo happens when the air-bladder is pricked or wounded in fuch a manner as to let the air out ; in thele cafes alfo the fifh cortinues at the bottom, witlout a puffibility of riling to the top. From this it is inferred, that the ufe of the air-bladder is, by fwelling at the will of the aninal, to increafe the furface of the fin's body, and thence diminifhing its \{pecific gravity, to enable it to rife to the top of the water, and to keep there at plesfure. On the contrary, when the fif wants to defcend, it is thought to contract the airbladder; and being thus rendered ppecifically Leavier, it delcends to the battom.

The ancients were of opinion, that the air-bladder in fithes ferved for fome purpules elfentially neeeflary to life ; and Dr Prieltley alfo conjecture ${ }^{\circ}$, that the raifing or deprefling the lifh is not the only ufe of thefc air-bladders, but that they allo may ferve fome uther purpofes in the esconomy of fithes. There are many arguments iudeed to be ufed on this fide of the queAion : the inolt conclufive of which is, that all the cartilaginous kind of fithes want air-bladders, and yet they rife to the top or tink to the bottom of the water without any difficulty; and though molt of the eelkind have air-bladders, yet they cannot raife themfelves in the water without great difficulty.

Fifhes are remarkable for their longevity. "Moft Longe of the diforders incident to mankind (fays Bacon) arife of fibe from the changes and alterations in the atmofphere; but fifhes refide in an element little \{ubject to change: theirs is an uniform exiftence; their movements are withont effort, and their life without labour. 'Their bones, alfo, which are united by cartilages, admit of indefinite extention; and the different lizes of animals of the fame kind, among fifhes, is very varions. They ftill keep growing : their bodies, inltead of fuffering the rigidity of age, which is the caule of the natural decay of land-animals, fill continue increaling with freth fupplies; and as the body grows, the cunduits

of life furnith their ftores in greater abundance. How long a fih, that feems to have fcarce any bounds put te its growth, continues to live, is not aicertained; perhaps the life of a man would not be fufficient to of meafure that of the fmalleft." -There have been two methods fallen upon for determining the age of fithes; the one is by the circles of the fcales, the other by the tranfverfe fection of the back bone. When a fin's feale is examined by a microfonpe, it is found to confill of a number of circles onc within another, in fome mesfure refombing thufe which appear on the tranfuerfe fection of a tree, and is fuppofed to give the fame iuformation. For, as in trees, we can tell their age by the number of their circles; fo, in filhes, we can tell theirs by the number of circles in every fcale, teckoning one ring for every year of the animal's exiftence. - The age of fithes that want fales may be known by the ether method, namely, by feparating the joints of the back-bone, and then minutely obferving the number of rings which the furface, where it was joined, exhibits.

Fifhes are, in general, the moft voracious animals in nature. In moft of them, the maw is placed next the mouth; and, though poffeffed of no fenible heat, is cndowed with a very furprifing faculty of digeltion. Its digeftive power feems, in fome meafure, to increafe in proportion to the quantity of food with which the fifh is fupplied. A fingle pike has been known to devour 100 roaches in three days. Whatever is poffeffed of life, feems to be the moft delirable prey for fifhes. Some that have very fmall mouths, feed upon worms, and the fpawn of other filh : others, whofe mouths are larger, feek larger prey; it matters not of what kind, whether of their own fpecies, or any other. Thofe with the largeft mouths purfue almoft every thing that hath life; and often meeting each other in fierce oppofition, the fifh with the largeft fwallow comes off with the victory, and devours its antagonift.-As a counterbalance to this great voracity, however, fiftes are incredibly prolific. Some bring forth their young alive, others produce only eggs : the former are rather the lealt fruitful ; yet even thefe produce in great ahundance. The viviparous blenny, for inftance, brings forth 200 or 300 at a time. Thore which produce eggs, which they are obliged to leave to chance, either on the bottom where the water is fhallow, or foating on the furface where it is deeper, are all much more prolitic, and feem to proportion their flock to the danger there is of confumption. - Lewenhoeck aflures us, that the cod fawnsabove nine millions in a feafon. The founder commonly produces above one million, and the mackarel above 500,000 . Scarce oue in 100 of thefe eggs, however, brings forth an animal : they are devoured by all the leffer fiy that frequent the fores, by water-fowl in fallow waters, and by the larger fifhes in deep waters. Such: a prodigious increafe, if permitted to come to maturity, would overftock nature; even the ocean itfelf would not be able to contain, much lefs provide for, one half of its inhabitants. But two wife purpofes are anfwered by this amazing increafe; it preferves the fpecies in the midt of numberlefs enemies, and ferves to furnifh the reft with a fuftenance adapted to their nature.

With refpect to the generation of many kinns of fines, the common opinion is, that the female depofits
her fpawn or eggs, and that the male afterwards ejects his fpern or male femen upon it in the water. 'I'he want of the organs of generation in fifhes gives an apparent probability to this : but it is Atrenuonfly oppofed by Linnzus. He afirms, that there can be no polibility of impregnaring the eggs of any animal out of its body. To confirin this, the general courle of nature, not only in birds, quadrupeds, and infects, but even in the vegetable world, has been called in to his affillance, as proving that all impregnation is performed while the egg is in the body of its parent : and he fupplies the want of the organs of generation by a very trange procefs, affirning, that the males eject their femen alway's fome days before the females depofit their ova or fpawn ; and that the females fwallow this, and thus have their eggs impregnated with it. He fays, that he has frequently: Ceen, at this time, three or four fenales gathered about a male, and greedily fnatching up into their mouths the femen be cjects. He mentions fome of the efoces, fome pearch, and fome of the cyprini, in which he had feen this procefs. But fee Comparative Anatomy, no 15 中.

Many opinions have been flarted in order to account how it happens that fifhes are found in pools, and ditches, on high mountains, and elfewhere. But Gmelin obferves, that the duck-kind fwallow the eggs of fifhes; and that fome of thele eggs go down, and come out of their bodies unhurt, and fo are propagated juult in the fame manner as has been obferved of plants.

For a more particular view of the ftructure of lifhes, fee Comparatife Anatomy, $n^{\circ} 146-167$.

ICHPHYOPHAGI, FISH-EATERS, a name given to a people, or rather to feveral different people, who lived wholly on tithes. The word is Greek, compounded of "xhus pifcis, "fifh," and $7 \times i=\frac{10}{}$ edere, "to eat."
"I'he İchthyophagifpoken of by Ptolemy are placed by Sanfon in the provinces of Nanquin and Xartong. Agatharcides calls all the inhabitants between Carmania and Gedrofia by the nanue Icbibyoppagi.

From the accounts given us of the Iclithyopnagi by Herodotus, Strabo, Solinus, Plutarch, \&c. it appears indeed that they had cattle, but that they raade bu me: of them, excepting to feed their fifh withal. 'They made their houfcs of large fith-bones, the ribs of whales ferving them for their beans. The jaws of thele animala ferved them for doors; and the mortars wherein they pounded their fith, and baked it at the fun, were nothirg elle but their vertebre.

ICHTHYPERIA, in natural hifory, a name given by Dr Hill to the bony palates and mouths of fifhes, ufually met with either foffle, in fincrle pieces, or in fragments. They are of the fane fubtance with the bufonite; and are of'very various figures, fome broad and fhort, others longer and flender; fome very gibbole, and others plainly arched. They are likewife of various fizes, from the tenth of an inch to two inches in length, and an inch in breadth.

ICKENILD-street, is that old Roman highway, denominated from the lcenians, which extended from Yarmonth in Norfolk, the eaft part of the kingdom of the Iceni, to Barley in Hertfordhire, giving name in the way to feveral villages, as Ickworth, Icklinglaam, and Ickleton in that kingdom. From Barley to Royflon it divides the counties of Cambridge and Hert-

ICONIUM, at prefent Cognt, formerly the capital city of Lycaonia in Alia Minor st Paul coming to Iconium (Acts xiii. 51. xiv. 1. \&cc.) in the year of Cbrift 45, converted many Jews and Gentiles there. It is believed, that in his firft journey to this city, he converted St Thecla, fo celebrated in the writings of the ancient fathers. But fome incredulous Jews excited the Gentiles to rife againft Paul and Barnabas, fo that they were upon the point of offering violence to them, which obliged St Paul and St Barnabas to fly for fecurity to the neighbouring cities. St Paul undertook a fecond journey to Iconium in the year 51; but we know no particulars of his journey, which relate peculiarly to Iconium.
 images; a name which the church of Rome gives to all who reject the ufe of images in religious maticrs.The word is Greek, formed from waw imaco, and xגarear rumpere, "to break."

In this fenfe, not only the reformed, but fome of the eaftern churches, are called Iconoclafies, and efteemed by them heretics. as oppofing the worlhip of the images of God and the faints, and breaking their figures and reprefentations in clurches.

The oppofition to images began in Greece under the reign of Bardnnes, who was created emperor of the Greeks a little after the commencement of tbe eighth century, when the worthip of then became common. Sec Image But the tumulis occafioned by it were quelled by a revolution, which, in 713 , deprived Bardanes of the imperial thoone. The difpute, however, broke out with redoubled fury under I.eo the Ifaurian, who iffued out an edict in the year 726, abrogating, as fome fay, the worthip of images, and ordering all the images, except that of Chrift's crucifixion, to be removed out of the churches; but according to others, this edict only prohibited the paying to them any kind of adoration or wurfhip. This edict occafioned a civil war, which broke out in the iflands of the Archipelago, and lyy the fuggeftions of the priefts and moaks, ravaged a part of Alia. and afterwards reached Italy. The civil commotions and infurrections in Italy wele chitfly promoted by the Roman pontiffs, Gregory I. and II. Leo was excommunicated, and his fubjects in the Italian provinces violated their allegiance, and rifing in arms either maffacred or banifhed all the emperor's deputies and officers. In confequence of thefe proceedings, Leo affembled a council at Conftantinople in 730, which degraded Germanus, the bifhop of that city, who was a patron of images; and he ordered all the images to be publicly burnt, and inflicted a variety of fevere punif. ments upon fuch as were attached to that idolatrous worfhip. Hence arofe two factions; one of which adopted the adoration and worfhip of images, and on that account were called iconotult or iconolatra; and the other maintained that fuch workip was unlawful, and that nothing was more worthy the zeal of Chriftians than to demolifh and deflruy thofe ftatues and pictures which were the nccalions of this grofs idolatry; and hence they were diftinguifhed by the titles of iconomachi, (from suav image, and $\mu \alpha \chi^{\omega}$ I content,) and icomolaf.u. The zeal of Gie. N' 63.
gory II. in favour of image worfhip, was not only imitated, but even furpaffed by his fucceffor Gregury III. in confequence of which the Italian provinces were torn from the Grecian empire.

Conftantine, called Copronymus, from xompos "ftercus," and onoнx " name," becaufe he was faid to have defiled the facred font at his baptifm, fucceeded his father Leo in 741 , and in 754 convened a council at Conftantinople, regarded by the Greeks as the feventh acumenical council, which folemnly condemned the worfhip and ufe of images. Thofe who, notwithitanding this decree of the council, raifed commotions in the flate, were feverely punifhed; and new laws were enacted, to fet bounds to the violence of monaftic rage. LeoIV. who was declared emperor in 775 , purfued the fame meafures, and had recourfe to the coercive influence of penal laws, in order to extirpate idulatry out of the Chriftian church. Irene, the wife of Leo, poifoned her huband in 780 ; affumed the reins of empire during the minority of her fon Conttantine, and in 786 fummoned a council at Nice in Bithynia, known by the name of the fecond Nicene council, which abrogated the laws and decrees againt the new idolatry, rellored the worfhip of images and of the crofs, and denounced levere punifhments againt thofe who maintained that God was the ouly object of religious adoration. In this contelt, the Britons, Germans, and Gauls, were of opinion, that images might be lawfully continued in churches, but they confidered the worfhip of them as higbly injurious and offenfive to the Supreme Being. Charlemagne diftinguifhed himfelf as a mediator in this controverfy: ke ordered four books concerning images to be compoled, refuting the reafons urged by the Nicene bifhops to juftify the worfhip of images, which he fent to Adrian the Roman pontiff in 790 , in order to engage him to withdraw his ap. probation of the decrees of the laft council of Nice. Adrian wrote an anfwer; and in 794, a coancil of 300 bifhops, affembled by Cliarlemagne at Francfort on the Maine, confirmed the opinion contaiaed in the four books, and folemnly condemned the worfhip of images. In the Greek church, after the banifhment of Irene, the controverly concerning images broke out anew, and was carried on by the contending parties, during the half of the ninth century, with various and uncertain fuccefs. The emperor Nicephorus appears upon the whole to have been an enemy to this idolatrous worfhip. His fucceffor, Michael Curopalatea, furnamed Rbangabe, patronized and encouraged it. But the fcene changed on the acceffon of Leo the Armenian to the empire; who affembled a council at Conflantinople in 814, that abolifhed the decrees of the Nicene council. His fucceffor Michael, furnamed Bal. bur, difapproved the worthip of inages, and his fon Theophilus treated them with great leverity. How= ever, the emprefs Theodora, after his death, and during the minority of her fon, affembled a council at Conftantinople in 842 , which reinftated the decrees of the fecond Nicene council, and encouraged image worfhip by a law. The council held at the fame place uader Photius, in 879, and reckoned by the Greeks the eighth general council, confirmed and renewed the Nicene decrees. In commenoration of this council, a feftival was inftituted by the fupertitious Greeks, called the fenfl of orthodoxy. The Latias were generally

## I C O [ 105 ] I D E

onogra- of opinion, that images might be fuffered as the means of aiding the memory of the faithful, and of calling to their remembrance the pious exploits and virtnous ations of the perfons whom they reprefented; but they detelted all thoughts of paying thent the keat marks of religious hnmage or adoration. The council of Paris, affenbled in 924 by Louis the Meek, refolved to allow the ufe of images in the churches, but feverely prohibited rendesing them religious worfhip. Neverthelefs, towards the conclation of this century, the Gallican clergy began to pay a kind of religious homage to the images of faints, and their example was followed by the Germans and other nations. However, the iconoclafts till had their adherents among the Latins ; the moft eminent of whom was Clandius bifhop of Turin, who, in 823 , ordered all images, and even the crofs, to be calt out of the cliurches, and committed to the flames; and he wrote a treatife, in which he declared both againtt the ule and worfhip of them. He condemned relics, pilgrimages to the holy land, and all voyages to the tombs of faints; and to his writings and labours it was owing, that the city of Turin, and the adjacent country, was, for a long time after his death, much lefs infected with fupertition than the other parts of Europe. The controverfy concerning the fanctity of images was again revived by Leo bihhop of Chalcedon, in the 1ith century, on occation of the emperor Alexius's converting the figures of filuer that adorned the portals of the churches into money in order to fupply the exigencies of the ftate. The bifop obftinately maintained that he had been guilty of facrilege; and publithed a treatife, in which he affirmed, that in thefe images there refided an inherent fanctity, and that the adoration of Chriflians ought not to be contined to the perfons reprefented by the ee images, but extended to the images themfelves. The emperor affembled a council at Con. ftantinople, which determined, that the images of Chrift and of the faints were to be honoured only with a relative worlhip; and that invocation and worlhip were to be addreffed to the faints only as the lervants of Chritt, and on account of their relation to him, as their mafter. Leo, diflatisfied even with thefe abfurd and fuperfitious decifions, was fent into banifhment. In the weltern church, the worhip of images was difapproved and oppuled by Ceveral confiderable parties, as the Petrobrufians, Albigenfes, Waldenfes, \&c. till at length this idolatrous practice was entirely abolifhed in many parts of the Chriltian world by the Reforma. tion. See Image.

ICONOGRAPHIA (derived from tix sv "image," and $\gamma \rho \alpha \beta=$ " I defcribe), the defcription of images or ancient fatues of marble and copper; alfo nf bults and femi-bults, penates, paintings in frefco, mofaic works, and ancient pieces of miniature.

ICONOL ATRE, or Iconolaters (from exach and $\lambda x \operatorname{coflivas}^{\prime}$ I worfhip,") or Iconoduli (from sixav and dorow "I ferve) ;" thofe who worfhip images: A name which the iconoclattes give to thofe of the Romih communion, on account of their adoring images, and of rendering to them the workip only due to God. Sce Iconoclasts and Image.

ICOSAHEDRON, in geometry, a regular folid, confilting of 20 triangular pyramids, whofe vertexes meet in the centre of a fophere fuppofed to circum.

Vol. IX. Part I.
fcribe it; and therefore have their height and bales Icofandria equal: wherefore the folidity of one of the fe pyramids multiplied by 20 , the number of bafes gives the folid contents of the icolahedron.

ICOSANDRIA (from धxoas "twenty;" and aunp " a man or hufband"); the name of the 12 th clals in Linnæus's fexual method, confifting of plants with hermaphrodite flowers, which are furnithed with 20 or more flamina, that are inferted into the inner fide of the calyx or petals. See Botaxy, p. 430

ICTINUS, a celebrated Greck architect who lived about 430 B. C. built Reveral magnificent temples, and among others that of Minerva at Athens.

IDA (anc. geog.), a mountain fituated in the heart of Crete where broadeft ; the highell of all in the ifland; round, and in compals 60 Itadia (Strabo); the nurfing place of Jupiter, and where his tomb was vifited in Varro's time.-Another Ida, a mountain of Myfia, or rather a chain of mountains (Homer, Virgil), extending from Zeleia on the fouth of the territory of Cyzicus to Lectum the utmolt promontory of Troas. The abundance of its waters became the fource of many rivers, and particularly of the Simois, Scamander, Efepus, Granicus, \&c. It was covered with green wood, and the elevation of its top opened a fine extenfive view of the Hellefpont and the adjacent countrics; from which realon it was frequented by the gods during the Trojan war, according to Homer. The top was called Gargara (Homer, Strabo); and celebrated by the poets for the judgment of Paris on the beauty of the three goddeffes, Minerva, Juno, and Venus, to the laft of whom he gave the preference.

IDALIUM (anc. geog.), a promontory on the eaft fide of Cyprus. Now Capo di Griego; with a high rugged eminence rifng over it, in the form of a table. It was facred to Venus; and hence the epithet Jdalia given her by the poets. The eminence was covered with a grove; and in the grove was a little town, in Pliny's time extinct. Idalia, according to Bochart, denotes the place or fpot facred to the goddefs.
II)EA, the reflex perception of objects, after the original perception or impreftion has been felt by the mind. See Metaphysics, paffim; and Logic, Part I.

IDENTITY, denotes that by which a thing is itfelf, and not any thing elfe; in which fenfe identity differs from fimilitude, as well as diverfity. See Metaphysics.

IDES, in the ancient Roman kalendar, were eight days in each month; the firlt of which fell on the 15 th of March, May, July, and October; and on the I 3 th day of the other months.- The origin of the word is contelted. Some will have it formed from ston "to fee;" by reafon the full moon was commonly feen on the days of the ides: others from eifer "fpecies, figure," on account of the image of the full moon then vifible: others from idulium or ovis idulis, a name given by the Hetrurians to a victim offered on that day to Jupiter: others from the Hetrusian word iduo, i. e. divido; by reafon the ides divided the moon into two nearly equal parts.

The ides came between the Kalends and the Nones; and were reckoned backwards. Thus they called the 14th day of March, May, July, and October, and the 0

12th

1diocy. 12th of the other months, the pridie idus, or the day before the ides; the next preceding day they called the tertia idus; and fo on, reckoning always backwards till they came to the Nones. This method of reckoning time is fill retained in the chancery of Rome, and in the kalendar of the Breviary.-The ides of May were confecrated to Mercury: the ides of March were ever efteemed unhappy, after Cæfar's murder on that day: the time after the ides of June was reckoried fortunate for thofe who entered into matrimony: the ides of Augult were confecrated to Diana, and were obferved as a feaft-day by the flaves. On the ides of September, auguries were taken for appointing the magiftrates, who formerly entered into their offices on the ides of May, afterwards on tbofe of March.

IDIOCY, a defect of underttanding. Both idiocy and Lunacy excufe from the guilt of crimes; (fee Crime, par. ull.) For the rule of law as to lunatics, which alio may be eafily adapted to idiots, is, that furiofus furore folum punizur. In criminal cafes, thetefore, idiots and lunatics are not chargeable for their own acts, if committed when under the fe incapacities: no, not even for treafon itfelf. Alfo, if a man in his found memory commits a capital offence, and before arraignment for it he becomes mad, he ought not to be arraigned for it: becaufe he is not able to plead to it with that advice and caution that he ought. And if, after he has pleaded, the prifoner becomes mad, he thall not be tricd: for how can he make his defence? If, after he be tried and found guilty, he lofez his fenfes before judgment, judgment fhall not be pronounced; and if, after judgment, he becomes of nonfane memory, execution flall be flayed: for, peradventure, fays the humanity of the Englifh law, had the prifoner been of found memory, he might have alleged fomething in flay of judgment or execution. Indeed, in the bloody reign of Henry VIII. a ftatute was made, which enacted, that if a perfon, being compos mertits, fhould commit bigh treafon, and after fall into madnefs, he might be tried in his ablence, and fhould fuffer death, as if he were of perfect memory. But this favage and inhuman law was repealed by the flatute $1 \& 2 \mathrm{Ph} . \mathbb{Z}$ M. c. 10 . For, as is oblerved by Sir Edward Coke, "the execution of an offender is for example, ut pana ad paucos, metus ad omnes perveniat: but fo it is not when a madman is executed; but fhould be a miferable fpectacle, both againft law, and of extreme imhumanity and cruelty, and can be no example to others." But if there be any doubt wbether the party be compos or not, this fhall be tried by a jury. And if he be fo found, a total idiocy, or abfolute infanity, excufes from the guilt, and of courfe from the puniflment, of any criminal action committed under fuch deprivation of the fenfes: but if a lunatic hath lucid intervals of undertanding, he fhall anfwer for what he does ins thofe intervals, as if he had no deficiency. Yet, in the cafe of abfolute madmen, as they are not anfwerable for their actions, they fhould not be pernitted the liberty of acting unlefs under proper control ; and, in particular, they ought not to be fuffered to go loofe, to the terror of the king's fubjeets. It was the doctrine of our ancient law, that perfons deprived of their reafon might be contined till they recover. 1 their fenfes, without waiting for the forms of a commiffion or other fpecial authority from the crown:
and now, by the vagrant acts, a method is chalked out for imprifening, chaining, and fending them to their proper homes.

The matrimonial contract likewife cannot take place in a flate of idiocy. It was formerly adjudged, that the iffue of an idiot was legitimate, and his marriage valid. A ftrange determination! fince confent is abfolutely requifite to matrimony, and neither idiots nor lunatics are capable of confenting to any thing. And therefore the civil law judged much more fen. fibly, when it made furh deprivations of reaion a previous impediment, though not a caufe of divorce if they happened after marriage. And modern refolutions have adhered to the fenfe of the civil law, by determining that the marriage of a lunatic, not being in a lucid interval, was abfolutely void. But as it might be difficult to prove the exact flate of the party's mind at the actual celebration of the nuptials, upon this account (concurring with fome private family reafons*), the fatute 15 Gco II. c. 30 . has provided, that the marriage of lunatics and perfons under phrenzies (if found lunatics under a commiffion, or committed to the care of truftees under any act of parliament) before they are declared of found mind by the lord chancellor, or the majority of fuch truftees, fhall be totally void.

Idiots and perfons of nonfane memory, as well as infants and perfons under durefs, are not totally difabled either to convey or purchafe, but fub modo only. Fur their conveyances and purchafes are voidable, but not actually void. The king, indeed, on behalf of an idiot, may avoid his grants or other acts. But it hath been faid, that a non compos limfelf, though he be afterwards brought to a right mind, fha.ll not be permitted to allege his own infanity in order to avoid fuch grant: for that no man fhall be allowed to flupify himfelf, or plead his own difability. The progrefs of chis notion is fomewhat curious. In the time of Edward I. non compos was a fufficient plea to avoid a man's own bond: and there is a writ in the regiller for the alienor himfelf to recover lands aliened by him during his infanity; dimn fuit non compos mentis fue, ut dicit, \&c. But under Edward III. a fcruple began to arife, whether a man hould be permitted to blemi/s himfelf, by pleading nis own infanity: and, afterwards, a defendant in affize having pleaded a releafe by the plaintiff fince the laft continuance, to which the plaintiff replied (ore fenus, as the manner then was) that he was out of his mind when he gave it, the court adjourned the affize; doubting, whether as the plaintiff was fanc both then and at the commencement of the fuit, he hould be permitted to plead an intermediate deprivation of reafon; and the queftion was afked, bow he came to remember to releafes if out of his fenfes when he gave it? Under Henry VI. this way of reafoning (that a man fhall not be allowed to difable himfelf, by pleading his own incapacity, becaufe he cannot know what he did under fuch a fituation) was ferioufly adopted by the judges in argument; upon a queftion, whether the heir was barsed of his right of entry by the feoffment of his infane anceftor? And from thefe loofe authorities, which Fitzherbert does not fcruple to rejeet as being contrary to reafon, the maxim that a man thall not flultify himfelf, hath been handed down as. fettled law: though later opinions, feeling the incon-
verience of the rule, have in many points endeavoured to reftrain it. And, clearly, the next heir, or other perfon intercted, may, after the death of the idiot or non compos, take adrantage of his incapacity and avoid the grant. And fo too, if he purchafes under this difability, and does not afterwards upon recovering his fenfes agice to the purchafe, his heir may either waive or accept the effate at his option. In like manner, an infant may waive fuch purchafe or conveyance, when he com:es to full age; or, if he does not then actually agree to it, his heirs may waive it after him. Perfons alfo, who purchafe or convey under durefs, may affirm or aveid fuch tranfaction, whenever the durefs is ceafrd. For all thefe are under the protection of the law; which will not fuffer them to be impofed upon through the imbecility of their prefent condition; fo that their acts are only binding, in cafe they be afterwards agreed to when fucll imbecility ceafes. Yet the guardians or committes of a lunatic, by the flatute $11 \mathrm{Geo}$.III . c. 20. are empowered to renew in his right, under the directions of the court of chancery, any leare forr lives or jears, and apply the profits of fuch renewal for the benefit of fuch lunatic, his heirs, or executors. See Lunacy.
IDIOM, among grammarians, properly fignifies the peculiar genius of each language, but is often ufed in a fynonymous fenfe with dialect. The word is Greek, 18,0мх " propriety;" formed of wios "proper, own."
IDIOPATHY, in phyfic, a diforder peciliar to a certain part of the body, and not arifing fom any preceding difeafe; in which fenfe it is oppofed to fympathy. Thus, an epilepfy is idiopachic when it hap. pens merely through fome fault in the brain; and fympathetic when it is the confequence of fome other diforder.
IDIOSYNCRASY, among phyficians, denotes a peculiar temperament of body, whereby it is rendered more liable to certain diforders than perfons of a different conflitution ufually are.
IDIOT, or IDEot, in our laws, denotes a natural fool, or a fool from his birth. See Intocy.
The word is originally Greek, swouns, which primarily imports a private perfor, or one who leads a private life, without any fhare or concern in the government of affairs.
A perfon who has underflanding enough to meafure a yard of cloth, number twenty rightly, and tell the days of the week, \&c. is not an idiot in the eye of the law. But a man who is born deaf, dumb, and blind, is confidered by the law in the fame flate as an idiot.
Idiot is alfo ufed, by ancient writers, for a perfon ignorant or unlearned; anfwering to illiteratus or $i \mathrm{~m}$ peritus. In this fenfe, Vietor tells us, in his Chronicon, that in the confullhip of Mcfiala, the Holy Gofpels, by command of the emperor Anallafius, were correeted and amended, as having been written by idiot evanglifits: Tanguam ab idiotis evangelifisis compofita.

IDLENESS, a reluctancy in prople to be employed in any kind of work.

Idlenefs in any perfon whatfoever is a high of. fence againft the public economy. In China it is a maxim, that if there be a man who does not work, or a woman that is idle, in the empire, fomebody muft
fuffer cold or hunger: the produce of the lands not being more than fufficient, with culture, to maintain the inhabitants; and therefore, though the idle perfon may fhift off the want from himfelf, yet it muft in the end fall fomewhere. The court alfo of Areopagus at Athens punifhed idlenefs, and exerted a rightof examining every citizen in what manner he fpent his time ; the intention of which was, that the Athenians, knowing they were to give an account of their occupations, fhould follow only fuch as were laudable, and that there might be no room left for fuch as lived by unlawful arts. The civil law expelled all flurdy vagrants from the city: and, in our own law, all idle perfons or vagabonds, whom our ancient flatutes defcribe to be " fuch as wake on the night, and fleep on the day, Flackp. and haunt cuftomable taverns and ale-houfes, and routs Commsnes. about; and no man wot from whence they come, ne whether they go ;" or fuch as are more particularly defcribed by ftatute 17 Geo. 11. c. 5. and divided into three claffes, idle and diforderly perfons, rogues and vagabonds, and incorrigible rogues;-all thefe are offenders againft the good order, and blemifhes in the government, of any kingdom. They are therefore all punifhed, by the fatute latt mentioned; that is to fay, idle and diforderly perfons with one month's im. prifonment in the houfe of correction; rogues and vagabonds with whipping, and imprifonment not exceeding fix months; and incorrigible rogues with the like difcipline, and confinement not exceeding two years: the breach and efcape from which confinement in one of an inferior clafs, ranks him among incorrigible rogues; and in a rogue (before incorrigible) makes him a felon, and liable to be tranfported for feven years. Perfons harbouring vagrants are liable to a fine of forty fhillings, and to pay all expences brought up. on the parifh thereby: in the fame mauner as, by our ancieat laws, whoever harboured any ftranger for more than two nights, was anfwerable to the public for any offence that fuch his inmate might commit.

IDOL, in pagan theology, an image, or fancied reprefentation of any of the heathen gods.-This image, of whatever materials it confifted, was, by certain ceremonies, called confecration, converted into a god. While under the artificer's hands, it was only a mere ftatue. Three things were neceffary to turn it into a god; proper ornaments, confecration, and oration. The ornaments were various, and wholly defigned to blind the eycs of the ignorant and ftupid multitude, who are chicfly taken with fhow and pageantry. Then followed the confecration and oration, whicla were performed with great folemnity among the Romans. See Image.

IDOLATRY, or the worfhip of idols, may be diAlinguifhed into two forts. By the firlt, men adore the works of God, the fun, the moon, the flars, angels, dæmons, men, and animals: by the fecond, men worfhip the work of their own hands, as flatues, pictures, and the like: and to thefe may be added a third, that by which men hase wormipped the true God under fenfible figures and reprefentations. This indeed may have been the cafe with refpect to each of the above kinds of idolatry; and thus the Ifraelites adored God under the figure of a calf.

The flars werc the firlt objects of idolatrous worfhip, on account of their beauty, their influence on

## I D O

the Greeks to the Trojan war with a fleet of go hips. During this celebrated war he rendered himfelf fameus by his valour, and Aaughtered many of the enemy. At his return from the Trojan war, he made a vow to Neptune in a dangerous tempeft, that if he efcaped from the fury of the feas and Itorms, he would offer to the god whatever living creature firft prefented itfelf to his eye on the Cretan flore. This was no other than his fon, who came to congratulate his father uponhis fafe inturn. Idonencus performed his promife to the god; and the inhumanity and rafhnefs of this facritice rendered him fo odions in the eyes of his fubjects, that he left Crete, and migrated in quett of a fettement. He came to Italy and founded a city on the coalt of Calabria, which he called Salutum. He died in an extreme old age, after he had had the fatisfaction of feeing his new kingdom flourif, and his fubjects happy. Accurding to the Greek feholiaft of Lycophron, v. 1217, Idcmentus, during his abfence in the Trojan war, entruited the management of his kingdom to Leucos, to whom he pronifed his daughter Clifithere in marriage at his return. Leucns at firt governed with moderation, but he was perfuaded by Nauplius king of Eubcea to put to death Meda the wife of his malter, with her daughter Clifithere, and tofeize the kingdom. After thefe violent meafures he Atrengthened himfelf on the thione of Crete, and Idomeneus at his return fourd it impoffible to expel the ufurper.

## 1i) UMEA. See Edom.

JEALOUSY, in ethics, is that peculiar t:neafinefs. which arifes from the fear that fome rival may rob us of the affection of one whom we greatly love, or fufpicion that he has already done it. The firt fort of jealoufy is infeparable from love, before it is in poffeffion of its object : the latter is often unjuft, generally mifchicvous, alvays troublefome.

Waters of 7 falousy. See Waters.
IDYLLION, in ancient poetry, is only a diminutive of the word EADOs, and properly fignifies any poem of moderate extent, without confidering the fubject. But as the collection of Theocritus's poems were called idyllia, and the paftoral pieces being by far the beft in that collection, the term-idyllion feems to be now appropriated to paltoral pieces.

JEARS or Geers, in the fea-language, an affemblage of tackles, by which the lower yatds of a thip are hoifted along the maft to their ufual flation, or lowered from thence as occafion requires; the for,eer of which nperations is called Jwaying, and the latter Ariking.

JEBUSEI, one of the feven ancient people of Ca naan, defceadents of Jthufi, Canaan's fon; fo warlike and brave, as to have ftood their ground, efpecially in Jebus, afterwards called ferufalem, down to the time of David. Judges i. 21.1 Sam.v. 6 .

JEDBURGH, a parliament-town of Scotland, capital of Tiviotdale or Roxburghfaire, is fituated nearly in the middle of the county, on the banks of the riven $\mathfrak{F}$ fld, whence it derives its name. It is well built and populous, and has a good market for corn. and cattle. On the weff fide of the river, near its junction with the Teviot, fland the beautiful ruins of an abbey founded by David I. a part of which ancient pile ftill
fervea for a parih-church.-Jedburgh is the feat of the fheriff's court and prefbytery; and is a barony in tbe family of Lothian, whofe eldeft fon is called Earl of Ancrum.
JEDDO, the capital town or city of the inands of Japan, where the emperor refides. It is open on all fides, having neither walls nor ramparts; and the houfes are built with earth, and braarded on the outfide to prevent the rain from deftroying the walls. In every flreet there is.an iron gate, which is hut up in the night ; and a kind of cuftom-houfe or magazine, to put merchandizes in. It is a large place, being nine miles in length and fix in breadth, and contains 1,000,000 of inlabitants. A tire happened in 1658, which, in the fpace of 48 hours, burnt down 100,000 houles, and in which a valt number of irihabitants perithed. The emperer's palace and all the reft were reduced to afhes; but they are all rebuilt again. The royal palace is in the middle of the town ; and is defended with walls, ditches, towers, and baftions. Where the emperor refides, there are three towers nine fories high, each covered with plates of gold; and the hall of audience is faid to be fupported by pillars of mafly gold. Near the palace are feveral others, where the relations of the emperor live. The emprefs has a palace of her own, and there are 20 fmall ones for the concubines. Befides, all the vaffal kings have each a palace in the city, with a handfome garden, and ftables for 2000 horfes. The houles of the common fort are nothing but a ground-floor, and the rooms are parted by folding-fcreens; fo that they can make the roons larger or fmalter at pleafure. It is feated in an agreeable plain, at the bottom of a fine bay; and the river which croffes it, is divided into feveral canals. 'E. Long. 140 O. N. Lat. 35. 32.

JEFFERY. See Geoffrey.
JEFFREYS (Sir George), baron Wem, commonly called $\mathcal{F}^{2}$ dge 7 Fefreys, was the fixth fon of John Jeffreys, Efq; of Aeton in Denbighfhire ; and was educated at Weftminfler-Fchool, whence he removed to the Inner Temple, where he applied himfelf to the ftudy of the law. Alderman Jeffreys, who was probably related to him, introduced him among the citizens of London; and he being a merry bottle companion, foon came into great bufnefs, and was chofen their recorder. He was afterwards chofen folicitor to the duke of York; and in 1680 was knighted, and made chief-juftice of Chefter. At length, refigning the recorderfinip, he obtained the poft of chief.juttice of the king's-bench, and, foon after the accefiion of James II. the great feal. During the reign of king Charles II. be thowed himfelf a bitter enemy to thofe diffenting minitters who, in that time of perfecution, were tried By him: he was one of the greateft advifers and promoters of all the oppreffions and arbitrary meafures carried on in the reign of James II.; and his fanguinary and inhuman proceedings againft Monmouth's unhappy adherents in the weft will cver render his name infamous. Whenever the prifoner was of a different party, or he could pleafe the court by condemning him, inftead of appearing according to the duty of his office, as his counfel, he would fcarce allow him to fpeak for himfelf; but would load him with the groffeft and moft vulgar abufe, browbeat, infult, and turn to ridicule the witneffes that fooke in his behalf; and even
threaten the jury with fines and imprifonment, if they Jeffreys made the leaft hefitation about bringing in the prifone: Jehovah. guilty. Yet it is faid, that when he was in temper, and matters perfectly iadifferent came before him, no one became a feat of juftice better. Nay, it even appears, that, when he was under no flate-infuence, he was fometines inclined to protect the natural and civil rights of mankind, of which the following inftance has been given:-The mayor and aldermen of Brio ftol had been ufed to tranfport convieted criminals to the American plantations, and fell them by way of trade. This turning to good account, when any pilferers or petty rogues were brought before them, they threatened them with hanging; and then fome officers who attended, carneftly perfuaded the ignorant in tinidated creatures to beg for tranfportation, as the only way to fave them; and in general their advice was fullowed. Then, without more form, each alderman in courfe took one, and fold him for lis own benefit; and fometinies warm difputes arofe between them about the next turn. This infamonstrade, which had been carried on many years, coming to the knowledge of the lord chief jutice, he made the mayor defcend from the bench, and ftand at the bar in his fcallet and furr, with his guilty brethren the aldermen, and plead as common crimmals. He then obliged them to give fecurities to anfwer informations; but the proccedings were flopped by the Revolution.-However, the brutality Jeffreys commonly thowed on the bench, where his voice and vifage were equally terrible, at length expofed him to a fevere mortification. A ferivener of Wapping having a caufe before him, one of the opponent's counfel faid he was a ftrange fellow; and fomes times went to church, and fometimes to conventicles; and it was thought he was a trimmer. At this the chancellor fired: "A trimmer? (faid he); I have heard much of that monfler, but never faw one. Come forth, Mr Trimmer, and let me fee your fhape." He then treated the poor fellow fo roughly, that, on his leaving the hall, he declared he would not undergo the terrors of that man's face again to fave his life, and he fhould certainly retain the frightful impreffions of it as long as he lived. Soon after, the prince of Orange coming, the lord chancellor. dreading the public refentment, difguifed himfelf in a feaman's drefs, in order to leave the kingdom ; and was drinking in a cellar, when this fcrivener coming into the cellar, and feeing again the face which had filled him with fuch horror, flarted ; on which Jeffreys, fearing he was known, feigned a cough, and turned to the wall with his pot of beer in his hand. But Mr Trimmer going out, gave notice that he was there; and the mob ruhing in, feiz.ed him, and carricd him before the lord-mayor, who fent him with a ftrong guard to the lords of the council, by whom he was committed to the Tower, where he died in 1689 . -It is remarkable, that the late countefs of Pomfret met with very rude infults from the populace on the weftern road, only becaufe the was granddaughter of the inhuman Jeffreys.

JEHOVAH, one of the fcripture names of God, fignifying the Being who is felf-exitent and gives exitto ence to others.

So great a veneration had the Jews for this name, that they left off the cultom of pronouncing it, whereby its true pronunciation was forgotten. They call 流

Jejune fetragrammaton, or "the name with four letters; and it cannot fail to be heard by God.

## JEjune style. See Style.

JEJUNUM, the fecond of the fmall guts; thus called from the Latin jejunus, "hungry;" becaufe always found empty. See Anatomy, $\mathrm{n}^{\circ} 93$.
Jellalean, or Gelalean Calendar, epocha, and year. See Calendar, Epocha, and Year.

JELLY, a form of food, or medicine, prepared from the juices of ripe fruits, boiled to a proper confiftence with fugar, or the flrong decoctions of the horns, bones, or extremities of animals, boiled to fuch a height as to be fliff and firm when cold, without the addition of any fugar. - The jellies of fruits are cooling, faponaceous, and acefcent, and therefore are good as medicines in all diforders of the prime vix, arifing from alkalefcent juices, efpecially when not given alone, but diluted with water. On the contrary, the jellies made from animal fubftances are all alkalefcent, and are therefore good in all cafes in which an acidity of the humours prevails: the alkalefcent quality of thefe is, however, in a great meafure taken off, by the adding lemon juice and fugar to them. There were formerly a fort of jellies much in ufe, called compound jellies; thefe had the reflorative medicinal drugs added to them, but they are now fcarce ever heard of.

Ferlr-Oat, a preparation of common oats, recommended by many of the German plyficians in all hec. tic diforders, to be taken with broth of fnails or cray-fifl.-lt is made by boiling a large quantity of oats, with the hafk taken off, with fome harthorn fhavings, and currants together, with a leg of veal cut to pieces, and with the bones all broken; thefe are to be fet over the fire with a large quantity of water, till the whole is reduced to a fort of jelly; which when flrained and cold will be very firm and hard. A few fpoonfuls of this are to be taken every morning, diluted with a bafon of either of the above-mentioned broths, or any other warm liquor.

JEMPTERLAND, a province of Sweden, bounded on the north by Angermania, on the eall by Medalpadia, on the foush by Helfingia, and on the weft by Norway. It is full of mountains; and the principal towne are Reffundt, Lich, and Docra.

JENA, a ftoong town of Germany, in the circle of Upper Saxony, and in Thuringia, with an univerfity. It is feated on the river Sala, in E. Long. 2. 59. N. Lat. 51. o.
JENCAPORE, a town of Afia, in Indoftan, and in the dominions of the Great Mogul, capital of a territory of the fame name. It is feated on the river Chaul, in E. Long. 76. 25. N. Lat. 30. 30.

JENISA, a river of the Ruffian empire, that runs from north to fouth through Siberia, and falls into the Frozen Ocean.

JENISKOI, a town of the Ruflian empire, in Siberia, feated on the river Jenifa. It is large, populons, and pretty Arong; and there are villages for feveral miles round it. It is fubject to the Tungufians, who are paganis, and chiefly live on the above river. They pay a tribute to the emperor for every bow, reckoning a man and a woman for une. The climate is extremely cold; and no other fruits grow there but black and red currants, frawberries, and goofeberries.

Corn, butchers meat, and wild fowls, are very cheap. jencon E. Long. 86. 25. N. Lat. 58. 40.

JENCOPING, a town of Sweden, in the province of Smaland, feated on the fouth fide of the lake Werter, with a ftrong citadel. The houfes are all built with wood. E. Long. 14. 20. N. Lat. 57. 22.

JENKIN (Robert), a learned Englifh divine in the 18 th century, was bred at Cambridge, became mafter of St John's college, and wrote feveral books much efleemed, viz. I. An hiftorical examination of the authority of General Councils, 4to. 2. The reafonablenefs and cerrainty of the Chriftian religion, 2 vols 8vo. 3. Defenfio S. Augufini. This book is written againft M. Le Clerc. 4. Remarks on fome bookslately publifhed, viz. Mr Whifon's eight fermons, Locke's paraphrafe, \&c. 5. A tranflation from the French of the life of Apollonius Tyaneus.
JENKINS (Henry). See Lomgevity.
Jenkins (Sir Leoline), a learned civilian and able flatefman of the laft century, born in Glamorganhire about the year 1623 . Being rendered obnoxious to the parliament during the civil war by adhering to the king's caufe, he confulted his fafety by flight ; but returning on the reltoration, he was admitted an advocate in the court of arches, and fucceeded Dr Exton as judge. When the queen-mother Henrietta dicd in 1669 at Paris, her whule eftate, real and perfonal, was claimed by her nephew Louis XIV.: upon which Dr Jenkins's opinion being called for and approved, he went to Paris, with three others joined with him in a commiffion, and recovered her effeets; for which he received the honour of knighthoed. He officiated as one of the mediators at the treaty of Nimeguen, in which tedious negociation he was engaged about four years and 'a half; and was afterwards made a privy counfellor and fecretary of flate. He died in 1685 ; and as he never married, bequeathed his whole eftate to charitable ufes: he was fo great a benefactor to Je-fus-college Oxford, that he is generally looked on as the fecond founder. All his letters and papers were collected and printed in 1724 , in 2 vols folio.

JENNY WREN, a name given by writers on fongbirds to the wren. See Wren.

JENTACULUM was, amongtt the Romans, a morning refrefhment like our breakfaft. It was exceedingly fimple, conlitting, for the mott part, of bread alone; labouring people indeed had fomething more fubftantial to enable them to fupport the fatigues of their employment. What has been here faid may be obferved of the Jews and Grecians alfo. The Greeks diltinguifhed this morning-meal by the feveral names of apisov, $\alpha \times \rho \alpha$ if $\mu \mu$ os or $\alpha \times \rho \alpha 7 t \sigma \mu x$, though apisov is generally applied to dinner. See Eating and Dinner.
JEOFAILE, (compounded of three French words, F"ay faille, "I have failed"), a term in law, ufed for an overfight in pleading or other proceedings at law.

The fhowing of thefe defects or overfights was formerly often practifed by the counfel; and when the jury came into court in order to try the iffue, they faid, This inqueft you ought not to take; and after verdiet they would fay to the court, To judgment you ought not to go. But feveral ftatutes have been made to aroid the delays occafioned by fuch fuggettions; and a judgment is not to be flayed after verdict for millaking the Chriftian or furname of either of the parties, or
phethab in a fum of money, or in the day, month, year, \&cc. where the fame are rightly named in any preceding record.

JEPHTHAH, judge of Ifrael, and fucceffor to Jair in the government of the people, was a native of Mifpeh, and the fon of one Gilead by a harlot. This Gilead having married a lawful wife, and had children by her, thefe cbildren drove Jephthah from his father's houfe, faying, that he fhould not be heir with them. Jephthah retired into the land of Tob, and there he became captain of a band of thieves and fuch other people as he had picked up together. At that time, the Ifraelites beyond Jordan, fecing themfelves preffed by the Ammonites, came to defire affiltance from Jephthah; and that he would take upon him the command of them. Jephthal at firl reproached them with the injuftice which they had done him, or at leaft which they had not prevented, when he was forced from his father's houfe. But as thefe people were very earnelt in their requeft, he told them, that he would fuccour thein, provided that at the end of the war they would acknowledge bim for their prince. This they confented to, and promifed with an oath.

Jephthah, in the year of the world 2817, having been acknowledged prince of the Ifraelites in an affembly of the people, was filled with the fpirit of God, and began to get his troops together ; to that end, he went over all the land which the children of Ifracl poffeffed beyond Jordan. At the fame time he made a vow to the Lord, that if he were fucceffful againft the Ammonites, he would offer up for a burnt-offering whatever fhould firf come out of his houfe to meet him. The battle being fought, Jephthah remained conqueror, and ravaged all the land of Ainmon. But as he returned to his houle, his only daughter came out to meet him with timbrels and with dances: whereupon Jephtliah tore his clothes, and faid, "Alas, my daughter, thou haft brought me very low: for I have made a vow unto the Lord, and cannot fail in the performance of it." His daughter anfwered, "My father, if thou haft made a vow unto the Lord, do with me as thou haft promifed; grant me only the favour that I may be at liberty to go up to the mountains, and there for two months bewail my virginity with my companions." Jephthah granted her this liberty: and at the end of two months, he uffered up his daughter, who died a virgin, a burnt-offering, agreeable to his vow, according to the opinion of molt commentators. In the mean time, the Ephraimites, jealons of the victory obtained by Jephthah over the Ammonites, paffed the river Jordan in a tumultuous manner, came and complained to Jephthah that he had not invited them to this war, and threatened to fet fire to bis houfe. Jephthah anfwered then, that he had fent to defire their affiflance; but obferving that they did not come, he put his life in his hands and hazarded a battle. The Ephraimites not being fatisfied with the fe reafons, Jephthah affembled the people of Gilead, gave then battle, and defeated them; fo that there were two and forty thoufand men of the tribe of Ephraim killed that day. We know nothing more in particular concerning the life of Jephthah, only that he judged Ifrael fix years, and was buried in a city of Gilead.

St Paul (Heb. xi. 32.) places Jephthah among the faints of the Old Teftament, the merit of whofe faith diainguifhed them. But it muft he obferved, that there is
fomething fo extraordinary in Jephathal's vow, that Jerloa, notwithftanding the fcripture [peaks of it in very plain Jeremiah. and clear terms, yet fuch difficulties arife concerning it as perplex the commentators. Some maintain, that this daughter of Jephthah was not facrificed, as that would have been a violation of the law of Mofes; and efpecially, when by the fame law he might have redeemed his daughter for ten Thekels of filver: therefore they contend, that it was fomething elfe Jephthah did to his daughter, fuch as devoting her to a llate of celibacy, or dedicating her to the fervice of God.-On the other hand, thofe who maintain the affirmative, or that Jephthah's daughter was actually facrificed, urge, that the times wherein Jephthah lived were fadly addicted to idolatry; alfo the manner wherein he lived before he was called to the affiftance of his country ; but above all, the clear, evident, and exprefs meaning of the text. They obferve, that vows of perpetual virginity are inflitutions of a modern date; and had there been no more in it, tleere would have been little occafon for rending his clothes, and bemoaning limfelf as he did; befides the bitter lamentations made by herfelf, and by all the daughters of Ifrael in fucceeding times. But if fhe was facrificed, we may fafely and confidently aver with Jofephus, who fays that the was, that this facrifice was neither lawful nor acceptable to God; but, on the contrary, an abouinable crime, that might, notwithftanding, have proceeded from a miftaken principle of religion.
JERBOA. See Mus.
JEREMIAH (the Proplecy of), a canonical book of the Old Teftament. This divine writer was of the race of the prictts, the fon of Hilkia of Anathoth, of the tribe of Benjamin. He was called to the prophetic office when very young, about the 13 th year of Jofiah, and continued in the difcharge of it about 40 years. He was not carried captive to Babylon with the other Jews, but remained in Judea to lament the defolation of his country. He was afterwards a prifoner in Egypt with his difciple Baruch, where it is fuppofed he died in a very advanced age. Some of the Chriftian fathers tell us he was floned to death by the Jews, for preaching againft their idolatry; and fome fay he was put to death by Pharaoh Hophrah, becaufe of bis prophecy againft him. Part of the prophecy of Jeremiah relates to the time after the captivity of Ifrael, and before that of Judali, from the firlt chapter to the 44th; and part of it was in the time of the latter captivity, from the $4^{\text {th }}$ chapter to the end. The prophet lays open the fius of Judah with great freedom and boldnefs, and reminds them of the fevere judgments which had befallen the ten tribes for the fame offences. He paffionately laments their misfortune, and recommends a fpeedy reformation to them. Afterwards he predicts the grievous calamities that were approaching, particularly the 70 years captivity in Chaldea. He likewife foretels their deliverance and happy return, and the recompence which Babylon, Moab, and other enemies of the Jews, fhould meet with in due time. There are likewife feveral intimations in this prophecy concerning the kingdom of the Meffiah; alfo feveral. remarkable vifions, and types, and hiftorical paffages relating to thofe times. The 52 d chapter does not belong to the prophecy of Jeremiah, which probably was added by Ezra, and contains a narrative of the tao
king of Jerufalem, and of what happened during the captivity of the Jews, to the death of Jechonias. St Jerom has obferved upon this prophet, that his Ayle is more caly than that of Ifaiah and Hofea; that he retains fomething of the rufticity of the village where he was born; but that he is very learned and majeftic, and equal to thofe two prophets in the fenfe of his prophecy.

JERICHO, or Hiertchus (anc. geog.), a city of Judea; fituated between Jordan and Jerufalem, at the diftance of 150 fladia from the latter, and 60 from the former. Jofephus fays, "the whole fpace from ferufalem is defart and rocky, and equally barren and uncultivated from 'Jericho to the lake A phaltites; yet the places near the town and above it are extremely fertile and delicious, fo that it may be juftly called a
? elivine plain, furpaffing the reft of the land of Canaan, no unfruitful country, and furrounded by hills in the manner of an amphitheatre. It produces opobalfamum myrobalans, and dates; from the laft of which it is called the city of palm-trees, by Mofes. The place is now called Raba; and is fituated, M. Volney informs us; "in a plain fix or feven leagues long, by three wide, around which are a number of barren mountains, that render it extremely hot. Here formerly was cultivated the balm of Mecca. From the defcription of the Hadjes, this is a fhrub fimilar to the pomegranate-trec, with leaves like thofe of rue: it bears a pupy nut, in which is contained a kernel that yields the refinous juice we call balm or balfam. At prefent there is not a plant of it remaining at Raha; but another fpecies is to be found there, called $Z a k$ koun, which prodsce a fweet oil, alfo celebrated for healing wounds. This zakkoun refembles a plumtree ; it has thoms four inches long, with leaves like thofe of the olive-tree, but narrower and greener, and prickly at the end; its fruit is a kind of acorn, with. out a ealyx, under the bark of which is a pulp, and then a rut, the kernel of which gives an oil that the Arabs fell very dcar: this is the fole commerce of Skaha, which is no more than a ruinous village.

JERIMOTH. See Jarimuth.
JEROME (St), in Latin Hieronymus, a famous doctor of the church, and the molt learned of all the Latin fathers, was the fon of Eufe bius; and was born at Stridon, a city of the ancient Pannonia, about the year $3 t^{\circ}$. He fludied at Rome under Donatus, the learned grammarian: After having received baptifm, he went into Gaul, and there tranicribed St Hilary's book de Synodis. He then went into Aquilcia, where lie contracted a friendifip with Heliodorus, who prevailed on hin to travel with him into Thrace, Pontus, Bithynia, Galatia, and Cappadocia. In 372 St Jerome retired into a defart in Syria, where he was perifcuted by the orthodo: of Melitius's party, for being a Sabcilian, becaufe he made ufe of the word Hypofacis, which had been ufed by the council of Rome in 369 . This obliged him to go to Jerufalem; where he applied himfelf to the fludy of the Hebrew lan. guage, in order to receive a more perfect knowledge of the Holy Scriptures; and about this time he confented to be ordained, on condition that he fhould not be contined to any particular church. In 381, he went to Conftantinople to hear St Gregory of Nazianzen ; and the following year returned to Rome, where he was . $\mathrm{V}^{3} 163$.
made fecretary to pope Damafus.. He then inftructed many Roman ladies in piety and the knowledge of the fciences, which expofed him to the calumnies of thofe whom he zealoufly reproved for their irregularities; and Pope Siricius not having ail the efleem for him which his learning and virtue'jufly intitled him to, this learned doctor left Romc, and returned to the monaftery of Bethlehem, where he employed himfelf in writing againft thofe whom he called beretics, efpecially againft Vigilantius and Jovinian. He had a quarrel with John of Jerufalemand Rufinus about the Origenifts. He rias the firft who wrote againif Pelagius; and died on the 3 oth of September 420 , at about 80 years of age. There have been feveral editions of his works; the latt, which is that of Verona, is in 11 vols folio. His principal works are, 1. A Latin verfion of the Holy Scriptures, diflinguifhed by the name of the Vulgate. 2. Commentaries on the Prophets, Ecclefiaftes, St Matthew's Gofpel, and the Epiftle to the Galatians, Ephefians, Titus, and Plilemon. 3. Polemical treatifes againft Montanus, Helvidius, Jovinian, Vigilantius, and Pclagius. 4. Several letters. 5. A treatife on the lives and writings of the ecclefiaftical authors who had flourifhed before his time.-St Jerome's fyle is lively and animated, and fometimes fublime.

Ferome of Progue, fo called from the place of his birth, in Bohemia. He was neither a monk nor clergyman, hut had a learned education. Having embraced the opinions of Joln Hufs, he began to propagate them in the year 1480. In the mean time the council of Nice kept a watchful eye over him, and confidering him as a dangerous perfon, cited him to appear before them and give an account of his faith. In obedience to this citation, he went to Conflance; but on his arrival, in 1415 , finding Hufs in prifon, he fet out for his own country. lieing feized however on the way, imprifoned, and examined, be was fo intimidated, that he retracted, and pretended to apptove of the condeniration of Wiekliff's and Hufs's opinions; but on the 26 th of May 1416, he condemned that recantation in thefe terms: "I am not afhamed to confefs here publicly my weaknefs. Yes, with horror I confefs my bafe cowardice. It was only the dread of the punifhment by fire which drew me to confent, againft my confcience, to the condemnation of the doctrine of Wickliff and Hufs." Accordingly fentence was pafled on him; in purfuance of which he was delivered to the fecular arm, and burnt in 1416 . He was a perfon of great parts, learning, and elocution.
JERONYMITES, or Hieronymites, a denomination given to divers orders or congregations of religious; otherwife called Hermits of St Feron.

JERSEY, an ifland in the Englifh channel, believed to be the illand called in the Itinerary Cofarea, in fucceeding times Ausia, by us Gerfoy, more frequently Forfey. It is fituated in the Englifh channel, is miles to the weft of Normandy, and 84 to the fnuth of Portland in Dorfethire, and in the time of the Romans was called Cafarea. It is not above 12 miles in length, nor much above 6 where hroadeft, which is at the two extremities. It is defended by rocks and dangerous quickfands. On the north fide the cliffs rife 40 or 50 fathoms high, which render it inacceffible on that fide ; but on the fouth the flore is almoll level with the water. In the weft part of the
illand

## J ER [ 113 ] J E R

inland is a large tract of land once cultivated and very fertile, but now a barren defart, caufed by the wefterly winds throwing up fand from the bottom to the top of the highelt eliffs. The higher lands are diverfified by gritty, gravelly, fony, and fine mould; the lower by a deep, rich, and heavy foil. The middle part of the ifland is fomewhat mountainous, and fo thick planted with trees, that at a diflance it refembles one entire foref, though in walking through it tbere is hardly a thicket or any other thing to be feen but hedge-rows and orchards of apple-trees. The valleys under the hills are finely watered by brooks, and have plenty of cattle and fmall fheep, with very fine wool, and very fweet meat, which is afcribed to the fortnefs of the grafs. The horfes are good for draught ; but few fit for the faddle. The ifland produces variety of trees, roots, and herbs; but not corn enough for the inhabitants, who therefore fend for it to England and France, and fometimes to Dantzic. The fields are inslofed by great mounds of earth, raifed from 6 to 8 or 10 feet high, proportionably thick and folid, planted with quickfets and trees. As the air of this illand is very healthy, thofe of the inhabitants who are temferate live to a great age: but the coaft is very fubject to ftorms by wefterly wind, from which they have no land to Melter them nearer than North America; and there is a valt chain of rocks about the ifland, among which the tides and currents are fo ftrong and rapid, that the navigation is dangerous to thofe who are not perfectly acquainted with the coalt. The buildings of this ifland are generally of rag-Itone; but fome of the wealthy inhabitants have their houfes fronted with a reddifh white ftone, capable of being polifhed like marble, and of which there is a rich quarry on a hill called ATontmado. The ordinary dwellings are thatched. The churches are very plain buildings, moft of them with fquare fteeples; and the communion table is not at the eaft end, as in the Englifh churches, but placed juft under the pulpit. The liaple manufacture is knit fockings and caps, many thoufand pair of which are weckly fold at St Helier to the merchants; alfo cyder, of which 25,000 hoghtheads lave been made here in one year. Their principal foreign trade is to Newfoundland; whither, particularly in $173^{2}$, they fent 24 hips; thefe proceed fiom thence to the Mediterranean to difpofe of their fifh.

On the fouth of the inand the fea feems to have encroaclied upon the land (which, as we have before obferved, declines on that fide), and to have fwallowed upwards of fix fquare miles, making a very beautiful bay of about three miles broad, and near the fame in depth. In the eaft corner of this bay llands the town of St Helier, very happily fituated. But the principal haven is in the weltern corner of the bay, which reccives its name from it, being called St Aubin's. There are, befides thefe, feveral other havens of lefs note; as, St Brelade's Bay, at the back of St Aubin's; the great bay of St Ouen, which takes in the greateft part of the weft fide of the inand, where the largeft fhips may ride in 12 and 15 fathoms, fafe from all but eaft winds. La Cre vaffe is a port only for boats; Greve de Lecq and Port St John are alfo fmall havens on the north fide, where is likewife Bonneuit. On the eaft there is the bay of St Catherine, and the harbour of Rofel. To the fouth-weft lies the laven Vol. 1X. Part I.
de la Chauffée. The laft we fhall mention is the port de Pas, a very little to the ealtward of St Au. bin's Bay.

The towns of St Helier and St Aubin, which, as already mentioned, fland both in the fame bay called St Aubin's Bay, opening to the fouth, are about three miles afunder. St Helier took its name from Elerius or Helier, a holy man, who lived in this ifland many centuries ago, and was hain by the Pagan Normans at their coming hither. He is mentioned among the martyrs in the martyrology of Coutance. His little cell with the flone bed is fill hown among the rocks; and in memory of him a noble abbey of Canons regular was founded in the little ifland in this bay, and annexed to Cherburgh abbey in Normandy in the reign of Henry I. and fuppreffed as an alien priory. The town of St Helier ttands at the foot of a iong and high rocky hill at the ealt end. It is a well-built and populous place; greatly improved and enlarged within the lalt century; and contains about 400 houfes, moltly fhops, and near 2000 inhabitants. The marketplace in the centre is fpacious, furrounded with handfome houfes, among which is the Cohue Royale or court of juflice. At the top of the market-place is a tatue of George II. of bronze gilt. 'The market is held on a Saturday, and much frequented.

St Aubin at the weft end of the bay is principally inhabited by merchants and mafters of thips, whom the neighbourhood of the port has invited hither. It is not more than half the fize of the other town, though greatly increafed within thefe 100 years; and has a good fone pier carried far into the fea, where Thips of confiderable burden lie fafe under the guns of the adjoining fort.

The ille of St Helier, more to the eaft in the fame bay, is in circuit near a mile, furrounded by the fea at or about every half flood. On the fite of the abbey before mentioned is now Elizabeth Caftle, one of the largeft and flrongeft fortreffes in Britain. Queen Elizabeth began it, and gave it her name. Charles I. enlarged, and Charles II. who was twice here, completed it. It was the laft fortrefs that held out for the king. It is the refidence of the governor and garrifon, and occupies the whole ifle, from whence at low water is a paffage called the bridge, half a mile long, formed of fand and ftones. A citadel was begum in the laft war on a nill, whence the cafle might be bombarded, but fince the peace left off.

Mount Orgeuil caftle, called alfo Gourray from the neighbouring village of that name, lies to the fouth of Rofel harbour in the bay of St Catharine. It was a place of ftrength before Henry Vth's time, and bid defiance to the attemps of the French under the conftable De Guefclin 1374 at the end of the reign of Edward III. It was repaired by Queen Elizabeth, but is now neglected, yet preferves an air of grandeur anfwering its name even in ruins. The afcent to its top is by near 200 fleps; and from thence by a telefcope may be feen the two front towers of the cathedral of Coutance. The famous William Prynne was confined in it three years.

The illand is divided into 12 parifhes, which are fo laid out that each has a communication with the fea; thefe are fubdivided into 52 vintaines, fo called from the number of 20 houfes, which each is fuppofed to have

P
formerly formerly contained, juft as in England to houfes anciently made a tything. The whole number of inhabitants is computed at about 20,000, of which 3000 are able to bear arms, and are formed into regiments. Their general review is on the fandy bay between the two towns, when they are attended with a train of above 20 brafs field pieces and two finall bodies of horfe in the wings.

The ehief officer is the governor, who has the cH ftody of his majefty's caftes, with the command of the garrifons and militia. The civil government is admiyitered by a bailiff, affitted by 12 jurats. They have here allo what they call an affembly of the itates. 'Thefe are convened by the governor or his deputy, the balliff confifts of himelf and the jurats, the dean and clergy, and the 12 high conftables.

There were formerly many druidical temples and altars in Ierfey, fome remains of which are fill to be fecn. The cromlechs are here called pouquelays, and there are fome tumuli and keeps. Roman coins have alfo been dug up in this ifland: and there are the remains of a Roman camp in the manor of Dilamant Chifilianity was firt planted here in the middle of the 6th century, and the ifland made part of the fee of Dol in Bretagne, and it is now governed by a dean. Befides the abbey of St Helier, here were four priories, Noirnomt, St Cilcment, Bonnenuit, and le Leeck, and above twenty chapels, now moftly ruined. During the laft war this ifland, together with that of Guernfey, became an object of defire to France, whofe vanity, no lefs than her intereft, was concerned in depriving Britain of thofe laft remnauts of her continental poffeffions. The firt attempt to atchieve this conquet took place in the year 1779. A force of 5000 or 6000 men was embarked in flat bottomed boats, and endeavoured to land in the bay of St Ouen, on the firtt of May. In this attempt they were fupported by five frigates and other armed veffels; but met with fuch a vigorous reliftance from the nilitia of the inand, affiled by a body of regulars, that they were compelled to retire with. out having landed a fingle perfon. Much difcontent and mutual recrimination took place among the French naval and military officers on this failure; and though the expedition was reprefented by many as ill concerted, and deflitute of every hope of fuccefs, another attempt was refolved on. Both the troops and feamen that had been employed in the former expedition were equally defirous of retrieving their honour; but they werc for fome time prevented from making any attempt of this kind by bad weather; and, before another opportunity offered, the fquadron which was defigned to cover their defcent was attacked by Sir James Wallace, who drove them afhore ou the coaft of Normandy, filenced a battery under whofe guns they had taken fhelter, captured a frigate of 34 guns, with two rich prizes, burnt two other large frigates, and a confiderable number of fmaller veffels.
Thus the fcheme of invading the inand of Jerfey was totally difconcerted, and laid afide for that time, but was refumed in the year 178 . The conduct of this fecond expedition was given to the baron de Rullecourt, who had been fecond in command when the former attempt was made. He was a man of courage, but fierce and violent in his difpofition, and feems to bave been very deficient in the prudence and conduct
necelTary for bringing any military enterprife to a fuccefsful iffue. The force entrulted to him on the prefent occalion confilted of 2000 men; with whom he embarked in very tempeftuous weather, hoping that he might thus be able to furprife the garrifon. Many of his tranfports, however, were thus difperfed, and he himfelf, with the remainder, obliged to take fhelter in fome inands in the neighbourhood of Jerfey. As foon as the weather grew calmer, he feized the opportunity of a dark night to effee landing at a place called Grouville, where he made prifoners of a party of militia. Hence he proceeded with the utmoit expedition to St Helier's, the capital of the inand, about three miles diftant. His arrival was fo unexpected, that he feized on a party of men wha guarded it , together with the commanding officer, and the magitrates of the ifland. Rullecourt then drew up a capitulation, the terms of which were, that the ifland fhould be inftantly furrendered to the French, and the garrifon be fent to England; threatening the town with immediate deftruction in cafe of noncompliance. It was in vain reprefented to him that no act of the deputygovernor and magiftrates could be valid while they remained in his power; but, as Rullecourt fill infilled, they were obliged to eomply, leaft his menaces thould have been carried into exeention. This point being gained, he advanced to Elizabeth Cafle in the neighbourthood of the town, fummoning it to furrender in virtue of the capitulation for the town and ifand juit concluded. To this a peremptory refufal was given, and followed by fuch a vigorous difcharge of artillery, that he was obliged to retire into the town. In the mean time the Britif troops flationed in the ifland began to aftemble from every quarter under the command of Major Pierfon ; who, on being required by the Fronch commander to fubmit, replied, that if the French themfelves did not, within 20 minutes, lay down their arms, he would attack them. This being refufed, an attack was inflantly made with fuch impetuofity, that the French were totally routed in lefs than half an hout, and driven into the market-place, where they endeavoured to make a fland. Their commander, exafperated at this unexpected turn of affairs, endeavoured to wreak his vengeance on the captive governor, whom he obliged to ttand by his fide during the whole time of the confliat. This, however, was quickly over; the French were broken on all fides, the baron himfelf mortally wounded, and the next in command obliged to furrender himfelf and the whole party prifoners of war; while the captive governor efcaped without a wound. This fecond difafter put an end to all hopes of the French minittry of being able to reduce the ifland of Jerfey, and was indeed no frall mortification to them; 800 troops having been landed at that time, of which not one efcaped. A montment was erected at the public expence in the church of St Helier, to the memory of Major Pierfon, to whom the deliverance of the ifland was owing; but who unhappily fell in the moment of viCtory, when only 24 years of age.

All the laading places and creeks round the ifland are now fortified with batteries, and 17 or 18 watchhoufes are erected on the headlands. Thefe are round towers with embrafurcs for fmall cannon and loop-holes for fmall mukketry; the entrance by a door in the
wall ant of the reach of man, and to be afeended by a ladder afterwards drawn up. This ifland with thufe of Guernfey, Sark, Alderney, and their appendages, were parcel of the duchy of Nurmandy, and were united to the crown of England by the firl princes of the Norman line. The language of the pulpit, and the bar, is the French, which is allo that generally foken by the people at large. They are governed by their own laws, which are for the molt part the ducal cuftoms of Normandy, being collected in an ancient book of cuftoms intitled Le grand couflumier. The king's writ, or procels from the courts of Welt. minller, is here of no force ; but his commiffion is. 'They are not bound by any common acts of our par. diaments, unlefo particularly named. All caufes are originally determined by their own officers, the bailiff and jurats of the iflands. But an appeal lies from them to the king and council in the lat refort.-Jer. sey is an earldom in the Villiers's family.

New Ferser, or, as it is commonly called, the Jerfeys (being two provinces united into une govern. ment), one of the united ftates of Nonth America, ly. ing from 39 to 41 degrees of north latisude, and from 74 to 75 degrees 30 minutes longitude well from London; in length 160 miles, in breadth 52.

It is bounded on the ealt by Hudfon's river and the fea; on the fouth, by the fea; on the welt, by Halaware bay and river, shich divides it from the Hates of Delaware and Pennfylvania; and on the north, by a line drawn from the mouth of Mahakkamak river, in latitude $41^{\circ} 24^{\prime}$, to a point on Hudfon's river, in latitude 41 containing about 8520 fquare miles, equal to $5,3 \pi 4,800$ acres. New Jeriey is divided into 13 counties, which are fubdivided into 94 town. thips or precincts. In 1784 , a cenfus of the inhabitants was made by order of the legilature, when they amounted to 140,435 , of which 10,501 were blacks. Of thefe blacks 1939 ouly were llaves ; fo that the proportion of naves to the whole of the inhabitants in the flate is as one to feventy-fix. The population for every fquare mile is eighteen. As to the face of the country, foil, and productions; the counties of Fuffex, Morris, and the northern part of Pergin, are mountainous, As much as five-eighths of molt of the louthern counties, or one fourth of the whole Aate, ia a fandy barren, unfit for cultivation. The land on the fea coalt in this, like that in the more fouthern flates, bas every appearance of made ground. The foil is genosally a light fand; and by digging, on an average, aoout fifty feet below the furface (which can be done, even at the difance of twenty or thirty miles from the fea, without any impediment from rocks or llones), jou come to falt marth. This fate has all the va. fieties of foilfrom the worft to the beft kind. It has a preater proportion of barrens than any of the flates. The barrens produce little elfe but fhrub oaks and white and yellow pines. In the hilly and mountainous parts of the liate, which are not too rocky for cultivation, the foil is of a flronger kind, and covered in itt satural fate with fately oaks, hickories, chefo nuts, \&c. \&c, and, when cultivated, produces wheat, ryc, Indian corn, buck wheat, oatr, barley, flax, and fruits of all kinds common to the climate. The land in this hilly country is good for grazing, and the fare mert feed great numbers of cattle for New Youk and

Philadelphia matkets, and many of them kecp large dairieã. The makets of New York and Philadelphia receive a very confiderable proportion of their fupplies from the contiguous parts of New Jerfey. And it is worthy of remarls that thefe contiguous parts are exceedingly well calculated, as to the nature and fertility of their foils, to afford thefe fupplies; and the in. tervention of a great number of navigable rivers and creeks renderà it very convenient to market their produce. Thefe fupplies confift of vegetables of many kinds, apples, pears, peaches, plums, ftrawberries, charries, and other fruits; cyder in large quantities and of the beft quality, butter, cheefe, beef, pork, mutton, and the leffer meats.

The trade of this flate is carried on almot folely with and from thofe two great commercial cities, New York on one fide, and Philadelphia on the other: though it wants not good ports of its own. The articles exported, befides thofe already mentioned, are wheat, flour, horfes, live cattle, hanas, which are celebrated as being the belt in the world, lumber, flay; feed, leather, and iron in great quantities in pigs and bars. Formerly copper ore was reckoned among their moft valuable exports; but the mines have not been worked fince the commencement of the late war. The iron manufacture is the greateft fource of wealth to the flate. Iron works are erected in Gloucefter, Burlington, Morris, and other counties. The mountains in the county of Morris give rife to a number of Areams neceflary and convenient for thefe works, and at the fame time furnith a copious fupply of wood and ore of a fuperior quality. In this county alone are no lefs than feven rich iron mines, from which might be taken ore fufficient to fupply the United States: and to work it into iron are two furnaces, two rolling and llitting mills, and about thirty forges, containing from two to four fires each. Thefe works produce annually about 5 to tons of har iron, 800 tons of pigs, befides large quantities of hollow ware, heet iron, and nail rods. In the whele Itate, it is fuppofed there is yearly made about 1200: or: of har iron, 1200 do . of pigs, 80 do. of nail 10 l , exclufive of hollow ware, and various other caltirigs, of which valt quantitics are made.
The character, manners, and cultons of the people are varions in different parts of the llate. The inha. bitanss are a collection of Low Dutch, Germans, Englifh, Scotch, Irifh, and New Englanders, or theiz defcendants. National attachment and mutual convenience have generally induced thele leveral kinds of people to fettle together in a body; and in this way their peculiar national manners, cuftoms, and charac. ter, are ftill preferved, efpecially among the lower clafs of people, who have little intercourle with any but thofe of their own nation. Religion, although its tendency is to unite people in thofe things that are effential to happinefs, occafions wide differences as to manners, cultoms, and even character. The Prefoyo terian, the Quaker, the Epifcopalian, the Baptilt, the German and Low Dutch Calvinit, the Methodill, and the Moravian, have each their dikinguilhing characteriftics, either in their worthip, their difcipline, of their drefs. There is ftill another very perceptite characteriftical difference, diftinet from either of the others, which arifes from the intercourfe of the inha-
bitant3

## J E R

Jerfey. bitants with different flates. The people in Weft Jerfey trade to Philadelphia, and of courfe imitaie their falhions, and imbibe their manners. The inhabitants of Eaft Jerfey trade to New York, and regulate their fafhions and manners according to thofe of New York. So that the difference in regard to fafhions and manners between Eałt and Weft Jcrfey, is nearly as great as between New York and Philadelphia. The people of New Jerfey are generally induftrious, frugal, and hofpitable. There are, comparacively, but few men of learning in the flate, nor can it be faid that the people in gencral have a tafte for the fciences. The lower clafs, in which may be included three-fifths of the inhabitants of the whole Itate, are ignorant, and are criminally neglectful in the education of their children. There are, in this ftate, about 50 Piefbyterian congregations, fubject to the care of three 1'rehbyteries, viz. that of New York, of New Brunfwick, and Philadelphia; 40 congregations of the Friends; 30 of the Baptifts; 25 of Epifcopalians; 28 of the Dutch, befides a few Moravians and Methodifts.

There are two colleges in New Jerfey; one at Princeton, called Nafau Hall; the other at Brunfivick, called $Q_{\text {ureen's-coll.ge. The college at Princeton was }}$ firtt founded about the year 1738, and enlarged by governor Belcher in $\mathbf{1 7 4 7}^{2}$. It has an annual income of about L. 900 currency; of which L. 200 arifes from funded public fecurities and lands, and the reit from the fecs of the fludents. There is a grammarfchool of about 30 fcholars, connected with the college, under the fuperintendance of the prefident, and taught by two malters. Before the late revolution this college was furnifhed with a philofophical apparatus worth L. 5co, which (except the elegant orrery conftructed by Mr Rittenhoufe) was almoft entirely deftroyed during the war, as was alfo the library, which now confifts of bet ween 2000 and 3000 volumes. -The charter for Queen's-college at Brunfwick was granted juft before the war, in confequence of an application from a body of the Dutch church. Its funds, raifed wholly by free donations, amounted foon after its eftablifment to four thoufand pounds; but they were confiderably diminifhed by the war. The fudents are under the care of a prefident. This college has lately inereafed both in numbers and repuration. There are alfo a number of flourifhing academies in this ftate; one at Trenton, another in Hakkenfak, others at Orangedale, Freehold, Elizabeth-town, Burlington, Newark, Spring-field, Morriltown, Bordentown, and Amboy: but there are no regular effablifhments for common fchools. The ufual mode of education is for the inhabitants of a village or neighbourhood to join in affording a temporary fupport for a fchoolmalter, upon fuch terms as is mutually agreeable. But the encouragement which thefe occafional teachers meet with, is generally fuch as that no perfon of abilities adequatc to the bufinefs will undertake it, and of courfe little advantage is derived from thefe fchools.

There are a number of towns in this itate, nearly of equal fize and importance, and none that has nore than 200 houfes, compactly built. - Trenton is the largel town in New Jerfey. This town, with Lamberton, which joins it on the fouth, contains 200 houfes, and about 1500 inhabitants. Here the legifature
meets, the fupreme court fits, and the public offices Jerfe are all kept, except the fecretary's, which is at Burlington. On thefe accounts it is confidered as the capital of the ftate. - Burlington ftands on the ealt fide of the Delaware, 20 milcs above Philadelphia by water, and ${ }_{7} 7$ by land. The ifland, which is the moll populous part of the city, is a mile and a quarter in length, and three quarters of a mile in breadth. On the ifland are 160 houfes, 900 white and 100 black inhabitants. There are two houfes for public worhip in the town, one for the Friends or Quakers, who are the moll numerous, and one for the Epifcopalians. The other public buildings are two markt-houfes, a court-houfe, and the bett gaol in the ftate. Befides thefe, there is an academy, a free fchool, a nail manufactory, and an excellent diftillery, if that can be called excellent which produces a poifon both of health and morals. - Perth Amboy ftands on a neck of land included bet ween Raritan river and Arthur Kull found. It lies open to Sandy Hook, and has one of the beit harbours on the continent. Veffels from fea may enter it in one tide, in almolt any weather.-Brunfrwick was incorporated in 178 , and is fituated on the fouth-well fide of Raritan river, 12 miles above Amboy. It contains about 200 houfes and 1600 inhabitants, one half of which are Dutch. Its fituation is low and unpleafant, being on the bank of the river, and under a high hill which rifes back of the town.- Princeton is a pleafant healthy village, of about 80 houfes, 52 miles from New York, and 43 from Philadelphia.-Elizabetb to wn and Neriark are pleafant towns; the former is 15 , and the latter 9 miles from New York. Newark is famed for its good cyder.

The government of this flate is vefted in a governor, legiflative council, and general affembly. The governor is chofen annually by the council and affembly jointly. The legillative council is compofed of one member from each county, chofen annually by the people. The general aftembly is compofed of three members from each county, chofen by the freemen. The council choofe one of their members to be viceprefident, who, when the governor is abfent from the Itate, poffeffes the fupreme executive power. The council may originate any bills, excepting preparing and altering any money bill, which is the fole prerogative of the affembly.

The firft fettlers of New Jerfey were a number of Dutch emigrants from New York, who came over between the years 1614 and 1620 , and fettled in the county of Bergen. Next after thefe, in 1627 , came over a colony of Swedes and Finns, and fettled on the river Delaware. The Dutch and Swedes, thougli not in harmony with each other, kept poffeffion of the country many years. In March 1634, Charles II. granted all the territory called by the Dutch Nerw Netherlands, to his brother the duke of York. And in June 1664, the duke granted that part now called Nero Ferfey to Lord Berkeley of Stratton, and Sir George Carteret, jointly; who in 1665 agreed upon certain conceffions with the people for the government of the province, and appointed Philip Carteret, Efq; their governor.-The Dutch reduced the country in 1672 ; but it was reftored by the peace of Weftminiter, February 9. 1674.

This thate was the feat of war for feveral yearg, dus-

Jeriey, ring the bloody conteft between Great Britain and Aerufatem. merica; and her loffes, both of men and property,
in proportion to the population and wealth of the flate, was greater than of any other of the thirteen flates.

Jersey, among woolcombers, denotes the fincit wool, taken from the reft by drefling it with a Jerfey comb.
JERUSALEM, a very famous and ancient city, capital of Judea or Paleftine, now a province of Turky in Afia. According to Manetho, an Egyptian hillorian, it was founded by the ilhepherds who invaded Egypt in an unknown period of antiquity *. According to Jofephus, it was the capital of Melchifedek's kingdom, called Salem in the book of Genefis: and the Arabians affert, that it was built in honour of Melchifedek by 12 neighbouring kings; which when they bad done, he called it ferufalem. We know nothing of it with certainty, however, till the time of king David, who took it from the Jebufites, and made it the capital of his kingdom, which it ever after continued to be. It was firt taken in the days of Jehoafh, by Hazael the king of Syria, who new all the nobility, but did not deltroy their city. It was afterwards taken by Nebuchadnezzar king of Babylon, who deftroyed it, and cartied away the inhabitants. Seventy years after, permifion was granted by Cyrus king of Perfia to the Jews to rebuild their city, which was done; and it continued the capital of Judea (though frequently fuffering much from the Grecian monarchs of Syria and Egypt), till the time of Vefpafian emperor of Rame, by whofe fon Titus it was totally deftroyed $\dagger$. It was, however, rebuilt hy Adrian ; and feemed likely to have recovered its former grandeur, being furrounded with walls, and adorned with feveral noble buildings; the Christians alfo being permitted to fettle in it. But this was a fhortlived change ; fot that when the emprefs Helena, mother of Conftantine the Great, came to vifit this city, the found it in the moft forlorn and ruinous fituation. Having formed a defign of reftoring it to its ancient luitre, the caufed, with a great deal of coft and labour, all the rubbith that had been thrown upon thofe places where our Saviour had fuffered, been buried, \&c. to be removed. In doing this, they found the crofs on which he died, as well as thofe of the two malefactors who fuffered with him; and, as the writers of thofc times relate, difcovered by a miracle that which had borne the Saviour of mankind. She then caufed a magniticent church to be built, which inclofed as many of the fcenes of our Saviour's fufferings as could conveniently be done, and adorned the city with feveral other buildings. The Emperor Julian is faid to have formed a defign of rebuilding the temple of Jerufalem, and of refloring the Jewifh worfhip. This fcheme was contrived on purpofe to give the lie to our Saviour's prophecy concerning the temple and city of Jerufalem; namely, that the firft fhould be totally deltroyed, without one fone being left upon another; and that Jerufalem fhould be trodden down of the Gentiles till the times of the Gentiles were fulfilled. In this attempt, however, according to the accounts of the Chriftian writers of that age, the emperror was fruftrated by an earthquake and fiery eruption from the earth, which
totally deffroyed the work, confumed the materials jerufalens, which had been collected, and killed a great number of the workmen.

This event hath been the fubject of much difpute. Mr Warburton, who hath publifhed a treatife exprefsly on the trath of this fact, hath collected the following tellimonies in favour of it. The firft is that of Ammianus Marcellinus, who tells us, "Julian (having been already thrice conful), taking Salluft, prefect of the feveral Gauls, for his colleague, entered a fourth time on this high magiftracy; and although his fenfibility of the many and great events which this year was likely to produce made him very anxious for the future, yet he both pufhed on the various and complicated preparativea for this expedition with the utmoit application, and, having an eye in every quarter, and being defirous to enternize his reign by the greatnefs of his atchievements, he projected to rebuild at an immenfe expence the proud and magnificent temple of Jerufalem; which (after many combats, attended with much bloodfhed on both fides, during the fiege by Vefpafian) was with great difficulty taken and deltroyed by Titus. He committed the conduct of this affair to Alypius of Antioch, who had formerly been lieutenant in Britain. When therefore this Alypius had fet himfelt to the vigorous execution of his charge, in which he had all the affilance that the governor of the province could afford him, horrible balls of fire breaking out near the foundations, with frequent and reiterated attacks, rendered the plact from time to time inacceffible to the fcorched and blafted workmen; and the victorious element continuing, in this manner, obitinately and refolutely bent, as it were, to drive them to a diflance, Alypius thought beft to give over the enterprife."

The next teftimony is that of Gregory Nazianzen. Speaking of the emperor Julian, he fays, "After having run through a courfe of every other tyrannical experiment againtt the faith, and upon trial defpifing all of them as trifling and contemptible, he at late brought down the whole body of the Jews upon us; whom, for their ancient turn to feditious novelties, and an inveterate hatred of the Chiltian name, he chofe as the fittef inftrument for bis machinations. Thefe, under a fhow of great good-will, which hid his fecret purpofe, he endeavoured to convince from their facred books and traditions, which he took upon him to interpret, that now was come the time foretold, when they fhould return to their own land, rebuild their temple, and reftore the law to its ancient force and fplendor. When thefe things had been thoroughly infinuated, and heartily entertained (for deceit finds eafy admittance when it flatters our parfions), the Jews fet upon the work of rebuilding with great attention, and pufhed on the project with the utmof labour and application. But when, now driven from their work by a violent whirlwind and a fudden earthquake, they lled together for refuge to a certain neighbouring church (fome to deprecate the impending mifchief; others, as is natural in fuch cafes, to catch at any help that prefents itfelf; and others again, inveloped in the crowd, wcre carried aiong with the body of thofe who fed), there are who fay,

## J E IR

$[188]$

Jerefem, the chureh refofed them entrance and that when they came to the doors which were wide open but a moment before, they found them on a fudden clufed by a lecret and invifible hand; a hand accultomed to work thefe wonders by the terror and confulion of the impious, and for the fecurity and comfort of godly men. This, however, is now invariably affirmed and believed by all, that as they itrove to force their way in by violence, the fire which burtt from the foundations of the temple, met and ftopped them. One part it burut and deftroyed, and another it defperately maimed, leaving them a living monument of God's commination and wrath againt finners. Thus the affair paffed; and, let no man continue incredulous concerning this or the other miraculous works of Grod But fill the thing moft wonderful and illurtrious was, a light which appeared in the heavens, of a crofs within a circle. That name and figure which impious men before eftermed fo difhonourable upon earth, was now raifed on high, and equally objected to the common view of all men; advanced by God limfelf as the trophy of his victory over unbelievers; of all trophies the molt exalted and fublime. Nay further, they who were prefent, and partakers of the miracle we are now about to fpeak of, fhow to this very day the fign or figure of the crofa which was then marked or impreffed upon their garments. For at that time, as these mon (whether fuch as were of us or Arangers) were fhowing thefe marks, or attend. ing to others who thowed them, each prefently obferved the wonder, either on himfelf or his neighbour; laving a radiant mark on his body or on his garment, in which there is fomething that, in art and elegance, exceeded all painting or embroidery."

Notwithttanding thefe tellimonies, however, this fact hath been frennonfly contelled by others; and indeed it mult be owned that the teftimonics above mentioned are by no means unexceptionable. In the laft particularly, the propenfity to the marvellous is fo exceedingly great, that every cone mult at firlt fight be Aruck with it. It is true indeed, the molt mira. culous part of it, as it feemed to he to Gregory, namely, the appearance of crofes upon the garments and bodies of fome of the people who were fluck, may be explained upon a natural princiole ; fince we are affured that lightning will fometimes produce ef-
$\ddagger$ See Lighto fects of this kind $\ddagger$ : but even this is no decifive proof
of the authenticity of the relation ; though it cannot by any means difcredit it, as fome think. On the whole, however, it is not a matter of any confequence whether this event happened with the circumftances above mentioned or not. If Julian did make any attempt to rebuild the temple, it is certain that fomething obfructed the attempt, becaufe the temple was never actually rebuilt. If he made no fuch attempt, the prophecy of our Saviour ftill bolds grood; and it furely cannot be thought to detract from the merit of a prophecy, that no body ever att.mpted to elude it, or prove it to be a falfehood.

Jerufalem continued in the hands of the eaftern em. pcrors sill the reign of the Caliph Omar, who reduced it under his fubjection. The Saracens continued in puffeffion of it till the year 109 , , when it was taken by the Cruiaders. They founded a new kingdom, of which Jerufalem was the capital, which lated 88 years
under nine kings, At laft thin kingdam vas uttely ruined by Galadin; and though the Chriftians once more got poffefion of the city, they were again obliged to relinquifh it. In 1217 , the Saracens were expelled by the Turks, who have ever fince continued in poffelfion of it.

The city of Jerufalem, in its moff fourifhing fate, was divided into four parts, each inclofed with its own walls; viz. I. The old city of Jebus, which tlood on mount Zion, where the prophets dwelt, and where David built a magnificent caftle and palace, which became the refidence both of himfelf and fucceffors : on which account it was emphatically called, the Gify of Davi.\%. 2. The lower city, called alfo the Daugh. fer of Zion, being built after it; on which food the two magnificent palaces which Solomon built for himfelf and his queen; that of the Maccabcan princess and the flately amphitheatre built by Herod, capable of containing 80,000 \{pectators ; the \{trong citade!, built by Autiochus, to command and overtop the temple, but afterwards razed by Simon the Maccabec, who recovered the city from the Syrians; and laftly, a fecond citadel, built by Herod, upon a high and craggy rock, and called by him Antonif. 3. The new city, moftly inhahited by tradefmen, artificers, and mer. chantc: and, 4. Mount Moriah, on which was buile the to faned temple of Solomon, defcribed in the fixth and feventh chapters of the fecond book of Kinga and, fince then, that rebuilt oy the Jews on their re. turn from Babylon, and afterwards built almof anew and greatly adorned and enriched by Herod.

Some idea of the magnificence of this temple may be had from the following confiderations. 1, That there were no lefs than 163,300 men employed in the work. 2. That notwithfanding that prodigious numi* ber of lands, it took up feven whole years in build. ing. 3. That the leeight of this building was 120 cubits, or 82 yards, rather more than lefs; and the courts round it abour half as high. 4. That the front, on the eaft fide, was fuftained by ramparts of fquare tlone, of yaft bulk, and built up from the valv ley below, which laft was 300 cubits ligh, and bo. ing added to that of the edifice amounted to 420 chbits; to which, if we add, 5 . The height of the principal tower above all the rett, via. 60, will bring: it to 480 cubits, which, reckoning at two reet to is cubit, will amount to 960 feet; but, according to the length of that meafure, as others reckon ic, viz. at two feet and an half, it will amoun to 1200 feet $;$ a prob digious height this from the ground, and fuch as might well make Jofephus fay, that the very defign of it was fufficient to liave turned the brain of any but Solomon. 6. Thele ramparts, which were raifed in this manner, to fill up the prodigious chafm made by the deep yalley below, and to make the area of a fuf ficient breadth and length for the edifice, were 1000 cubits in length at the hottom, and 800 at the top, and the breadth of them 100 more. \% The hage buttrelTes which fupported the ramparts were of the fame height, fquare at the top, and 50 cubits broad, and jutted out 150 cubits at the batom. 8. The ftones, of which they were built, were, ascording to Jofephus, 40 cubits longs 12 thick, and 8 high, all of marble, and fo exprifitely joined, that they feemed one continued piece, or rathe: polithed rock, g. Ac.

## I E-R [ 119 ] J E R

rufalem cording to the fame Jewih hiftorian, there were 1453 columns of Parian marble, and twice that number of pilafters; and of fuch thicknefs, that three men could hardly embrace them. and their height and capitals proportionable, and of the Corinthian order. But it is likely Jofephus hath given us thefe two laft articles from the temple of Herod, there being nothing like them mentioned by the facred hitorians, but a great deal about the prodigious cedars of Lebanon ufed in that noble edifice, the excellent workmanfhip of them adlapted to their feveral ends and defigns, together with their gildings and other curious ornaments. The only thing more we fhall wenture to add is, what is affirmed in Scripture, that all the materials of this ftupendous fabric were finifhed and adapted to their feveral ends before they were brought to Jerufalem, that is, the flones in their quarries, and the cedars in Lebanon; fo that there was no noife of as, hammer, or any tool, heard in the rearing of it.

At prefent Jerufalem is called by the Turks Cudfembaric, and Coudfleriff; and is reduced to a poor thinly inhabited town, about three miles in circumference, fituated on a rocky mountain, furrounded on all fides, except the north, with fleep afcents and deep valleys ; and thefe again environed with other hills, at fome diftance from them. In the neighbourhood of the city there grow fome corn, vines, olives, \&c. The flately church erected by the emprefs Helena, on mount Calvary, is fill flanding. It is called the church of the fepulchre; and is kept in good repair by the generous offerings of a conflant concourfe of pilgrims, who annually refort to it, as well as by the contributions of feveral Chriftian princes. The walls of this church are of fone, and the roof of cedar ; the eaft end inclofes Mount Calvary, and the weft the holy fepulchre: the former is covered with a noble cupola, npen at top, and fupported by 16 maffive columns. Over the high altar, at the eaft end, is another fately dome. The nave of the church conflitutes the choir; and in the infide ifles are flown the places where the moft remarkable circumftances of our Saviour's paffion were tranfacted, together with the tombs of Godfrev and Baldwin, the two firt Chriftian kings of Jerufalem. In the chapel of the crucifxion is fhown the very hole in the rock in which the crofs is faid to have been fixed. The altar in this chapel hath three crofies on it; and is richly adorned, particularly with four lamps of immenfe value that hang before it, and are kept conflantly burning. At the weft end is that of the fepulchre, which is hewn in that form out of the folid rock, and hath a fmall dome fupported by pillars of porphyry. The cloifter round the fepulchre is divided into fundry chapels, appropriated to the feveral forts of Chriftians who refide there; as Greeks, Armenians, Maronites, Jacobites, Copts, Ahyffines, Georgians, \&c. and on the north-weft fide of it are the apartments of the Latins, who have the care of the cluurch, and are forced to refide conftantly in it ; the Turks keeping the keys of it, and not fuffering any of them to go out, but obliging them to receive their provifions in at a wicket. At Eafler there are fome grand ceremonies performed in the church, reprefenting our Lord's paffion, crucifixion, death, and relurtection, at which a vaft concourfe of pilgrims commonly affif. For a particular account of
them, we refer the reader to Doctors Sliaw and Po. Ierustern cocke.

On Mount Moriah, on the fouth caft part of the city, is an edifice called Solomon's Temple, tlanding on or near the fame foot as the ancient; but when or by whom erected is uncertain. In the midft of it is a Turkih mofque, where the Jewifh fanctum fanctorum is fuppofed to have flood. The building, which Dr Pococke thinks mult have been formerly a Chritian church, is held in the utmot veneration by the Turks.

The city is now under the government of a fangiac, who refides in a houfe faid to have been that of 'lontius Pilate, ovcr-againt the cafle of Antonia built by Herod the Great. Many of the churches erected in memory of fome remarkable gofpel-tranfaction, have been fince converted into mofques; into fome of which miney will pincure admittance, but not into othcrs. Both the friars and other Chrilians are kept fo poor by the tyranny of the government, that the clief fuppore and trade of the place confifts in providing frangers with food and other accummodations, and felling them beads, relics, and other trinkets, for which they, are obliged to pay confiderable fums to the fangiac, as well as to his officers; and thofe are feldom fo well. contented with their ufual duties, but they frequently extort fome frefh ones, efpecially from the Francifcans, whofe convent is the common receptacle for all pilgrims, and for which they have confiderable allowances from the pope, and other crowned heads, befides. the prefents which Arangers generally raake them at their departure. The mot remarkable antiquities in the neighbourhood of Jerufalem are, 1. The pools of Bethefôa and Gihon; the former 120 paces long, 40 broad, and at leait eight deep, but now without water; and the old arches, which it fill difeovers at the wett end, are quite dammed up: the other, which is about a quarter of a mile without Betriehem-gate, is. a sery flately relic, 106 paces long, and 60 broad, lined with a wall and plafter, and fill well fored with water. ${ }^{2}$. The tomb of the Virgin Mary, in the valley of Jehoflaphat, into which one defcends by a magnificent fightit of 47 fteps. On the right hand as one goes down, is alfo the fepulchre of St Ann the mother, and on the left that of Jofeph the humband, of the virgin-mother: fome add likewife that of Jehoiakim her father. In all thefe are erected altars for priefts of all forts to fay mafs, and the whole is cut into the folid rock. 3. The tomb of king Jehofhaphat, cut likewife into the rock, and divided into feveral apartments; in one of which is his tomb, which is adorned with a flately portico and entablature over it. \&. That commonly called Abjalom's pillar or place, as being generally fuppofed to be that which he is faid to have erected in his life-time to perpetuate his memory, as. he had no male-ifue. The place, however, both with. in and without, hath more the refemblance of a fepulchre than any thing elfe: though we do not read. that he was buried there, neither do the people here affirm that he was. There is a great heap of fones, about it, which is continually increaling; the fuperftitions Jews and Turks always throwing fome as they pafs, in token of their abhorrence of Abfalom's unnatural rebellion againt fo good and holy a parent. The Atructure iefelf is about zo cubits fquare, and 60 high, rifing in a lofty fquare, adorned below with four columns

[-J S
Jeruatem columns of the Ionic order, with their capitals, entablatures, \&cc. to each front. From the lieight of 20 to 40 cubits, it is fomewhat lefs, and quite plain, excepting a fmall fillet at the upper end: and from 40 to the top it changes into a round, which grows gradually into a point, the whole cut out of the folid rock. There is a room within, confiderably higher than the level of the ground without, on the fides of which are niches, probably to receive coffins. 5. A little eatward of this is that called the tomb of Zechariah, the fon of Barachiah, whom the Jews flew between the temple and the altar, as is commonly fuppofed. This fabric is all cut out of the natural rock, 18 feet high, and as many fquare ; and adorned with Ionic columns on each front, cut out likewife of the fame rock, and fupporting a cornice. The whole ends in a pointed top, like a diamood. But the moft curious, grand, and elaborate pieces, in this kind, are the grotts without the walls of Jerufalem, ftyled the royal fepulchres; but of what kings is not agreed on. They confit of a great number of apartments, fome of them fpacious, all cut out of the folid marble rock; and may jufly be pronounced a royal work, and one of the mott noble, furprifing, and magnificent. For a particular account of them we mult refer the reader, for want of room, to Pococke's Travels. In the neighbourhood of Jerufalem is a fpot of ground, about 30 yards long and 15 broad, now the burying-place of the Armenians, which is hown as the Aceldama, or Field of Blood, formerly the Potter's Field, and fince ftyled Campo Sando, or the Holy Field, purchafed with the price of Judas's treafon, for the burial of Arangers. It is walled round, to prevent the Turks abufing the bones of Chriftians; and one half of it is taken up by a building in the nature of a charnel houre. Befides the above, a great many other antiquities in the city and its environs are fhown to ftrangers; there being fcarce any place or tranfaction mentioned either in the Old or New Teftament, but they fhow the very fpot of ground where the one flood, and the other was done; not only here, but all over Judra.

JESI, an ancient town of Italy, in the territory of the church, and in the marca or march of Ancona, with a bifhop's fee. It is feated on a mountain, near a river of the fame name, in E. Long. 12. 20. N. Lat. 43.50.

JESSO, Jedso, or Yalfo, a large ifland of Afia to the north of Niphon, and faid to be governed by a prince tributary to the empire of Japan ; but is very little known to the Europeans, fo that nothing can be faid with certainty concerning it.

JESSES, ribbons that hang down from garlands or crowns in falconry; alfo fhort Araps of leather faflened to the hawk's legs, and fo to vervels.

JESTING, or concife zuit, as dittinguifhed from continued wit or humour, lies either in the thought, or the lauguage, or both. In the firt cafe it does not depend upon any particular words or turn of the expreflion. But the greateft fund of jefts lies in the language, i. e. in tropes or verbal figures; thofe afforded by tropes confift in the metaphorical fenfe of the words, and thofe of verbal figures principally turn upon a double fenfe of the fame word, or a fimilitude of found in different words. The third kind of joker, which lie both in the fenfe and language, arife from figures of $2 \mathrm{~N}^{2}: \mathrm{C}_{3}$.
but the wit turns upon the choice of the words.
JESUITS, or the Society of Jesus; a famous religious order of the Romifh church, founded by Ignatius Loyola. See Ignatius.-The plan which this fana-Foundat tic formed of its conftitution and laws was fuggetted, of che or as he gave out, and aa his followers fill teach, by the der. immediate infpiration of heaven. But notwithflanding this high pretenfion, his defign met at firf with violent oppofition. The pope, to whom Loyola had applied for the fanction of his authoity to confirm the intitution, referred his petition to a committee of cardinals. They reprefented the eftablifhment to be unneceffary as well as dangerous, and Paul refufed to grant his approbation of it. At laft, Loyola removed all his fcruples by an offer which it was impoffible for any pope to refift. He propofed, that befides the three vows of poverty, of chaftity, and of monaltic obedience, which are common to all the orders of regulars, the members of his fociety fhould take a fourth vow of obedience to the pope, binding themfelves to go whitherfoever he fhould command for the fervice of religion, and without requiring any thing from the holy fee for their fupport. At a time when the papal authority had received fuch a fhock by the revolt of fo many nations from the Romilh church ; at a time when every part of the popih fyltem was attacked with fo much violence and fuccef8, the acquifition of a body of men, thus peculiarly devoted to the fee of Rome, Confirn and whom it might fet in oppofition to all its encmies, by the was an object of the higheft confequence. Paul in- pope, al Atantly perceiving this, confirmed the inftitution of the $\frac{\text { from wh }}{\text { motives }}$ Jefuits by his bull, granted the mot ample privileges to the members of the fociety, and appointed Loyola to be the firft general of the order. The event hath full juftified laul's difcernment, in 'expecting fuch beneficial confequences to the fee of Rome from this inAtitution. In lefs than half a century, the fociety obtained eftablifhments in every country that adhered to the Roman catholic church : its power and wealth increafed amazingly ; the number of its members became great ; their character as well as accomplifhments were ftill greater; and the Jefuits were celebrated by the friends aud dreaded by the enemies of the Romiifh faith as the moft able and enterprifing order in the church.

The confitution and laws of the fociety were perfected by Laynez and Aquaviva, the two gencrals who fucceeded Loyola, men far fuperior to their mafter in abilities and in the fcience of government. They framed that fyltem of profound and artful policy which ditinguifhes the order. The large infufion of fanaticifm mingled with its regulation fhould be imputed to Loyola its foundcr. Many circumftances concurred in giving a peculiarity of character to the order of Jefuits, and in forming the members of it not only to take greater part in the affairs of the world than any other body of monks, but to acquire fuperior influence in the conduct of them.
The primary object of almoft all the monaltic orders is to feparate men from the world, and from any con- of the cern in its affairs. In the folitude and filence of the der fing cloiltcr, the monk is called to work out his own fal- -1 ar. 4 vation by extraordinary acts of mortification and piety. He is dead to the world, and ought not to mingle

## J E S [ 121 ] J E S

fuits in its tranfactions. He can be of no benefit to man. kind but by his example and by his prayers. On the contrary, the Jefuits are taught to confider themfelves as formed for action. They are chofen foldiers, bound to exert themfelves continually in the fervice of God, and of the pope his vicar on earth. Whatever tends to inftruct the ignorant, whatever can be of ufe to reclaim or to oppofe the enemies of the holy fee, is their proper object. That they may have full leifure for this active fervice, they are totally exempted from thofe functions the performance of which is the chief bufinefs of other monks. They appear in no procef. fions; they practife no rigolous autterities; they do not confume one half of their time in the repetition of tedious offices: but they are required to attend to all the tranfactions of the world, on account of the influence which thele may have upon retigion; they are directed to fludy the difpofitions of perfons in high rank, and to cultivate their friendihip; and by the very conftitution as well as genins of the order, a fpirit of action and intrigue is infufed into all its members.

As the object of the fociety of Jefuits differed from that of the other monafic orders, the diverfity was no lefs in the form of its goverment. The other orders are to be confidered as voluntary affociations, in which whatever affects the whole body is regulated by the common fulfrage of all its members. The executive power is vefted in the perfons placed at the head of each convent or of the whole fociety; the legina. tive authority refudes in the community. Affairs of moment, relating to particular convents, are determined in conventual chapters; fuch as refpeet the whole order are confidered in general congregations. But Loyola, full of the ideas of implicit ohedience, which he had derived from his military profeffion, appninted that the government of his order thould be purely monarchical. A general, chofen for life by deputies from the feveral provinces, poffeffed power that was fupreme and independent, extending to every perfon and to every cafe. He, by his fole authority, nominated provincials, rectors, and every other officer employed in the government of the fociety, and could remove thein at pleafure. In him was vefted the fovereign adminiftration of the revenues and funds of the order. Evely member belonging to it was at his difpofal; and by his uncontrollable mandate he could impofe on them any tak, or employ them in what fervice focver he pleafed. To his commands they were required to yield not only outward obedience, but to tefign up to him the inclinations of their own wills and the fentiments of their own underflandings. They were to litten to his injunctions as if they had heen uttered by Chritt himfelf Under his direction they were to be mere palfive infruments, like clay in the hands of the potter, or like dead carcafes incapable of reliftance. Such a fingular form of policy could not fail to imprefs its charakter on all the members of the order, and to give a peculiar force to all its operations. There is not, in the annals of mankind, any example of fuch a perfeet defpotifm, exercifed not over monks fhut up in the cells of a convent, but over men difperfed among all the nations of the earth.

As the conftitutions of the order veft in the general fuch abfolute dominion over all its members, they care-
fully provide for his being perfectly informed with re. Jefuits. fpect to the character and ahilities of his fubjects. Every novice who offers himifelf as a candidate for entering into the order, is obliged to manifett his confcience to the fuperior, or a perfon appointed hy him; and is required to confefs not only his fins and defects, but to difcover the inclinations, the paffions, and the bent of his foul. This manifellation mult be renewed every fix months. The fociety, not fatisfied with pcnetrating in this manaer into the innermoft recefles of the heart, directs each member to obferve the words and actions of the novices: they are conflituted fpies upon their conduct, and are bound to difclofe every thing of importance concerning them to the fuperior. In order that this forutiny into their character may be as complete as poffible, a long noviciate mult expire, during which they pafs through the feveral gradations of ranks in the fociety; and they muft have attained the full age of thirty-three years before they can be adinitted to take the final vows, by which they become profeffed members. By thefe various methods, the fuperiors, under whofe immediate infpection the novices are placed, acquire a thorough knowledge of their difpofitions and talents. In order that the general, who is the foul that animates and moves the whole fociety, may have under his eye every thing neceftary to inform or direct him, the provincials and heads of the feveral houfes are obliged to tranfmit to him tegular and fre. quent reports concen ning the members under their in. fpection. In thefe they defeend into minute details with refpect to the character of each perfon, his abilities natural or acquired, his ternper, his experience in affars, and the particular department for which he is beft fitted. Thefe reports, when digefted and arranged, are entered into regilers kupt of purpofe, that the general may, at one comprthenfive view, furvey the tate of the fociety in every corner of the carth; obferve the quatifications and talents of its members; and thus choofe, with perfect information, the intruments which his abfolute power can employ in any fervice for which he thinks meet to deftine them.

As it was the profefled intention of the order of Progiefis of Jefnits to labour with unwearied zeal in promoting the power the falvation of men, this engaged them of courfe in and influmany active functions. From their firll inftitution, ence of the they confidered the education of youth as their peculiar province; they aimed st being fpiritual guides and confeflors; they preached frequently in order to inAruct the people; they fet out as miffionaries to convert unbelieving nations. The novelty of the inftitution, as well as the fingularity of its objects, procured the order many adinirers and patrons. The governers of the fociety had the addrefs to avail themfelves of every circumftance in its favour; and in a thort time the number as well as influence of its members increafed wonderfully. Before the expitation of the fixteenth century, the Jefuits had obtained the chief direction of the education of youth in every catholic country in Europe. They had beconne the confeffors of a!molt all its monarchs ; a function of no frall importance in any reign, but, under a weak prince, fuperinr even to that of minifter. "Iliey were the fpiritual guides of almott every perfon emisent for rank or power. They polieffed the highell degree of confidence and interelt with the papal court, as the moft
zcalous

Jefuits.
zealous and able champions for its authority. The the Jefuits, influenced by the fame principle of atadvantages which an active and enterprifing body of men might derive from all theie circumftances are obvious. They formed the minds of men in their youth. They retained an afcendant over them in their advanced years. They polfeffed, at different periods, the direction of the moft confiderable conrts in Europe. They mingled in all affairs. They took part in every intrigue and revolution. The general, by means of the extenfive intelligence which he received, could regulate the operations of the order with the molt perfeet difcernment ; and, by means of his abfolute power, could carry them on with the utmolt vigour and eflect.

Togetlier with the power of the order, its wealth continued to increafe. Various expedients were devifed for eluding the obligation of the vow of poverty. The order acquired ample poffeffions in every catholic country; and by the number as well as magnificence of its public buildings, together with the value of its property, moveable or real, it vied with the molt opu lent of the monaltic fraternities. Befides the fources of wealth common to all the regular clergy, the Jefuits poffeffed one which was peculiar to thenfelves. Under pretext of promoting the fuccefs of their mifLons, ant of facilitating the fupport of their miffionaries, they obtained a fpecial licence from the court of Rome to trade with the nations which they laboured to convert. In confequence of this, they engaged in an extenfive and lucrative commerce borh in the Ealt and Weat Indies. They opened warehoufes in different parts of Europe, in which they vended their commodities. Not fatished with trade alone, they imitated the example of other commercial focieties, and aimed at obtaining fettlements. They acquired porfeffion accordingly of a large and fertile province in the fouthern continent of Amrrica, and reigned as fovereigns over fome bundred thoufand fubjects.
Unhappily for mankind, the valt influence which the order of Jefuits acquired by all thefe differcnt means, has been often exerted with the molt pernicious effect. Such was the tendency of that difcipline obferved by the fociety in forming its members, and fuch the fundamental maxims in its conftitution, that every Jefuit was taught to regard the intereft of the order as the capital object to which every confideration was to be facrificed. This fpirit of attachment to their order, the molt ardent perhaps that ever influenced any body of men, is the characteritic principle of the Jefuits, and ferves as a key to the genius of their policy as well as the pecultarities in their fentiments and conduct.

As it was for the honour and advantage of the fo-* ciety that its members fhould poffefs an afcendant over perfons in high rank or of great power; the defire of acquiring and preferving fuch a direction of their conduct with greater facility, has led the Jefuits to propagate a fitem of relaxed and pliant motality, which accommodates itfelf to the paffions of men, which jultifics their vices, which tolerates their imperfec tions, which authorifes alinoft every action that the moft audacious or crafty politician would wifh to perpetrate.

As the profperity of the order was intimately connected with the prefervation of the papal anthority,
tachment to the interelts of their fociety, have been the moft zealous patrons of thofe doctrines which tend to exalt ecclefiaftical power on the ruins of civil government. They have attributed to the court of Rome a juriddiction as extenfive and abfolnte as was claimed by the moit prefunptuous pontiffs in the dark ages. They have contended for the entire independence of ecclelialties on the civil inagiftrates. They have publifhed fuch tenets concerning the dity of oppoling princes who were enemies of the Catholit faith, as countenanced the moft atrocious crimes, and tended to diffolve all the ties which connect fubjects with their rulers.

As the order derived both reputation and authority from the zeal with which it Itood forth in defence of the Romifh church agdint the attacks of the reformers, its members, proud of this diftinction, have conlidered it as their peculiar function to combat the opinions and to check the progrefs of the Proteltats. They have made ufe of every art, and have employed every weapon againft them. They have fet themfelves in oppoftion to every gende or tolerating meafure in their favour. They have inceflantly ftired up againft them all the rage of ecclelialtical and civil perfecution.

Monks of other denominations have indeed ventured to teach the lame pernicions doctrines, and have held opinions equaliy inconfulent with the order and happinefs of civil fuciety. But they, from reafons which are obvious, bave tither delivered fuch opinions with greater referve, or have propagated them with lefs fuccefs. Whoever recollects the events which have happened in Europe during two centuries, will find that the Jefuits may jufly be confirlered as refponfible for mont of the pernicions effects arifing from that corrupt and dangerons caluiftry, from thofe extrava. gant tentes concerning ecclefiaftical power, and from that intolerant ipirit, which have been the difgrace of the chuich of Rone throughout that period, and which have brought fo many calamities upon civil fociety.

But, amidft many bid confequences flowing from Some: the inflitution of this order, mankind, it mult be ac- vantag knowledged, have derived from it fome confiderable fuling advantages. As the Jefuits made the edication of inflim t youth one of their capital objects, and as their firt of his attempts to eflablifh culleges for the reception of ftu- order. dents were violently oppoled by the univerfities in different countries, it became neceffary for them, as the moft effectual nethod of aequiring the public favour, to furpals their rivals in fcience and indultry. This prompted them to cultivate the Itudy of ancient literature with extraordinary ardour. This put them upon various methods for facilitating the inftruction of youth; and, by the improvements which they made in it, they have contributed fo much towards the progrefs of polite learning, that on this account they have merited well of fociety. Nor has the order of Jefuits been fuccefsful only in teaching the elements of literature; it las produced likewife eminent maflers in many branches of lcience, and can alone boalt of a greater number of ingenious authors than all the other. religious fraternities taken together.

But it is in the nesy world that the Jefuits have ex: hibited

## J E S [ 123 ] J E S

refuits. hibited the moft wonderful difplay of their abilities, and have contributed moft effectually to the benefit of the human fpecies. The conquerors of that unfortunate quarter of the globe had nothing in view but to plunder, to enllave, and to exterminate its inhabitants. The Jefuits alone have made humanity the object of their fettling there. About the beginning of the laft century, they obtained admiffion into the firtile province of Paraguay, which ftretches acrofs the fouthern continent of America, from the bottom of the mountains of Potofi to the confines of the Sparifh and Portuguefe fettlements on the banks of the river de la Plata, They found the inhabitants in a nate little different from that which takes place among men when they firft begin to unite together; ftangers to the arts, fubfifing precarioully by hunting or fifhing, and hardly acquainted with the firt principles of fubordination and government. The Jefuits fet themfelves to inftruct and to civilize thele favages. They taught them to cultivate the ground, to rear tame animals, and to build houfes. They brought them to live together in villages. They trained them to arts and manufactures. They made them rafte the fweets of fociety, and accultomed them to the bleffings of fecurity and order. Thefe people became the fubje Is of their benefactors, who have governed them with a tender attention, refembling that with which a father directs his children. Refpected and beloved almoft to adoration, a few Jefuits prefided over fome hundred thoufand Indians. They maintained a perfect equality among all the members of the community. Each of them was obliged to labour, not for himfelf alone, but for the public. The produce of their fields, together with the fruits of their induftry of every fpecies, were depofited in common florehoufes, from which each individual received every thing neceflary for the fupply of his wants. By this inftitution, almolt all the paffions which difturb the peace of fociety, and render the members of it unhappy, were extinguithed. A few magiftrates, chofen by the Indians themfelves, watched over the public tranquillity, and fecured obedience to the laws. The fanguinary punifhments frequent under other governments were unknown. An admonition from a Jefuit, a ीight mark of infamy, or, on fome fingular occafion, a few laftes with a whip, were fufficient to maintain good order among thefe innocent and happy people.

But even in this meritoricus effort of the Jcfuits for the good of mankind, the genius and fpirit of their order have mingled and are difcernible. They plainiy aimed at eftablifhing in Paraguay an indeper. dent empire, fubject to the fociety alone, and which, by the fuperior excellence of its conititution and police, could fcarcely have failed to extend its dominion over all the fouthern continent of America. With this view, in order to prevent the Spaniards or Portu. guefe in the adjacent fettlements from acquiring any dangerous influence over the people within the limits of the province fubject to the fociety, the Jefuite endeavoured to infpire the Indians with hatred and contempt of thefe nations. They cut off all intercourfe between their fubjects and the Spanifh or Portuguefe fettlements. They prohibited any private trader of either nation from entering their territories. When they were obliged to admit any perron in a public cha-
racter from the neighbouring governments, they did not permit him to have any converfation with their fubjects; and no Indian was allowed even to enter the houle where thefe ftrangers refided unlefs in the pre. fence of a Jefuit. In order to render any communication between them as difficult as poffible, they induttrioully avoided giving the Indians any knowledge of the Spanifh or of any other European language; but encouraged the different tribes which they had civilized to acquire a certain dialect of the Indian tongue, and laboured to make that the univerfal language throughout their dominions. As all thefe precautions, without military force, would have been infufficient to have rendered their empire fecure and permanent, they inftructed their fubjects in the European arts of war. They formed them into bodies of cavalry and infantry, completely armed and regularly difeiplined. They provided a great train of artillery, as well as magazines flored with all the implements of war. Thus they eftablifhed an army fo numerous and wellappointed, as to be formidable in a country where a few fickly and ill-difciplined battalions conipofed all the military force $k$ ept on foot by the Spaniards or Portuguefe.

Such were the laws, the policy, and the genius of Downfa? this formidable order ; of which, however, a perfect of the order knowledge has only been attainable of late. Europe had obferved, for two centuries, the ambition and power of the order. But while it felt many fatal effects of thefe, it could not fully difcern the caufcs to which they were to be imputed. It was unacquainted with many of the fingular regulations in the political conftitution or government of the Jcfuits, which formed the enterprifing fpirit of intrigue that dillinguifhed its members, and elevated the body itfelf to fuch a height of power. It was a fundamental maxim with the Jefuits, from their firf inftitution, not to publifh the rules of their order. Thefe they kept concealed as an impenetrable myRery. They never communicated them to Atrangers, nor even to the greater part of their own members. They refuled to produce them when required by courts of juftice; and, by a Atrange folecifm in policy, the civil power in different countries authorifed or connived at the eftablifhment of an order of men, whofe conftitution and laws were concealed with a foliciude which alone was a good reafon for having excluded them. During the profecutions lately carried on againt them in Portugal and France, the Jefuits have been fo inconfiderate as to produce the myfterious volumes of their inftitute. By the aid of thefe authentic records, the principles of their government may be delineated, and the fources of their power inveltigated with a degree of certainty and precifion which, previous to that event, it was impoiffible to attaia.

The pernicious effects, however, of the Cpiric and conltitution of this order, rendered it early olnoxious to fome of the principal powers in Europe. and gradually brought on its downfal. The emperor CharlesV. faw it expedient to check its progreis in his dumi. nions; it was expelled England, by puclamation 2 James I. in 1604 ; Venice, in 1606 ; Portugal, in 1759; France, in 1764; Spain and Sicily, in 1767: and totally fuppreffed and abolifhed by the late Pope Clement XIV. in 1773.

## J E S [

JESUITS bark. See the article Cinchona.
The account there given being, however, fomewhat defegive and indifinct in regard both to the enumeration of the Species and th botanical diftinctions, it has been thought proper to fupply thofe defects in this place by the following more purticular defcriptions and additional notices concerning an article of fo great importance in the materia medica.
"1. Cinchona officinalis (Quinquina Condam. Acta Gallic. 1738), Perultan. Bark Trce. The charactere are as fullows.
"Cal. Perianthium monophyllum. fuperum, quinquefidum, minimum, perfifiens. Cor. monopetala, infundibuliforenis; tubus cylindricus, longus; limbus patulus, quinquifidus, acutus. Sum. Filans nta quinque, minima; anthere oblonge, intra faucem corollw. Pift. Germen 「ubrotundum, inferum ; ft las longitudine corollæ. figma crafiufculum, oblungum, fimplex. Per. Capfula fubrotunda; calyce coronata, bilocularis, a bafi verfus apicem bifariam dehifcens. Sem. plurima, ublonga, compreffa, marginata. Obferv. Flos interdum demit quintam partem numeri in fingulis partibus."

In Tol. XL, of the Phil. Tranf p. 8t. $\mathrm{N}^{\circ}+46$. there is an account of the Jefuits-bark tree of Peru by Mr William Arrot.-M. de la Condamine after. wards gave a mote particular and [cieutific account of this tree: fince which fpecimens of the fructification have been Cent to Europe; and Dr Fulteney his given an excellent figure in his inaugural differtation $D_{e}$ Cortice Peruviano in ${ }^{1} 76 \frac{4}{4}$, fiom which our figure is copied.

The properties and preparations of the Peruvian bark have been already fufficiently detailed under the arricle Cinchona. We fhall here add the following notice of a new preparation of this bark recommended by M. Litnel. He directs to "boil lix grains of falt of tartar with an ounce of bark in a pint of water; and, after filtering the decoction, another pint of water is to be boiled with the fame quantity of falt and the remaining bark. In this way no bitternefs remains; at the fame time that the ltrength of the bark appears to be completely exhaufted, as alcobol only extracted two grains of refin from it "
2. Cinchova C.aribeta feu Jamaicensis. Of this bark Dr Wright has given an accurate defcription with an elegant engraving in the Phil. Tranf. vol. Ixvii. P. 504, from which we fhall extract the botanic claracters fo as to dillinguih it from other fpecies.
Plate
©CLIII.
"Fol ovata, integerima, acuta, enervia, oppofita. Flor. fingulares, axillares. Cal. Perianthium monophyllum, quinquefidum, minimum, perfilens, campanulatum, obfoletifimi, qui quedentatum. Cor. monopetala, infundibuliformis; tubus cylindraceus, longiffimus; limbus quinquepartitus, iubo requalis; laciniis ovatis, oblongis, refloxis, quandoque pendulis. Stam. Filamenta quinque, filiformia, erecta e medio tubi, longitudine corollx; anhheræ longiffimæ, obtufæ, erectæ fupra bafin exteriorem, affixæ in fance corollæ. Capf. bipartibilis, in duas partes diffepiniento parallelo, latere inferiore dehifcens Sen. plurima, compreffa, marginata, oblonga."

Dr Wright at firf found this tree of a Emall fize; fince which he difcovered it 50 feet high, and of a proportional height.

The bark from the larger trunk is very fibrous and

124 ] J E S
woody; that from the limbs and roots, when dry, breaks Thort olf, and powders eafier than the Peruvian bark. The Jefuits bark of Jamaica is one of the molt agreeable bitters; and infuled in wine or fpirits with a little lemon-peel, makes a rich and elegant tincture.

In the north fide of Jamaica, where this bark is produced in the greatelt perfection, it is held in high efteem, and andwers every purpofe of the Jefuits bark. It fits eafy on the fomach, and never uccanons vamiting nor naufea, but checks them in remitting fee vers, or where the ftomach is weak or difordered.
3. Cinchona Triflora: "Foliis oppolitis, ovatis, a. cutis, integerrimis, petiolatis; Floribus cribus, axillaribus."
'Ihe leaves are like the Cim, The nowers three in number from the axillx of the leaves, and of a fine red culour. The laciniæ are reflected. The feed-veffels are larger than any of the other fpecies we have yet feen.

Mr Roberts difcevered this bark tree about the year 1781 , but found it no where elfe than in that dittrict of Jamaica called Mancbioncel. It grows by the lide of a fmall rapid river near the Bath, and is about 35 feet ligh, but not thick in froportion

Towards the bottom of the trunk the bar's is rough and furrowed; but higher up it is fmooth, and has much sie appearance of the Peruvian hark. It is thinncr, more fibous, and redder, than either the Peruvian or the Jamaica bark already mentioned. When powdered, it is of a cinnamon colour, inclining more to red. The talte is multy, bitter, and aftringent. It yields its qualities either intufed in wine or fpirits, but with fome difficulty to cold infution by water.

Trials have been made with this bark in the cure of fevers, and in feveral with fuccefs. But few people could bear more than 20 grains, and even that quantity fometimes occafioned fo diftrefliug a ficknefs and naufea that its exhibition has been in gemeral left off.
4. Cinchona Floribunda, (Phil. Tranl. vol. Ixxiv. tab. 19. page 452.), St Lucia-Bakk Tree. "Cinchona foribus panniculatis, glabris; laciniis linearibus, tubo longioribus; flaminis exfertis; foliis ellipticis, glabris."

The [pecimen of this bark we have examined was externally finooth; it was thin, and very fibrous. Its tafte was a molt naufeous bitter, that lafted long in the mouth; its altringent quality was more than the Pe ruvian bark.

This bark is violently emetic when frefh; but on long keeping, it lofes this quality in part only, as no. more than 20 grains can be ventured on, and its repetition at feveral hours diftance.

Intermitting and remitting fevers have been cured by this bark, after refilting the ufe of the Peruvian bark. But it is probable that in thofe cafes the cure was effected more from its emetic powers than by its tonic virtues. At prefent, however, it has gone into difufe, except perhaps in the inands where it grows, or where the Peruvian bark has either failed, or cannot ealily be got to hand.
5. Cinchona Brachicarpa: "Foliis ellipticis, rigidis, obtufis, glabris; Floribus panniculatis, glabris; Capfulis ovatis, coltatis.

Mr John Lindfay furgeon, Weftmoreland, Jamaica, an expert and diligent botanit, difcovered this fpecies about

## J E S

dips about the year 1785 . It grew on the fide of a fteep hill or eminence running from eaft to weit, and the tree was only about eight or ten feet high.

The leaves in a recent fate were oval, fhining, and rigid; the fprig dries with great difficulty, and turns to a rulty brown. The fpike has many wlate fowers, firm 1 r in figure to thofe of the St Lucia bark tree. The feed-veffels are larger than thofe of the Peruvian. The feeds are fmall and fcaly. The trunks of this fmall tree are much furrowed; the cuticle very thick; the bark farther up, fmooth and brown ; that of the intide is of the colour of the Peruvian bark, but more fibrous. It lias no aroma; and is lefs bitter, but more sftringent, than the cinchona officinalis.

Mr Lindfay bas made trial of this bark in the cure of intermitring and remiting fevers with fuccefs. He finds that the Aomach will bear 25 or 30 grains very well. He has ufed it alfo in tincture and decoction, in various caftes of dyfpeplia, with advantage. On the whole, were this bark to be had in fufficient quartity, it pronifes to be an ufeful fuccedancum to the Peruvian bark.

6 Cinchona Angustifola: "Floribus panniculatis glabris; Caßfulis oblongis pentagonis ; Foliis linearibus lanceolatis." (Vide Aa. Stockhohn, vol.viii. 1787 , P. 117. Tab. 3.)
7. Cinchona Montana. This fpecies, which is a native of Guadaloupe and Martinico, was firft defcribed by M. Mallet, in the Fournal de Pbysique for March 1781, under the name of 2 uinquina Piton; and is faid to have been employed by the author with the happieft effects, in intermittent fevers, even after the Peruvian baik had failed. - It has fince been fcientifically defcribed, and a figure of it given, by M. Badier in the Fournal de Pbyrique, Feb. ${ }^{1789}$, under the name of "Ciucbona MIontona, foliis ovatis utrinque glabris, ftipulis bafi connato-vaginantibus, corymbo terminali, corollis glabris." It is defcribed as a very beautiful tree, growing more than 40 feet high, and having a large regular head of branches with a thick fotiage. The bark, when the epidermis is removed, is of a grey-brown colour, and its tafte very bitter. It would feem to contain no refin, all its extract being foluble in water. It is however reprefented as a very quick and powerful febrifuge, as we have already noticed; at the fame time that it poffeffes an emetic and cathartic property. To thefe poffibly its effect on fever may be in part owing; though whether its evacuating qualities will admit of its ever becoming a good fubfitute for the officinalis, or whether it poffeffes any tonic power, remains yet to be determined.
8. Cinchona Sfinosa; thus defcribed in the four. nal de Pbyfque for October 1790: "Foliis minimis fubrotundis, pedunculis uniforis, corollis glabris quadrifidis tetrandris, feminibus fubemarginatis." It is a native of St Domingo. The flowers are like thofe of the Caribxa, but fmaller by a half. It is but a fhrubby plant, not exceeding eight or ten feet in height. The leaves are fmall and very glabrous, and the branches terminated by a fpine. The peculiar properties of this bark, or its comparative efficacy as a medicine, have not yet heen afcertained.

9, 10. In the Manuel des Vegetaux by M. de St Germain, we find two fpecics mentioned under the names
of Cinchona Antillana and Cinchona Herbacea; but as no defcriptions are added, we can fay nothing concerning them.
if. A bark under the name of Angustura Bark has lately been introduced into practice as a fubftitute for the Peruvian bark. See London Medical Journal, vol. x. page 15t.

This bark is of much the fame colour and thicknefs as the canelld aromatica, and powders very freely It has a good deal of the aromatic talte j jined to bitternefs and altringency; and has been fuppofed a true fpecies of cinchona, different from the Hanca or white fort mentioned by Mr William A rrot in Phil Tranf. vol. xl. n ${ }^{2} 446 . \mathrm{Mr}$ Eruce, however, is faid to have pronounced it to be the bark of the Brucea antidyfenterica; to which indeed the refemblance is very confiderable in its effects.

The Angultura bark was fuppofed at firit to be the production of a tree growing on the coalt of Africa; but is now found to come from the Spanifh Main. According to Experinerents and Oifervations on the Anruffura bark, by Auguftus Everard Brande, juft publifhed, it is faid to excel the Peruvian bark in fome of its properties, and in other difeafes to have different qualitics. It is a powerful bitter, joined with an aroma not more pungent than the cafcarilla, having a portion of pure oil which approaches in its nature to. camphor. It differs from the Peruvian bark, by poffeffing a narcotic principle; and feems more powerful than it both as a tonic and an antifeptic. Varions experiments on the antifeptic power of different fubltances are related, in which the columbs feems the lealt efficacious, and the Angu!lura bark to elaim the higheft. rank. The following is given as the beft mode of preparing the extract.
"Thequantity of extract obtained by the following method is fomewhat lefs than by boiling, but it appears altogether the beft. Four ounces of powdered Anguftura hark were put into a flannel bag of a conical flape: a fufficiency of boiling water was then poured upon it, and this repeated till the filtering liquor had but little taife or colour. On evaporation by a gentle heat, there remained 13 drams and one fcruple of an estract, poffeffing the full flavour of the bark, and which contained two drams of refinous matter."

Half a pound of bruifed Angufura bark was put into a flill with a gallon of water, and two quarts crawn off. This dillilled water has a very fingular flavour, perhaps fomething like ftrong parfey water. A uhite effential oil fiwam on the furface, but in too fmall a quantity for feparation or afcertaining its weidht. This poffefies the full fmell of the bark, and is acrid to the tafte, leaving a glow in the mouth like camphire. From fix pounds of this bark, it is faid, only two fcruples of eftential oil have heen ohtained by diflillation.--The tincture feems alfo an ufeful preparation, but the refin in its pure flate appears acrid and ftimulating.

In Mr Brande's practice this bark feems to have excelled the Peruvian in curing intermittents: Dr Pearfon, however, found that it was fcarcely fuperior in any infance, snd fometimes not equal ; but in low fevers, and putrid fevers, it feemed fuperior. In the headach, attended with fever, but arifing from the ftomach, Mr Brande found it ufeful; and in dyfentery and dyfpeplia it has been of great fervice.

JESUS the Son of Strach, a native of Jerufalem, com.

## Jefuits

Bark,

Jefus
Chrift.
compofed, about 200 B. C. the book of Ecclefafticus, called by the Greeks Mavagico, "replenifhed with virtue ;" who alfo quote it under the title of the Wiflum of Solomon the fon of Sirach. His grandfon, who was alfo of the fame name, and a native of Jerufalem, tranflated it from the Hebrew into Greek about 121 B. C. We have this Greek verfion, but the Hebrew text is loit.

Jesus Christ, the Son of God, and Saviour of mankind, defcended from heaven, and tonk upon him the human nature in Judea, towards the conclufion of the reign of Herod the Great, king of that country. The place of his birth was Bethlchem, a flourihing city of Judah; but the year in which he was born is not precifely afuert ined. The mot general opinion is, that it happened anout the year of Rome $7+8$ or 749, and about 18 months before the death of Herod. Four infpired whiters have tranfmitted to us an account of the life of Jefus Chrif. They mention particularly his birth, lineare, family, and parents; but fay very little conceming his infancy and carlier yourh. Herod being informed that the Meffiah, or king of the Jews, fo much fpoken of by the prophets, was now born, being afraid that his kingdom fhould now be taken away, contrived how to deflroy his fuppofed rival : but Chrilt, being carried, while very young, into $E_{g y p t}$ efcaped the cruelty of the tyrant ; who, being determined to make fure work, made a general maffacre of the infints about Bethlehem, from the age of twn $\}$ eals and under.

Aftei the death of Herod, our Saviour was brought back to Judxa; but we are totally ignorant of what his employment was during the interval between his return thither and the time of his entering upon the minillry. We know only, that when he was but 12 years of age, he difputed in the temple with the molt lamed of the Jewith doctors; whom he furprifed with his knowledge, and the anfwers he gave to their quettions. After thin, as the feripture tells us, he continued with his parents, and was fubject to them, till he entered upin his minilty. It is faid, indeed, though upon no fure foundation, that during this perind he followed the trade of his father, who was a carpenter. In the 30 th year of his age, he began his public minitty; to which the attention of the people was drawn by the preaching of John, a prophet miraculoully infpired of God to proclaim the exittence of the Saviour, as now defcended upon earth, and vifible to the eyes of all; and by this prophet Chritt himfelf was baptized in the waters of Jordan, that he might not, in any point, neglect to anfwer the demands of the Jewith law.

It is not neceflary here to enter into a particular detail of the life and aftions of Jefus Chrift. Every one knows, that his life was one continued feene of the moll perfect fanctity, and the pureft and molt active virtue; not only withont fpot, but alfo beyond the reach of fufpicion. And it is alfo well known, that by miracles of the mofl Aupendons kind, and not more tupendous than falutary and beneficent, he difplayed to the univerfe the truth of that religion which he brought with him from above, and demonftrated the reality of his divine commiffion in the mot illuftrious manner. For the propagation of his religion shrough the country of Judæa, our Saviour chofe Iz
apoitles; whom, however, he fent out only once, and after their return kept them conftantly about his perfon. But, befides thefe, he chofe other 70 , whom he difperfed throughout the country.

There have been many conjectures concerning the reafon why the number of apotles was fixed at 12, and that of the other teachers at 70 . The firit, however, was, according to our Saviour's own words (Matt. xix. 28.), an allufion to the 12 tribes of I rrael, thereby intimating that he was the king of the fe 12 tribes; and as the number of his other meffengers anfwers evidently to that of the fenators who compofed the Sanhedrim, there is a high degree of probability in the conjecture of thofe who think that Chritt by this number defigned to admonith the Jews, that the authority of their Sanhedrim was now at an end, and that all power with refpect to religious matters was velted in him alone. His miniftry, however, was confined to the Jews; nor, while he remained upon earth, did he permit his apottles or difciples to extend their labours beyond this favoured nation. At the fame time, if we confider the illuftrious aets of mercy and benevolence that were performed by Chrit, it will be natural to conclude, that his fame muft foon have fpread abroad in other countries. Indeed this feems probable from a paffage in fcripture, where we are told that fume Greeks applied to the apottle Philip in order to fee Jefus. We learn alfo from authors of no fmall note, that Abgarus $\dagger$ king of Edeffa, heing feized + See with a fevere and dangerous illnefs, wrote to our Lord, garu. imploring kis affiftance; and that Jefus not only fent him a gracious anfwer, but alfo accompanied it with his picture, as a mark of his efleen for that pious prince. Thefe letters are till extant ; but by the judicious part of mankind are univerfally looked upon as fpurious; and indeed the late Mr Jones, in his treatife entitled $A$ neru and full meihod of fetting the canonical autbority of the Nezu Tefantint, hath offered reafons which feem almoft unanfwerable again』 the authenticity of the whole tranfaction.

The preaching of our Saviour, and the numberlefs miracles he performed, made fuch an impreffion on the body of the Jewifn nation, that the chief priefts and leading men, jealous of his authority, and provoked at his reproaching them with their wicked lives, formed a confpiracy againft him. For a confiderable time their defigns proved abortive ; but at laft Jefus, knowing that tie had fulfilled every purpofe for which he came into the world, fuffered himfelf to be taken through the treachery of one of his difciples, named Fudas Ifcariot, and was brought before the Sanhedrim. In this afiembly he was accufed of blafphemy; and being afterwards hrought before Pilate the Roman governor, where he was accufed of fedition, Pilate was no fooncr fat down to judge in this caufe, than he received a mefface from his wife, defiring him to have nothing to do with the affair, having that very day had a frightful dream on account of our Saviour, whom the called that juft man. The governor, intimidated by this neffage, and till more by the majelty of our Saviour himfelf, and the evident falfehood of the aecufations brought againft him, was determined if poffible to fave him. But the clamours of an en. raged populace, who at laft threatened to accufe Pilate himfelf as a traitor to the Roman emperor, got
the better of his love of juftice，which indeed on other oceafions was not very fervent．

Our Saviour was now condemned by his judge， though contrary to the plainett dictates of reafon and juftice；was ex：cuted on a crofs between two thieves， and very foon expired．Having continued three days， in a tate of d －ath，he rofe from the dead，and made himfelf vifible to his difciples as formerly．He con－ verfed with them 40 days after his refurrection，and employed himfelf during that time in inftructing them more fully concerning the nature of his kingdom ； and having manifetted the certainty of his refurrec－ tion to as many witneffes as he thought proper，he was．in the prefence of many of his difciples，taken up into heaven，there to remain till the end of the world．Sec Christianity．

JET＇，a black inflammable fubflance of the bitumin－ ous kind，harder than afphatum，and fufceptible of a goud polifh．It becomes electrical by rubbing，attracting lignt badies like yellow amber．It fwins on water， So that its fpecific gravity muth be lefs than 1000； notwithflanding which it has been frequently con－ founded with the lapis olfidianus，the fpecific gravity of which．according to Kiirwan，is no lefs than 1744. It alion refembles cannel coal extremely in its hardnefs， receiving a polifh，not foiling the fingers，\＆c．fo that it has alfo been confounded with this．The diftinction， however，is eafily made beiwixt the two ；for cannd－ coal wants the electrical propertics of jet，and is like－ wife fo heavy as to link in water；its feceific gravity being no lefs than 1273 ；whereas that of jet，as has already been faid，is lets than 1000 ．

Mi．Magellan is of opiniun that jit is a true amber， differing from the yellow kind only in the mere eir－ cumilance of colour，and being lighter on acconnt of the greater quantity of bituminous matter which enters into its compofition．When burning it emits a bituminue folly．It is never found in ferata or continued maffes like foffil ftones；but always in fe－ parate and unconnected heaps like the true amber． Great quantities of it have been dug up in the Pyrenæan mountains；alfo near Batalka，a fmall town of Portugal：and in Galicia in Spain．It is foun 1 alfo in Ireland，Sweden，Pruffia，Germany，and Italy．It is ufed in making fmall buxes，buttons，bracelets， muurning jewels，\＆c．Sometimes alfo it is employed in conjunction with proper oils in making varnifhes． When mixed with lime in powder，it is，faid to make an extraordinary hard and durable cement．
$\mathcal{Y}_{E T \cdot d} d^{\prime} E a u$ ，a French term，frequently alfo ufed with us，for a fountain that cafts up water to a con－ fiderable height in the air．See Hydrostatics， $n^{\circ} 27 \cdot$ ；and Iceland，$n^{\circ} 3 \cdot 4$ ．

JE I＇TY－head，a name ufually given in the royal dock－ yards to that part of a wharf which projects beyond the reft；but more particularly the front of a wharf，whefe fide forms one of the cheeks of a dry or wet dock．

JEWEL，any precious flone，or ornament befet with them．See Diamond，Ruby，\＆c．

Jewels made a part of the ornaments with which the Jews，Greeks and Romans，efpecially their ladies of diftinction，adorned themfelves．Su prodigious was the extravagance of the Roman ladies，in particular， that Piiny the elder fays he faw I．ollio Paulina with an equ：page of this kind amounting，according to Dr

Arbuthnot＇s calculation，to $322,9 \mathrm{t} 61.13$ s． 4 d．of ourr money．It is worthy of obfervation，that precious ftones amonglt the Romans and all the ancients were much fearcer，and confequently in highcr efteem than they are amongl us，fince a commerce has been opened with the Indies．－The ancients did not know how to cut and polifh them to much perfection；bu．coloured ftones were not fcarce，and they cut them very well either hollow or in relief．－When luxury had gained ground amongit them，the Romans hung pendants and pearls in their ears ；and for this purpofe the ear；of both fexes were frequently bored．See Ears．

Jモwとl（John），a learned Englifh writer and bifhop， was born in 1522，and educated at Oxford．In1；40 he proceeded A．B．became a noted tutor，and was foon after chofen rhetoric lecturer in his college．In February 1544，he commenced A．M．He had early imbibed Protellant principles，and inculcated the fame to his pupils；but this was carried on privately till the acceffion of King Edward VI．in 1546 ，when he made a public declaration of his faith，and entered into a clofe friendithip with Peter Martyr，who was made profeffor of divinity at Oxford．In 1550，he took the degree of B．D．and frequently preached be－ fore the univerfity with great applaufe．At the fame time he preached and catechifed every other Sunday at Sunningwell in Berk月lize，of which church be was rectur．Upon the acceffion of Qiecn Mary to the crown in 1553，he was one of the trit wha felt the rage of the ftorm then raifed againt the reformation； for before any law was made，or order given by the queen，he was expelled Corpus Chiiti college by the fellows，by their own private authority；but he con－ tinued in Oxford till he was called upon to fubferibe to fome of the Pupilh dactrines，under the fevereft pe－ nalties，which he fubmitted to．However，this did not procure his fafety；for he was obliged to fly，and， after encountering many difficulties，arrived at Fanck． fort，in the 2d year of Quteen Mary＇s reign．Whete he made a public recantation of his fubicription to the Popilh doctrines．Thence he went to Siraburg，and aftenwards to Zurich，where he attended Pater Mar－ tyr，in whofe houfe he refided．He returned to Eng－ land in＇558，after Queen Mary＇s death；and in 1559， was confecrated bilhop of Saliftury．This prometion was given him as a reward for his great merit and learning；and another atteftation of thefe was given him thy the univerfity of Oxfond．who，in $1 ; 65$, con－ ferred os him in his ablence the degree of D．D．In this character he attended the queen to Ox＇ord the following year，and prefided at the divinty difpura－ tions held before her majelly on that occafion．He had before greatly diftinguifhed himfelf by a fermon preached at St Iaul＇s．crofs，pretently after he was made a bimp，wherein he rave a public cha！lenge to all the Ruman cathulics in the world，to produce but one clear and evident teftimony out of any father or fanous writer，who flourifined within 600 years after Chirt，for any one of the articles which the Roma－ nilts maintain againft the church of England；and， two years afterwardi，he publifhed his famous apology for this church．In the mean tine，he gave a parti－ cular attention to his dincefe；where he began in nis firft vifitation，and perfected in his lalt，fuch a refur－ mation，not only in his cathedral and pa ochias
churches, but in all the churches of his jurifdiction, as procured him and the whale order of bifoops due reverence and efteem. For he was a careful overlooker and thict obferver, not only of all the flocks, but alfo of the pallors, in his diocefe: and he watched fo narrowly upon the proceedings of his clancellor aud archdeacons, and of his ftewards and receivers, that they had no oportunities of being guilty of oppreftion, injuftice, or extortion, nor of being a burden to the people, or a fcandal to himelf. To prevent thefe and the like abufes, for which the ecclefialtical courts are often too jultly cenfired, he fat often in his confittorycourt, and faw that all things were catried rightly there: he alfo fat often as affitlant on the bench of civil juftice, being limfelf a jultice of the peace. A midft thefe employments, however, the care of his health was too much neglected; to which, indeed, his general courfe of life was totally unfavourable. He rofe at four o'eluck in the morning; and, after prayers with his family at five, and in the cathedral about fix, he was fo fixed to his ftudies all the morning, that he could not without great violence be drawn from them. After dinner, his doors and eals were open to all fuitors; and it was whferved of him, as of Titus, that he never fent any fad from him. Suitors being thus difmiffed, he heard, with great impartiality and patience, fuch caufes debated before him, as cither devolved to him as a judge, or were referred to him as an arbitrator; and if he could fpare any time from thefe, he reckoned it as clear gain to his itudy. About nine at night he called all his fervants to an account how they had fpent the day, and he went to prayors with them. From the chapel he withdrew again to his ftudy till near midnight, and from thence to his bed; in which when lie was laid, the gentleman of his $b: d$ chamber read to him till he fell afleep. This watchful and laborious life, without any recreation at all, except what his neceflary refrefhment at meals and a very few hours of reft afforded him, wafted his life too fall. He died at Monkton- Farley, in 1571 , in the 50 th year of his age. He wrote, 1. A view of a feditious bull fent into England by Pope Pius V. in 156g. 2. A treatife on the Holy Scriptures. 3. An expofition of St Paul's two tpittes to the Theffalonians. 4. A treatife on the facrament. 5. An apology for the national church. 6. Several fermons, controverfial treatifes, and other works.
"This excellent prelate (fays the Rev. Mr Granger) was one of the greatell champions of the reformed religion, as he was to the church of England what Bellarmine was to that of Rome. His admirable Apology was tranflated from the Latin by Anne, the fecond of the four learned daughters of Sir Anthony Coke, and mother of Sir Francis Bacon. It was publifhed, at it came from her pen, in $55^{6} 4$, with the approbation of the queen and the prelates. The fame Apology was printed in Greck at Contantinople, under the direction of St Cyril the patriarch. His Defence of his Apology, againft 1 larding and other Popifh divines, was in fuch clteem, that Queen Elizabuth, King James I. King Charles 1. an fuur fucceflive archbifhops, ordered it to be kept chained in all parifhchurches for public ufe.

FeUfL-Blocks, in the fea-language, a name given to two fmall blocks which are fufpended at the extre$\mathbb{N}^{2} 164$.
mity of the main and fore top.fail yards, by means of an eye-bolt driven from without into the middle of the yard-arm, parallel to its axis. The ufe of thele blocks is, to retain the upper-part of the top-maft ftudding-fails beyond the foirts of she top-fails, fo that each of thofe fails may hase its full furce of action, which would be diminifled by the encroachment of the other over its furface. The baliards, by which thofe fudding fails are hoilted, are accordingly pafied throngh the jewel-blocks; whence, communicating with a block on the top-maft head, they lead downwards to the top or decks, where they may be conve. niently hoifted. See Sall.

JEWS, a name derived from the patriarch Judah, and given to the defeendants of Abraham by his cldelt fon Ifaac, who for a long time pofleffed the land of Palelline in Affa, and are now difperfed throngh all nations in the vorld.

The hittory of this people, as it is the moft fingular, fo is it alfu the mof ancient in the world; and the greatet part being before the beginning of profane liftory, depends entirely on the authenticity of the Old Teltament, where it is only to be found.-To repeat here what is laid in the facred writings would both be fuperfluous and tedious, as thofe writings are in every perfuns hands, and may be confulted at pleafure. It feems moll proper therefore to commence the hifory of the Jews from their return to Jerufalem from l3abylon, and the rebuilding of their city and temple under Ezra and Nehennah, when the feripture leaves off any farther accounts, and profane hiftorians begin to take notice of them. We fhall, however, premife a chronological lift of their judges and kings down to the captivity.

The Ifraelites had no king of their nation till Saul. Before him, they were governed, at firt by elders, a: in Egypt ; then by princes of God's appointment, as Mofes and Jothua; then by judges, fuch as Othnicl, Ehud, Shamgar, Gideon, Jephthah, Samfon, Eili, Samuel; and laft of all by kings, as Saul, David, So. lomon, Rehoboam, \&c.

A lif of the Judges of Ifrael in a chronological order. The numbers prefixed denote the years of the world.
2570. The death of Jofhua.

2585 . The government of the elders for about 15 years.
2592. An anarchy of about feven years. The hittory of Micah, the conquelt of the city of Laifh, by part of the tribe of Dan, and the war undertaken by the 11 tribes againt Benjamin, are all referred to this time.
2591. The firlt fervitude under Cuhan rifhathaim king of Mefopotamia, began in 259t, and latted eight years to 2599 -
2599. Othniel delivered 1 frael in the soth year after peace eftablifhed in the land by Jumua.
2662. A peace of about 62 years, from the deliverance procured by Othnicl, in 2599 , to 2662 , when the fecond fervitude under Eglon king of the Moabites happened. It latted is years.
2679. Ehud delivers Ifrael.

After him Shamgar governed, and the land was in peace till the soth year after the fird deliverance procured by Othniel.
2699.
2699. The third fervitude under the Canaanites, which lafted 20 years, from 2699 to 2719.
2719. Deborah and Barak deliver the Ifraelites: from the deliverance procured by Ehud to the end of Diborah and Barak's government, were 40 years.
8768. Abimelech the natural fon of Gideon is acknowledged king by the Shechemites.
2771. Fe died at the fiege of Theber in Faleftine.
2772. Tola after Abimelech governs for 23 years, from 2772 to 2795.
2795. Jair fucceeds Tola, and governs 22 years, from 2795 to 2816.
2799. The fifth fervitude under the Philitines, which latted 18 years, from 2799 to 2817.
2817 . The death of Jair.
2817. Jephthah is chofen head of the Ifraelites beyond Jordan, he defeated the Ammonites, who opprefied them. Jephthah governed fix years, from 2817 to 2823 .
2823 . The death of Jephthah.
28:0. Ibzan governs feven years, from 2823 to 2830.
28i4. Elun fucceeds Ibzan. He governs from 2830 to 2840.
Abdon judges Ifracl eight years, from 28,40 to 28q8.
$28_{4} 8$. The fixth fervitude, under the Philillines, which lafted 40 years, from $28+8$ to 2888 .
$28+8$. Eli the high pritt, of the race of Ithamar, governed to years, the whole time of the fervitude under the Philiftines.
2849. The birth of Samfon.
2887. The death of Samfon, who was judge of Ifrael during the judicature of Eli the high-prieft.
2888. The death of Eli, and beginning of Samuel's government, who fucceeded him.
2909. The election and anointing of Saul, fuft king of the Hebrews.

## A chronological lift of the kings of the Hetrewes.

Saul, the firt king of the lfraclites, reigned 40 years, from the year of the world 2909 to 2949.

Ihbotheth the fon of Saul fucceeded him, and reigned fix or feven years over part of Ifrael, from 2949 to 2956.

David was anointed king by Samuel in the year of the wotld 2934, but did not enjoy the regal power till the death of Saul in 2949, and was not acknowledged king of all Ifrael till after the death of Ifhbofheth in 2956. He ditd in 2990 at the age of 70.

Solomon his fon fucceeded hins; he received the royal unction in the year 2989 . He reigned alone after the death of David in 2990. He died in 3029 , after a reign of 40 years.

After his death, the kingdom was divided; and the ten tribes having chofen Jerobeam for their king, Rehoboam, the fon of Solomon, reigned only over the tribes of Judah and Berijamin.

The Kiugs of Judah.
Rehobnam, the fon and fucceffor of Solomon, reigned 17 years; from the year 3020 to 3046 .

Abijam, three years, from 3046 to 3049 .
Afa. 41 years, from 3049 to 3090 .
Jelionhaphat, 25 years, from 3090 to 3115 .
Jehoram, four years, from 3115 to 2119. Vol. IX. Part I.

Ahaziah, one year, from 3119 to 3120.
Athaliah, his mother, reigned fix years, from $3120 \underbrace{\text { Jews }}$ to 3126.

Joalk was fet upon the throne by Jehoiada the high-prieft, in 3126 . He reigned 40 years, to the yoar 3155.

Amaziah, 29 years, from 3165 to 3194 .
Uzziah, otherwife called Azariab, reigned 27 years, to the year 322 I . Then attempting to offer incenfe in the temple, he was ftruck with a leprofy, and obliged to quit the government. He lived after this 26 years, and died in $32+6$.

Jotham his fon took upon him the government in the year of the world 3221 . He reigned alone in $3^{2} 46$, and died in 32 Gz .

Ahaz fucceeded Jotham in the year of the world 3262. He reigned 16 years, to 3278 .

Hezekiah, 28 years, from 3278 to 3305.
Manaffeh, 55 years, from the year of the world, 3306 to 3361.

Amon, 2 years, from 3361 to 3363.
Jofiah, 31 years, from $33 \sigma_{3}$ to 3394 .
Jehoahaz, three months.
Eliakim, or Jehoiakim, II years, from the year 3394 to 3405 .

Jehoiachin, or Jechoniah, reigned three months and ten days, in the year 3405 .

Mattaniah, or Zedekiah, reigned 11 years, from 3405 to 3416 . In the laft year of his reign Jerufalam was taken, the temple burnt, and Judah carried into captivity, beyond the Euphrates.

Kings of Ifrael.
Jeroboam reigned 22 years, from 3029 to 305 t.
Nadab, one year. He died in 3051.
Baafha, 22 years, from 3052 to 3074.
Elah, two years. He died in 3075 .
Zimri, feven days.
Omi, 11 years, from 3075 to 3086. He had a competitor Tibni who fucceeded, and died in what year we know not.

Aliab, 21 years, from 3086 to 3107.
A haziah, two years, from 3 to6 to 3108.
Jehoram, the fon of Ahab, furceeded him in 3 ros. He reigned 12 years, and died in 3120 .

Jehu ufurped the kingdom in 3120 , reigned 28 years, and died in 3148 .

Jehoahaz reigned 17 years, from 3148 to 3165.
Joall reigned 14 yeats, from 3165 to 3179.
Jeroboam II. reigned +1 years, from 3179 to 3220 .
Zachariah, 12 years, from 3220 to 3232 .
Shallum, reigned a month. He was killed in $3233^{\circ}$
Menahem, 10 years, from $3^{2} 33$ to $3^{2}+3$.
Pekahiah, two years, from $3^{2}+3$ to $3^{2} 45$.
Pekah, 20 gears, from 3245 to 3265 .
Hohlea, 18 years, from 3265 to 3283 . Here the kingdom of Ifrael liad an end after a duation of 253 years.

Cyrus the Great, king of Perfia, having conquered Cyrus pub* Babylon and almoft all the weftern parts of Afia, per- lifhes a deceiving the defolate and ruinous condition in which creefor rethe province of Paleftine lay, formed a defign of re- building, floring the Jews to their native country, and permitting them to rebuild Jerufalem and re-eftablifh their wornhip. For this purpofe he iffued out a decree in the firtt year of his reign, about $53 \dot{\alpha}$ B. C. by which they

## J E W [ 130 ] J E W

Jews. were allowed not only to return and rebuild their city, the Perfians, infomuch that they had almot drawn but to carry along with them all the facred veffels which Nebuchadnezzar had carried off, and engaged to defray the expence of building the temple himfelf. This offer was gladly embraced by the more zealous Jews of the tribes of Judah, Benjamin, and Levi; but many more, being no doubt lefs fanguine about their religion chofe to flay where they were.

In 534 B . C. the foundations of the temple were laid, and matters feemed to go on profperoully, when the undertaking was fuddenly obftructed by the Samaritans. Theefe came at firt expreffing an earneft defire to affilt in the work, as they worthipped the fame God with the Jews; but the latter refufed their affiftance, as they knew they were not true Ifraelites, but the defcendants of thofe heathens who had been tranfplanted into the country of the ten tribes after their captivity by Shalmanezer. This refufal proved the fource of all that bitter enmity which afterwards took place between the Jews and Samaritans; and the immediate confequence was, that the latter made all the oppofition in their power to the going on of the work. At laft, however, all obflacles were fur- mounted, and the temple finifhed as related in the books of Ezra and Nehemiah. The laft of thefe chiefs died about 409 B. C. after having reltored the Jewifh worfhip to its nriginal purity, and reformed a number of abufes which took place immediately on its commencement.

But though the Jews were now reflored to the free exercife of religion, they were neither a free nor a powerful people as they had formerly been. They
upon themfelves the difplealure of Alexander the Great. That monarch having refolved upon the liege of Tyre, and being informed that the city was wholly fupplied with provifions from Judea, Samaria, and Galilee, fent to Jaddua, then high-prieft, to demand of him that fupply which he had been accuftomed to pay to the Perlians. The Jewith pontiff excufed himfelf on account of his oath of fidelity to Darius; which fo pro. voked Alexander, that he had no fooner completed the reduction of Tyre than he marched againf Jerufalem. The inhabitants then, being with good reafon thrown into the utmoft confernation, had recourfe to prayers; and Jaddua is faid, by a divine revelation, to have been commanded to go and meet Alexander. He obeyed accordingly, and fet out on his journey, deffed in his pontifical robes, at the of head of all his priefts in their proper liabits, and at- prie tended by the ref of the people dreffed in white gar-Ale ments. Alexander is faid to have been feized with the fuch awful refpect on feeing this venerable proceffion, that be embraced the high-prief, and paid a kind of religious adoration to the name of God engraven on the front of his mitre. His followers being furprifed at this unexpected behaviour, the Macedonian monarch informed them, that he paid that refpect not to the prieft, but to his God, as an acknowledgment for a vifion which he had been favoured with at Dia; where he had been promifed the conquefl of Perfia, and encouraged in his expedition hy a perfon of much the fame afpect and dreffed in the fame habit with the pontiff before him. He afterwards accompanied Jaddua into Jerufalem, where he offered facrifices in the temple. The high-prieft fhowed him alfo the prophecies of Daniel, wherein the deftruction of the Perfian empire by himfelf is plainly fet forth; in confequence of which the king went away highly fatisfied, and at his departure afked the high-prief if there was nothing in which he could gratify limfelf or his people. Jaddua then told him, that, aceording to the Mofaic law, they neither fowed nor ploughed on the feventh year ; therefore would clteem it an high favour if the king would be pleafed to remit their tribute in that year. To this requeft the king readily yielded; and having confirmed them in the enjoyment of all their privileges, particularly that of living under their own laws, he departed.

Whether this ftory deferves credit or not (for the whole tranfaction is not without reafon called in queAtion by fome), it is certain that the Jews were much favoured by Alexander; but with him their good fortune feemed alfo to expire. The country of Judea being fituated between Syria and Egypt, became fub- Mi ject to all the revolutions and wars which the ambi- fat tious fucceffors of Alexander waged againft each other. Jew At firt it was given, together with Syria and Phe- Ale dea nicia, to Leomedon the Mitylenian, one of Alexander's ${ }^{\text {d }}$ generals; but he being foon after ftripped of the other two by Ptolemy, Judea was next fummoned to yield to the conqueror. The Jews fcrupled to break their oath of fidelity to Leomedon; and were of confequence invaded by Ptolemy at the head of a powerful army. The open councry was eafily reduced; but the city being itrongly fortified both by art and nature, threatened a flrong refiftance. A fupertitious

## J E W [ $1337 \quad$ J E WV

5. fear for breaking the fabbath, howcver, prevented the befieged from making any defince on that day; of which Ptolemy being informed, he caufed an affault to be made on the fabhath, and eafily carried the place. At firft he treated them with great feverity, and carried 100,000 men of thens into captivity ; but reflecting foon after on their known fidelity to their conquerers, he reftored them to all the privileges they had enjoyed under the Macedonians. Of the raptives he put fome into garrifons, and others he fettled in the countries of Libya and Cyrene. From thofe who fettled in the latter of thefe countries defcended the Cyrenean Jews mentioned by the writers of the New Teflament.

Five years after Ptolemy had fubdued Judea, he was forced to yield it to Antigonus, referving to himEelf only the cities of Ace, Samaria. Joppa, and Gaza; and carrying off an immenle boots. together with a great number of captives, whom he fettled at Alexan: dria, and endowed with conliderable privileges and im-munities.-Antigonus belaved in fuch a tyrannical manner, that great numbers of his Jewifl fubjects fled into Egypt, and otleers put themfelves under the prosection of Seleucus, who alfo granted them confiderable privileges. Hence this nation came gradually to be fpread over Syria and Afia Minor ; white Judea feenned to be in danger of being depopulated till it was recovered by Ptolemy in 292. The affairs of the Jews then took a more profperous turn, and continued in a thriving way till the reign of Ptolemy Philopator, when they were grievoufly oppreffed by the incurfions of the Samaritans, at the lame time that Antiochus Theos king of Syria invaded Galilee. Ptolemy, however, marched again't Antiochus, and defeated him; after which, having gone to Jerufalem to offer facrifices, he ventured to profane the temple itfelf by going into it. He penetrated through the two outer courts; but as he wwas about to enter the fanetuary, he was flruck with fuch dread and terror that he fell down half-dead. A dreadful perfecution was then raifed againft the Jews, who had attempted to hinder him in his impious attempt; but this perfecution was flopped by a fill more extraordinary accident related under the article Egypt, $\mathrm{n}^{\circ}$ 30. and the Jews again received into favour.

About the year 204 B. C. the country of Judea was ed by fubdued by Antiochus the Great ; and on this occ? eat. fion the loyalty of the Jews to the Egyptians failed them, the whole nation readily fubmitting to the king of Syria. This attachment fo pleafed the Syrian monarch, that he fent a letter to his general, wherein he acquainted him that he defigned to reftore Jerufalem to its ancient fplendor, and to recal all the Jews that had been driven out of it : that out of his fingular refpect to the temple of God, he granted them $: 0,000$ pieces of filver, towards the charges of the victims, frankincenfe, wine, and oil; 1400 meafures of fine wheat, and 375 meafures of falt, towards their ufual oblations: that the temple fhould be thoroughly repaired at his coft ; that they fhould enjoy the free exercife of their religion; and reflore the public fervice of the temple, and the prielts, Levites, fingers, \&c. to their ufual functions: that no ftranger, or Jew that was un--purified, fhould enter farther into the temple than was zllowed by their law; and that no fefh of unclean
beafts fhould be brought into Jerufalem ; not even their finins: and all thefe under the penalty of paying 3000 pieces of filver into the treafury of the temple. He further granted an exemption of taxes for three years to all the difperfed Jews that thould come within a limited time to fettle in the metropolis; and that all who had been fold for flaves within his donimions hould be immediately fet free.

This fudden profperity proved of no long duration. Dreadfu? About the year 176, a quarrel happered between conmos Onias at that time high priett, and one Simon, gover. tions. nor of the temple, which was attended with the mor fatal ennfequences. The caufes of this quarrel are unknowil. 'The event, however, was, that Simon finding he could not get the better of Onias, informed Apol. lonius governor of Ccelofyria and Paleftine, that there was at that time in the temple an immenfe treafure, which at his pleafure might be feized upon for the ufe of the king of Syria. Of this the governor inflantly fent intelligence to the king, who difpatched one Hehiodorus to take poffefion of the fuppofed treafure. This perfon, through a miraculous interpofition, as the Jews pretend, failed in his attempt of entering the temple; upon which Simon accufed the high-prieft to the people, as the perfon who had invited Heliodorus to Jerufalem. This produced a kind of civil war, is which many fell on both fides. At laft Onias having complained to the king, Simon was banifhed; but foon after, Antiochus Epiphanes having afcended the throne of Syria, Jafon, the high-prieft's brother, taking advantage of the neceffities of Antiochus, purchafed from him the high-priefthood at the price of 350 talents, and obtained an order that his brother fhould be fent to Antioch, there to be confined for life.

Jafon's next flep was to purchafe liberty, at the price of 150 talents more, to build a gymnafum at Jerufalem fimilar to thofe which were ufed in the Grecian cities; and to make as many Jews as he pleafed free citizens of Antioch. By means of thefe powers he became very foon able to form a flrong party in Judea; for his countrymen were exceedingly fond of the Grecian cultoms, and the freedom of the city of Antioch was a very valuable privilege. From this time therefore' a general apoftacy tork place; the fervice of the ${ }^{\text {A generas }}$ temple was neglected, and Jaion abandoned himfelf apates pace without remorfe to all the impieties and abfurdities of paganifm.

He did not, however, long enjoy his ill-acquired dig. nity. Having fent his brother Menelaws with the ufual tribute to Antiochus, the former took the opportunity of fupplanting Jafon in the fame manner that he had fupplanted Onias. Having offered for the highpriefthood 300 talents more than his brother had given, he ealily obtained it, and returned with his new commiffion to Jerufalem. He foon go: himfelf a frong party; but Jafon proving too powelful, forced Menelaus and his adherents to retire to Antioclı. Here, the better to gain their point, they acquainted Antiochus that they were determined to renounce their old religion, and wholly conform themfelves to that of the Greeks: which fo pleafed the tyrant, that he immediately gave them a force fufficient to drive Jafon out of Jerufalem; who thereupon took refuge among the Ammonites.

Menelaus being thus freed from his rival, took care At latt he was fummoned to Antioch; and finding nothing but the payment of the promifed fum would do, fent orders to his brother Ly finachus to convey to him as many of the facred utentils belonging to the temple as could be fpared. As thefe were ail of gold, the apolate foon raifed a fufficient fum from them, not only to fatisfy the king, but alfo to bribe the courtiers in his favour. But his brother Onias, who had been all this time confined at Antioch, getting intelligence of the facrilege, made fuch bitter complaints, that an infurrection was ready to take place among the Jews at Antioch. Menelaus, in order to avoid the impending danger, bribed Andronicus, governor of the city, to mirder Onias. This produced the moft vehement complaints as foon as Antiochus returned to the capital (he having teen abfent for fome time in order to quell an infurreetion in Cilicia); which at laft ended in the death of Andronicne, who was executed by the king's order. By dint of money, however, Menelaus fill found means to keep up his credit ; but was obliged to draw fuch large fums from Jerufalem, that the inhabitants at latt maffacred his brother Ly fimachus, whom he had left governor of the city in his abfence. Antiochus foon after took a journey to Tyre; upon which the Jews fent deputies to him, both to jultify the death of Lyfimachus, and to accufe Menelaus of being the author of all the troubles which had happened. The apoflate, however, was never at a lofs while the could procure money. By means of this powerful argument he pleaded his caufe fo effectually, that the deputies were not only caft, but put to death ; and this unjuft fentence gave the traitor fuch a complete via ory over all his enemies, that from thenceforth he commenced a downright tyrant. Jerufalem was deltitute of protektors; and the fanhedrim, if there were any zealous men left among them, were fo much terrified, that they durf not oppofe hin, though they evidently faw that his defign was finally to cradicate the religion and liberties of his country.

In the meantime, Antiochus was taken up with the conqueft of Egypt, and a report was fome how or other fpread that he had been killed at the fiege of Alexandria. At this news the Jews imprudently fhowed fome figns of joy; and Jafon thinking this a proper opporsunity to regain his loft dignity, appeared before Jerufalem at the head of about 1000 refolute men. The gates were quickly opened to him by fome of his friends in the city; upon which Menelans retired into the citadel, and Jafon, minding nothing but his refeutment, committed the moll horrid butcheries. At laft he was ol-liged to leave both the city and country, on the news that Antiochus was coming with a powerful army againft him; for that prince, highly provoked at this rebellion, and efpecially at the rejoicings the Jews had made on the report of his death, had actually refolved to punin the city in the fevereft manner. Accordingly, about t 70 B. C. having made himfelf mafler of the city, he behaved with fuch cruelty, that within three days they reckoned no fewer than 40,000 killed, and as many fold for flaves. In the midh of this dreadful calamity, the apoftate Menelaus found means not only to preferve himfelf from the general Maughter, but even to regain the good graces of the
king, who, having by his means plundered the temple of every thing valuable, returned to Antioch in a kind of triumph. Before he departed, however, he put Judea under the government of one Philip, a barbarous Phrygian ; Samaria under that. of Andronicus, a perfon of a fimilar difpofition ; and left Menelans, the moft hateful of all the three, in poffelion of the ligh-priefthood.

Though the Jews fuffered exceedingly under thefe His tyrannical governors, they were till referved for greaterliri calanities. About 163 B. C. Antiochus having been cru moft fevercly mortified by the Rumans, took it into his head to wreak his vengeance on the unhappy Jews. For this purpofe he difpatched Apollunius at the head of 22,000 men, with orders to plunder all the cities of Judea, to murder all the men, and fell the women and cliildren for flaves. Apollonius accordin.ly came with his army, and to outward appearance with a peaceable intention; neither was he fufpected by the Jews, as he was fuperintendaut of the tribute in Palettine. He kept himfelf inactive till the next fabbath, when they were all in a profonad quiet ; and then, on a fudden, commanded his inen to arms. Some of them he fent to the temple and fynag.ogues, with orders to cut in pieces all whom they found there; whilt the reft going through the flreets of the city maffacred all that came in their way; the fuperflitious Jews not attenipting to make the lealt refiftance for fear of breaking the fabbath. He next ordered the city to be plundered and fet on fire, pullet down all their flately buildinge, caufed the walls to be demolithed, and carried away captive about 10,000 of thofe who had efeaped the flaughter. From that time the feevice-of $\mathrm{Th}^{2}$ the temple was totally abandoned; that place having pro been quite polluted, both with the blood of multitudes anl who had been killed, and in various other ways. The Jey Syrian troops built a large fortrefs on an eminence in lijh the city of David; fortified it with a frong wall and flately towers, and put a garrifon in it to command the temple over-againt which it was built, fo that the foldiers could eafily fee and fally out upon all thofe who attempted to come into the temple; fo many of whom swere continually plundered and murdered by them, that the reft, not daring to flay any longer in Jerufatem, fled for refuge to the neighbouring nations.

Antiochus, nut yet fatiated with the blond of the Jews, refolved either totally to abolifh their religion, or deftroy their whole race. He therefore iffued out a decree that all nations within his dominions fhould forfake their old religion and gods, and worhip thofe of the king under the molt fevere penalties. To make his orders more effectual, he fent overfeers into every province to fee them Itrictly put in execution; and as he knew the Jews were the only people who would difobey them, fpecial directions were given to have them treated with the utmoft feverity. Athencas, an old and cruel miniter, well verfed in all the pagan, rites, was fent into Judea. He began by dedicating the temple to Jupiter Olympius, and fetting up his fatue on the altar of burnt-offerings. Another leffier altar was raifed before it, on which they offered facrifices to that falfe deity. All who refufed to come and worfhip this idol were either maffacred or put to fome cruel tortures till they either complicd or expired under the bands of the executioners. At the fame time, altara,

## J E W [ 133$]$ E W

few:. groves, and ftatues, were raifed every where throurh the country, and the inhabitants compelled to worfhip them under the fame fevere penalties; while jt was infant death to oblerve the fabbath, circuncifon, or any other inftitution of Mofes.

At laft, when valt numbers had been pot to cruel I2 At latt, when valt numbers attach:a apoftacy, an eminent prieft, named Muftathias, began to Ignalize himfelf by his bravery and zeal for religion. He had for fume time been obliged to retire to Modin his native place, in order to avoid the perfecntion which raged at Jerufalem. During his recefs there, A pelles, one of the king's officers, came to oblige the inhabitants to comply with the abovementioned orders. By him Mattathias and his fons were addreffed in the molt earnell manner, and hat the mof ample promifes made them of the king's favour and protection if they would renounce their religion. But Mattathias anfwered, that though the whole Jewifh nation, and the whole world, were to conform to the king's ediet, yet both he and his fons would continue faithful to their God to the laft minute of their lives. At the fame time perceiving one of his commerymen inf going to offer facrifices to - idol, he fell upon him and intantly killed him, agrewable to the law of Mofes ir, fuch cafes. $\mathrm{U}^{\top}$ pon th:is his fons, fred with the fame zeal, killed the officer and his men ; overthrew the altar and idol; and running about the city, cried out, that thofe who were zealous for the law of God fhould follow them; by which means they quickly faw themfelves at the head of a numerous troop, with whom they foon after with. drew into fome of the deferts of Judea. 'Гhey were followed by many others, fo that in a thort time they found themfelves in a condition to refit their enemies; and having confidered the danger to which they were expoled by their ferupulous obfervance of the fabbath, they refolved to defend themfelves, in cafe of an at. tack, upon that day as well as upon any other.

In the year 167 B . C. Mattathias finding that his fullowers daily increafed in number, began to try his ftrength by attacking the Syrians and apoltate Jews. As many of thefe as he took he put to death, but forced a much greater number to fly for refuge into foreign countries; and having foon fruck his enemies with terror, he marched from city to city, overturned the idolatrous altars, opened the Jewifh fynagogues, made a diligent fearch after all the facred books, and cauled freft copies of them to be written; he alfo cauled the reading of the Scriptures to be refumed, and all the males born fince the perfecution to be circumcifed. In all this he was attended with fuch fuccefs, that he had extended his reformation through a confiderable part of Judea within the fpace of one year ; and would probably have completed it, had he not been prevented by death.

Mattathias was fucceeded by his fon Judas, furnaExploits of med Maccabeus, the greateit uninfpired hero of whom Judas Mac- the Jews can boaft. His troops amounted to no more abbus. than $60 c o$ men; yet with thefe he quickly made himfelf maller of fome of the llrongeft fortreffes of Judea, and became terrible to the Syrians, Samaritans, and apoltate Jews. In one year he defeated the Syrians in five pitched battles, and drove them quite out of the country; after which he purified the temple, and refored the true worfhip, which had been interrupted for three years.and a half. Only one obitacle now re.
which had been placed over againft the temple, and which Judas could not at prefent reduce. In order to prevent them from interrupting the worhip, however, he fortified the mountain on which the temple Itood, with an high wall and llong towers round about, leaving a garrifon to defend it; making fome additional fortifications at the fame time to Bethzura, a fortrefs at about 20 miles diflance.

In the mean time Antiochus being on his return from an unfuccefoful expedition into Perfia, reccived the difagrecable news that the Jews had all to a man revolted, defeated his generals, driven their armies out of Judea, and reftored their ancient worfhip. This threw him into fuch a fury, that he commanded lis charioteer to drive with the utmof fpeed, threatening uttely to extirpate the Jewini race, without leaving a fingle perfon alive. Thrfe words were fcarce uttered, when he was fized with a violent pain in his bowels, which no remedy could cure or abate. But notwith- Death of ftanding this violent Thock, fuffering himfolf to be hur- Antiochus ried away by the tranfports of his fury, he gave orders Epiphaveso for proceeding with the fame precipitation in his journey. But while he was thus haftening forward, he fell from his chariot, and was fo bruifed by the fall, that his attendants were furced to put him into a litter. Not being able to bear even the motion of the litter, he was forced to halt at a town called Taba on the confines of Perfia and Babylonia. Here he kept his bed, fuffering inexpreffible torments, occafioned chiefly by the vermin which bred in his body, and the Itench, which made bim infupportable even to himfelf. But the torments of his mind, caufed by his reflecting on the former actions of his life, furpaffed by many degrees thofe of his body. Pulybius, who in his account of this prince's death agrees with the Jewifh hiftorians, tells us, that the uneafinefs of his mind grew at laft to a contant delirium or ftate of madnefs, by reafon of feveral fpectres and apparitions of evil genii or fpirits, which he imagined were continually reproaching him with the many wicked actions of which he had been guilty. At laft, laving larguifhed for fome time in this miferable condicion, he expired, and by his death freed the Jews from the molt inveterate enemy they had ever known.

Nothwithfanding the death of Antiochus, however, the war was ftill carried on again!t the Jtws; but through the valour and gnod conduct of Judas, the Syrians were conflantly defeated, and in 163 13. C. a peace was concluded upon terms very advantageous to the Jewifh nation. This tranquillity, however, was of no long continuance; the Syrian generals renewed their hoftilities, and were attended with, the fame ill fuccefs as before. Judas defeated them in five engagements; but in the fixth was abandoned by all his men except 800 , who, together with their chicf, were flain in the year $161 \mathrm{~B} . \mathrm{C}$.

The news of the death of Judas threw his counrry. Explouts of men into the utmoft conflernation, and feemed to give Jnathan, new life to all their enemics. He was fucceeded, how. simun, aid ever, by his brother Jonathan; who conducted mat- Hyrcan. ters with no lefs prudence and fuccefs the Judas had done, till he was treacheroully feized and put to death by 'Iryphon, a Syrian ufurper, who fhorily after murdered his own fovereign. The traitor immediately prepared to invade Judea; but found all tis projects f:ufrated

Jews. fiuftrated by Simon, Jonathan's brother. This pontiff repaired all the fortreffes of Judea, and furnifhed them with frefh garrifons, took Joppa and Gaza, and drove out the Syrian garrifon from the fortrefs of Jerufalem; but was at laft treacherounly murdered by a fon-in-law named Ptolcmy, about 135 B. C.

Simon was fucceeded by his fon Hyrcan ; who not only hiook off the yolse of Syria, but conquered the Samaritans, demolifhed their capital city, and became maller of all Paleftine, to which he added the provinces of Samaria and Galilee; all which he enjoyed till within a year of his death, without the leaft difturbance fro : without, or any internal difcord. His reign was no lefs remarkable on the account of his great wifdom and piety at home than his conquefts abroad. He was the firf fince the captivity who had aflumed the royal title; and he raifed the Jewifh nation to a greater degree of fplendor than it had ever enjoyed fince that tinie. The author of the fourth book of the Maccabees alfo informs us, that in him three dignities were centered which never met in any other perfon, namely, the royal dignity, the high-priefthood, and the gift of prophecy. But the inltances given of this laft are very equivoc.l and fufpicious. The laft year of his reign, however, was in,bittcred by a quarrel with the Pharifees; and which proceeded fuch a length as was thought to have flortened his days. Hyrcan had always heen a great friend to that fect, and they had hitherto cajoyed the molt honourable employments in the Itate ; but at length one of them, named Eleas $z a r$, took it into his head to queftion Hyrcan's legitimacy, alleging, that his mother had formerly been a llave, and confequently that he was incapable of enjoying the high priefthood. This report was credited, or pictended to be fo, by the whole fect; which irritated the high-prieft to fuch a degree, that he joined the Sadducees, and could never afterwards be reconciled to the Pharifees, who therefure raifed all the troubles and feditions they could during the flort time he lived.

Hyrcan disd in 107 B. C. and was fucceeded by his eldett fon Aritobulus, who conquered Iturea, but proved a moit cruel and barbarous tyrant, polluting his hands with the blood even of his mother and one of his brothers, keeping the reft clofely confined during his reign, which, however, was but fhort. He was fucceeded in 105 by Alexander Jannæus, the grcateft conqueror, next to king David, that ever fat on the Jewifh throne. He was hated, however, by the Pharifees, and once in danger of being killed in a tumult excited by them; but having caufed his guards to fall upon the mutinous mob, they killed 6000 of them, and difperfed the reft. After this, finding it impolfible to remain in quiet in his own kingdom, he left Jerufalem, with a detign to apply himfelf wholly to the extending of his conqueft ; but while he was bufied in fubdning his forcign enemies, the Pharifees raifed a rebellion at home. This was quafhed in the year 86 B . C. and the rebels were treated in the moft inhuman manner. The faction, however, was by this means fo thoroughly quelled, that they never dared to lift up their heads as long as he lived; and Alexander having made feveralconqueftsin Syria, died about 79 B.C.

The king left two fons, Hyreanus and Arifobulus; hut bequeathed the government to his wife Alexand:a
as long as the lived: but as he faw her greatly afraid, and not without reafon, of the refentment of the Pharifees, he defired his queen, jut before his death, to fend for the ptincipal leaders of that party, and pre-tween h tend to be entirely devoted to them ; in which cafe, he fons $\mathrm{H}_{y}$ affured her, that they would fupport her and her fons canus ar after her in the pcaceable poffifion of the government. Ari With this advice the queen complied; but found herfelf much embarraffed by the turbulent Pharifees, who, afier feveral exorbitant demands, would at laft be contented with nothing lefs than the total extermination of their adverfarits the Sadducees. As the queen was unable to refilt the ftrength of the pharifaic faction, a moft cruel perfecution immediately took place againft the Sadducees, which continued for four years ; until at lat, upon their earuelt petition, they were difperfed among the feveral garrifons of the kingdom, in order to fecure them from the violence of their enemies. A few years after this, being feized with a dangerous ficknefs, her youngelt fon Ariflobulus collected a ttrong party in order to fecure the crown to himfelf; but the queen, being difpleafed with his conduct, appointed her other fon Hyrcanus, whom the luas before made high-prielt, to fucceed her llo in the royal dignity. Soon after this the expired, and left her two fons competitors for the crown. The Pharifees raifed an army againt Ariftobulus, which almolt inftantly deferted to him, fo that Hyrcanus found himfelf obliged to accept of peace upon any terms; which, however, was not granted, till the latter had ahandoned all title both to the royal and pontifical dignity, and contented himfelf with the enjoyment of his peculiar patrimony as a private pelfon.

But this depofition did not extinguifh the party of Hyıcanus. A new cabal was raifed by Antipater an Idumxan profelyte, and father of Herod the Great ; who carried of Hyrcanus into Arabia, under pretence that his life was in danger if he remained in Judea. Here lit applied to Aretas king of that country, who undertook to reflore the depofed monarch; and for that purpofe invaded Judea, defeated ArithoLulus, and kept him clofely befieged in Jeru[alem. The later had recourfe to the Romans; and having bribed Scau. mo one their Renerals, hato rus, one of their generals, he defeated Aretas wich in by A the lols of 7000 of his men, and drove him quite out fobulus of the country. The two brothers next font prefents to Pompey, at that time commander in chief of all the Roman forces in the eaft, and whom they made the arbitrator of their differences. But he, fearing that Ariftobulus, againft whom he intended to declare, might obftuet his intended expedition againft the Nabatheans, difmiffed them with a promife, that as foon as he had fubdued Aretas, he would come into Judea and decide their controverfy.

This delay gave fuch offence to Arifobulus, that he fuddenly departed for Judea without even taking leave of the Roman general, who on his part was no lefs offended at this want of refpee. The confequence was, that Pompey entered Judea with thofe troops with which he had defigned to ad againft the Nabathreans, and fummoned Arifobulus to appear before him. The Jewith prince would gladly have been excufed; but was forced by his own people to comply with Pompey's fummons, to avoid a war with that gescral. He came accordingly more than once or twice

## J E W

[ 135 ] J E W
to him, and was difmiffed with great promifes and marks of fiendihip. But at laft Pompey infifted, that lie flould deliver into his hands all the fortified places he poffeffed ; which let Ariftobulus plainly fee that he w- in the interelt of his brother, and upon this he fled to Jerufalem with a defign to oppofe the Romans to the utmoft of his power. He was quickly followed by Pompey; and to prevent hoflilities was at laft forced to go and throw himfelf at the feet of the haughty Roman, and to promife him a confiderable fum of money as the reward of his furbearance. This fubmiffion was accepted; but Gabinus, being fent with fome troops to receive the flipulated fum, was repul$f \in d$ by the garrifon of Jerufalem, who thut the gates againt him, and refufed to fulfil the agreement. This difappointment fo exafperated Pompey, that he immediately marched with his whole army againft the city.

The Roman general firt fent propofals of peace ; but finding the Jews refolved to ftan' out to the lant, he began the fiege in form. As the pluce was Atrongly fortified both by nature and art, he might lave found it very difficult to accomplih his defign, had not the Jews been fuddenly feized with a qualm of confrience refpecting the obfervance of the fabbath-day. From the time of the Maccabees they had made no fcruple of taking up arms againft an offending enemy on the fahbath ; but now they difcovered, that though it was lawful on that day to fland on their defence in cafe they were actually attacked, yet it was unlawful to do any thing towards the preventing of thofe preparatives which the enemy made towards fuch future allaults. As therefore they never moved an hand to hinder the erection of mounds and batteries, or the making of breaches in their walls on the fabbarh, the befiegers at laft made fuch a confiderable breach on that day, that the garrifon could no longer refift them. The city was therefore taken in the year 63 B . C. 12,000 of the inhabitants were flaughtered, and many more died by their own hands; while the priefts, who were offring up the ufual prayers and facritices in the temple, chofe rather to be butchered along with their brethren, than fuffer divine fervice to be one moment interrupted. At laft, after the Romans had fatiated their cruelty with the death of a valt number of the inhahitants, Hyrcanus was reflored to the pontifical dignity with the title of prince; but forbid to affurse the title of kins, to wear a diadem, or to extend his territories beyond the limits of Judea. To prevent future revolts, the walls were pulled down ; and Scaurus was left governor with a lifficient force. But before he departed, the Roman general gave the Jews a fill greater offence than almoft any thing he had hitherto done; and that was by entering into the mol facred receffes of the tenuple, where he took a view of the golden table, candleftick, cenfers, lamps, and all the olher facred vefiels; but, out of refpect to the Deity, forbore to touch any of them, and when he came out commanded the priets immediately to purify the temple according to cuntom.

Pompey having thus fubdued the Jewifh nation, fet out for Rome, carrying along with him Arifobulus and his two fons Alexander and Antigonus, as captives to adorn his future triumph. Arifobulus himfelf and his fon Antigonus were led in triumph; but A.
lexander found meane to efeape into Judca, where lee Juws. raifed an army of 10,000 foot and I 500 horfe, and began to forify fcveral Atrong holds, from whence he made incurfions into the neighbouring country. As for Hyrcanus, he liad no fooner found himfelf freed from his rival brother, than he telapfed into his former indolence, leaving the care of all lis affais to Antipater, who, like a true politician, failed not to turn the weaknefs of the prince to his own advantage ard the aggrandizing of his family. He forefaw, however, that he could not caffly compafs his ends, unlefs he ingratiated himelf with the Romans; and therefore fpared neither pains nor coft to gain their favour Scaurus foon after received from him a fupply of corn and other provifions, without which his army, which he had led againft the metropolis of Arabia, would have been in danger of perifining; and after this, he prevailed on the king to pay 300 talents to the Rumans, to prevent them from ravihing his country. Hyrcanus was now in no condition to face his enemy Alexander; and therefore had again recourfe to the Romans, Antipater at the fame time fending as many troops as he could fpare to join them. Alexander ventured a battle; but was defeated with confiderable lofs. and befieged in a ftrong fortrefs named Alexandrion. Here he would have been forced to furrender; but his mother, partly by her addrefs, and partly by the fervices the found means to do the Roman general, prevailed upon him to grant her fon a pardon for what was palt. The fortieffes were then demolifhed, that they might not give occafion to frefh revolts; Hyrcanus was again reftored to the pontifical dignity; and the province was divided into five fevelal diltriats, in each of which a feparate court of judicature was erect- Jewing ${ }^{20}$ ed. The firf of thefe was at Jerufalem, the fecond vernment at Gadara, the third at Amath, the fourth at Jeri-chauged sho, and the 6fth at Sephoris in Galilee. Thus was the into ana government changed from a monarchy to an arito- arifocracy; cracy, and the Jews now fell under a fet of domineering lords.

Soon after this, Arifobulus found means to eicape from his confinement at Rome, and raifed new troubles in Judea, but was again defeated and taken prifoner: his fon alfo renewed his attempts; but was in like manner defeated, with the lofs of near 10,000 of his followers : after which Gabinius, having fettled the affairs of Judea to Antipater's mind, refigned the government of his province to Craffus. The only tranfaction during his government was his plundering the temple of all its money and facred utenfils, amounting in the whole to 10,000 Atic talents, $i$. $\varepsilon$. above two millions of our money. After this facrilege, Craffus fet out on his expedition againlt Parthia, where lie perifhed; and his death was by the Jews interpreted as a divine judgment for his impiety.

The war between Cafar and Pompey afforded the Jews ${ }^{2} f_{1}$. Jews fome refpite, and likewife an opportunity of in. vewred by gratiating themfelves with the former, which the poli-cxara. tic Antipater readily embraced. His fervices were rewarded by the emperor. He confirmed Hyrcanus in his priefthood, added to it the principality of Judea to be entailed on his polterity. for ever, and reftored the Jewifh nation to their ancient rights and privileges; ordering at the fame time a pillar to be erected, whereon all thefe grants, and his own dec:ec, fhould be en-

 [ 136 ]graved, which was accotdingly done; and foon after, when Cxfar hiniflf came into Judea, he granted libcrty alfo to fortify the city, and rebuild the wall which had been demolifhed by Pompey.

During the lifetime of Ciefar, the Jews were fo hishly favoured, that they could fearcely be faid to feel the Roman yoke. After his death, howevcr, the nation fell into great diforders; which were not finally quelled till Herod, who was cteated king of Judea by Marc Anthony in 40 B. C. was full eftabifled on the throne by the taking of Jerufalem by his allies the Romans in $37 \mathrm{~B} . \mathrm{C}$. The immediate confequence of this was another cruel pillage and maflacre: then followed the death of Antigonus the fon of Arillobulus, who had for three years maintained his ground againft Herod, put to dcath his brother Phafacl, and cut of Hyrcanus's ears, in order the n:ore effectually to incaFrcitate him for the high-priethood.

The Jews gained but little by this change of maflers. The new king proved ome of the greateft tyrants mentioned in hiftory. He began his reign with a cruel perfecution of thofe who had fided with his rival An--ligonus; great rumbers of whom he put to death, feiring and confifcating their effects for his own ufe. Nay, fuch was his jealoufy in this laft refpect, that he caufed guards to be placed at the city gates, in order to watch the bodies of thofe of the Artigonian faction who were carried ont to be buried, left fome of their riches mould be carried along with them. :His jealoufy next prompted him to decoy Hyrcanus, the banifhed pontiff, from Parthia, where he lad taken -refuge, that he might put him to death, tho' contrary -o his mof folemn promifes. His cruclty then fell upon his own family. He had married Mariamne, the daughter of Hyrcanus; whofe brother, A iftobulus, a young prince of great hopes, was made high-prielt at the interceffion of his mother Alexandra. But the tyrant, confcious that Ariftobulus had a better right to the kiugdom than himfelf, caufcd him foon after to be drowned in a bath. The next victim was his beloved queen Mariamne herfelf. Herod had becn fummoned to appear firft before Marc Anthony, and then before Augutus, in order to clear himfelf from fome crimes laid to his charge. As he was, however, doubtful of the event, he left orders, that in cafe he was condemned, Mariamne fhould be put to death. This, together with the death of her father and brother, gave leer fuch an averfion for him, that fhe foowed it on all occafions. By this conduct the tyrant's refentment was at laft fo much inflamed, that having got her falfely accufed of infidelity, the was condemned to die, and executed accordingly. She fuffered with great refolution; but with her ended all the happinets of her hufland. His love for Mariamne increafed fo much after her death, that for fome time he appeared like one quite difracted. His remorfe, however, did not get the hetrer of his cruelty. The death of Mariamne was foen followed by that of her mother Alexandra, and this by the execution of feveral other perfons who had joined with her in an attempt to fecure the kingdom to the fons of the deceafed queen.

Herod, having now freed himfelf from the greateft part of his fuppofed enemies, began to fhow a greater contempt for the Jewih ceremonies than formerly; and introduced a number of heathenifh games, which made No ${ }^{\circ} \mathbf{1}_{6}$.
him odious to his lubjects. Ten bold felluws at laft took it into their heads to enter the theatre where the tyrant was celebrating fotne games, with daggers concealed under their clothes, in order to flab him or fome of his retinue. In cafe they fhould mifcarry in the attempt, they had the defperate fatisfaction to thin', that, if they perifhed, the tyrant would be rendercd Aill more odious by the punithment inflitted on them. They were not millaken: for Herod being informed of their defign by one of his fpies, and caufing the aiflaflins to be put to a moft excruiating death, the people were fo much exafperated againat the informer, that they cut and tore him to pieces, and call his flefly to the dogs. Herod tried in vain to difeover the aythors of this affront ; but at laft having caufed fome women to be put to the rack, he extorted from them the names of the principal perfons concerned, whom he caufed immediately to be pur to death with their familics. This produced fuch diflurbances, that, apprchending nothing lefs than a general revolt, he fet about fortifying Jerualent with feveral adjitional works, rebuilding Saruaria, and putting garrifons into feveral forte effes in Judea. Notwithlanding this, however, Herod had fhottly after an opportunity of regaining the affections of his fubjects in fome meafure, by his generofiy to them during a famine; but as he foon relapfed into his former cruelty, their love was again turned into hatred, which continued till his death.

Herod now, about 23 B. C. began to adorn his Rehui cities with many ftately buildings. The moft re-the te markable and magnificert of them all, however, was the temple at Jerufalem, which he is faid to have raifed to a higher pitch of grandeur than even Solomon himfelf had done. Ten thoufand artificers were immediately fet to work, under the direction of 1000 priefts, the beff fkilled in carving, mafonry, \&c. all of whom were kept in conftant pay. A thoufand carts were employed in fetching materials; and fuch a number of other hands were employed, that every thing was got ready within the face of two years. After this they fet about pulling down the old building, and rearing up the new one with the fame expedition: fo that the boly place, or temple, properly fo called, was finifhed in a year aud an half; during which we are told that it never rained in the day-time, but ouly in the night. The remainder was finifhed in fomewhat more than eight years. The temple, properly fo called, or holy place, was but 60 cubits ligh, and as many in breadth; but in the front he added two wings or thoulders which projected 20 cubits more on each fide, and which in all made a front of 120 cubits in length, and as many in height; with a gate 70 cubits high and 20 in breadth, but open and without. any doors. The flones were white marble, 25 cubits in length, 12 in height, and 9 in breadth, all wrought and polifhed with exquifite bcauty; the whole refembling a ftately palace, whofe middle being confidera. bly raifed ahove the extremities of each face, made it afford a beautiful vifla at a great diftance, to thefe who came to the metropolis. Inftead of doors, the gates clofed with very coflly veils, enriched with a variety of flowering of gold, filver, purple, and every thing that was rich and curious; and on each fide of the gaies were planted two Mately columns, from whofe
ws. whofe cornices hung golden feftoons and vines, with their clufters of grapes, leaves, \&c. curiounly wrought. The fuperttructure, however, which was properly reared on the old foundation without fufficient additions, proved too heavy, and funk down about 20 cubits; to that its height was reduced to 100 . This foundation was of an aftonifhing flrength and height, of which an account is given under the article Ierusalem. The platform was a regular fquare of a fladiun or furlong on cach fide. Each front of the fquare had a fpacious gate or entrance, enriched with fuitable ornaments; but that on the weft had four gates, one of which led to the palace, another to the city, and the two others to the fuburbs and fields. This inclofure was furrounded on the outlide with a ftrong and high wall of large fones, well cemented; and on the infide had on each front a ftately piazza or gallery, fupported by columns of fuch a bignefs, that three men could but juit embrace them, their circumference being about 27 feet. There were in all 162 of them, which fupported a cedar cieling of excellent workmanhip, and formed three galleries, the middlemolt of which was the largeft and higheft, it being 45 feet in breadth and $r 00$ in height, whereas thofe on each fide were but 30 feet wide and 50 in height.

The piazzas and court were paved with marble of various colours; and, at a fmall diftance from the galleries, was a fecond inclofure, furrounded with a flight of beautiful marble rails, with ttately columns at proper diftances, on which were engraven certain admonitions in Greek and Latin, to forbid flangers, and thofe Jews that were not puified, to proceed farther urder pain of death. This inclofure had but one gate on the eaft fide; none on the welt; but on the north and fouth it had three, placed at equal diftances from each other.

A third inclofure furrounded the temple, properly fo called, and the altar of burnt-offerings; and made what they called the court of the Hebrezus or $1 /$ raclites. It was fquare like the reft: but the wall on the outfide was furrounded by a fight of $1+$ fteps, which hid a confiderable part of it ; and on the top was a terrace, of about 12 cubits in breadth, which went quite round the whole cincture. The eaft fide had but one gate ; the weft none; and the north and fouth four, at equal dittances. Each gate was afcended by five fleps more before one could reach the level of the inward court ; fo that the wall which inclofed it appeared within to be but 25 cubits high, though confiderably higher on the outfide. On the infide of each of thofe gates were raifed a couple of fpacious fquare chambers, in form of a pavilion, 30 cubits wide axd 40 in height, each fuppoted by columns of 12 cubits in circumfe. rence.

This inclofure had likewife a double fight of gal. leries on the infide, fupported by a double row of columns; but the weftern fide was only one continued wall, without gates or galleries. The women had likewife their particular courts Separate from that of the men, and one of the gates on the north and fouth leading to it.

The altar of burnt-offerings was likewife high and fpacious, being 10 cubits in breadth, and 15 in height. The afcent to it was, according to the Nofaic law, fenooth, and without fteps; and the altar ot unhewn

Vol. IX. Patt I.
flones. It was furrounded, at a convenient diftance, with a low wall or rail, which divided the court of the priefts from that of the lay Ifraelites; fo that thcfe laft were allowed to come thus far to bring their offerings and facrifices; though none hut the priefls were allowed to come within that inclofure.

Herod caufed a new dedication of this temple to be performed with the utmof magnificence; and prefented to it many rich trophies of his former victorics, after the cuftom of the Jewifh monarchs.
This, and many other magnificent works, however, did not divert the king's attention from his ufual jealouties and cruelty. His tifter Salome, and one of his fons named Antipater, taking advantage of this dirpofition, prompted him to murder his two fons by Mariamne, named Alexander and Arifobulus, who had been educated at the court of Augultus in Italy, and were jufly admired by all who faw them. His cruelty foon after broke out in an impotent attempt to deftroy the Saviour of the world, but which was attended with no other confequence than the deftruction of 2000 innocent chuldren of his own fuhjects. His mifery was almof brought to its fummit by the difcovery of Antipater's defigus againft himfelf; who was accordingly tried and condemned for trcafon. Something fill more dieadful, however, yet awaited him; he was feized with a moft loathfome and incurable difeafe, in which he was tormented with intolerable pains, fo that his life became a burden. At lat he died, to the 25 that his hife became a burden. At lath he died, to the His deatire great joy of the Jews, five days after he had put Antipater to death, and after having divided his kingdom among his fons in the following manner. - Archelaus had Judea; Antipas, or Herod, was tetrarch of Galilee and Perea; and Plilip had the regions of Trachonitis, Gaulon, Batanea, and Panias, which he erected likewife into a tetrarchy. To his filler Salome he gave 50,000 pieces of money, together with the cities of Jamnia, Azotus, and Phafaelis; befides fome conficerable legacies to his other relations.

The cruelty of this monfter accompanied him to lis grave; nay, he in a manner carried it beyond the grave. Being well apprifed that the Jews would rejoice at being freed from fuch a tyrant, he bethought himfelf of the following infernal ftratagem to damp their mirth. A few days before his death, he furnmoned all the heads of the Jews to repair to Jericho under pain of death; and, on their arrival, ordered them all to be thut up in the circus, giving at the fame time ftrift orders to his fifter Salome and her hufband to have all the prifoners butchered as foon as his breath was gone out. "By this means (faid he), I hall not only damp the people's joy, but fecure a real mourning at my death." Thefe cruel orders, how. ever, were not put in execution. Immediately after the king's death, Salome went to the Hippodrome, where the heads of the Jews were detained, caufed the gates to be flung open, and declared to them, that now the king had no farther occalion for their attendance, and that they might depart to their refpective homes; after which, and not till then, the news of the king's death was publifhed. Tumults, feditions, and infurrections, quickly followed. Archelaus was op- New 26 pofed by his brethren, and cbliged to appear at Rome fion of the before Augullus, to whom many complaints were kingdom brought againft him. After hearing both parties, by Augur-

Jews.
 and Afcalon.
the emperor made the following divifion of the king. for of Herod the Great, was promoted by Caius to dom: Archelains had one half, under the title of ethnarch, or governor of a nation; together with a promife that he fhould have the title of king, as foo as he thawed himfelf worthy of it. This ethnarch contained Judea Propria, Idumea, and Samaria: but this lat was exempted from one-fourth of the taxes paid by the refl, on account of the peaceable behaviour of the inhabitants during the late tumults. The remainder was divided between Philip and Herod; the former of whoas had Trachonitis, Batanea, and Auranitis, together with a fall part of Galilee; the batter had the reft of Galilee and the countries beyond the Jordan. Salome had half a million of fiver, together with the cities of Jamnia, Azotus, Ihafaelis,

For forme years Archelaus enjoyed his government in peace; but at left, both Jews and Samaritans, tired out with his tyrannical behaviour, joined in a petition to Auguftus against him. The emperor immediately fummoned him to Rome, where, having heard his accufation and defence, be banifhed him to the city of Vienne in Dauphiny, and confifcated all his effects. Judea being by this fentence reduced to a Roman province, was ordered to be taxed: and Cyrenius the governor of Syria, a man of confular dignity, was font thither to fee it put in execution: which having done, and fold the palaces of Archelans, and feized upon all his treasure, he returned to Antioch, leawing the Jews in no final ferment on account of this new tax.

Thus were the \{eels of diffenfion down between the Jews and Romans, which ended in the moll lamentable catallrophe of the former. The Jews, always impatient of a foreign yoke, knew from their prophecies, that the time was now come when the Mefliah Mould appear. Of confectuence, as they expected him to be a great and powerful wat rior, their rebellious and foditious spirit was heightened to the greateft degree; and they imagined they had nothing to do but take up arms, and victory would immediately declare on their file. From this time, therefore, the country was never quiet; and the infatuated people, while they rejected the true Meffiah, gave themselves up to the direction of every impostor who chose to lead them to their own deffruction. The governors appointed by the Romans were alfo frequently changed, but feldom for the better. About the 16 th year of Chrilt, Pontus Pilate was appointed governor ; the whole of whole adminitration, according to Jofephus, was one continued fcene of venality, rapine, tyranny, and every wicked action; of racking and putting innocent men to death, untried and uncondemned; and of every kind of ravage cruelty. Such a governor was but ill calculated to appeafe the ferments occafioned by the late tax. Indeed Pilate was fo far from at tempting this, that he greatly inflamed them by taking every occafion of introducing his ftandards with mages and pictures, confecrated fields, \&c. into their city; and at lat attempting to drain the treafury of the temple, under pretence of bringing an aqueduct into Jerufalem. The mont remarkable tranfaction of his government, however, was his condemnation of Jesus Christ: feven years after which he was removed from Judea; and in a short time Agrippa, the grand-
the regal dignity. He did not, however, long enjoy this honour; for, on his coming into Judea, having Agri railed a perfecution againft the Clriftianz, and blaf-ngade phemounly fuffering himself to he ftyled a God by Some deputies from Tyre and Sidon, he was miraculoury truck with a difeafe, which foo put an end to his life. The faced hitlerian tells us, that he was eaten of worms; and Jofephus, that he was feized with moot violent pains in his heart and howell; fo that he could not but reflect on the bafenefs of thole flatterers, who had but lately complimented him with a kind of divine immortality, that was now about to expire in all the torments and agonies of a miSerable mortal.

On the death of Agrippa, Judea was once more The reduced to a province of the Roman empire, and had dom new governors appointed over it. There were Vent- red dias, Felix, Fellus Albinus, and Geffius Flores. prov Under their government the Jewifh affairs went on from bad to worse; the country farmed with robbers and affafins; the latter committing every where the mot unheard-of cruelties under the pretence of religoon; and about 64 A.C. were joined by 88,000 . workmen, who had been employed in further repairing and beautifying the temple. About this time alto, Geffus Florus, the lat and wort governor the Jews ever had, was font into the country. Josephus feems at a lops for words to defcribe him by, or a. moniter to compare him to. His repines, cruelties, conniving for large fums with the handitti, and, in a word, his whole behaviour, were fo open and barefaced, that he was looked upon by the Jews more like a bloody executioner font to butcher, than a magifate to govern them. In this dillracted fate of the country, many of the inhabitants forfook it to feet: for an afylum fomewhere elfe; white those who remanned applied themselves to Cellius Gallus, governor of Syria, who was at Jerufalem at the paflover; befeeching him to pity their unhappy tate, and free them from the tyranny of a man who had totally ruined their country. Florus, who was prefent when there complaints were brought againft him, made a mere jet of them; and Ceftius, inflead of making a ftrict inquiry into his conduct, difmiffed the Jews with a general promife that the governor should behave better for the future; and fat himself about computing. the number of Jews at that time in Jerufalem, by the number of lambs offered at that feftival, that he might fend an account of the whole to Nero. By his computation, there were at that time in Jerusalem 2,556,000; thu' Jofephus thinks they rather amounted to $3,000,000$.

In the year 67 began the fatal war with the Romans, Caus which was ended only by the deflruction of Jerufalem. the The immediate caufe was the decifion of a content war with the Syrians concerning the city of Cæfarea. The the Jews maintained that this city belonged to them, be- man caufe it had been built by Herod; and the Syrians pretended that it had always been reckoned a Greek city, fince even that monarch had reared temples and statues in it. The conteft at lat came to fuck an height, that both parties took up arms againtt each other. Felix put an end to it for a time, by fending fume of the chiefs of each nation to Rome, to plead
their eanfe before the emperor, where it hung in fufpenfe till this time, when Nero decided it againft the Jews. No fooner waa this decifion made public, than the Jews in dill parts of the country fiew to arms; and though they were every where the fufferers, yet, from this fatal period, their rage never abated. Nothing was now to be heard of but robberies, murders, and every kind of cruelty. Cities and villages were filled with dead bodies of all ages, even fucking babes. The Jews, on their part, fpared neither Syrians nor Romans, where they got the better of them; and this d. proved the deftruction of great numbers of their peaceful brethren: 20,000 were maffacred at Cæfarea, 50,000 at Alexandria, 2000 at Ptolemais, and 3500 at Jerufalem.

A great number of affaftins, in the mean time, having joined the factious Jews in Jerufalem, they beat the Romans out of Antonia, a fortrefs adjuining to the temple, and another called Mufluda; and likewife out of the towers called Pbufael and Mariamne, killing all who oppofed them. The Romans were at lalt reduced to fuch Alraits, that they capitulated on the fingle condition that their lives fhoull be fpared: notwithitanding which, they were all maffacred by the furious zealots: and this treachery was foon revenged on the faithful Jews of Scythopolis. The fe had offered to affilt in reducing their factious brethren; but their fincerity being fufpected by the rownfmen, they obliged them to retire into a neighbouring wood, where, on the third night, they were maffacred to the number of 13,000 , and all their wealth carried off. The rebels, in the mean time, croffed the Jordan, and took the fortreffes of Machæron and Cyprus; which laft they razed to the ground, aficr having put all the Romans to the fworl--'This iusbrought Ceftius Gallus, the Syrian govenor, into Judxa with all his forces; but the Jews, partly by treachery and partly by force, got the better of him, and drove him out of the country with the lofs of 5000 men.

All this time fuch dreadful diffenfions reigned a. mong the Jews, that great numbers of the better fort forefecing the fad effects of the refentment of the Romans, left the city as men do a finking veffel; and the Chriltians, mitidful of their Saviour's prediction, retired to Pella, a city on the other fide of Jordan, whether the war did not reach. Miferable was the fate of fuch as either could not, or wonld not, leave that devoted city. Vefpafian was now ordered to foinfleave Greece, where he was at that time, and to march with all Speed into Judea. He did fo accordingly at the head of a powerful army, ordaring his fon Titus in the mean time to bring two more legions from A. lexandria; but before he could reach that country, the Jews had twice attempted to take the city of Afcalon, and were each time repulfed with the lofs of 10,000 of their number. In the beginning of the year 68, Vefpafian entered Galilee at the head of an army of 60,000 men, all completely armed and excellently difciplined. He firt took and burnt Gadara: then he laid fiege to Jotapa, and took it after a flout refiltance; at which he was fo provoked, that he caufed every one of the Jews to be mailacred or carried into captivity, not one being left to carry the dreadful news to their brethren. Forty thoufand perifhed on this occafion:
only 1200 were made prifoners, anong whom was Jofephus the Jewifh hiftorian. Japha next fhared the fame fate, after an obltinate flege; all the men being maffacred, and the women and children carried into captivity. A week after this the Samaritans, who had affenbled on Mount Gerizzim, wete almot all put to the fword, or perilhed. Joppa fell the next vietim to the Roman vengeance. It had been formerly laid watte by Cettius ; but was now repeopled and fortified by the feditious Jews who infelted the country. It was taken by form, and fhared the fame fate with the reft. Four thoufand Jews attempted to efcape by taking to their fhips; but were driven back by a fudden tempeft, and all of them were drowned or put to the fword. Tarichea and Tiberias were next taken, but part of their inhabitants were fpared on account of their peaceable difpofitions. Then followed the fieges of Gamak, Gifchala, and Itabyr. The firf was taken by florn, with a dreadful flaughter of the Jews; the laft by tratagem. The inhabitants of Gilchala were inclinable to furrender: but a feditions Jew of that town, named Foln, the fon of Levi, head of the fation, and a vile fellow, oppofed it; and, having the molb at his back, overawed the whole city. Oa the fabbath he begged of Titus to forocar hoftilities till to morrow, and then he would accept his offer; but inftead of that, he fled to Jerufalem with as many as would follow him. The Romans, as foon as they were informed of his fight, purfued, and killed 6000 of his fullowers on the road, and brought back near 3000 women and children prifoners. The inhabitants then furrendered to Titus, and only the factious were punilhed; and this completed the reduction of Galilee.

The Jewilh nation by this time was divided into Differene two very oppolite parties: the one forefeeing that factions this war, if continued, muft end in the total ruin of among the their country, were for putting an end to it by fub- Jews. mitting to the Romans; the other, which was the remains of the faction of Judas Gaulonites, breathed nothing but war and confulion, and oppofed all peaceable meafures with invincible obfinacy. 'This laft, which was by far the moft numerous and powerfut, conited of men of the vilet and molt profligate characters that can be paralleled in hiftory. They were proud, ambitious, cruel, rapacious, and committed the moft horrid and unnatural crimes under the mank of religion. They affirmed every where, that it was offering the greateft difhonour to God to fubmit to any earthly potentate; much lefs to Romans and to heathens. This, they faid, was the only motive that induced them to take up arms, and to bind themfelses under the ftrietett obligations not to lay them down till they had either totally extirpated all foreign authority, or perifhed in the attempt.-This dreadful diffenlion was not confined to Jerufalem, but had infected all the cities, towns, and villages, of Patenine. Even houfes and families were fo divided againft cach other, that, as our Saviour lad exprefsly forctold, a man's greateft enemics were often thofe of las own family and houfehold. In hort, if we may beliese Jofephus, the zealots acted more like incarnate devils than like men who had any ferife of humanity left them.-This obliged the contrary party likewife to rife up in arms in their own defence againth ithofe niifcreants; from whom, however, they fuffered much

$$

Jews. more than they did even from the exafperated Romans. - The zealots began their outrages by murdering all that oppoled them in the countries round about. oppofition from the other party headed by A nanus, who had lately been high-prieit. A fierce engarement enfued between them; and the zealots were driven into the inner cincture of the temple, wherc they were clofely befieged. John of Gifchala above mentioned, who had pretended to fide with the peaceable party, was then fent with terms of accommodation; but, inftead of advifing the befieged to accept of them, he perfuaded them fill to hold out, and call the Idumeans to their affiftance. They did fo, and procured 20,000 of them to come to their relicf; but the fe new allies were refufed admittance into the city. On that night, lowever, there happened fuch a viulent form, accompanied with thunder, lightning, and an earthquake, that the zealots from within the inner court fawed the bolts and hinges of the temple-gates withont being heard, forced the guards of the befiegers, fallied into the city, and led in the Idumeans. The city was inftantly filled with butcheries of the moll horrid kind. Barely to put any of the oppofite party to death was thought too mild a punifhment; they mult have the pleafure of murdering them by inches: fo that they made it now their diverfion to put them to the mof exquifite tortures that could be invented; nor could they be prevailed upon to difpatch them till the violence of their torments had rendered them quite incapable of feeling them. In this manner perifhed $12,0^{-0}$ perfons of noble extraction, and in the flower of their age; till at lalt the Idumeans complained fo much againft the putting fuch numbers to death, that the zealots thought proper to erect a kind of tribunal, which, however, was intended not for judgment but condemuation; for the judges having once acquitted a perfon who was manifeftly innocent, the zealots not only murdered him in the temple, but depoled the new-created judges as perfons unfit for their office.

The zealots, after having exterminated all thofe of any charafter or diftinction, began next to wreak their vengeance on the common people. This obliged many of the Jews to forfake Jerulalem, and take refuge with the Romans, though the attempt was very hazardous; for the zealots had all the avenues well guarded, and failed not to put to death fuch as fell into their hands. Vefpafian in the mean time ftaid at Cefarea an idle fpectator of their outrages; well knowing that the zealots were fighting for him, and that the frength of the Jewifh nation was gra$3^{6}$ dually walting away. Every thing fucceeded to his They turn wilh. The zealots, after having malfacred or driven their arms away the oppofite party, turned their arms againft againfeach each other. A party was formed againft John, under other.

Not thinking himfelf, however, as yet malter of force fufficient to befiege Jerufalem, he invaded Idumea with 20,000 men. The Idumeans oppofed him with 25,000; and a fharp engagement enfeed, in which neither party was victorious. But Simon, foon after, having corrupted the Idumean general, got their arıny delivered up to him. By this means he tafily became mafter of the country; where he committed fuch cruelties, that the iniferable inhabitants abandoned it to feek for flelter in Jerufalem.

In the city, matters went in the fame way. John tyrannized in fuch a manner, that the Idumeans revolted, killed a great number of his men, plundered his palace, and forced him to retire into the temple. In the mean time the people, having taken a notion that he would fally out in the night and fet tire to the city, called a council, in which it was refolved to admit Simon with his troops, in order to oppofe John and his zealots. Simon's lirt attempt againft his rival, however, was ineffectual, and he was obliged to content himfelf with befieging the zealats in the temple. In the mean time the miferies of the city were increafed by the llarting up of a third party headed by one Eleazar, who feized on the court of the prielts, and kept John confined within that of the Ifraslites. Eleazar kept the avenues fo well guarded, that none were admitted to come into that part of the temple but thofe who came thither to offer facrifices ; and it was by thefe offerings chiefly that he maintained himfelf and his men. John by this means found himfelf hemmed in between two powerful enemies, Simon below, and Eleazar above. He defended himfelf, however, againit them both with great refolution; and when the city was invefted by the Romans, having pretended to come to an agreement with his rivals, he found means totally to cut off or force Eleazar's men to fubmit to him, fo that the factions were again reduced to two.

The Romans, in the year 72 , began to ajvance to- Th wards the capital. In their way they deftroyed many ma thoufands, wafting the country as they went along ; van and in the year 73 arrived before the walls of Jernfa- Je lem, under '「itus afterwards emperor. As he was a man of an exccedingly merciful difpofition, and greatly defired to fpare the city, lie immediately fent offers of peace; but thefe were rejected with contempt, and he himfelf put in great danger of his life, fo that he refolved to begin the fiege in form. In the mean time, Simon and John renewed their hoftilities with greater fury than ever. John now held the whole temple, fome of the out-parts of it, and the valley of Cedron. Simon had the whole city to range in ; in fome parts of which John had made fuch devaftations, that they ferved them for a field of battle, from which they fallied unanimoufly againt the common enemy when* ever occalion Served; after which they returned to their ufual hollilities, turning their arms againtt each other, as if they had fworn to make their ruin more eafy to the Romane. Thele drev fill nearer to the walls, having with great labour and pains levelled all the ground between Scopas and them, by pulling down all the houles and hedges, cutting down the trees, and even cleaving the rocks that ftoed in their way, from Scopas to the tomb of Herod, and Bethara or the pool of ferpents; in which work fo many
factious, who, by their inteftine feuds, had deltroyed
Whilf this was doing, Titus fent the befieged fome offers of peace; and Jofephus was pitched upon to be the meffenger of them: but they wore rejefted with indignation. He fent a fecond time Nicaaor and Jofephus with frefh offers, and the former received a wound in his flooulder; upon which Titus refolved to begin the affault in good earnetl, and ordered his men to rafe the fuburbs, cut down all the trees, and ure the materials to raife platforms againt the wall. Every thing was now carried on with invincible ardour; the Romans began to play their engines againft the city with all their might. The Jews had likewife their machincs upon the walls, which they plied with uncommon fury: they had taken them lateiy from Ceftius: but were fo ignorant in their ufe, that they did little execution with them, till they were better inferusted by fome Roman deferters: till then, their chief fuccefs was rather owing to their frequent fallics; but the Roman legions, who had all their towers and machines before them, made terrible harock. The leaft fones they threw were near 100 weight; and thefe they could throw the length of a quarter of a mile againft the city, and with fuch a force, that they could do mifchief on thofe that flood at fome dittance behind them. Titus had reared three towers 50 cubits high; one of which lappening to fall in the middle of the night, greatly alarmed the Roman camp, who immediately ran to arms at the noife of it ; but 'Titus, upon knowing the caufe, difiniffed them, and caufed it to be fet up again. Thefe towers, being plated with iron, the Jews tried in vain to fet fire to them, but were at length forced to retire ont of the reach of their fhot ; by which the battering rams were now at full liberty to play againft the wall. A breach was foon made in it, at which the Romans entered; and the Jews, abandoning this laft inclofure, retired behind the next. This happened about the 28 th of A pril, a fortniglt after the beginning of the fiege.
lohn defendad the remple and the caflle of Antonia, and Simon the reft of the city. Titus marched cluff to the ficond wall, and plied his battering-rams fo furioufy, that one of the towers, which looked towards the noth, gave a prodigious thake. The men who were in it, made a fignal to the Romans, as if they would furrender; and, at the fance time, fent Simon word to be ready to give them a warm recep. tion. 'Titus, having difoovered their ftratagem, plied his work more furiouny, whilt the Jews that were in the tower fet it on fire, and flung themfelves into the tlames. The tower being fallen, gave them an entrance into the fecond inclofure, five days afier gaining the firft ; and Titus, who was beut on faving the city, would not fuffer any part of the wall or flreets to be demolifhed; which left the breach and lanes fo oarıow, that when his men were furioully repulfed by Simon, they had not room enough to make a quick retreat, fo that there was a number of them killed in it. This overfight was quickly tectified; and the attack renewed with fuch vigour, that the place was carried four days after their firlt repulfe.

The famine, laging in a terrible manner in the city, was foon followed by a petlilence; and as thefe two drcadful judgments incteafed, fo did the rage of the
fuch quantities of provifion, that they were forced to prey upon the people with the mof unheard-ot cruzl. ty. They forced their haufes; and, if they found any victuals in them, they butchered them for not apprifing them of it; and, if they found nothing but bare walls, which was almot every where the cafe, they put them to the moit fevere tortures, under pretence that they hall fome provifion concealed. "I fhould (fays Jofephus) undertake an inp sfible tafk, were I to enter ints a detail of all the cruelties of thofe impious wretches; it will be fuficient to fay, that I do not think, that fince the creation any city ever fuffered fuch dreadful calamities, or abounded with men fo fertile in all kinds of wickednefs."

Thitus, who knew their miferable condition, and was Atill willing to $f_{\text {pare }}$ them, gave them four days to cool ; during which he caufed his army to be mullered, and provifions to be diltributed to them in fight of the Jews, who flocked upon the walls to fee it. Jo- ofers of fephus was fent to fpcak to them afrefh, and to exhort peace rethem not to run themfelves into an inevitable ruin by jected. obflinately perfilting in the defence of a place which could lold out but a very little wile, and which the Romans looked upon already as their own. But this fubborn people, after many bitter invectives, besan to dart their arrows at him ; at which, not at all difcouraged, he went on with greater vehemence: but all the effect it wrought on them was, that it prevailed on great numbers to feal away privately to the Romans, whiltt the reft beeame only the more defpe. rate and refolute to hold out to the laft, in Spite of Ti tus's merciful offers.

To haflen therefore their deflined ruin, he caufed the city to be furrounded with a flrong wall, to prevent cither their receiving any fuccours or provifion from abroad, or their efeaping his refentment by fight. This wall, which was near 40 ftadia or five miles in circuit, was yet carried on with fuch fpecd, and by fo many hands, that it was finilhed in three days; by which one may guefs at the ardour of the befiegers to make theniflyes mafters of the city.
There was now nothing to be feen thro' the ftreets of Jerufalem but heaps of dead bodies rotting above ground, walking fkeletons, and dying wretches. As many as were caught by the Romans in their fallies, Titus caufed to be crucified in fight of the town, to in. ject a terror among the rell: but the zealots gave it out, that they were thofe who fled to him for protection; which when Titus underilood, he fent a prifoner with his hands cut off to undective, and aflure then, that he fpared all that voluntarily came over to him; which encouraged great numbers to aecept his ofiers, tho' the avenues were clofely guarded by the fakious, who put all to death who were caught going on that errand. A greater mifchief than that was, that even thofe who efcaped fafe to the Roman camp were miferably butchered by the foldiers, from a notion which, thefe had taken that they had [wallowed great quano tities of gold; infomuch that two thoufand of them. were ripped up in one night, to come at their fuppofed treafure. When Titus was apprifed of this bar. barity, he would have condemned all thofe butcherings wretches to death; but they proved fo numerous, that he was forced to fpare them, and conteuted himfelf.
with fending a proclamation thro' his camp, that as inany as thould be fulpected theneeforward of that horrid villany, frould be put to immediate death: yet did not this deter many of them from it, only they dill it more privately than before ; fo greedy were they of that bewitching metal. All this while the defection increafed thith more thro' the inhumanity of the faction within, who made the miferies and dying groans of their !tarving brethren the fubject of their cruel mirth, and carried their barbarity even to the fheathing of , their fwords in fport in thofe poor wretches, under pretence of trying their fharpnefs.

When they found therefore that neither their guards nor feveities could prevent the people's fight, they had recourfe to another ithatagem equally impious and cruel : which was, to hire a pack of vile pretenders to prophecy, to go ahout and encourage the defpairing remains of the penple to expect a fpeedy and miraculous deliverance; and this impofture proved a greater expedient with that infatuated nation than their other precautions.
Nothing could be more dreadful than the famifhed condition to which they were now reduced. The poor, having nothing to $t$. mit to but the Roman's merey or a fpecdy death, ran all hazards to get out of the city; and if in their flight, and wandering out for herbs or ary other fuftenance, they fell into the hands of any of 'Citus's parties fent about to guard the avenues, they were unmercifully fonurged, and crucified if they made the lealt reliftance. The rich within the walls were now forced, though in the molt private manner, to give half, or all they were worth, for a meafure of wheat, and the middling fort for one of barley. This they were forced to convey into fome private place in their houfts, and to feed upon it as it was, without daring to pound or grind it, much lefs to boil or bake it, keit the noife or farell foould draw the rapacions zealots to come and cear it from them. Not that thefe were reduced to any real want of provifions, but they had a double end in this barbarous plunder; to wit, the ftarving what they criully flyled all ufelefs perfons, and the keeping their own flores in referve. It was upon this fad and pinching juncture, that an unhappy mother was reduced to the extremity of butchering and eating her own child.

When this news was fpread through the eity, the horror and confternation were as univerfal as they were inexpreffible. It was then that they began to think themfelves forfaken by the Divine Providence, and to expect the moft terrible effects of his anger againit the poor remains of their nation; infomuch that they began to envy thofe that had perithed before them, and to wifh their turn migtt come before the fad expected cataltrophe. Their fears were but too jult; fince Titus, at the very firt hearing of this iuhuman deed, fwore the cotal extirpation of city and people. "Since (faid he) they have fo often refufed my proffers of pardon, and have preierred war to peace, rebellion to ohedience, and famine, fuch a dreadful one efpecially, rop plenty, I am determined to bury that accurfed metoopolis under its ruins, that the fun may never thoot his beams on a city where the muthers feed on the fleth of their children, and the fathers, no lefs guiley than they, choofe to drive them to fuch eatremities, rather than lay down thair arms."

The dreadfull antion happened about the end of fuly, by which tine the Romans, having purfued their attacks with frelh vigour, made themfelves mallers of the fortrefs Antonia; which obliged the Iews to iet fire to thofe itately galleries which joined it to the temple, !eg diay finouid alford an eafy pafage to the befiegers into this lalt. A bout the fame time Titus, with much difficulty, got materials for raifing new mounds and terraces, in order to hallen the fiege, and fave, if polfible, the fad remains of that once glorious tlructure ; but his pity proved fill worfe and worle befluwed on thofe obitinate wretches, who only became the more furious and defperate by it. Titus at length caufed fire to be fet to the gates, after having had a very bloody encounter, in which his men were repulfed with lofs. The Jews were fo terrified at it, that they fuffered themfelves to be devoured by the flames, without attempting either to extinguifh them or fave themfelves. All this while Jofephus did not ceafe exhorting the infatuated people to furrender, to reprefent to them the dreadful confequences of an obltinate refiftance, and to affure them that it was out of mere compaffion to them that he thus ha. zarded his owa life to fave theirs: be received one day fueh a wound in his head by a flone from the battlements, as laid him for dead on the ground. The Jews fallied out immediately, to have feized on his budy; but the Romans proved too quick and flrong for them, and carried him off.

By this time the two factions within, but efpecially John ${ }^{45}$ that of John, having plundered rich and poor of all ders th they lad, fell alfo on the treafury of the temple, temple whence John took a great quantity of golden utenfils, together with thofe magnificent gifta which had been prefented to that facred place by the Jewifh kings, by Auguttus, Livia, and many other foreign princes, and melted then all to his own ufe. The repofitories of the facred oit which was to maintain the lamps, and of the wine which was referved to accompany the ufual facritices, were likewife feized upon, and turned into common ufe; and the laft of this to fueh excefs, as to make bimfelf and his party drunk with it. All this while, not only the zealors, but many of the pcople, were Aitll under fuch an infatuation, that tho' the fortrefs Autonia was loft, and nothing left but the temple, which the Romans were preparing to batter down, yet they could not perfuade themfelves, that God would fuffer that buly place to be raken by heathens, and were thill expecting fome fudden and miraculous deliverance. Even that vile monter John, who commanded there, either feemed confident of it, or elfe endeavoured to make them think him fo. For, when Jofephus was fent for the laft time to upbraid his obllinately expoling that lacred building, and the miferable remains of God's people, to fudden and fure deftruction, he only anfwered him with the bittereft invectives; adding, that he was defending the Lord's vineyard, which he was fure could not be taken by any hunan force. Jofephus in vain reminded him of the many ways by which he had polluted both eity and temple; and in particular of the feas of blood which he cauled to be thed in both thofe facred places, and which, he alfured him from the old prophecies; were a certain fign and forerunner of their fpeesy furrender and deftruction, John remained as infexible
as if all the prophets had affured him of a deliverance; till at length Titus, forefeeing the inevitable ruin of that flate:\% cdifice, which he was fill extrenty defirous to fave, vouchfafed even himfelf to fpeak to them, and to perfuade then to furrender. But the factious, looking upon this condeufcention as the effects of his fear rather than generofity, only grew the more furinus upon it, and forced him at laft to come to thofe extrem:ties, which he had hitherto endeavonured to avoid. That his army, which was to attack the temple, might have the freer paffage towards it thro' the cafte Antonia, he caufed a confiderable part of the wall to be pulled down, and levclled ; which prowed fo very ftrong, that it took him usp feven whole days, by which time they were far advanced in the month of July.

It was on the byth day of that month, as all Jofephus's copies have it, that the daily facrifice ceafed for the firf time fince its relloration by the brave Judas Maccabeus, there being no proper perfon left in the temple to offer it up. Titus caufed the factious to be feverely upbraided for it; exhorted John to fet up whom he would to perform that office, rather than fuffer the fervice of God to be fet afide; and then challenged him and his party to come out of the temple, and fight on a more proper cround, and thercby fave that facred edifice from the fury of the Roman troops. When nothing conld prevail on them, they began to fet fire again to the gallery which yielded a communication between the temple and the calle Antonia. The Jews had already burnt about 20 eubits of it in length; but this fecond blaze, which was likewife encouraged by the befieged, confumed about 14 more; after which, they beat down what remained itanding. On the 27th of July, the Jews, having filled part of the weftern portico with combuftible matter, mande a kind of flight; upon which, fome of the forwardelt of the Komans having faled up to the top, the Jews fet fire to it, which flamed with fuch fudden fury, that many of the former were confumed in it, and the reft, venturing to jump down from the battlements, were, all but one, crufhed to death.

On the very next day, Titus having fet fire to the north gallery, which inclofed the outer court of the temple, from fort Antonia to the valley of Cedron, got an ealy admittance into it, and forced the befieged into that of the priefls. He tried in vain fix days to bat . ter down one of the galleries of that precinct with an helepolis: he was forced to mount his battering-rams on the terrace, which was raifed by this time; and yet the flrength of this wall was fuch, that it eluded the force of thefe alfo, tho' others of his troops were bufy in fapping it. When they found that neither rams nor fapping could gain ground, they bethought themfelves of fcaling; but were vigoroully repulfed in the attempt, with the lofs of fome flandards, and a number of men. When Titus therefore found that his defire of faving that building was like to coft fo many lives, he fet fire to the gates, which, being plated with filver, butnt all that night, whillt the metal dropt down in the melting. The flame foon communicated itfelf to the porticoes and galleries; which the befieged beheld without offering to ftop it, but contented themfelves with fending whole rolleys of impotent curles againt the Romans. Tlis was doce on the eighth of

Augult; and, on the next day, Titus, having given Jewso orders to extinguift the fire, calied a council, to determine whether the remainder of the temple fhonld be faved or demolilhed. That general was Mill for the former, and moft of the reft declared for the latter; alleging, that it was no longer a temple, but a fcene of war and flaughter, and that the Jews would never be at reft as long as any part of it was leftftanding: but when they found Titus filify bent on preferving fo noble an edifice, againt which he told them he could have no quarrel, they all came over to his minf. The next day, Augult the roth, was therefore determined for a general affault : and the night before the Jews made two defperate faliies on the Romans; in the latt of whieh, thefe, being timely fuccoured by Titus, beat them back into their in 0 clufure.

But whether this laft Jewih effort exafperated the befiegers, or, which is more likely, as Jofephus thinks, puthed by the hand of Providence, one of the Roman foldiers, of his own aceord, took up a blazing firebrand, and, getting on his comrade's fhonlders, threw it into one of the apartments that furrounded the fancthary, through a window. This immediately fet the whole north-fide in a flame up to the third flory, on the fame fatal day and month in which it lad been formerly burnt by Nebuchadnezzar. Titus, who was gone to rell himfelf a while in his pavilion, was awaked at the noife, and ran immediately to give orlers to have the fire extinguifhed. He called, prayed, threatened, and even caned his men, but in vain; the cona fufion was fo great, and the foldiers fo obtinately bent upon deftroying all that was left, that he was neither heard nor minded. Thofe that flocked thither from the camp, inflead of obeying his orders, were bufy, cither in killing the Jews, or in increafing the flames. When Titus obferved that all his endeavours were vain, he entered into the fanctuary and the molt holy place, in which he found flill fuch fumptuous utenfils and other rickes as even exceeded all that had been told him of it. Out of the former he faved the golden candleflick, the table of ftew bread, the altar of perfumes, all of pure yrold, and the book or volume of the law, wrapped up in a rich gold tiffue: but in the latter he found no utenfils, becaufe, in all probability, they had not maue a frefh ark fince that of Solomon had been loft. Upon his coming cut of that facred place, fome other foldiers fet lire to it, and obliged thofe that had ftaid behind to come out ; they all fell foul on the plunder of it, tearing even the gold. plating off the gates and timber-work, and carried off all the coflly utenfils, robes, \&c. they found, infomuch that there was not one of them who did not enrich limfelf by it.

An horrid maffacre followed foon after, in which a A dreadfut great many thoufands perihed: fome by the flames, maflacres. others by the fall from the battlements, and a greater number by the enemy's fword, which deltroyed all it net with, without diftinction of age, fex, or quality. Anmong them were thpwards of 6000 perlo:s who liad been feduced thither by a falfe prophet, who promifed them that they thould find a fpeedy and miraculous relief there on that very day. Some of them remained five whole days on the top of the walls, and afterwands threy themfelves on the gene-

Jews．ral＇s mercy；but were anfwered that they had outitaid the time，and were led to execution．The Romans cai－ ied their fury to the burning of all the treafure hou－ fes of the place，tho＇they were full of the richelt fur－ niture，plate，vellments，and other things of value， which hatd been laid up in thote places for fecusity． In a word，they did not eeafe burning and butchering， till they had deftroyed all，except two of the temple． gates，and that part of the court which was deflined for the women．

In the mcan time the feditions made fuch a vigo－ rous pufh，that they efcaped the fury of the Romans， at leaft for the prefent，and retired into the city．But here they found all the avenues fo well guarded，that there was no poffibility left for them to get out；which obliged them to fecure themfelves as well as they could on the fouth．fide of it，from whence Simon，and Joln of Gifchala，fent to defire a parley with Titus． Thoy were anfwered，that though they had been the caufe of all this bloodihed and min，yit they fhould lave their lives fpared，if they laid down their arms， and furrendersd themfelves prifoners．＇l＇o this they replicd，that they liad engaged themfelves，by the moll folemn oatha，never to furrender ；and therefore， ouly begged leave to retire into the mountains with their wives and children：which infolence fo exafpe－ tated the Roman general，that he caufed an herald to hid them Rand to their defence；for that not one of them mould be fpared，fince they had rejected his laft offers of pardon．Immediately after this，he aban－ doned the city to the fury of the foldies，who fell forthwith on plundering，fetting fire evory where，and murdering all that fell into their hands；whild the facticus，who wore left，went and fortified themfelves in the royal palace，uhcre they killed 8000 Jews who had taken refuge there．

In the nucan time，great preparations were making for a vigorous attack on the upper city，efpecially on the royal palace；and this took them up from the zoth of Acgult to the $7^{2 t} t_{1}$ of September，during which tine great numbers came and made their fub－ miftion to Titus．The warlike engines then played fo furioufy on the factions，that they were taken with a fudden panic；and，inflead of fleeing into the towers of Hippicos，Phafael，or Mariamne，which were yet wintakin，and fo frong that nothing but famine could have reduced them，they ran like madmen towards Si－ loah，with a defign to have attacked the wall of cir－ cumvallation，and to have efcaped out of the city； tut，being there repulled，they were forced to go and hide themfelves in the public links and common few－ ers，fome one way and fome another．All whom the Romans could find were put to the fivord，and the ci－ ty was fet on fire．This was on the eighth of Sep－ tember，when the city was taken and entered by T ＇i－ tus．He would have put an end to the maffacre；but his men killed all，except the molt vigorous，whom they thut up in the porch of the women jult mention－ cd．Fronto，who had the care of them，referved the youngeft and moft beautiful for＇Titus＇s triumph； and fent all that were above feventeen years of age in－ to Egypt，to be employed in fome public works there； and a great number of others were fent into feveral ci－ ties of Syria，and other provinces，to be expofed on the public theatre，to exhibit fights，or be devour－ ENO 16 ．
ed by wild beats．The number of thofe prifoners amounted to 97,000 ，befides about in，000 more，who were either ftarved though neglect，or farved them－ felves through fullennefs and defpair．－The whole num－ ber of Jews who perifhed in this war is computed at up－ wards of $1,400,000$ ．

Befides thefe，however，a valt number perifhed in caves，woods，wilderneffes，common－fewers，\＆c．of whom no computation could be made．Whillt the foldiers were ftill buly in burning the remains of the city，and vifiting all the hiding－places，where they killed numbers of poor creatures who had endeavoured simon to evade their cruelty，the two grand rebels Simon Johnt and John were found，and referved for the triumph of the conqueror．John，being pinched with hinger， foon cane out ；and having begged his life，obtamed it ；but was condemned to perpetual imprifonment． Simon，whofe retreat had been better ftored，held out till the end of October．The two chiefs，with 700 of the handfomeft Jewifh captives，were made to at－ tend the triumphal chariot；after which Simon was dragged through the Arects with a rope about his neck，feverely fourged，and then put to death；and John was fent into perpetual imprifonment．－Three caftes flill remained untaken，namely，Hcrodion，Ma－ cheron，and Maflada．The two former capitulated； but Maflada held out．＇The place was exceedingly llrong both by nature and art，well fored with all kinds of provifions，and defended by a numerous par－ rifon of zealots，at the liead of whom was one Elea．Mafla zar，the grandfon of Judas Gaulonites，formerly men－ tioned．The Roman general baving in vain tried his engines and battering－rams againt it，bethought him－ felf of furrounding it with a high and Atrong wall， and then ordesed the grates to be fet on fire．The wind pufled the flames fo fiercely againft the Jews， that Eleazar in defpair perfuaded them firf to kill their wives and children，and then to choofe ten men by lot，who thould kill all the relt；and lally one out of the furviving ten to difpatch them and himfelf；on－ ly this laft inan was ordered to fet fire to the place be－ fore he put an end to his own life．All this was ac－ cordingly done ；and on the morrow，when the Romans were preparing to fcale the walls，they were greatly furprifed neither to fee nor hear any thing move．On this they made fuch an hideous outcry，that two wo－ men，who had conctaled themfelves in an aqueduct， came forth and acquainted them with the defperate catallrople of the befieged．

Thus ended the Jewifh nation and worfhip；nor have they ever fince been able to regain the fmallef footing in the country of Judta，nor indeed in any other country on earth，though there is fcarce any part of the globe where they are not to be found．They continue their vain expectations of a Meffiah to deli－ ver them from the low eflate into which they are fal－ ten；and，notwithttanding their repeated difappoint－ ments，there are few who can ever be perfuaded to embrace Chriltianity．Their ceremonies and religious wormip ought to be taken from the law of Mofes； but they lave added a inultitude of abfurdities not worth the inquiring after．In many countries，and in different ages，they have been terribly maffacred，and in general have been better treated by the Mahome－ tans and Pagans than by Chriftians．Since the revi－路
sal of arts and learning, however, they have felt the benefit of that increafe of humanity which hath taken place almoft all over the globe. It is faid, that in this country the life of a Jew was formerly at the difpofal of the chief lord where be lived, and likewife all his goods. So ftrong alfo were popular prejudices and fufpicions againft them, that in the year 1348, a fatal endemic diftemper raging in a great part of Europe, it was faid that they had poifoned the fprings and wells; in confequence of which a million and a half of them were cruelly maffacred. In 1492, half a million of them were driven out of Spain, and 150,000 from Portugal. Edward I. did the fame. In fhort, they were every where perfecuted, oppieffed, and moft rigoroully treated.

In this enlighted period a more generous fyftem is taking place. France has allowed them the rights of citizens, which induces numbers of the moft wealthy Jews to fix their refidence in that country. Poland is about granting them very great privileges and immunities; England, Holland, and Pruffia tolerate and protect them; and the emperor has revoled fome reilrictions, for whieh an edict has lately paffed: Spain, Portugal, and fome of the Italian flates, are ftill, however, totally averfe to their dwelling among them.
JEZIDES, among the Mahometans; a term of fimilar import with heretics among Chrittians.

The Jezides are a numerous fect inhabiting Turky and Perfia, fo called from their head Jezid, an Ara. bian prince, who llew the fons of Ali, Mahomet's fa-ther-in-law; for which reafon ihe is reckoned a parricide, and his followers hereitcs. Thele are about 20,000 Jezides in Turky and Perlia; who are of two forts, black and white. The white are clad like Turks; and diftinguifhed only by their thits, which are not dit at the neck like thofe of others, but have only a round bole to thruft their heads through. This is in memory of a golden ring, or circle of light, which defcended from heaven upon the neck of their eheq, the head of their religion, after his undergoing a fat of forty days. The black Jezides, thongh married, are the monks or religious of the order; and thefe are called Fakirs.

The Turks exact exceffive taxes from the Jezides, who hate the Turks as their mortal enemies; and when, in their wrath, they curfe any ercature, they call it muffulman: but they are great lovers of the Chriftians, being more fond of Jefus Chritt than of Mahomet, and are never circumcifed but when they are forced to it. They are extremely ignorant, and believe both the bible and the koran without reading either of them: they make vows and pilgrimages, but have no places of religious worlhip.

All the adoration they pay to God confifts of fome fongs in honour of Jefus Chrith, the virgin, Mofes, and Cometimes Mahomet; and it is a principal point of their religion never to \{peak ill of the devil, left he fhould refent the injury, if ever he fhould come to be in favour with God again, whicl they think poffible; whenever they fpeak of him, they call him the angel Peacock. They bury their dead in the firt place they come at, rejoicing as at a feftival, and celfbrating the entry of the deceafed into heaven. They go in companies like the Arabians, and change their llabitations Vol, IX. Part I,
every 15 days. When they get wine, they drink it to excefs; and it is faid, that they fometimes do this with a religious purpofe, calling it the blood of Chritt. They buy their wives; and the market-puice is 200 crowns for all women, laandfome or not, without diftinction.

JEZRAEL, or Jezreml, a town in the north of Samaria, towards mount Carmel, where ftood a palace of the kings of Ifrael, 1 Kings xxi. 18. On the borders of Galilee (Jofhua xix.) faid to be one of the towns of Iffachar. - The valley of Jezreel (Judges vi. 17.) was fituatcd to the north of the town, running from weft to eaft for ten miles, hetween two mountains; the one to the north, comnonly called Hermon, near mount Tabor; the other Gilboa: in breadth two miles.

IF, an idand of France, in Provence, and the mofe eaftern of the three before the harbour of Marfeilles. It is very well fortified, and its port one of the beft in the Mediterranean.

IGIS, a town of the country of the Grifons, in Caddea, with a magnificent calle, in whicl is a cabiner of curiofities, and a handfome library; 23 miles fouth weft of Choira, and 23 fouth of Glaris. E. Lon. 9. o. N. Lat. 49. 10.

IGLAW, a contiderable and populous town of Germany, in Moravia, where they have a manufactory of good cloth, and excellent beer. It is feated on the river Igla, 40 miles weft of Brin, and so fouth-eat of Prague. E. Long. 15.5. N. Lat. 49. 10.

IGNATIA, in botany, a genus of the monogymia order, belonging to the pentandria claifs of plants. The calyx is five-toothed; the corolla is long; the fruit an unilocular plum, with inany feeds. There is but one fpecies, the amara, a native of India. The fruit of this tree contains the feeds callod St Igraztius's besns.
The beft account of the plant that lias yet appeared, is that fent by father Camelli to Ray and Petiver, and publifhed in the Philofophical Tranfactions for the year 1699 : he obferves, that it grows in the Philippiacs ifands, and winds iffelf about the tallett trees to the top; that it has large, ribbed, bitter leaves, a Sower like that of the ponegranate, and a fruit larger than a mclon. Some sefemble the fruit to a poinegranate, probably from mifapplying Camell's words. The fruit is covered with a thin, gloffy, blackih, green, apd as it were marbled fhell, ander which is lodged anothe: of a ftony hardnefs: within this is contained a foft, yellow, bitterith pulp, in which lie the feeds or beans, to the number commonly of 24 , each covered with a filvery down.

The fame gentlenan gives an accommt of the virtues attributed to thefe fecds by the Iudians; but experience has fhown that they are dangerous. Konig relates, that a perfon, by drinking fome of a fpirituous tincture of them inftead of aqua vite, was thrown into Atrong convultions: and Dr Grim, that a dram of the feed in fubtance occalioned, for a time, a total deprivation of the feufes. Others mention violent vomitings and purgings from its ufe. Neumann hatlo obferved intermitting fevers removed by drinking, on the approach of a paroxyfm, an infution of fome grains of the bean nade in carduus water: We are not, however, from hence to look upon this medicine as an univerfal $£=b r i f u g e$, or to ufe it indifcriminattly.

Ignatius.

Thefe beans (for fo cuftom requires that we fhould call them) are about the fize of a moderately large nutmeg ; in figure fomewhat roundif, but extremely irregular fod-cly any two being entiely alike, full of nateq in depteffions and prominences; in colour, externally yellawifh brown, but when the onter fkin is taken off, of a tlackifi brown, and in part quite blackith; in conffitence hard and compact as horn, fo as not to be reducible into a powdery form, but by cutting or rafping: for all their hardnefs, however, they are not pro,? againtl worms. When frefl, they have fomewhat of a mufky finell, which by age is lolt : their tafte is very bitter, refembled by fone to that of centalry.

According to fome, it is from this plant that the Columbo: ot is ohtzined.

IGNATIUS Loyola, (canonized), the founder of the well known order of the Jesuirs, was born at the cafle of Looyola, in Bifcay, 1491 ; and became frat page $t$ Ferdinand $\mathbb{C}$. King of Spain, and then an officer in his army. In this latt capacity, he fignalized himfelf by his valour; and was wounded in both legs at the fiege of Pumpelum, in 1521 . To this circunflance the Jefuits owe their origin ; for, while he was under cure of his wound. a Lije of the Saints was put into his hands, which determined hion to furfake the military for the eeel fallical profefion. His firll devout exercife was to didicate lumfelf to the bleffed virgin as her knight: he then went a pilurimage to the Holy Land ; and on lis return to Eurupe, be continued his theological fludics in the uaiverfities of Spain, though he was then ? 3 years of age. After this he went $t 1$ Paris; and in France laid the foundation of this new order, the inllitutes of which he prefented to Pope Paul III. who made nany objections to them, but at laft confirmed the inflitution in 1540 . The founder died in 1555, and left his difciples two famous books: 1. Spiritual exercifes; 2. Conftitutions or rules of the order. But it mult be remembered, that though thefe avowed inflitutes contain many privileges obnoxious to the wilfare of fociety, the mot diabolical are contained in the private rules intitled Monita fecre$t a$, which were not difeovered till towards the clofe of the laft century ; and mont writers attribute thefe, and even the Conflitutions, to Laynex, the fecond general of the order.

Igsatius (St), furnamed Theophraflus, one of the apoftolical sathers of the church, was born in Syria, and educated under the apofle and evangelift St Jobn, and intimately acquainted with fome other of the apottles, efpecially St Peter and St Paul. Being fully inltructed in the doctrines of Chriftianity, he was, for his eminent parts and piecy, ordained by St Jolu, and confirmed ahout the year 67 bifhop of Antioch, by thofe two apoltits, who firf planted Chriftianity in that city, where the diciphes alfo were firf called Chrifians. Antioch was then not only the metropolis of Syria, but a city the moft famous and renowned of any ia the eaft, and the ancient feat of the Roman emperors, as will as of the viccroys and governors. In this important feat he continued to fit fomewhat above 40 ytars, both an honour and fafe-guard of the Chriltian religion, till the year 107, when Trajan the emperor, fiufted with a victory which he had lately obtaned over the Scythinns and Daci, about the ninth year of his reign, came to Antioch to make preparations for
a war againt the Parthizns and Armenians. He en- Pgn tered the city with the pomp and folmmities of a triumph ; and, as his firtl care ufually wis about the concernments of relifion, he began prefently to inquire into that affair. Chriftianity had by this time made fuch a progrefs, that the Romans grew jealous and uneary at it. This prince, therefore, had already commenced a perfecution againft the Chrifians in other parts of the empire, which he now refolved to carry on here. However, as lie was naturally of a mild difpofition, though he ordered the laws to be put in force againft them if convicted, yet he forbad them to be fought after.

In this flate of affairs, I natius, thinking it more prudent to go himfelf than flay to be fent for, of his own accord prefented himfelf to the emperor; and, it is faid, thete pafferl a long and particular difcourfe between them, wherein the emperor expreffing a furprife how he dared to tranfyrefs the laws, the bifhop took the opportunity to affert his own imnocency, and to explain and vindicate his faith wish freedom. The iffue of this was, that he was caft into prifon, and this fentence paft d upon him, That, being incurably overIun with fuperlition, he fhould be carried bound by foldiers to Rome, and there thrown as a prey to wild beafts.
He was fist c nducted to Seleucia, a port of Syria, at about 16 miles dillance, the place where Paul and Barnabas fet fail for Cyprus. Arriving at Simyrna in Ionia, he went to vilit Pulycarp bifhop of that place, and was himfelf vilited by the clergy of the A fian churches round the country In return for that kindnefs, he wrote letters to feveral churehes, as the Ephefians, Marnefians, and Tiallians, befides the Romans, for their iuftruction and ellabliflment in the faith; one of thefe was addreffed to the Chriflians at Rome, to acquaint them with his prefent ftate, and paffomate defire not to be hindered in the courfe of martyrdom which he was now haftening to accomplifh.
His guard, a little impatient of their ftay, fet fail with him for Troas, a noted city of the leffer Phrygia, not far from the ruins of old Troy; where, at his arrival, he was much refrefhed with the news he received of the perfecution ceafing in the church of Antioch : hither alfo feveral churches fent their meffengers to pay their refpects to him; and hence too he difpatched two epillles, one to the church of Philadelphia, and the other to that of Sinyrna; and, together with this laft, as Eufebius relates, he wrote privately to Polycarp, recommending to him the carc and iafpection of the church of Antioch.

From Troas they failed to Neapolis, a maritime town in Macedonia; therce to Pinilippi, a Roman coloriy, where they were entertained with all imaginable kinduefs and courtefy, and conducted forwards on their journey, paffing on foot througts Macedouia and Epirus, till they came to Epidanium, a city of Dalmatia; where again taking fhipping, they failed through the Adriatic, and arrived at Rhegium, a port-town in Italy; directing their courfe thence through the Tyrrhenian fea to Puteoli, whence Ignatius defired to proceed by land, ambitious to trace the fame way by which St Paul went to Rome : but this wifh was not complied with; and, after a flay of $2+$ hours, a profperous wind quickly carried them to the Roman port, the great harbour and flation for their navy, built near Ottia, at the mouth of the Tyber, about 16 miles
from Rome; whither the martyr longed to come, as much defirous to be at the end of his race, as his keepers, weary of their voyage, were to be at the end of their journey.

The Chrittians at Rome, daily expecting his arrival, were come out to meet and entertair him, and accordingly recsived him with a mixture of joy and forrow; but when fome of them intinated, that poffibly the populace might be taken off from defiring his death, he expreffid a pious indignation, intreating them to caft no rubs in his way, nor do any thing that might hinder him, now he was haftening to his crown. There are many fuch expreffions as this in his epittle to the Romans, which plainly fhow that he was highly am. bitious of the crown of martyrdom. Ytt it does not appear that he rafhly fought or provoked danger. Among other expreflions of his ardor for fuffering, he faid, that the wild beafts had feared and refufed to touch fome that had been thrown to them, which he hoped would not happen to him. Being conducted to Rome, he was prefented to the profect, and the emperor's letters probably delivered concerning him. The interval before his martyrdom was fent in prayers for the peace and profperity of the church. I hat his punifhment might be the more pompous and public, one of their folemn feltivals, the time of their Saturualia, and that part of it when they eelebrated their Sigillaria, was pitched on for his exceution ; at which time it was their cultom to entertan the people with the bloody coullicts of gladiators, and the hunting and fighting with wild beatts. Accordingly, on. the $\cdot 3^{\text {th }}$ hal. January, i.e. December 20. he was brought out into the amphitheatre, and the lions being ler loofe upon him, quickly difpatched their meal, leaving nothing but a few of the lardeft of his buncs. Thefe remains were gathered up by two deacons who had been the compations of his journey; and being tranfported to Antioch. were interred in the cen etery, without the gate that leads to Dapline ; whence, by the command of the emperor Theodofius, they were removed with great pump and foleminy to the Tycheon, a temple within the ciny, oedicated to the pub lic genius of it, but now confecrated to the memory of the martyr.

St Ignatius flands at the head of thofe Antinicene fathers, who have occalionally colivered their opinions in defence of the tue divinity of Chrit, whom he calls the Son of Guel, and his eternal Word. He is alfo reekoned the great clampion of the doctrine of the epircopal order, as diftinct and fuperior to that of prietl and deacon And one, the moth important, ufe of his writings refpects the authenticity of the holy Scriptures, which he frequently alludes to, in the very ex. prufions as they thand at this day.- Archhimop Uith. er's edition of his works, printed in 1647 , is thought the bett : yct there is a frefher edition extant at Am . fterdan, where, befide the bett notes, there are the differtations of Uther and Pearfon.

## St Ignities's Bean. See Ignatia.

IGNIS fatues, a kind of light, fuppofed to be of an clectric nature, appearing frequently in mines, maifty places, and neal Atagnating waters. It was formerly thought, and is IIill by the fupertitious believed, to have fomething ominous in its nature,
and to prefage death and other misfortunes. There Ignition have been inflances of people being decoyed by thefe lights into marthy places, where they have perifhed; Ignorance. whence the names of Igris fotuus, Will-with a-wifp, and Fock-with a a lanthorn, as if this appearance was an evil (pirit which took delight in doing mifchief of that kind. For a further account of the nature and properties of the ignis-fatuus, fee the articles Light and Meteor.

IGNITION, properly fignifies the fetting fire to any fubtance; hut the fenfe is commonly reltrained to that kind of burning which is not accompanied with flame, fuch as that of charcoal, cinders, rectals, ftones, and other folid fubftances.

The effects of ignition are firlt to diffipate what is called the phlogifon of the ignited fubilance, after which it is reduced to athes. Vitrification next follows; and lattly, the fubftance is totally difipated in vapour. All thefe effects, however, depend on the prefence of the air ; for in vacuo the phlogifton of any fubitance cannot be diffipated. Neither can a body which is totally delitute of philogiton be ignited in fuch a manner as thofe which are not deprived of it: for as long as the phlogitton remains, the heat is kept up in the body by the action of the external air upon it ; but when the phlogilton is totally gone, the air always deftroys, intlead of augmenting, the heat. Philof plier have therefore been greatly embarraffed in explaning the phenomena of ignition. See Phlogiston.

IGNOBILES, amongit the Romans, was the defignation of fuch perfons as had no right of ufing pictures and Matues. See fos Imaginis.

IGNOMIN1A, a fpecies of punifhment amongt the Romans, whereby the offender fuffered public fhame, either by virtue of the pretor's edict, or by order of the cenfor. This punifhment, belides the feandal, duprived the party of the privilege of bearing any offices, and almott all other liberties of a Roman citizen.
IGNORAMUS, in law is a word properly ufed by the grand inqueft empanelled in the inquifition of caufes criminal and public, and written upon the bill whereby any crime is offered to their confideration, when as they minike their evidence as deftetive or too weak to make goud the prefentment; the effect of which word fo written is, that all farther inquiry upon that paity for that fault is thereby fopped, and he delivered without farther anfwer. It hath a refemblance with that cuftom of the ancient Romans, where the judges, when they abfolved a perfon accufcd, did wite A. upon a little table provided for that purpose, i. e abfolvinus; if they judged him guilty, they wrote C. i. e. condemnamus; if they found the caufe difficult and doubtful, they wrote N. L. i. e. non I'guet.
IGNORANCE, the privation or ablence of knowledge. The caufes of ignorance, according to Locke, are chicfly thefe three. 1. Want of ideas. 2. Want of a difcoverable connection between the ideas we have. 3. Want of tracing and exanining our ideas. See Metaphysics.

Ignorasce, in a more particular fenfe, is ufed to denote illiteracy. Previous to the taking of Rome by the Gauls, fuch grofs ignorance prevailed among the Romans, that few of the citizens cuuld read or wite, and T 3

$1_{k}$ norance the alphabet was almof unknown. During three ages there were no public fchools, but the little learning their children had was taught them by their parents; and how little that was may be partly concluded from this circumflance, that a mail was ufually driven into the wall of the temple of Jusiter Cupitalinus, on the 1 sth of Sep. tember, to affilt the ignorance of the people in reckoning the years, becaufe they were unacquainted with leters or ligures. The driving of the nail was afterwards converted into a rel:gious ceremony, and performed by the Difiutor, to avert public calamities.
lgnorancl, or mitake, in law, a defect of will, whereby a perfon is excufd from the guilt of a crime, when, intenting to do a lawfulact, he does that which is unlawful. For here the deed and the will acting feparately, there is not that conjunction beween them which is neceffary to form a criminal act. But this muld be an ignorance or miftake of fact, and not an error in point of law. As if a man intending to kill a thief or honfe-breaker in his own houfe, by miftake kills one of his uwu family, this is no criminaladion: but if a man thinks he thas a right is kill a perfon exconnaurieated or outhwed wherever he meets him, and dues fo; this is wilful murder. lom a millake in point of haw, which every perfon of diferetion not only may, but is bound and prefumed to know, is, in criminal cafes, no fort of defence. Ignorantia juris quod quifyue tenetur- firere, neminem exanfat, is as well the maxim of our own law as it was of the Roman.
igutana, in zoology, a feceies of lacerta.
Alud-hiersma. Sce Nuraena.
HOR, Johor, or For, a town of Afia, in Malacca, and capital of a province of the fane name in the perimfula beyond the Ganges. It was taken by the Portugusfe in 1603, who deftroyed it, and carried off the cannon; but it has fince been rebuilt, and is now in poffeffion of the Dutcli. E. Long. 23.55. N. Lat. 1.15.

JIB, the foremof fail of a mip, being a large flayfail extended frorr. the outer end of the bowfprit prolonged by the jib-boom, towards the fore-top mafthead. Sce Sail.

The jib is a fail of great command with any fidewind, but efpecially when the fhip is clofe bauled, or has the wind upon her bean ; and its effort in cafing the fhip, or turning her lead to leeward, is very powerful, and of great utility, particularly when the Ship is working through a narrow chamel.
$\mathcal{F}_{13}$-Bion, a boom run out fron the extremity of the bowfrit, parallel to its length, and ferving to extend the bottom of the jib, and the flay of the fore-top-gallaut maft. This boom, which is nothing more than a continuation of the bow-fprit forward, to which it may be confidered as a top mant, is ufually attached so the bowfprit by means of two large boom irons, or by one boom iron, and a cap on the outer end of the bowfprit ; or, finally, by the cap withont and a Atreng lafling within, inftead of a boom iron, which is generally the method of fecuing it in frall mer-chant-fips. It may therefore be drawn in upon the bowfprit as nceafion recquires; which is ufvally praczifed whem the fhip enters a harbour, where it might very foun be broken or carried away, by the veffels Which are moored therein, or pafing by under fail.
JIBUEL-AreEz: the mons avrafuis of the middle
age, an aftemblage of many very rocky mountains in Africa, in the kingdom of Algiers. Here Mr Bruce met with a race of people much fairer in the complexion than any of the nations to the fouthward of Britain: their hair was red, and their eyes blue: they maintain their independence, and are of a favage difpofition, fo that our traveller found it difficult to approach them with fafety. They are called Neardia; and each of them has a Greek crofs in the middle between the eyes, marked with antimony. They are divided into tribes, but, unlike the other Arabs, have huts in the mountains built of mud and ftraw; and are, by our author, fuppofed to be a remnant of the Vandals He even thinks that they may be defcended from the remainder of an army of Vandals mentioned by Procopius, which was defeated among the fe mountains. They live in perpetual war with the Moors, and boaft that their anceltors were Chriftians. 'They pay no taxes.

JIDDA, a town of Arabia, fituated, according to Mr Bruce, in ${ }^{3} \mathrm{~N}$. Lat. $28^{\circ}$ of $t^{\prime}$ E. Long. $39^{\circ} 16^{\prime}+5^{\prime \prime}$. It is fituated in a very unwholefom?, barren, and defert part of the country. Immediately without the gate to the eallward is a defert plain filled with the huts of the Bedoweens or country Arabs, built of long bundles of fpartum or bent-grafs put together like fafcines. Thefe people fupply the town with milk and butter. "There is no llirring out of the town (fays Mr Bruce) even for a walk, unlefs for about half a mile in the fonth fide by the fea, where there is a number of finking pools of flagnant water, which contributes to make the town very unwholefome."

From the difagreeable and inconvenient fituation of this port, it is probable, that it would have been long ago abandoned, had it not been for its vicinity to Mecca, and the valt annual influx of wealth occationed by the India trade; which, however, does not continue, but palfes on to Mecca, whence it is difperfed all over the calt. The town of Jidda itfelf receives but little advantage, for all the cultoms are immediately fent to the needy and rapacious fheriff of Mecea and his dependents. "The gold (fays Mr Bruce) is returned in bags and boxes, and paffes on as rapidly to the mips as the goods do to the market, and leaves as little profit behind. In the mean time provifions rife to a prodigious price, and this falls upon the townfmen, white all the profit of the traffic is in the hands of flrangers; mott of whom, after the market is over (which does not laft fix weeks), retire to Yemen and other neighbouring countries, which abound in every fort of provifion.

From this fcarcity, Mr Bruce fuppofes it is that polygamy is lefs common bere than in any other part of Arabia. "Few of the inhabitants of Jidda (fays cur author) can avail themfelves of the privilege granted by Mahomet. He cannot marry more than one wife, becaufe be cannot maintain more; and from this caufe arifes the want of people and the number of unmarried women."
The trade at Jidda is carried on in a manner which appeared very ftrange to our traveller. "Nine fhips (fays he) were there from India ; fome of them worth, 1 fuppofe, 200,0001 . One merchant, a Turk, living at Mecca, 30 hours journey off, where no Chriftian dares go whillt the continent is open to the Turk for escapt,
efcape, offers to purchafe the cargoes of four out of thefe nine thips himfelf; another of the fame calt cones and fays he will buy none unlefs he has them all. The famples are fhown, and the cargoes of the whole nine fhips are carried into the wildelt parts of Arabia by men with whom one would not wifh to trud himfelf alone in the field. This is not all ; two India brokers come into the room to fettle the price; one on the part of the India Captain, the other on that of the buyer the Turk. They are neither Mahometans nor Chriltians, but have credit with both. Thry fit down on the carpet, and take an India thawl which they carry on their Thoulder like a napkin, and fpread it over their hands. They talk in the mean time indifferent converfation, as if they were employed in no feriuus bufinefs whatever. After about 20 minutes fpent in handling each others fingers below the flawl, the bargain is concluded, fay for nine fhips, without one word ever having been fpoken on the fubjeet, or pen or ink ufed in any thape whatever. There never was one inftance of a difpute happening in thefe fales. But this is not all; the money is yet to be paid. A private Moor, who has nothing to fupport him but his character, becomes refponfible for the payment of thefe cargoes. This man delivers a number of coarfe hempen bags full of what is fuppofed to be money. He marks the contents upon tie bag, and puts his, feal upon the fring that ties the mouth of it. This is received for what is marked upon it without any one ever having opened one of the bags; and in India it is current for the value marked upon it as loug as the bag lafts.

The port of Jidda is very extenfive, and contains numberlefs fhoals, fmall if inis, and fuuk rocks, with deep channels, however, between them; but in the harbour itfelf thips may ride fecure, whatever wind blows. The only danger is in the coming in or going out ; but as the pilots are very fkilful, accidents are never known to happen. The charts of this harbour, as Mr Bruce informs us, are exceedingly erroneous. White he flaid here, he was defired by Captain Thomhill to make a new chart of thic harbour ; but finding that it had been undertaken by another gentleman, Captain Newland, he dropped it. He argues in the Itrongeft terms againft the old maps, which he fays can be of no ufe, but the contrary; and hé gives it as a characteritic of the leed fea, "Fcarce to have foundings in any part of the channel, and often on both fides; whilt afhore, foundings are hardly found a boat length from the main. To this, fays he, I will add, that there is fearce one ifland on which I ever was, where the boltffrit was not over the land, while there were no foundings by a line heaved over the ftern. Of all the veffets in Jidda, only two had their log.lines properly divided, and yet all were fo fond of their fuppofed accurasy, as to aver they had kept their courfe within five leagues between India and Babelmandel. Yet they had made no eflimation of the currents without the flraits, nor the different very flrung ones foon after palfing Socotra; their halfminute glaffes, upon a medium, ran 57 feconds; they lad made no ubiervations on the tides or currents in the lied fea, either in the channel or in the inward yaflage ; yet there is delineated in this map a courfe of

Captain Newland's, which he kept in the middle of
 you would think every yard was meafured and founded!"

hkENILD street, one of the four famous ways which the Romans made in England, called Stratu" Iicnorum, becaufe it began in the country of the Ireni, who inhabited Norfolk, Suffolk, and Cambridgeflire.

ILA, Ilay, or I/la, onc of the Weftern Ifles of Scotland, lying to the weft of Jura, from which it is feparated by a natrow channel. It extends 28 miles in length from north to fouth, and is .18 in breadth from eaft to welt. On the ealt lide, it is full of mountains covered with heath; to the fouthward, the land is tolerably well cultivated. In fome parts the inhabitants have found great plenty of limeftone, and lead-mines are worked in three different places. The only harbour in Ina is at Lochdale, near the north end of the inand. Here are feveral rivers and lakes well fored with trout, eels, and falmon. In the centre is Loch Finlagan, about three miles in circuit, with the little ine of that name in the middle. Here the great lord of the ifles once refided in all the pomp of royalty; but his palaces and offices are now in ruins. lutlead of a throne, Macdonald ftood on a flone feven feet fquare, in which there was an impreffion made to receive his feet; here he was crowned and anointed by the bifhop of Argyle and feven inferior prietls, in prefence of the chieftains. This flone fill cxilts. The ceremony (after the new lord lad collected his kin. dred and vallals) was truly patriarchal. After putting on his armour, his helmet, and his fword, he took an oath to rule as his anceftors lad done; that is, to govern as a father would his children: his people in return fwore that they would pay the fame obedience to him as children would to their parent. The dominions of this potentate, about the year 1586 , confitited only of Ilay, Jura, Knapdale, and Cantyre: fu, reduced were they from what they had been before the deprivation of the great earl of Rofs in the reign of James III. Near this is another little ine, where he affembled his council, Ilan na Corlle, or "the ifand of council;" where 13 judges conflantly fat to decide differences among his fubjects; and received for their trouble the 1 th part of the value of the affair tried before them. In the firt ifland were buried the wives and children of the lords of the ifles; but their own penfons were depolited in the more facred ground of Iona. On the thores of the lake are fome marks of the quarters of his Carnauch and Gilli glafies, "the military of the ifes:" the firlt fignifying a trong man, the laft a grim looking fellow. The firft were lightarmed, and fought with darts and daggers; the latt with fharp hatchets. Thefe are the troops that Shakefpeare alludes to, wben he fpeaks of a 1 ) nald, who
Of Kerwes a:ad Gallow-grates way fayplied.

Befides thofe already mentioned, the lords had a houfe and chapel at Laganon, on the fouth fide of Loch-andaal: a ilrong cafte on a rock in the fea, at Dunowaik, at the fouth-ralt end of the countiy; fur they
lla, nade this inand their reflience after their expulfion from that of Man in $\mathbf{1} 30 \%$ - There is a tradition, that while the Ifle of Man was part of the kingdom of the illes, the rents were for a time paid in this country : thofe in filver were paid on a rock, thill calied Creis-a-nione, or "the rock of the filver-rent;" the other, Creg a-nairgid, or "the rock of rents in kind." Thife lie oppofite to each other, at the mouth of a harbour on the futh fide of this illand. There are feveral forts built on the ifles in freth water lakes, and divers caverns in different parts of the ifland, whicb have been uled occafionally as places of Arength. The illand is divided into four parifhes, viz. Kildalton, Kilaron, Kilchoman, and Kilmenie. 'I he produce is corn of different kinds; fuch as bear, which fometimes yields cleven fold; and oats fix. fold. Much flax is raiicd leere, and abont L. 2000 wonth fold out of the ifland in yarn, which might better be manufactured on the lpot, to give employ to the poor natives. Notwithllanding the excellency of the land, above L. 1000 worth of meal is annually imported. Ale is frequent ly made in this illand of the young tops of heath, mixing two thirds of that plant with one of malt, fometimes adding hops. Buethius relates, that this liquor was much ufed among the Picts; but when that nation was extirpated by the Scots, the fecret of making it perifhed with them. Numbers of cattle are bred here, and about 1700 are annually exported at the price of 50 flillings each. The fland is often overflocked, and numbers die in March for want ot fodder. None but milch-cows are houfed: eattle of all other kinds, except the faddle-horfes, run out during winter

The number of inhabitants is computed to be between feven and eight thoufand. About 700 are employed in the mines and in the fifhery: the rell are gentlemen farmers, and fubtenants or fervants. The women finin. The fervauis are paid in kind; the fixth part of the crop. They have houfes gratis: the mafter gives them the feed tor the lirft year, and lends them horfes to plough annually the land annexed.

The quadrupeds of this ifland, as enumerated by Mr Pennant $\dagger$, are itot,, weefuls, otters, and hares: the lait fmall, dark coloured, and bad runners. The birds are eagles, peregrine falcons, black and red game,

263. 

power of fafcination is as ftrongly believed here as it was by the thepherds of Italy in times of old.
"fcio guis teneros oculis zuli fiominat arnos?"
But here the power of the evil-eye affects more the mulch-cows than lambs. If the good houfewife perceives the effect of the malicious on any of her kine, Mie takes as much milk as the can drain from the enchanted herd (for the witch commonly leaves very little). She then boils it with certain heibs, and adds to them flints and untempered ikeel: after that the fecures the door, ana invokes the three facred perfons. This puis the witeh into fuch an agony, that the comes nilling willing to the houre, begs to be admitted, to obtain relicf by touching the powerfol pot: the good wuman then makes her terms; the witch reftores the milk to the cattle, and in return is freed from her pains. But fonctimes, to fave the trouble of thofe charms (for it may happen that the diforder may arife from other caules than an evil eyc), the trial is made by immerging in milk a certain herb, and if the cows are lupernaturally aftected, it inftantly diltills blood. The unfuceefsful lover revenges !imelf on his happy rival by charms potent as thofe of the fnepherd Alphelibxus, and exactly fimilar:

> Netce tibibus modis ternos, A.arylli, colores: Xecte, Imarylh, modo.

Donald takes three threads of different hues, and ties three knots on each, three times imprecating the molt crucl difappointments on the nuptial bed: but the bridegroom, to avert the harm, ftands at the altar with an untied thoe, and puts a fixpence beneath his foot.

Hitory furnifies very few materials for the great events or revolutions of Ilay. It feems to have been long a feat of empire, probably jointly with the Ille of Man, as being moft conveniently fituated for the government of the rell of the Hzbrides; for Crovan the Norwegian, after his conquelk of that inland in so66, retired and finithed his days in Ilay. There are more Danifh or Norwegian names of places in this inland than any other: almoft all the prefent farms derive their titles from them; fuch as Perfibus, Torridale, Torribolfe, and the like. On the retreat of the Danes it became the feat of their fucceffors the lords of the illes; and continued, after their pover was broken, in the reign of James III. in their defeendants the Macdonalds, who held or ought to have h-ld it from the crown. It was in the poffeflion of a Sir James Macdonald, in the year 1598 , the fame who won the battle of Traii-dhruinard. His power gave umbrage to James VI. who directed the lord of Macleod, Cameron of Lochiel, and the Macneites of Barra, to fupport the Macleans in another invafon. The rival parties met wear the hill of Benbigger, eat of Kilarow; a fierce enragement enfued, and the Macdonalds were defeated aud almolt entirely cut off. Sir James efcaped to Spain; but returned in 1620 , was pardoned, received a penlion, and died the fame year at Glafgow ; and in him expired the latt of the great Macdonalds. But the king, irritated by the dilurbances raifed by private wars, wayed between thele and other clans, refumed the grant made by his predecef. for, and transferred it to Sir John Camphell of Calder, who held it on paying an annual feu-duty of five hundred pounds ferling, which is paid to this day. The

chefter, ifland was granted to Sir Joln as a reward for his defonfo. undertaking the conquett ; but the family confidered it as a dear acquifition, by the lofs of many gallant followers, and by the expences incurred in fupport of it.

ILCHESTER, a town of Somerfethire in England, feated on the river Yeovil, 129 miles from L Mdon, is fo called, becaufe it once had a caille, and flands on the river Ivel. It is a place of great antiquity, as appears by the Roman coins which are fometimes duy up. It is likewife evident, from the ruins and from two towers on the bridge, that it was once a large place, and encompaffed with a double wall. It alfo had feveral parifh churches, theugh now but one. It is governed by two bailiffs, who with the twelve burgeffes are $1 . r d s$ of the manor. In the reign of Edward III. the affizes for the county were fixed here, which have fince be on held alternately at Wells, Tauntor, and Bridgewater. The knights of the fhire are always chofen here, and it is the place for the countycourts and jail. On the latter is its chief dependence, and therefore it cannot be very polite. It is noted for being the bitth.place of Roger the famous Friar Bacon. Ilchefter is an earldom in the Fox family.

ILDEFONSO (St), a celcbrated royal refidence of Spain, diltant about two miles from Segovia. It was erected by Philip V. in the middt of a folitary wood, and in the bofom of fteep mountains. It is chiefly remarkable for its gardens. There is nothing magnificent in the palace, particularly in its exterior appearance. The front on the fide of the garden is of the Coriuthian order, and not deflitute of elegance. Here are the king's apartments, which look upon a parterre furrounded with vafes and marble itatues, and a calcade which, for the richnefs of its decorations, may be compared with the finelt of the kind.

The purity and clearnefs of the water is indeed in. comparable. Plilip V. could not, in this refpect, be better ferved by nature. From the mountains which fhade the palace defcend feveral rivulets, which fupply the refervoirs. 'Thefe waters anfwer the double purpofe of fupplying numerous fountans, and of diffuting life and verdure through the magnificent gardens, the fight of which alone is a fufficient recompence for a journey into Spain. They art on the infide a league in circumference. The inequality of the ground affords every moment new points of view. The principal alleys anfwer to different tunmits of neighbouring mountains; and one in particular produces the molt agreeable effect. It is terminated at one end by the graud front of the palace. Fion this point are feen, at one view, five fountains, ornamented with elegant groups, rifing into an amphitheatre, above which appear the fummits of lofy mountains. The moll clevated of thefe groups is that of Andromeda faltened to a rock. When feen at a little diftance it is peihaps defective, becaufe the rock appears too diminutive by the fide of the moniter which threatens Andromeda; and of Perfeus, by whom it is attacked ; but the whole contributes to the beauty of the view. The molt remarkable of the five groups is that of Neptune.
ravels in. '" Genius (fays M. Bourgoanne $\dagger$ ) prefided at the ir, I. C8. compofition and in the choice of the fituation; the deity of the ocean appears erect, furrounded by his marine court. His attitude, his threatening conute-
nance, and the manner of holding his trident, announce
that he has jull innofed filcuee on the mutinous waves; and the calm which reigns in the bafon, detended from twery wind by the triple wall of vudure by wheh it is furrounded, feem to indicate that he has not iffura his commands in vain. Oiten have 1 leated myfelf, with Virgil in my hand, by the fide of this filent water, under the thade of the verdant foliage, nor ever did I fail to recullect the famons Quas Liso!
"There are other fountains worthy of the attention of the curious; fuch as that of Latona, where the limpid fleaves, fome perpendicniarly, and others in every dircition, fall from the hoarfe throats of the Lycian peafants, half transfurmed into frogs, and fpouting them forth in fuch abundance, that the fatue of the goddels difappears under the wide mantle of liquid crytal ; that alfo of Diana in the bath, furrounded by her nymph.; in the twinkling of an eye all the chatte cont is hidden bencath the waters; the fpectator imagines he hears the whiftling of aquatic birds, and the roaring of lions, from the place whence this momentary deluge cfeapes by a hundred" canals. The fountain of Fame is formed by a fintle jet-d'eau, which rife 130 feet, exhibiting to the dittance of feveral leagues round the trimmph of art over nature, and falls in a gentle flower upon the gazing fpectators. There are fome fituations in the gardens of St Ildefonfo, whence the eye takes in the whole of the greater part of thefe fountains, and where the ear is delighted with the harmony of their murmurs. The traveller who wihes to charin all his fenfes at once, mult take his ftation on the high flat ground in front of the king's apartment. In the thick part of the foliage are contrived two large arbours, from the top of which are feen tewenty cryftal columns riinng into the air to the height of the furrourding trees, mixing their refpleadent whitenefs with che verdure of the foliage, unitung their confufed noife to the rulting of the branches, and refrefhing and embalming the air: if the traveller here experience no pleafing fenfations, let him return home, he is utterly incapable of feeling either the beauties of art or nature.
"The reader may here imagine (continues our anthor) my enthufiafm too extruvagant. He is nilitaken; let him follow me to the great refervoir of abuadant and limpid waters. He will have to climb for f , me ninutes, but will not regret the trouble he has taken. Let us fuppofe ourfelves arrived at the long and narrow alles which takes up the whole of the upper part of the gardens; proceed to the middte, and turn your face toward the calle. To the vall bomizon around you, no other bounlaries are difcovered but thufe which limit the human fi; ht ; thefe alone prevent you from difcovering the Pyrences. Obferve the fteeple, which feems but a point in the immenfe extent: you will perlaps imagine it to be that of the parifh church of St Ildefnino; but, in reality, it is the cathedral of Segovia, at tuon leagues dititance. The gardens, through which you have paffed, becone trartower to the eyc. You fuppofe yourfulf clofe to the royal habitation; the alleys̊, fountains, and parierres, have aill difappeared; you fee but one road, which, ia the form of a velfel, upon the prow of which youffern to ftand, has its Itern on the top of the palace. Aftewward turn and take a view of the little lake behind
nldefonf. you, of which the irregular borders do not, like what we call our Englifh gardens, merely ape the diforder of nature. Nature herfelf has traced them, except on the fide where you ftand. This ftraight alley is united at each end to the curve which furrounds the refervoir. The waters, which Aream in abundance from the fides of the mountain in front, meet in this refervoir, and thence defcend by a thoufand invifible tubes to other refervoirs, whence they are fpouted in columns or fheets upon the flowery foil to which they were Atrangers. The birds, drawn by their clearnefs, come to Nk im and agitate their cryltal. 'The image of the tufted woods which furround them is reflected from their immoveable fufface, as is alfo that of fome fimple and rural houfes, thrown, as by accident, into this delightful picture, which Lonrain would have imitated, but perhaps could not have imagined. The oppofite bank is obfcured by thick fhades. Some hollows, over thatlowed by arching trees, feem to be the afylums of the Naiades. Dilturb them not by indifcreet loquacity, but filently admire and meditate.
" It is impofible, however, not to go to the fource of thele waters; let us follow the meandring of their courfic, and obierve the winding paths which there terminate, after appearing and difappearing at intervals throngli the copfe. Let us liften to the bubbling of the rivulets which from time to time efcape from our light, and haften to the reudezvous alfigned them by the defcendants of Louis XIV. They formerly lolt themelves in the valleys, where they quenched the third of the lumble iulabitants, but are now confecrated to the pleafures of kings. Afcending the back of the pyramidical mountain, behind which their fource is concealed, we arrive at the wall which conlines a part of them in the garden, and which was hidden by the trees; nothing, however, ought here to recal to mind exclufive property and flavery. Woods, waters, and the majettic folitude of mountains, which are at a diHance from the tumult of coutts and cities, are the property of every man.-Beyond this wall, which forms the exterior enclofure of the gardens, is an empry and flat ground, where the infant Don Louis, brother to the king, chofe a place which he confecrated to cultivation. Father on, the mountain hecomes more flefp, and is covered with trees to its fummit. Let us now return; as we feek amufement and not fatigue. We will follow the courfe of the waters, they defcend in hubbling ftreams from one level of the gardens to the other. In their courle, in one place they water the fect of the trees, in others they cro's an alley to nourifh more flowly the plants of a parterre. From the bafon of Andromeda they run between two rows of trees in the form of a canal, the too fudden inclination of which is taken off by cafcades and windings. They receive and carry with them from the gardens the rivulets; which after baving played amongit the gods and nymphs, and moiltened the throats of the fwans, tritons, and lions, humbly defcend under ground, and run on into the bofom of the neighbouring meadows, where they fulfil purpofes lefs brilliant but more ufeful.
"We mult not quit thefe magnificent gardens without fopping at a place which appears to promife nuch, but produces not any very great effect. This is the fquare of the eight alleys, Plage de lus ocho callis. In
the centre is the group of Pandora, the only one which or lead painted of a bronze colour. Eight alleys an. fwer to this centre, and each is terminated by a fountain. Plats of verdure fill up the intervals between the alleys, and each has an altar under a portico of white marble by the fide of a balon facred to fome god or goddefs. Thefe eight altars, placed at equal diftances, and decorated among other jets-d'eau, have two which rife in the form of tapers on each lide of their divinities. This cold regularity difplealed Philip V. who a little before lis death, when vifiting the gardens, made fome fevere reproaches to the inventor upon the fubject. Philip had not the pleafure of completely enjoying what he had created; death furprifed him when the works he had begun were but half finifhed. The undertaking was however the moft expenlive one of his reign. The finances of Spain, fo deranged under the princes of the houfe of Autria (thanks to the wife calculations of Orry, to the fubfidies of France, and lill more to the courageous efforts of the faithful Caftilians), would have been fufficient for three long and ruinous wars, and for all the operations of a monarchy which Philip V. had conquered and formed anew, as well as to have refitted the Thocks of ambition and political intrigue; but they funk beneath the expenfive efforts of magnificence."

It is fingular that the caftle and gardens of St Ildefonfo fhould have coft about $45,000,000$ of piaftres, pre cifely the fun in which Philip died indebted. This enormous expence will appear credible, when it is known that the fituation of the royal palace was at the beginning of this century the noping top of a pile of rocks; that it was neceffary to dig and hew out the flones, and in feveral places to level the rock; to cut out of its fides a paffage forsa hundred different canals, to carry vegetative earth to every place in which it wasintended to fubltitute cultivation for Iterility, and to work a mine to clear a paffage to the roots of the numerous trees which are there planted. All thele efforts were crowned with fuccefs. In the orchards, kitchen gardens, and parterres, there are but few flowers, efpaliers, or plants, which do not thrive ; but the trees, naturally of a lofty growth, and wbich confequently muft frike their roots deep into the earth, already prove the infufficiency of art when it attempts to fruggle againft nature. Many of them languifh with withered trunks, and with difficulty keep life in their almot naked branches. Every year it is neceffary to call in the aid of gunpowder to make new beds for thole which are to fupply their place; and none of thein are covered with that tufted foliage which belongs only to thofe that grow in a natural foil. In a word, there are in the groves of St Ildefonfo, marble ftatues, bafons, calcades, limpid waters, verdure, and delightful profpects, every thing but that which would be more charming than all the relt, thick hades.

The court of Spain comes hither annually during the heat of the dog-days. It arrives towards the end of July, and returns at the beginning of October. The fituation of St Ildefonfo, upon the declivity of the mountains which feparate the two Caftiles, and fronting a vaft plain where there is no obitacle to the paf. fage of the north wind, renders this abode delightful in fummer. ' 1 re mornings and evenings of the hottelt
NO 164.
days are agreeably cool. Yet as this palace is upwards of 20 leagues from Madrid, and half of the road which leads to it crofles the broad tops of mountains, exremely fteep in many places, it is much more agreeable to the lovers of the chace and folitude than to others.

ILERIDA (anc. geog.), the capital of the Higertes ; fituated on an eminence between the rivers Sicoris and Cinga: An unhappy city, often befreged, and often taken, becaufe lying expoled to the incurfions from Gaul; and under Gallienus it was deftroyed by the Germans. Now Lerida, in Catalonia, on the river Segra.

ILEX, the Holm or Hozlr Tree: A genus of the Retragynia order, belonging to the tetrandria clafs of plants; and in the natual method ranking under the 43 d order, Dumofe. The calyx is quadridentated; the corolla rotaccous; there is no ftyle; the berry is monofpermous.

There are feveral fpecies of this genus; but the mont semarkable is the aquifolium, or common holly. Of this there are a great number of varieties with variega* ted leaves, which are propagated by the nurfery-gardeners for fale, and fome years paft were in very great elleem, but at prefent are but little regarded, the old tafte of tilling gardens with fhorn evergreens being pretty well abolifhed; however, in the difpofition of clumps, or rather plantations, of evergreen trees and Shrubs, a few of the molt lively colours may be admitted, which will have a grod efeet in the winter-feafon, if they are properly difpofed.

The beft of thefe varieties are the painted lady-holly, Britihh holly, Biadley's beft loolly, phyllis or creamholly, milkmaid holly, Prichet's helt holly, goldedged hedgehog holly, Chyney's holly, glory-of-thewett holly, Broaderick's holly, Partridge's holly, Herefordhire white holly, Blind's cream holly, Longtaff's holly, Eales's holly, filver-edged hedgehog holly. All thefe varietics are propagated by budding or grafting them upon focks of the common green holly: there is alfo a variety of the common holly with fmooth leaves; but this is frequently found intermixed with the prickly-leaved on, tbe fame tree, and often on the fame branch there are both forts of leaves.

The common holly grows naturally in woods and fo. refts in many parts of England, where it rifes from 20 to 30 feet high, and fometines more, but their ordinary height is not above 25 feet : the fem by age becomes large, and is covered with a gregin fmooh oark; and thofe trees which are not loped or browfed by eattle, are commonly furnifhed with branches the great. eft part of their length, fo form a fort of cone; the branches are garnihed with oblong oval leaves, of a lucid green on their upper furface, but are pale on their under, having a trong midrib: the edges are incented and waved, with fharp thorns terninatiug each of the points, fo that fome of the thorns are raifed upward, and others are bent downward, and being very flif they are troublefome to handle. The leaves are placed alternate on every fide of the branches; and from the bafe of their footftalks come out the flowers in clufters, ftanding on very fhort footfalks; each of thefe fuftain five, fix, or more flowers. They are of a dirty white, and appear in May ; but are fucceeded by roundih berries, which turn to a beautiful red a-

Vol. IX. Part I.
bout Michaelmas, and continue on the trees, if they are not deftroyed, till after Chrillmas.

The common holly is a very beautiful tree in winter; therefore deferves a place in all plantations of evergreen trees and ihrubs, where its thining leaves and red berries make a fine variety; and if a few of the beft varie, gated kinds are properly intermixed, they will enliven the fcene. It is propagated by feeds, which never come up the firt year, but lie in the ground as the haws do; therefore the berries hould be buried in the ground qne year, and then taken up and fown at Michaelmas, upon a bed expofed only to the morning fun; the following fpring the plants will appear, which muft be kept clean from weeds; and if the fpring fhould prove dry, it will be of great fervice to the plants if they are watered once a-week; but they muft not have it oftener, nor in too great quantity, for too much moiflure is very injurious to thefe plants when young. In this feed-bed the plants may remain two years; and then fhould be tranfplanted in the autumn, into beds at about fix inches afunder, where they may fland two years longer; during which time they mult be contantly kept clean from weeds; and if the plants have thriven well, they will be ftrong enough to tranfplant where they are defigned to remain: for when they are tranfplanted at that age, there will be lefis danger of their failing, and they will grow to a larger fize than thofe which are removed when they are much larger; but if the ground is not ready to receive then at that time, they thould be tranfplanted into a nurfery in sows at two feet diftance, and one foot afunder in the rows, in which place the plants may remain two years longer; and if they are defigned to be grafted or budded with any of the variegated kinds, that fhould be performed after the plants have grown one year in tbe nurfery: but the plants fo budded or grafted fhould continue two years after in the nurfery, that they may make good fhoots before they are removed; though the plain ones hould not Aland longer than two years in the aurfery, becaufe when they ate older they do not tranfplant fo well. The beft time for removing hollies is is the autumn; efpecially in dry land; but where the foil is cold and moift, they may be tranfplanted with great fafety in the fpring, if the plants are not too old, or have not flood long unremoved, for if they lave, there is great doubt of their growing when removed.

Ujes. Sheep in the winter are fed with croppings of helly. Birds eat the berries. The bark fermented and afterwards wathed from the woody fibres, makes the common bird-lime. The plant makes an impenetrable fence, and bears cropping; however, it is not found in ali refpects to anfwer for this purpofe equally well with the hawthorn. The wood is ufed in fineer. ing, and is fometimes flained black to imitate ebony. Handles for knives and cogs for mill-wheels are made of it. It is alfo made into hones for whetting of razors. Mr Miller fays, he has feen the floor of a room laid with compartments of holly and mahogany, which had a very pretty effect.

ILFKACOMB, a town of Devonfhire, feated on the Severn fea, almoft oppofite to Swanfea in Glamorganthire, 186 miles from London. It is a populouf, rich, trading fea-port, efpecially with herrings in the U

Hiac Briftol-channel ; noted for maintaining conflant lights to direct the failors; for its convenience of building and reparing fhips; and for the fafe fhelter fhips
from Ireland find here, when it is extremely dangerous for then to run into the mouth of the Taw, which they call Barnftaple-water; and this is one reafon why the Barnftaple merclants do fo much of their bufinefs at this port. The harbour, with its quaty, warp houfe, light-houfe, pilot-boats, and tow-boats, were formerly maintained at the expence of the anceftors of the lord of the manor; and then it had a quay or pier 850 feet long; but by time and the violence of the fea all went to decay ; to remedy which, the parliament paffed an act in 1731, for both repairing and enlarging the piers, harbour, \&c. It is governed by a mayor, bailiffs, \&c. and confifts chichy of one ftreet of fcattered houfes almot a mile long. The parifh is large, containing feveral tythings and manors.
illac Passion, a violent and dangerous kind of colic ; called alio volvulus, niferere meri, and chordapfus. It takes its name from the inteftine ilion, on account of its being ufually affected in this diflemper; or perhaps from the Greek verb tixiv "to wind or twit"; whence alfo it is the Latins call it volvulus. See $\mathrm{M}_{\mathrm{E}}$ dicine Index.
II.I.AD, the name of an ancient epic poem, the firft and fineft of thofe compofed by Homer.

The poet's defign in the fliad was to flow the Grecks, who were divided into feveral little fates, how much it was their intereft to preferve a harmony and good undertanding among themfelves; for which end he fets beforc them the calamities that befel their anceftors from the wrath of Achilles, and his mifunderftanding with Agamemnon; and the advantages that afterwards accrued to them from their union. The iliad is divided into 24 books or rhapfodies, which are marked with the letters of the alphabet.

ILISSUS, a river running to the calt of Athens; which, with the Eridanus running on the weft fide, falls below the city into the fea. Sacred to the mufes, called Ilifiades; on whofe bank their altar food, and where the luftration in the lefs mytteries was ufually performed.

IL,IUM, Ilion, or Ilios, (anc. geog.) a name for the city of Troy, but moft commonly ufed by the poets, and diftinguifhed by the epithet Vetus ; at a greater diftance from the fea than what was afterwards called Ilium Novum, and thought to be the Ilienfium Pagus of Stabo. New or modern llium was a village nearer the fea, with a temple of Minerva; where Aiexander, after the battle of Granicus, offered gifts, and called it a city, which he ordered to bo enlarged. His orders were executed by Lyfimachus, who cncompaficd it with a wall of 40 ftadia. It was afterwards adorned by the Romans, who granted it immunities as to their mother-city. From this city the $I$ lias of Homer takes its name, containing an account of the war carried on between the Greeks and Trojans on account of the rape of Helen; a variety of difafters being the confequence, gave rife to the proverb Ilias satorum.

ILKUCH, a royal town of Poland, in the palatisate of Cracow, remarkable for its filver mines mixed with lead. It is feated in a barren and mountainous कountry, in E. Long. 20.0. N. Lat. 50. 26.

ILLECEBRUM, in botany: A genus of the mo- Mifecebs nogynia order, belonging to the pentandria clafs of plants; and in the natural method ranking under the 12th order, Holoracea. The caly $x$ is pentaphyllous, and cartilaginous; there is no corolla; the ftigma is fimple; the capfule quinquevalved, and monofper. mous. There are feveral fpecies, of which the moft remarkable are the paronychia and the capitatum. Both thefe have trailing falks near two feet long, which fpread on the ground, garnihed with fmall leaves like thofe of knot.grafs. The heads of the flowers come out from the joints of the falks, having neat filvery bractea furrounding them, whicla make a pretty appearance. Their flowers appear in June, and there is generally a fucceffion of them for at leaft two months; and when the autumn proves warm, they will ripen their feeds in October. They are propagated by feeds which fhould be fown in a bed of light earth in the beginning of April: the plants will come up in May, when they fhould be kept clean from weeds till they are fit to remove. Sume fhould be planted in fmall pots, and the reft in a warm border, oblerving to water and fhade them till they have taken new root. Thefe plants are fometimes killed in Cevere winters; for whictu reafon it is directed to plant fome of them in pots, that they may be fheltered during that feafor.

1LLENOIS, a people of North America, inhabiting a country lying ncar a large lake of the fame name (called alfo Michigan), formed by the river St Laurence. The country is fertile; and the people plast Indian corn, on which they chiefly fubfift. They are civil, active, lively, and robut ; and are much lefs cruel in their difpofitions than the other Indian nations. They are, however, faid to be great libertines, and to marry a number of wives; but fome of their villages have embraced Chriftianity.

ILLICIUM, in hotany: A genus of the pentagynia order, belonging to thc dodecandria clafs of plants; and in the natural method ranking with thofe of which. the order is doubtful. 'The calyx is teiraphyllous, and deciduous; there are eight petals, and eight petaloid fubulated nectaria. There are 16 famina with bifid. anthere; the capfules are ovate, compreffed, and ma. nofpermous. There are two fpecies, viz. I. The floridanum, with red flowers, and very odorous fruit. It is a native of China. 2. The anifatum, a native of the woods of China and Japan. It rifes with an erect branched ftem to the height of a cherry-tree; and is covered with an afh-coloured bark, under which is another bark that is green, flefhy, fome. what mucons, and of an aromatic talte, combined with a fmall degree of aftringency. The wood is hard and brittle; the pith fmall in quantity, fungous, and of a green herbaceous colour. The leaves refemble thofe of laurel; the flowers, in fome iort, thofe of narciffus. Thefe laft generally ffand fingle, are of a pale white, and confift of 16 petals, which daffer in their form. The extremity of the flower- ttalk being continued into the germen or feed-bud of the flower, forms eight conjoined capfules, or one deeply divided into cight parts. Of thefe capfules, fome frequently decay ; the retl inclofe each a fingle feed, fomewhat refembling that of palma chrifti, and which, when the hardifh corticle that clofely covers and involves it is broken, exhibits a kernel that is white, flefhy, foft, and of a vapid tafte

Lumina- tafte. The bonzes, or priefts of China and Japan, in-

Hence they generally place beforc their idols garlands and bundles made of the branches. A fimilar opiniora the Bramins inculcate into the Indians, of the Malabar fig, or fous religiofa. The bark of the anifetree, reduced to powder, and equally burnt, the public watchmen in Japan, by a very curious contrivance defcribed by Kempfer, render ufeful in the meafuring of time during the darknefs of the night. The fame powder is frequently burnt in brazen veffels on the Japanefe altars. as incenfe is in other countries, from a belief that the idols in whofe honour the ceremony is performed are greatly refrefhed with the agreeable fragrancy of its odour. It is remarkable, that a branch of this tree being added to the decoction of the poifonous finh, termed by the Dutch de opblafer (a fifh the mof delicate, if the poifonous matter bc firl properly expelled), increafes its noxious quality, and exafperates the poifon to an aflonifhing degree of activity and power.

ILLUMINATING, a kind of miniature-painting, anciently much practifed for illuftrating and adorning books. Befides the writers of books, there were artifts whofe profeffion was to ornament and paint manufcripts, who were called illuminators ; the writers of books firlt finifhed their part, and the illuminators embellihed them with crnamented letters and paintings. We frequently find blanks left in mauufcripts for the illuminators, which were never finted up. Some of the ancient manufcripts are gilt and burnifhed in a ftyle fuperior to later times. Their colours were excellent, and their fkill in preparing them mull have been very great.

The practice of introducing ornameuts, drawings, emblematical figures, and even portraits, into manufcripts, is of great antiquity. Varro wrote the lives of feven hundred illuftrious Romans, which he enriched with their portraits, as Pliny attefts in his Natural Hittory (lib. xxxv. chap. 2.) Pomponius Atticus, the friend of Cicero, was the author of a work on the actions of the great men amongit the Romans, which he ornamented with their portraits, as appears in his life by Cornelius Nepos (chap. 18.) But thefe works have not been tranfmitted to pofferity. There are, however, many precious documents remaining, which exhribit the advancement and decline of the arts in different ages and countries. Thefe inellimable paintings and illuminations difplay the manners, cutloms, habits ecclefiaftical, civil, and military, weapons and inftruments of war, utenfils and architecture of the ancients; they are of the greatelt ufe in illuflrating many important facts relative to the hiftory of the times in which they were executed. In thefe treafures of antiquity are preferved a great number of fpecimens of Grecian and Roman art, which were executed before the arts and fciences fell into neglect and contempt. The manufcripts containing thefe fpecimens form a valuable part of the riches preferved in the princtpal libraries of Europe. The Royal, Cottonian, and Harleian libraries, as alfo thofe in the two univenfitics in England, the Vatican at Rome, the imperial at Vienna, the royal at Paris, St Mark's at Venice, and many cthers.

A very ancient MS. of Genefis, which was in the MuminaCottonian library, and almoft deftroyed by a fire in 1731, contained two hundred and fifty curious paintings in water colours. Twenty-one fragments, which efcaped the fire, are engraven by the fociety of antiquaries of Londen. Several fpecimens of curions paintings alfo appcar in Lambecius's catalogue of the imperial library at Vienna, particularly in Vol. III. where forty-eight drawings of nearly equal ansiquity with thofe in the Cottonian library are engraven; and feveral others may be found in various catalogues of the Italian libraries. The drawings in the Vatican Virgil made in the fourch century, before the arto were entirely neglected, illuflrate the different fubject: treated of by the Roman poet. A miniatue drawing is prefixed to each of the gofpels brought over to England by St Anguftin in the fixth century, which is preferved in the library of Corpus Chrifti college, Camo bridge: in the compartments of thofe drawings are depicted reprefentations of feveral traufactions in each gofpel. Thic curious drawings, and elaborate ornanents in St Cuthbert's gofpels !made by St Ethelwald, and now in the Cottonian library, exhibit a Ariking fpecinen of the flate of the arts in England in the feventh century: The fame may be obferved with refpect to the drawings in the ancient copy of the four gofpels preferved in the cathedral church of Litchfield, and thofe in the Codex Rufhworthianus in the Bodleian library at Ox ford. The life of St Paul the hermit, now remaining in Corpus Chritti college, Cambridge, (G2), affords an example of the Ayle of drawing and ornamening letters in England in the eighth century ; and the copy of Prudentius's Pfycomachia in the Cottonian library (Cleop. c. 8.) exhibits the flyle of drawing in Italy in the ninth century. Of the teath century there are Roman drawings of a fingular kind in the Harlcian library ( $\mathrm{N}^{\circ}$ 2820.) $\mathrm{N}^{\circ}{ }_{5280}$, 1802, and $43^{2}$, in the fame library, contain fpecimens of ornamented letters, which are to be found in Irim MSS. from the twelfth to the fourteenth century. Cædmon's Poetical Paraphrafe of the book of Genefis, written in the eleventh century, which is preferved amongtt $F$. Junius's MSS. in the Bodleian library, exhibits many fpecimens of utenfils, weapons, inftruments of mulic. and implements of huflandry ufed by the Anglo- Saxons. The like may be feen in extracts from the Pentatench of the fame age, in the Cottonian library (Claud. B. 4.) The manufcript copy of Terence in the Bodleian library (D. 17.) difplays the dreffes, mafks, sec. worn by comedians in the twelfth century. if not earlier. The very elegant Pfalter in the libraty of Trinity Coillege, Cambridge, exhibits \{pecimens of the art of drawing in England in the fame century. The Virgil in the Lambeth library of the 13 th century ( $\mathrm{N}^{\circ}+$ 71. $^{1}$ ), written in Italy, thows both by the drawings and writing, that the Italians produced works much inferior to ours at that period. The copy of the Apocalypfe in the fame library ( $\mathrm{N}^{*} 209$ ), containis a curious example of the manner of painting in the fourteenth century.-The beautiful paintings in the hitary of the latter part of the reign of king Rich. II. in the Harleian library ( $\mathrm{N}^{\circ} 1319$ ), afford curious fpecimens of manners and cuftome, both civil and military, at the clofe of the fourteenth and in the beginning of the fifteenth century; as does $\mathrm{N}^{2} 2278$

## 1 L L [ 156 ] I M A

Humins- in the fame library. - Many other inflances might be
producel; but thofe who defire farther information may confule Strutt's Regal and Eeclefiattical Antiquities, fto, and his Horda-Angel-cyunan lately publithed in three vols.
'lhis art was much pratifed by the clergy, and even by fome in the higheft fations in the church. "The famous Ofinund (fays Bromton), who was confecrated bifhep of Salitbury A. D. 1076, did not difdain to fpend fome part of his time in writing, binding, and illuminating books." Mr Strutt, as already noticed, has given the public an opportmity of forming fome judgraent of the degree of delicacy and ait with which thefe illuminations were executed, by publifhing prints of a prodigions mumber of thent, in his Regal and ecclyfuylical anticruities of Eaghand, and Vicev of the cufoms, $\mathcal{S}^{\circ} \mathrm{c}$. of Eingland. In the firit of thefe works we are prefented with the genuine portraits, in miniature, of all the kings, and leveral of the queens of Eugland, from Edward the Confeffor to Henry VII. mollly in thicir crowns and royal robes, together with the portraits of many other eminent perfons of both fexes.

The illuminators and painters of this period feem to have been in poffeffinn of a confiderable number of co louring materials, ard to have known the arts of preparing and mixing them, fo as to form a great variety of colours: for in the fecimens of their miniaturepaintings that are till extant, we perceive nut only the five primary colours, but alfo various combinations of them. 'Though Strutt's prints do not exhibit the Lright and vivid colours of the originals, they give us equally a view, nut only of the perions and dretfics of our auceitors, but alfo of their culloms, manuers, arts, and employmeats, their arms, fhips, houfee, furniture, \&e. and enable us to judge of their fkill in draxing. The figares in thofe paintings are often ftiff and furmal; but the ornaments are in general fine and delicate, and the colours clear and bright, particularly the gold and azure. In fome of thefe illuminations the paffions are Itrongly painted. Huw itrongly, for example, is terror painted ia the faces of the earl of Warwick's failors, when they were threatened with a thipwreck, and grief in the countenances of thofe

- See Sirute, who were prefent at the death of that hero *? Afvol. ii.
plates 56, 58.
ter the incruduction of printing, this elegant art of illuminating gradually deelined, and at length was quite neglected.

Before concluding, it may not be improper to obferve, tbat from the fifth to the tenth century, the miniature printings which we meet with in Greek MSS. are generally gond, as are fome which we find among thofe of Italy, England, and France. From the tenth to the middle of the fourteenth centary they are commonly very bad, and may be confidered as fo many monuments of the barbarity of thofe ages; towards the latter end of the fourteenth, the paintings in manuferipts were much improved; and in the two fucceeding centuries, many excellent performances were produced, efpecially after the happy period of the re foration of the arts, when great attention was paid to the works of the ancients, and the ftudy of antiquity became fafhionable.
illuminators. See Illuminating.
ILLUMINED, Illuminath, a church term, anci-
ently applied to fuch perfons as had received baptifn. This name was occafoned by a ceremony in the bap. tifm of adults; which confited in puting a lighted taper in the hand of the perfon baptized, as a fymbol of the faith and grace he bad received in the facrament.
Illumined, Iflumizati, is alfo the name of a feet of heretics, who fprang up in Spain abont the year 15:5, and were called by the Spaniards Alamlrados. Their principal docrines were, that by means of a fublime manner of prayer, which they had attained to, they entered into) fo petfect a itate, that they had no ocecafion for ordinances, faeraments, nor good works; and that they could give way even to the vilent actions, without Gre. The fece of Illumined was revived in France in the year 1634. and were foon after juined by the Guerinets, or dificiples of I'eter Guerin, who torgether made but one body, called alion Ielumined: but they were fo hotly purfued by Louis XIII. that they were fona defruyed. The brothers of the Roify Crofs are fometimes alfo called Illumined. SeeRasycrusim.

ILIUSTRIOUS, Illustris, was heretofore, in the Roman empire, a title of honour peculiar to people of a certain tank. It was lira given to the moft dittinguified anong the kuights, who had a right to bear the latus clavus: afterwards, thofe were intitled illuffrious who held the firt rank among thofe called bonorati; that is, the prafecti? praturii, prafecti urbis, treafurers, conites, \&e.

There were, however, diferent degrees among the illuffious: as in Spain they have grandees of the firts and fecond clafs, fo in Rome they had their illuftres, whom they called great, majores; and others lefs, called illufres ninores.-Fer isflance; the prefectus pratorii. was a degrce below the malter of the uflicea, though they were both illuffes.
The Novels of Valentinian difinguif as far as five kinds of illufles; among whom, the illuffres allininj/lridtores bear the firlt rank.

ILILIRICUM, (Solun perhaps underitood) Livy, Herodian, St. Paul; called $/ l$ lyris by the Grecks, and fometimes Illyrias: the country extendiag from the Adriatic to P'annonia thas celled. Its boundaries are variouly afigned. Pliny makes it extend in lengthfrom the, river Arfia to the Drinius, thus including Liburnia to the weft, and Dalmatia to the eaft : which is alfo the opinion of Ptolemy; who fettles its limits from mourit Scardus and the Upper Moefia on the eatt, to Ifria in the weft. A Roman province, divided by Augutus into the Superior and Inferior, but of which the limits are left undetermined both by ancient hiAtorians and geographers. Illyrii the people ; called Illyres by the Greeks. The country is now called Selavonia.

ILLYRIUS, (Matthias, Flaccus, or Francowitz) one of the mott learned divines of the Augßurgh confeffion, born in Iftria, anciently called Illyrica, is 1520 . He is faid to have been a man of valt genius, extenfive learning, of great zeal againt Popery; but of fuch a reftefs and pafionate temper, as overbalanced all his good qualities, and occafioused mach difurbance in the Proteflant ehurch. He publified a great number of books, and died in 1575.

Mraci, in a religions fenfe, is an artificial repreo fentation
nage. fentation or fimilitude of fome perfon or thing, ufed either by way of decoration and ornament, or as an object of religious worthip and adoration ; in which laft fenfe, it is ufed indifferently with the word Ibol.

The noble Romans preferved the imazes of their ancettors with a great deal of eare and concern, and had them carried in proceffion at their funcrals and triumphs: thele were commonly made of wax, or wood, theugh fometimes of marbie or braff. They placed them ia the reflibules of their houtcs; and they were to Ray there, esen if the houlcs lappened to be fuld, it being accounted impious to difplace them. Appius Claudius was the lirt who brought them into the temples, in the year of Rome 259, and he added inferiptions to them, fhowing the origin of the perfons repefented, and their brave and virthous atchievements. - It was unt, liowever, allowed for all, who had the imares of cheir anceftors in their houfes, to have them carried at their funerals; this was a thing only granted to fuch as had honourably difcharged themfelves of their offices: for thofo who faited in this refpect, furfited that privilege ; and in caite they had been guilty of any great crime, their images were -bruken in pitces. See Ianobiles and Jus.

The Jews abfolutely condemn all images, and do toot fo much as fuffer any flatues or figures in their houfes, much lefs in their fyrnagogus or places of workhip.

The ufe and adoration of imares are things that have been a long time controverted in the world.

It is plain, from the practice of the primitive church, recorded by the earlier fathels, that Chriltians, for the firlt three centuries after Chiff, and the greater past of the fourth, neither worfhipped images nor ufed them in their worthio. However, the greater part of th: Popilh divines maintain, that the ufe and wormip of images were as ancient as the Chriftian religion itfelf: to prove this, they alledge a decree, faid to have been made in a council held by the $A$. polllcs at Antioch, commanding the faithful, that they may not err about the object of their worfhip, to make images of Chif and worfhip thern. Baron. ad ann. 102: But no notice is taken of this decree, till 700 years after the $\Lambda$ poftolic times, after the difpute about images had conmenced. The firlt inftance that occurs in any credible author of images among Chriftians, is that $r$ ecorded by Tertullian de Pudicit. c. so. of certain cups, or chalices, as Bellarmine pretends, on which was reprefented the parable of the good fhepherd carrying the lelt theep on his fhoulders: but this inftance only proves, that the church, at that time, did not think emblematical figures unlawful ornaments of cups or ehalices. Another inllance is taken from Eulebius. Hift. Eccl. lib. vii. cap. 18: who fays, that in his time there were to be feen two brafs tatues in the city of Paneas or Cæfarea Philippi ; the one of a woman on her knecs, with her arins Itretched out, the other of a man over againft her, with his hand extended to receive hel : thefe llatues were faid to be the images of our Saviour and the woman whom he cured of an iffue of blood. From the foot of the fatue reprefenting our Saviour, fays the hiltorian, fprung up an exotic plant, which, as foon as it grew to touch the border of his garment, was faid to cure all forts of diftempers. Eufebius, however, vouches none of thele things; nay, he fuppoles that the woman who erected.

## 157 I I M A

this Itatue of our Saviour was a pagan, and afcribes it to a pagan, cultom. Farther, Philoltnrgius, Eccl. Hill. lih. vii. c. 3 - exprefsly fays, that this ftatue was carefully preferved by the Cliriltians, but that they paid no kind of worfhip to it, becaufe it is not lawful for Chrillans to wonlhip brafs or any otlier matter. The primitive Chrittians abfained from the worthip of inuages, not, as the Papilts pretend, from tendernefs to lieathen idolaters, but becaufe they thought it unlawful in itfelf to nake any imazes of the D eity. Juftin Mart. Apol. ii. p: 44. Clem. Alex. Stron. 5. Strom. 1. and Proti: p. 4 6. Aug. de Civit. Dei. lib. vii. c. 5. and lib. iv. c. 32 . Id. de Fide et Symb. c. 7. Lactant. lih. ii. c. 3. Tertull. Apol. c. 12. Arnob. lib. vi. f. zoz. Some of the fathers, as Tertullian, Clemens Alexandrinus, and Drigen, were of opinion, that, by the recond commandincret, the ants of painting and e: graving were iendered undawful to a Chithan, Ityling them evil and wicked arts. T'ert. de Idol. cap.3. Clem. Alex. Admon. ad Gent. p. $q$. Orig. contra Celfum lio. vi. p. t82. The ufe of images in churches as ornamente, was firft introduced by fome Chrillians in Spain, in the beginning of the fourtlr century; hut the practice was condemned as a dangerous innovation, in a council held at Eliberis in $30 \%$. Epiphanius, in a lette: preferved by Ferom, tom. ii. ep. 6. bears ftrong tellimony againft images, and may be confidered as one of the firt Iconoctasts. The cultom of admitting pietures of faints and martyrs into the churches (for this was the firt fource of intuge-worfhip) was rare in the latter end of the fourth century; but became common in the fifth: however, they were fill confidered only as ornaments; and even in this view, they met . with very confiderable oppofition. In the following century the cuftom of thus adorning churches became almoft univerfal, both in the eaft and weit. Petavius exprefily fays, (de Incar. lib. xv. cap. tq.) that no Itatues were yet aliowed in the churches; becaufe they bore too near a refemblance to the idcls of the Gentiles. Towards the clole of the feurth or begin. ning of the fifth century; images, which were introduced ${ }^{-}$ by way of ornament, and then ufed as an aid to devotion, began to be actually workipped. However, is continued to be the doctrine of the church in the fixth and in the beginning of the feventh century, that images were to be ufed only as helps to devotion, and not as objects of worthip. The worfhip of them was condemned in the ftrongeft terms by Pope Gregory the Great; as appears by two letters of his written in 601 . From this time to the beginning of the eighth century, there occurs no fingle inllance of any worfinip given or allowed to be given to images hy any council or affembly of bihhops whatever. But they were commonly worthipped by the monks and populace in the beginning of the eighth century; infomuch, that in the year 726 , when Leo publifhed his famous edict, it had already fpread into all the provinces fubject to the empire.

The Lutherans condemn the Calvinits for breaking the images in the churches of the Catholics, looking on it as a kind of facrilege ; and yet they condemn the Romanits (who are profeffed image-norfbippers) as idolaters: nor can thefe lait keep pace with the Greeks, who go far beyond them in this point; which has occafioned abundance of diputes among them. Sce Iconoclasts.

The Mathometang have a perfect aretfion to images 3.: which

## I M A [ $\left.1 \begin{array}{lll}158\end{array}\right] \quad$ M E

which was what led them to deff roy mof of the beautiful monuments of antiquity, both facred and profane, at Conflantinople.

Image, in Rhetoric, alfo fignifies a lively defription of any thing in a difcourfe.

Images in difcourfe are definen by Longines, to be, in general, any thoughts proper to produce expreffions, and which prefent a kind of picture to the mind.

But, in the more limited fenfe, he fays, images are fuch difcourfes as come from ns, when, by a kind of enthufiafm, or an extraordinary emotion of the foul, we feem to fee the things whereof we fpeak, and prefent them before the ejes of thofe who hear us.

Images, in rhetoric, have a very different ufe from what they have among the poets: the end principally propofed in poetry is, aftonifhent and furprize; whereas the thing chiefly aimed at in profe, is to paint things naturally, and to fhow them clearly. They have this, however, in common, that they both tend to move, each in its kind.

Thefe images, or pictures, are of vaft ufe, to give weight, magnificence, and ftrength, to a difcourfe. They warm and animate it ; and, when managed with art, according to Longinus, feem, as it were, to tame and fubdue the hearer, and put him in the power of the fpeaker.
Image, in Optics, a figure in the form of any object, made by the rays of light iffuing from the feveral points of it, and meeting in fo many other points, either at the bottom of the eye, or on any other ground, or on any tranfparent medium, where there is no furface to reflect them. Thus we are faid to fee all objects by means of their images formed in the eye.

IMAGINATION, a power or faculty of the mind, whereby it conceives and forms ideas of things communicated to it by the outward organs of fenfe. See Metaphysics.

Force of Imbgingtion. See Monster.
IMAGO, in Natural Hifory, is a name given by l.innæus to the third flate of infects, when they appear in their proper flape and colours, and undergo no more transformation.
imAM, or Inan, a minifter in the Mahometan church, anfwering to a parifh prieft among us. The word properly fignifies what we call a prelate, antifes, one who prefides over others; but the Muffulmen frequently apply it to a perfon who has the care and intendancy of a mofque, who is always there at firft, and reads prayers to the people, which they repeat after him.

Imam is alfo applied, by way of excellence, to the four chiefs or founders of the four principal fects in the Mahometan religion. Thus Ali is the imam of the Perfian, or of the fect of the Schiaites; Abu-beker the imam of the Sunnites, which is the feet followed by the Torks; Saphii, or Safi.y, the imam of another feet, \&c.

The Mahometans do not agree among themfelves about this imamate or dignity of the imam. Some think it of divine right, and attached to a fingle family, as the pontificatic of Aaron.-Others hold, that it is indeed of divine right, but deny it to be fo attached to any fingle fanily, as that it may not be transferred to another. They add, that the imam is to be clear of all grofs fins; and that otherwife he
may be depoifed, and his dignity may be conferred on another. However this be, it is certain, that after an imam has once been owned as fuch by the Muffulmen, he who denies that his authority comes immediately from God is accounted impious; he who does not obey him is a rebel ; and he who pretends to contradift what he fays is efteemed a fool, among the orthodox of that religion. The Imams have no outward mark of diftinction ; their habit is the fame with that of the Turks in common, except that the turban is a little larger, and folded fomewhat differently.

IMAUS, (anc. geog.), the largeft mountain of Afia, (Strabo) ; and a part of Taurus, (Pliny) ; frora which the whole of India runs of into a valt plain, refembling Egypt. It extends far and wide through Scythia, as far as to the Mare Glaciale, dividing it into the Hither or Siythia intra Imaum, and into the Farther or Scytbia extra Inaum, (Ptolemy); and alfo flretching out along the north of India to the caftern ocean, feparates it from Scythia. It had various names according to the different countries it run through : Poftellus thinks it is the Sephar of Scripture.

IMBECILITY, a languid, infirm flate of body, which, being greatly impaired, is not able to perform ito ufual exercifes and functions.

IMBIBING, the action of a dry porous body, that abforbs or takes up a moift or fluid one: thus, fugar imbibes water; a fpunge, the moilture of the air, scc.
IMBRICATED, is ufed by fome botanifts, to exprefs the figure of the leaves of fome plants, which are hollowed like an imbrex, or gutter-tile, or are laid in clofe feries over one another like the tiles of an houfe.

IMERETIA, or Immeretta, the name of a kingdom, or rather principality, of Georgia, confiling of four provinces, is under the dominion of a prince named David. See Georgia.

The capital, where prince David refides, is called Curtays. The remains of a church announce that Curtays was formerly a large city; but at prefent it can fcarcely be accounted a village.

Solomon, the father of the prefent fovereign, ordered the citadel to be deftroyed as well as the ramparts of the city; for he thought, and very wifely, that Caucafus was the only fortification capable of being defended by an ariny of 6000 men mudifciplined and deftitute of artillery.
The number of the inhabitants of Imeretta is reckoned to be 20,000 families; but the grearer part of them live neither in towns nor villages, but are difperfed throughout the level country, each of them poffeffing a fmall hut or cottage. Thefe people have fewer ftrangers among them, and they are more engaging in their appearance, than the Georgians. They are of a milder and lefs pufillanimous charzcter; and the principal branch of their commerce confifts in wines, a confiderable quantity of which they export in nkins as far as the confines of Georgia. They are acquainted with no other trade; for they arc poor and miferable, and greatly oppreffed by their lords.

The ordinary revenues of Imeretta, like thofe of Georgia, arife from a tythe which vaffals are obliged to pay in wines, cattle, and corn, and fome fubfidies furnithed annually by neighbouring princes. The ex-
etia, traordinary revenues for the mof part arife from coneion. fifcations of every kind; but notwithfanding this, the finances of the prince are fo limited, that he is often under the neceffity of going from houfe to houfe, to live at the expence of his vaffals, never quitting their habitations until the preffing wants of his hofts abfolutely compel him. It is therefore probable, that the court of the fovereign of Imeretta is as deficient in brilliancy as his table is in fplendor when he dines at home. His principal difhes confift of a certain food called goin, which is a kind of millet boiled, and a piece of roaft meat, with fome liigh-feafoned fauce. He never eats but with lis fingers, for forks and fpoons are unknown in Imeretta. At table he generally gives audiences refpeEting affairs of the firt confequence, which he dctermines as he thinks proper ; for in every country fubject to his dominiens there is no other law but his will.
On Friday, which is the market-day, all his now ediets are publifted by a kind of herald, who climbs up into fome tree, in ordcr to proclaim the will of his fovercign. The Imerettans profefs the religion of the Greek church. Their patriarch mult be of the royal family ; but it is feldom that he can eithcr read or write: the priefts who compofe the rell of the clergy are not much more enlightened. The greater patt of their churches are pitiful edifices, which can fcarcely be diffinguifined from the common huts of the inhabitants but by a pafteboard crucifix, and a few coarfe paintings of the Virgin, whicla are feen in them.
IMITATION, derived from the Latin imitare, to "reprefent or repeat," a found or action, either exactly or nearly in the fame manner as they were originally exhibited.

Imitation, in mufic, admits of two different fenfes. Sound and motion arc either capable of imitating themfelves by a repetition of thcir own particular modes; or of imitating other objects of a nobler and more abflracted nature. Nothing perhaps is fo purely mental, nothing fo remote from external fenfe, as not to be imitable by mufic. But as the defcription of this in M. Ronffeau, article Initation, is nobly animated, and comprehends all that is neceffiry to be faid on the fubje $\ell$, we tranllate it as follows.
"Dramatic or theatrical mufic (fays he) contributes to imitation no lefs. than painting or poetry: it is in this common principle that we muft invefligate both the origin and the final caufe of all the fine arts; $x_{\text {as }}$ M. le Batteaux has fown $\dagger$. But this imitation is not equally extenfive in all the imitative arts. Whatever the imagination can reprefent to itfelf is in the department of poetry. Painting, which does not prefent its pichures to the imagination immediately, but to external fenfe and to one fenfe alone, paints only fuch objects as are difcoverable by fight. Mufic might appear fubjected to the fame limits with refpeet to the ear; yet it is capable of painting every thing, even fuch images as are objects of ocular perception alone : by a magic almof inconceivable, it feems to transform the ears into eycs, and endow them with the double function of perceiving vifible objects by the mediums of their own; and it is the greateft miracle of an art, which can only aet by motion, that it can make that very motion reprefent abfolute quiefcence. Night,

Acep, filence, folitude, are the noble efforts, the grand Imitation. images, reprefented by a pieturefque mufic. IVe know that noife can produce the fame effect with filence, and filence the fame effect with noife; as when one neeps at a lecture infipidly and monotonically dclivered, but wakes the inftant when it ends. But mufic acts more intimately upon our fpirits, in exciting by one fenfe difpofitions fimilar to thofe which we find excited by another; and, as the relation between thefe images cannot be fenfible unlefs the impreflion be frong, painting, when divelted of this energy, cannot rellore to mufic that affiftance in imitations which fhe borrows from it. Though all nature fhould be afleep, he who contemplates her does not neep; and the art of the mufician confilts in fubftituting, for this image of infenfibility in the object, thofe emotions which its prefence excites in the heart of the contemplator. He not only ferments and agitates the ocean, animates the flame to conflagration, makes the fountain murmur in lis harmony, calls the rattling fhower from heaven, and fwells the torrent to refitlefs rage; but he paints the horrors of a boundlefs and frightful defart, involves the fubterraneous dungeon in tenfold gloom, foothes the tempelt, tranquillizes the difturbed elements, and from the orcheftra diffufes a recent fragrance through imaginary groves; nay, he excites in the foul the fame emotions which we feel from the immediate perception and full influence of thefe objects."

Under the word Harmony, Rouffeau has faid, that no affiftance can be drawn from thence, no original prin. ciple which leads to mufical imitation; fince there cannot be any relation between chords and the objects which the compofer would paint, or the paffions which he would exprefs. In the article Melody, he imagines he has difcovered that principle of imitation which harmony cannot yield, and what refources of nature are emplored by mufic in reprefenting thefe objects and there paffions.

It is hoped, however, that in cur article of Melodr. we have fhown upon what principle mufical imitation may be compatible with harmony; though we admit, that from melody it derives its mof powerful energy, and its molt attractive graces. Iet we mutt either be deceived beyond all poffibility of cure, or we have felt the power of imitative harmony in a ligh degree. Wre are certain that the fury, the impetuofity, the rapid viciffitudes, of a battle, may be fuccefsfully and vividly reprefented in harmony. We have participated the exultation and triumph of a conqueft, infpired by the found of a full chorus. We have felt all the foleninity and grandeur of devotion from the fow movement, the deep chords, the fwelling harmony, of a fentimental compofition played upon the organ. Nor do we imagine harmony lefs capable of prefenting the tender depreffion, the fluctuating and trenulous agitation, of grief. As this kind of imitation is the nobleft effort of mufic, it is aftonifhing that it fhould have been overlooked by M. D'Alembert. He has indced apologized, by informing us, that his treatife is mercly elementary: but we are uncertain how far this apology ought to be regarded as fufficient, when it is at the fame time confidered, that he has given an account of imitation in its mechanical, or what Rouffeau calls ite terlinicel

Imitation tecluicul, fenfe; which, however, to prevent ambigu-

## Inmer.

 ity, we fhould rather choofe to call mymefis, or anacephaliofis. To Rouffezu's account of the word in thisacceptation, we return.
"Imitation (fays he), in its technical fenfe, is a reiteration of the fame air, or of one which is fimilar, in feveral parts where it is repeated by one after the other, either in unifon, or at the diflance of a fourth, a fifth, a third, or any other interval whatever. The imitation may be happily enough purfued even though feveral notes hould be changed; provided the fame air may always be recognifed, and that the compofer does not deviate from the laws of proper modulation. Frequently, in order to render the imitation more fenfible, it is preceded by a general reft, or by long notes which Seem to obliterate the impreffion formerly made by the air till it is renewed with greater force and vivacity by the commencement of the imitation. The imitaion may be treated as the compofer choofes; it may be abandoned, refumed, or another begun, at pleafure ; in a word, its ules are as much relaxed as thofe of the fuguc are fevere: for this reafon, it is defpifed by the moik eminent mafters; and every imitation of this Find too much affected, a!mott always betrays a novice in compofition."

Imitation, in oratory, is an endeavour to refemble a fpeaker or writer in thofe qualities with regard to which we propofe them to ourfelves as patterns. The firt hiltorians among the Romans, fays Cicero, were very dry and jejune, till they began to imitate the Greeks, and then they hecame their rivals. It is well known how clofely Virgil has imitated Homer in his Aneid, Hefiod in his Georgics, and Theocritus in his F.clogues. Tercnce copied after Menander ; and Plautus after Epicarmus, as we lcarn from Horace, lib. ii. ep. ad Auguft, who himfelf owes many of his beauties to the Greek lyric poets. Ciccro appears, from many paflages in his writings, to have imitated the Greek orators. Thus Quintilian fays of him, that The has expreffed the ftrength and fublimity of Demofthenes, the copioufnefs of Plato, and the delicacy of Ifocrates.

IMMACULATE, fomething without flam, chiefly applicd to the conception of the holy Virgin. See Conception Immaculuté.

IMMATERIAL, fomething devoid of matter, or that is pure firit. See Metaphysics.

IMMEDIATE, whatever is capable of producing an effect without the intervention of external means; thus we fay, an immediate caufe, in oppofition to a mediate or remote one.

IMMEMORIAL, an epithet given to the time or duration of any thing whofe beginning we know nothing of.

In a legal fenfe, a thing is faid to be of time imme. morial, or time out of mind, that was before the reign of our king Edward II.

IMMENSITY, an unlimited extenfion, or which no finite and determinate fpace, repeated ever fo often, can equal.

IMMER, the moft eafterly ifland of all the New Hebrides in the Suuth Sea. It lies about four leagues from Tanna, and feems to be about five leagues in circumference; it is of a confiderable height, with a fattop.

No 164.
immeretta, or Imeretia. See Imeretia. Imm: IMMERSION, that act by which any thing is plunged into water or other fluid.

It is ufed in chemiftry for a fpecies of calcination, when any body is immerfed in a fluid to be corroded: or it is a fpecies of lotion; as when a fubftance is plunged into any fuid, in order to deptive it of a bad quality, or comaunicate to it a good one.

Immerston, in aftronomy, is when a fier cr planet is fo near the fun with regard to our obfervations, that we cannot fee it; being, as it were, inveloped and hid in the rays of that luminary. It alfo denotes the be.ginning of an eclipf" of the moon, or that moment when the moon begins to be darkened, and to enter in. to the fhadow of the earth.

IMMOLATION, a ceremony ufed in the Roman facrifices; it confifted in throwing upon the head of the victim fome fort of corn and frankincenfe, together with the mola or falt cake, anci a little wine.

IMMORTAL, that which will laft to all eter. nity, as having in it no principle of alteration or corruption.

IMMUNITY, a privilege or exemption from fome office, duty, or impofition, as an esemption from tolls, \&c.

Immunity is more particularly underfood of the liberties granted to cities and communities.

IMMUTABILITY, the condition of a thing thas cannot change. Immutability is one of the divine attributes. Sec God.

IMOLA, a town of Italy, in the tervitory of the church, and in Romagna, with a bifanp's fee. It is a very handfome populous place; and is feated on the river Santerno, in E. Long. 11. 43. N. Lat. 44. 28.

IMPALE, in heraldry, is to conjoin two coats of arms pale-wife. Women impale their coats of arms with thofe of their hufoands. See Heraldry.

To impale cities, camps, fortifications, \&c. is to inciofe them with pallifadues.

To Inspale, or Empale, fignifics alfo to put to death by fpitting on a flake fixed upright.

IMPALPABLE, that whofe parts are fo extremely minute, that they cannot be difinguifhed by the fenfes, particularly by that of feeling.

IMPANA CION, a term ufed by diviues to fannify the opinion of the Lutherans with regard to the eucharitt, who beliere that the fpecies of bread and wine remain together with the body of our Saviour after confecration.

IMPANNELLING, in law, fignifies the writing down or entering into a parchment, lift, or fchedule, the names of a jury fuminoned by the fheriff to appear for fuch public fervices as jurits are employed in.

IMPARLANCE, in law, a petition in count for a day to confider or advife what anfwer the defendant fhall make to the plaintif's action; and is the continuance of the caufe till another day, or a longer time given by the court.
IMPASSIBLE, that which is exempt from fuffering ; or which cannot undergo pain, or alteration. The Stoics place the foul of their wife man in an impafible, imperturbable ftate. See Apathy.

IMPASTATION, the mixtion of various materials of different colours and confiltencies, baked or bound
ratiens agether with fome cement, and hardened either by the Il air or by fire.

IMPATIENS, тоUCH-me-not, and Balfamine: A genus of the monogamia order, belonging to the fyngenefia clofs of plants; and in the natural method ranking under the 2 qth order, Corydides. The calyx is diphyllous; the corolla pentapetalons, and irregular, with an hooded nectarium; the capfule fuperior and quinquevalved

Species. 1. The noli-me-tangere, or common yellow halfamine, is a native of Britain, but is cultivated in many gardens for euriofity. It hath a fibrous root, an upright, jointed, fucculent, ftalk, about 18 inches high, with alternate oval leaves; and, from the axillas of the ftalks, long, flender, branching footfalks, each fuftaining many yellow flowers; fucceeded by taper capfules, that burf open and dart forth their feeds with great velocity, whence its name. 2. The balfamina, or balfam, is a native of India. It hath a fibrous root, an upright, thick, fucculent falk, branching all around a foot and an half or two feet high ; with long, fpear fhaped, fawed leaves, the upper ones alternate; and from the joints of the Italk and branches clufters of mort foot-ftalks, each fuftaining one large irregular flower, of different colours in the varieties; fowering from June or July till September.

Culture. The firf fpecies is very hardy, and will grow freely from the feeds in any common border; but the fecond requires artificial warmth. The feeds will indeed grow in the full ground, but rarely before the month of May; and more freely then, if covered with a hand-glafs, \&c. But the plants raifed by artificial heat will flower five or fix weeks fooner than thofe raifed in the natural ground. The feeds ought therefore always to be fowed on a hot-bed in March or April, and the plants continued therein till June; and if the frames be deep, they will then be drawn up to the length of two or three feet; after which they may be planted in pots, which mult likewife be continued in the hot bed till the plants have taken frefh root.

IMPEACHMENT, an accufation and profecution for treafon and other crimes and mifdemeanors. Any member of the lower houfe of parliament may impeach any one belonging either to that body or to the houfe of lords. The method of proceeding is to exhibit articles on the behalf of the commons, by whom managers are appointed to make good their charge. Thefe articles are carricd to the lords, by whom every perfon impeached by the commons is always tried; and if they find him guilty, no pardon under the great feal can be pleaded to fuch an impeachment. I2 Will. III. cap. ii.

IMPECCABILES, in chuich hiftory, a name given to thofe heretics who boatted that they were impeccable, and that there was no need of repentance : fuch were the Gnoftics, Prifcillianifts, \&c.

IMPECCABILITY, the ftate of a perfon who cannot tin: or a grace, privilege, or principle, which puts him out of a poflibilicy of fimning.

The fchoolmen diftingrifh fereral kinds and degrees of impeccability : that of God belongs to him by nature : that of Jefus Chrift confidered as man, belongs to him by the hypottatical union: that of the bleffed is a confequence of their condition: that of men is the ef. 6 of a confirmation in gace, and is rather

Vol. IX. Part I.
called impeccance than impeccability; accordingly divines diftinguif between thefe two : this ditinction is found neceffary in the difputes againtt the Pelagians, in order to explain certain terms in the Greek and Latin fathers, which without this diftiuction are eafily confounded.

IMPEDIMENTS, in law, are fuch hindrances as put a ftop or flay to a perfon's feeking for his right by a due courfe of law. Perfons under impediments are thofe under age or coverture, non compos mentis, in prifon, beyond fea, \&cc. who, by a faving in our laws, have time to claim and profecute their rights, after the impediments are removed, in cafe of fines levied, \& c.

IMPENETRABILITY, in philofophy, that pro. perty of body, whereby it cannot be pierced hy another: thus, a boly which fo fills a fpace as to exclude all others, is faid to be impenetrable.

IMPERATIVE, onc of the moods of a verb, ufed when we would command, intreat, or advife : thus, go read, take pity, be advifed, are imperatives in our language. But in the learned languages, this mood has a peculiar termination to diftinguifh it from others, as i, or ito, " go :" lege, or legito, " read," \&c. and not only fo, but the termination varies, according as you addrefs one or more perfons, as audi and audite;

IMPERATOR, in Roman antiquity, a title of bonour conferred on victorious generals by their armies, and afterwards coufirmed by the fenate.

Imperutor was allo the title adopted by the Roman emperors.

IMPERATORIA, masterwort: A genus of the digynia order, belonging to the pentandria clafs of plants; and in the natural method ranking under the $45^{\text {th }}$ order, Umbollate. The fruit is roundih, compreffed in the middle, gibbous, and furrounded with a border; the petals are inflexo-emarginated. There is but one fpecies, viz. the oftruthium, a native of the Auftrian and Styrian Alps, and other mountainous places of Italy. Mr Lightfoot informs us, that be has found it in Ceveral places on the banks of the Clyde in Scotland; but whether indigenous or not, is uncertain. The root is as thick as a man's thunb, ruming obliquely in the ground; it is flefhy, aromatic, and has a tlrong acrid tafte, biting the tongue like pellitory of Spain: the leaves arife immediately from the root; they have long foot-flalks, dividing into three very hort ones at the top, each fuftaining a trilobate leaf, indented on the border. The footfalks are deeply channeled, and, when broken, emit a rank odour. The flower ftalks rife about two feet high, dividing into two or three branches, each being terminated by a pretty large umbel of white flowers whofe petals are [plit; thefe are fucceeded by oral comprefled feeds, fomewhat like thofe of dill, but larger. - The plant is cultivated in gardens for the fake of its roots, which are ufed in medicine. It may be propagated cither by feeds, or by parting the roots in autumn. They thrive beft in a fhady fituation. - The root has a flavour fimilar to that of angelica, and is efteemed a good fudorific. There are inftances of its having cured the ague when the bark had failed. It fhould be dug up in winter, and a ftrong infufion made in wine.

IMPERFECT, fomething that is defective, or that X wants
superfect wants fome of the properties found in other beings of the fame kind.
Imperfect Tenfe, in grammar, a tenfe that denotes fome preterite cafe, or denotes the thing to be at that
time prefent, and nct quite finifhed; as fcribebam, " I was writing." See Grammar.

IMPERIAL, fomething belonging to an emperor, or empire. See Emperor and Empire.-Thus we fay, his imperial majefly, the imperial crown, imperial arms, icc.
Inpertal Crozun. See Heraldry, p. 462.
InPERLAL Chamber, is a fovereign court, eftablifhed for the affairs of the immediate flates of the empire. Sce Chamber, and Germany.
Impertal Cities, in Germany, are thofe which own no other head but the emperor.
Thefe are a kind of little commonwealths; the chief magiftrate whereof does homage to the emperor, but in other refpects, and in the adminiftration of jultice, is fovereign.
Imperial cities have a right of coining money, and of keeping forces and fortified places. Their deputies affift at the imperial diets, where they are divided into two branclies, that of the Rhine and that of Suabia. There were formerly 22 in the former and 37 in the latter; but there are now only 48 in all.
$I_{\text {apperial }}$ Diet, is an affembly or convention of all the flates of the empire. See Diet and Germany.

IMPERIALI (John Baptift), a celebrated phyfician of Vicenza, where he was born in 1568. He compofed feveral efteemed works both in profe and verfe, written in good Latin; and died in 1623 .
impersonal verb, in grammar, a verb to which the nominative of any certain perfon cannot be prefixed; or, as others define it, a verb deflitute of the two firft and primary perfons, as decet, oportet, \&c. The imperfonal verbs of the active voice end in $t$, and thofe of the paffive in tur; they are conjugated thro' the third perfon fingular of almof all the tenfes and moods : they want the imperative, inftead of which we ufe the prefent of the fubjunctive; as paniteat, purnetur, \&c. nor, but a few excepted, are they to be met with in the fupines, participles, or gerunds.

IMPERVIOUS, a thing not to be pervaded or paffed through, either by reafon of the clofenefs of its pores, or the particular configuration of its parts.

IMPETIGO, in Medicine, an extreme roughnefs and foulnefs of the fkin, attended with an itching and plentiful fcurf.

The impetion is a fpecies of dry pruriginous itch, wherein fcales or fcurf fucceed apace; arifing from faline corrofive humours thrown out upon the exterior parts of the body, by which means the internal parts are ufually relieved.
IMPETRATION, the act of obtaining any thing by requelt or prayer.

Impetration was more particularly ufed in our ftatutes for the pre-obtaining of benefices and churchoffices in England from the court of Rome, which did belong to the difpofal of the king and other lay patrons of the realm; the penalty whereof is the fame with that of provifors, 25 E. III.
IMPETUS, in mechanics, the force with which one body frikes or impels another.

IMPLICATION, in law, is where fomething is
rport Phyfical impoffibility is that which is contrary to the law of nature.

A thing is morally impoffible, when of its own nature it is poffible, but yet is attended with fuch diff. culties, as that, all things confidered, it appears impoffible. Thus it is merally impoffible that all men fhould be virtuous; or that a man fhould throw the fame number with three dice a hundred times fucceffively.

A thing which is impofible in law, is the fame with a thing impoffible in nature : and if any thing in $\varepsilon$ bond or deed be impolfible to be done, fuch deed, \&c. is void. 21 Car . I.

IMPOST, in law, fignifies in general a tribute or cuftom, but is more particularly applied to fignify that tax which the crown rectives for merchandifes imported into any port or haven.

IMPOSTHUME, or abfeefs, a collection of matter or pus in any part of the body, either owing to an obtrution of the fluids in that part which makes them change into fuch matter, or to a tranflation of it from fome other part where its was generated. See Surgery.

IMPOSTOR, in a general ferife, denotes a perfon who cheats by a fictitious character.

Religious Ispostors, are fuch as falfely pretend to an extraordinary commifion from heaven; and who terrify and abufe the people with falfe denunciations of judgments. Thefe are punifhable in the temporal courts with fine, imprifonment, and infamous corporal punifhment.

IMPOTENCE, or Impotency, in general, denotes want of Arength, power, or means, to perform any thing.

Divines and philofophers diftinguin two forts of impetency; natural and moral. The firt is a want of fome phy fical principle, neceffary to an action; or where a being is abfolutlly defective, or not free and at liberty to act : The fecond ouly imports a great difficulty; as a ftrong habit to the contrary, a violent paffion, or the like.
Impotency is a term more particularly ufed for a natural inability to coition. Impotence withrefpect to men is the fame as fterility in women; that is, an inability of propagating the fpecies. There are many caufes of impotence; as, a natural defect in the organs of generation, which feldom admits of a cure : accidents or difeafes; and in fuel cafes the impotence may or may not be remedied, according as thefe are curable or otherwife.-The met common caufes are, early and immoderate venery, or the venereal difeafe. We have inflances, however, of unfitnefs for generation in men by an impediment to the ejection of the femen in coition, from a wrong direetion which the orifice at the zerumontamun got, whereby the feed was thrown up into the bladder. M. Petit cured one patient under fuch a difficulty of emifition, by making an incifion like to that commonly made in the great operation for the Hone.

On this fubject we have fome curious and original obfervations by the late Mr John Hunter in his Treatife on the Venereal Difeafe *. He contiders impotency as depending upon two caufes. One he refers to the mind ; the otber to the organs.

1. As to inpotency depending upon the mind, he oblerves, Impotencr: that as the "parts of generation are not neeeffary for the exiftence or fupport of the individual, but have a reference to fomething clfe in which the mind has a principal concern; fo a complete action in thofe parts cannot take place without a perfect harmony of body and of mind : that is, there mult be both a power of body and difpofition of mind; for the mind is fubject to a thoufand caprices, which affect the actions of thefe parts.
"Copulation is an act of the body, the fpring of which is in the mind; but it is not volition: and according to the ftate of the mind, fo is the act performed. To perform this aet well, the body fhould be in health, and the mind fhould be perfectly confident of the powers of the body : the mind fhould be in a flate entirely difengaged from every thing elfe: it hould have no difficulties, no fears, no apprehenfions, not even an anxiety to perform the act well; for even this anxiety is a tate of mind different from what fhould prevail; there fhould not be even a fear that the mind itfelf may find a difficulty at the time the act fhould be performed. Perhaps no function of the machine depends fo much upon the fate of the mind as this.
"The will and reafoning faculty have nothing to do with this po:ver ; they are only employed in the act, fo far as voluntary parts are made ufe of: and if they ever interfere, which they fometimes do, it often produces znother itate of mind which deftroys that which is proper for the performance of the act ; it produces a defire, a wih, a hope, which are all only diffidence and uncertainty, and create in the mind the idea of a poffibility of the want of fuccefs, which deftroys the proper ftate of mind or neceffary confidence.
"There is perhaps no act in which a man feela himfelf more interefted, or is more anxious to perform well; his pride being engaged in fome degree, which if within certain bounds would produce a degree of perfection in an act depending upon the will, or an act in voluntary parts; but when it produces a flate of mind contrary to that fate on which the perfection of the act depends, a failure muft be the confequence.
"The body is not only rendered incapable of per. forming this aet by the mind being under the above influence, but alfo by the mind being, tho'perfectly confident of its power, yet confcious of an impropriety in performing it; this, in many cafes, produces a fate of mind which fhall take away all power. The flate of a man's mind refpecting his fifter takel away all power. A confcientious man has been known to lofe his powers on finding the woman he was going to be connected with unexpectedly a virgin.
" Shedding tears arifes entirely from the fate of the mind, although not fo much a compound action as the act in queltion; for none are fo weak in body that they cannot fled tears : it is not fo mueh a compound action of the mind and ftrength of body joined, as the other act is; yet if we are afraid of thedding tears, or are defirous of doing it, and that anxiety is kept up through the whole of an affecting feene, we certainly thall not fhed tears, or at leatt not fo freely as would have happened from our natural feelings.
". From this account of the neceffity of having the $X 2$
mird

Imporency. mind independent refpecting the act, we mutt fee that it may very often happen that the flate of mind will be fuch as not to allow the animal to exert its nasural powers: and every failure increafes the evil. We mult allo fee from this frate of the cafe, that this act muft be often interrupted; and the true caufe of this interruption not being known, it will be laid to the charge of the body or want of powers. As thefe cales do not arife from real inability, they are to be carefully dillinguifhed from fuch as dy; and perkaps the only way to diftinguith them is, to examine into the thate of mind refpecting this act. So trifing often is the circumblance which fhall produce this inability depending on the mind, that the very delire to pleafe thall have that effect, as in making the woman the fole object to be gratified.
"Cafes of this kind we fee every day; one of which 1 fhall relate as an illuthation of this fubject, and alfo of the method of cure.-A gentleman told me, that he had loft his virility. After above an hour's inveftigation of the cafe, I made out the following facts: that he had at unneceffary times Atrong ercetions, which thowed that he had naturally this power; that the erections were accompanied with defire, which are all the natural powers wanted; but that there was ftill a defect fomewhere, which I fuppofed to be from the mind. I inquised if all women were alike to him? his anfiver was, No ; fome women he could have connection wihh as well as ever. This brought the defect, whatever it was, into a fmaller compafs: and it appeared there was but one woman that produced this inability, and that it arofe fron a defire to perform the act with this woman well ; which defire produced in the mind a doubt or fear of the want of fuccefs, which was the caufe of the inability of performing the act. As this arufe entirely from the ftate of the mind produced by a particular circunitance, the mind was to be applied to for the cure: and I iold him that he might be cured, if he conuld perfectly aty on his own power of felf-denial. When I explained what I meant, he told me rhat he could depend upon every act of his will or refulution. 1 then told tien, that, if he had a perfect confiderice in himfelf in that refpect, he was to go to bed to this woman, but fitt promife to himfelf that he would not have any connection with her for fix sights, let his inclinations and powers be what they rould; which he engaged to do, and alfo to let me know the refult. About a fortnight after, he told me, that this refolution had produced fuch a total alteration in the ftate of bis mind, that the power fuon took place; for inftead of going to bed with the fear of inability, be went with fears that he fhould be por. fefled with too much defire, too mucls power, fo as to become uneafy to him: which really happened; for he would have been happy to have fhortened the time; and when he had once broke the fpell, the mind and powers went on together, and his mind never returned to its former ftate."
2. Of impotency from a want of proper correfpondence between the agious of the different organs. Our author, in a former part of his Treatife, when conlidering the difeafes of the urcthra and bladder, had remarked, that every organ in an animal body, without exception, was made up of different parts, whofe functions or aetions were totally different from one another, al-
though all tending to produce one ultimate effect. In Imporen all fuch oryans when perfect (he obferves), there is a fucceffion of motions, one naturally arifing out of the other, which in the end produces the ultimate effect ; and an irregularity alone in thefe actions will conititute difeafe, at leaft will produce very difagreeable effects, and often totally frultrate the intention of the organ. This principle Mr Hunter, on the preient occalion, applics to the "actions of the tefticles and penis: for we find that an irregularity in the actions of thefe parts fumetimes happen in men, producing impotence; and fomething finular probably may be one caule of barreunefs in women.
"In men, the parts fubfervient to generation may bediviled into two; the effential, and the acceflury. The teflicles are the effential; the penis, \&e. the acceffory. As this divifion arifes from their ules or actions in health, which exactly correfpond with one another, a want of exactnefs in the correfpondence or fufceptibility of thofe actions may alfo be divided into two : where the actions are reverfed, the acceffory taking place without the firit or effential, as in erections of the penis, where neither the mind nor the tefticles are 1 tt mulated to action; and the fecond is where the tefticles performs the action of fecretion too readily for the penis, which has not a correfponding erection. The firt is called priapi/m; and the fecond is what ought to be called feminal weaknefs.
"The mind has confiderable effect on the correfpondence of the attions of thefe two parts: but it would appear in many inflances, that erections of the penis depend more on the flate of the mind than the fecretion of the femen does; for many have the fecretion, but not the erection; but in fuch, the want of erection appears to be owing to the mind only.
" Priapifm often arifes fpontaneounly; and often from vifible irritation of the penis, as in the venereal gunouheea, efpecially when violent. The fenfation of fuch erections is rather uneafy than pleafant; nor is the fenfation of the glans at the time limilar to that arifing from the erections of defire, but more like to the feufation of the parts immediately after coition. Such as arife fpontaneoufly are of more ferious confequence than thofe from inflammation, as they proceed prohailly from caufes not curable in themfelves or by any known methods. The priapifm arifing from inflammation of the parts, as in a gonorihcea, is attendtended with nearly the fame fymptoms; but generally the fenfation is that of pain, proceeding from the inflammation of the parts. It may be obferved, that what is faid of priapifm is only applicable to it when a difeafe in itfelf, and not when a fymptom of other dif. eafes, which is frequently the cafe.
"The common practice in the cure of this complaint is to order all the nervous and Atrengthening medicines; fuch as bark, valerian, mufk, camphor, and alfo the cold bath. I have feen good effects from the cold bath; but fometinies it does not agree with the conflitution, in which cafe I have found the warm bath of fervice. Opium appears to be a Specific in many cafes; from which circumftance I thould be apt, upon the whole, to try a foothing plan.
"Seminal weakneff, or a fecretion and emiffion of the femet withnut erections, is the reverfe of a priapifm, and is by much the wort difeare of the two.

## I M P [165] 1 M I

ncs. There is great variety in the degrees of this difeale, there being all the gradations from the exait correfpondence of the actions of all the paris to the telticles afting alone; in every cafe of the difeafe, there is too quick a fecretion and evacnation of the femen. Like to the p-iapifm, it does not arile from defires and abilites; although when mild it is atiended with both, but not in a due proportion; a very flight defire often producing the frill effect. The fecretion of the femen flall be fo quick, that fimple thought, or even toying, fhall make it flow.
"Dreams lave producel this evacuation repeatedly in the fame night ; and even when the dreams have beon foflight, that there has been no confcioufnefs of them when the fleep has been broken by the act of enuffinn. I have known cafes whepe the tefticles have been fo ready to fecrete, that the lealt friction on the glans has produced an emffion: 1 have known the fimple action of walking or riding produce this effect, and that repeatedly, in a very fhort fpace of time.
"A young man, abou: four or five and twenty years of age, not fo much given to venery as mott young men, had thefe laft mentioned complaints upon him. Thrce or four times in the night he would emit; and if he walked faft, or rode on horfeback, the fame thing would happen. He could farcely have connection with a woman before he emitted, and in the emifion there was hardly any fpafm. He tried every fuppofed flrengthening medicine, as alio the cold bath and fealathing, but with no effect By taking 20 drops of laudanum on going to bed, he prevented the night emiffions; and by taking the fame quantity in the morning, he could walk or ride without the before mentioned inconvenience. I directed this practice to be continued for fome time, alhough the difeafe did not return, that the parts might be accuftomed to this healthy fate of action; and I have reafon to believe the gentleman is now well. It was found neceffary, as the conftitution became more habituated to the opiate, to increafe the dofe of it.
"The fpalms, upon the evacuation of the femen in fuch cafes, are extremely night, and a repetition of them foon takes place ; the firf emiffion not preventing a fecond; the conftitution being all the time but little affected (a). When the tefticles act slone, without the acceffory parts taking up the neceffary and natual confequent action, it is fill a more melancholy difeafe; for the feeretion arifes from no vifible or fenfible caule, and does not give any vifible or fenfible effect, but runs off fimilar to involuntary ftools or urine. It has been obferved that the femen is more suid than natural in fome of thefe cafes.
"There is great variety in the difeafed actinns of thele parts; of which the following cafe may be confidered as an example. A gentleman has had a ftricture in the urethra for many years, for which he has frequently ufed a bougie, but of late has neglected it. He has had no connection with women for a confider. able time, being afraid of the confequences. He has
often in his feep involuntary emiflions, which generally Impotency awake him at the paroxy fm; but what furprifes him molt is, that often he has fuch without any femen palling forwards through the peniy, which makes him think that at thofe times it gocs backwards into the bladder. This is not always the cale, for at other times the Cemen paffes forwards. At the time the femen feems to pafs into the blatder, he has the crection, the dream; and is awaked with the fame mode of action, the fame fenfation, and the fame pleafure, as when it paffes through the urethra, whether dreaming or waking. My opinion is, that the fame irritation takes place in the bulb of the urethra without the femen, that tak:s place there when the femen enters, in confequence of all the natural preparatory iteps, whereby the very fame actions are excited as if it came into the pafare: from which one would fupo pofe, that either femen is not fecreted; or if it be, that a retrograde motion takes place in the actions of the acceleratores urinx. But if the firlt be the cale, then we may fuppofe, that in the natural thate the actions of thofe mufcles do not arife fimply from the itimulus of the $f=m e n$ in the part, but from their action being a termination of a preceding one making part of a feries of actions. Thus they may depend upon the friction, or the imagination of a friction, on the penis; the tefticles not doing their part, and the fpafm in fuch cafes ariling from the friction and not from the fecretion. In many of thofe cafes of irregularity, when the erection is not ftrong, it thall go off without the emiflion : and at other times an emilfion flall happen almoft without an erection ; but thefe arife not from debilitygbut affections of the mind.
"In many of the preceding cales, wathing the penis, fcrotum, and perinxum, with cold water, is often of fervice; and to render it colder than we find it in fome feafons of the year, common falt may be added to it, and the parts wafhed when the falt is almoft dif. fulved."

Impotency is a canonical difability, to avoid marriage in the fpiritual court. The marriage is not void $a b$ initio, but voidable only by fentence of feparation during the life of the parties.

IMPRECAIION, (derived from in, and precor, "I pray;") a curfe or wifh that fome evil may befal any one.

The ancients had their goddefles called Imprecations, in Latin Dire, i. e. Deorum ire, who were fuppofed to be the "executioners of evil confciences. They were called Dirc in heaven, Furies on earth, and Eumenides in hell. The Romans owned but three of thefe $I \mathrm{~m}$. precations, and the Greeks only two. They invoked them with prayers and pieces of verfes to deftroy their enemies.

IMPREGNATION, the getting a female with child. Sce Conception.

The term impregnation is alfo ufed, in pharmacy, for communicating the virtues of one medicine to another, whether by mixture, coction, digeftion, \&c.

IM.
(A) "It is to be confidered, that the conflitution is commonly affected by the falms only, and in proportion to their violence, independent of the fecretion and evacuation of the fomen, But in fome cafes even the erection going off without the foafms in the emiffion, flall produce tbe fame debility as if they lad taken place.".

rmirefing TMPRESSING sEAMEN. The power of imprefIl fing fea-faring men for the fea-fervice by the king's commiffion, has been a matter of fome difpute, and
fubmitted to with great reluctance; though it hath vcry clearly and learnedly been fhown by Sir Michael Fofter, that the practice of impreffing, and granting powers to the admiralty for that purpofe, is of very ancient date, and hath been uniformly continued by a regular feries of precedents to the prefent time : whence he concludes it to be part of the common law. The difficulty arifes from hence, that no flatute has exprefly declared this power to be in the crown, though many of them very ftrongly imply it. The flatute 2 Ric. II. c. 4. fpeaks of mariners being arrefted and retained for the king's fervice, as of a tling well known, and practifed without difpute; and provides a remedy againt their rumning away. By a latcr flatute, if any waterman, who ufes the river Thames, flall hide himfelf during the execution of any commiffion of preffing for the king's fervice, he is liable to heavy penalties. By another ( 5 Eliz. c. 5.) no fifherman fhall be taken by the queen's commiffion to ferve as a mariner; but the commifion fhall be firft brought to two juftices of the peace, inhabiting near the fea-coaft where the mariners are to be taken, to the intent that the juftices may choofe out and return fuch a number of ablelodied men, as in the commiffion are contained, to ferve her majefty. And by others, efpecially protections are allowed to feamen in particular circumiltances, to pievent them from being impreffed. Ferrymen are alfo faid to be privileged from being impreffed, at common law. All which do moft evidently imply a power of impreffing to refide fomewhere; and if any where, it muft, from the fpirit of our conflitution, as well as from the frequent mention of the king's commiffion, refide in the crown alone.-After all, however, this method of manning the navy is to be confidered as only defenfible from public neceffity, to which all private confiderations muft give way.

The following perfons are exempted from being imprefied : A pprentices for three years; the mafter, mate, and carpenter, and one man for every 100 tons, of veffels cmployed in the coal trade; all under 18 years of age, and above 55 ; foreigners in merchant-flips and privateers; landmen bctaking themfelves to fea for two years; feamen in the Greenland fifhery, and harpooners, employed, during the interval of the fifhing feafon, in the coal-trade, and giving fecurity to go to the fifhing next fcafon.

IMPRESSION is applied to the fpecies of objects which are fuppofed to make fome mark or impreffion on the fenfes, the mind, and the memory. The Peripatetics affert, that bodies emit fpecies refembling them, which are conveged to the common fenforium, and they are rendered incelligible by the active intelleet; and, when thus Spiritualized, are called expreffions, or exprefs jpecics, as being expreffed from the others.

Impressionalfo denotes the edition of a book, regarding the mechanical part only; whereas edition, befides this, takes in the care of the editor, who corrected or augmented the copy, adding notes, \&c. to render the work more ufeful.

IMPRISONMENT', the fate of a perion reftrained of his liberty, and detainecu under the cuftody of another.

No perfon is to be imprifoned but as the law directs, either by the command or order of a sourt of record, or hy lawful warrant; or the king's procefs, on which one may be lawfully detained. And at common law, a perfon could not be imprifoned unlefs he were guilty of fome force and violence, for which his body was fubject to imprifonment, as one of the higheft executions. Where the law gives power to imprifon, in fuch cafe it is juftifiable, provided he that does it is purfuance of a flatute exactly purfues the flatute in the manner of doing it ; for otlierwife it will be deemed falfe imprifonment, and of confequence it is unjuftifiable. Every warrant of comnitment for imprifoning a perfon, ought to run, "till delivered by due courfe of law," and not " until farther order;" which has been held ill: and thus it alfo is, where one is imprifoned on a warrant not mentioning any caufe for which he is committed. Sce Arrest and Com. mitment.
Falfe Imprisonmsnt. Every confinement of the perfon is an impriforment, whether it be in a common prifon, or in a private houle, or in the flocks, or even by forcibly detaining one in the public Atreets. Un. lawful or falfe imprifonment, confifts in fuch confinemont or detention without fufficient authority: which authority may arife either from fome procefs from the courts of juftice; or from fome warrant from allegal power to commit, under his hand and feal, and expreffing the caufe of fuch commitment ; or from fome other fpecial caufe warranted, for the neceffity of the thing, either by common law or act of parliament; fuch as the arrefling of a felon by a private perfon without wartant, the impreffing of mariners for the public fervice, or the apprehonding of waggoners for mifbehaviour in the public highways. Falfe imprifonment alfo may arife by executing a lawful warrant or procefs at an unlawful time, as on a Sunday; or in a place privileged from arrefts, as in the verge of the king's court. This is the injury. The remedy is of two forts; the one removing the injury, the other making fatisfacion for it.

The means of remoring the actual injury of falle imprifonment are four-fold, 1. By writ of Mainprize. 2. By wit De Omio et Atia. 3. By writ De Homine. Replegiando. 4. By writ of Habeas Corpus. Sce thofe articles.

The fatisfadory remedy for this injury of falfe imprifonment, is by an action of trefpafs wi et armis, ufually called an action of falfe imprifonment; which is generally, and almo凡 unavoidably, accompanied with a charge of affaule and battery alfo: and therein the party flall recover damages for the injuries he has received; and alfo the defendant is, as for all other injuries committed with force, or vi et armis, liable to pay a fine to the king for the violation of the public peace.

IMPROMPTU, or Inprompru, a Latin word frequently ufed among the French, and fometimes in Euglifh, to fignify a piece made off hand, or extempore, without any previous meditation, by mere force and vivacity of imagination.

IMPROBATION, in Scots law, the name of any action brought for fetting any deed or writing atide upon the head of forgery.

IMPROPRIATION, in ecclefiafical law.
Sce
Appropriation.

## I N A

IMPURIT'Y, in the law of Mofes, is any legal defilement. Of thefe there were feveral forts. Some were voluntary, as the touching a dead body, or any animal that died of itfelf, or any creature that was efteemed unclean ; or the touching things holy, by one who was not elean, or was not a prieft ; the touching one who had a leprofy, one who had a gonorrhoca, or who was polluted by a dead carcale, \&e. Sometimes thefe inpurities were involuntary; as when any one inadvertently touehed bones, or a fepulchre, or any thing polluted; or fell into fuch difeafes as follute, as the leprofy, \&c.

The beds, elothes, and moveables, which had touched any thing unclean, contracted alfo a kind of impuri$t y$, and in fome cales communicated it to others.

Thefe legal pollutions were generally removed by bathing, and latled no longer than the evening. The perfon polluted plunged over head in the water, and either had his elothes on when he did fo, or walhed himfelf and his clothes feparately. Other pollutions continued feven days, as that which was contracted by touching a dead body. That of women in their month. ly courfes lafted till this was over with them. Other impurities lafted 40 or 50 days; as that of women who were lately delivered, who were unclean 40 days after the birth of a boy, and 50 after the birth of a girl. Others again lafted till the perfor was cured.

Many of thefe pollutions were expiated by facrifices; and others by a certain water or lye made with the afhes of a red heifer, facrifieed on the great day of expiation. When the leper was cured, he went to the temple, and offered a facrifice of two birds, one of which was killed and the other fet at liberty. He who had touched a dead body, or had been prefent at a funeral, was to be purified with the water of expiation, and this upon pain of death. The woman who had been delivered, offered a turtle and a lamb for her expiation; or if the was poor, two turtles or two young pigenns.

Thefe impurities, whieh the law of Mofes has expreffed with the greatell aceuracy and eare, were only figures of other more important impurities, fuch as the fins and iniquities committed againlt God, or faults committed againt our neighbour. The faints and prophets of the Old Teftament were fenfible of this; and our Saviour, in the gofpel, has ftrongly inculcated, that they are not outward and eorporeal pollutions which render us unacceptable to God, but fuch inward pollutions as infect the foul, and are violations of juttice, truth, and chanity.

IMPUTATION, in general, the charging fome thing to the account of one which belonged to another: thus, the affertors of original fin maintain, that Adam's fin is imputed to all bis polterity.

In the fame fenfe, the righteoufnefs and merits of Chrift are imputed to true believers.

INACCESSIBLE, fomething that cannot be come at, or approached, by reafon of intervening obftacles, as a river, rock, \&e. It is chiefly ufed in fpeaking of heights and ditanees. See Geometry.

INACHUS, founder of the kingdom of Argos, 1856 B. C. See Argos.

INALIENABLE, that whieh eannot be legally alicnated or made over to another: thus the dominions of the king, the revenues of the church, the eltates of
a minor, \&c. are inalienable, otherwife than with a re- Inanimate ferve of the right of redemption.

INANIMATE, a body that las either lod its foul, Inca, or that is not of a nature eapable of having any.

INANITION, among phyficians, denotes the fate of the fomach when empty, in oppofition to repletion.

INANITY, the fchool term for emptinefs or atfolute vacuity, and implies the abfence of all body and matter whatfoever, fo that nothing remains but mere face.

INARCHING, in gardening, is a method of grafting, commonly ealled grafting by approach; and is ufed when the flock intended to graft on, and the tree from which the graft is to be taken, ftand fo near, cr can be brought fo near, that they may be joined to. gether. The branch to be inarehed is to be bitted to that part of the ftoek where it is to be joined; the rind and wood are to be pared away on one lide for the length of three inches, and the ftock or branch where the graft is to be united mutt be ferved in the fame manner, fo that the two may join equally and the fap meet. A little tongue is then to be cut upwards in the graft, and a noteh made in the fock to admit it; fo that when they are joined, the tongue will prevent their Aipping, and the graft will more elofely unite to the floek. Having thus brought them exactly together, they mult be tied with fome bals, or worlted, or other foft tying; and then the place mult be covered with fome giafting clay, to prevent the air from dryiny the wound, and the wet from rotting the flock. A llake mult be fixed in the ground, to which both the ftock and the graft mutt be tied to prevent the winds from difplacing them. When they have rcmained in this ftate for four months, they will be fufficiently united, and the graft may then be cut off from the mother-tree, oblerving to flope it clofe to the ftock; and at this time there hould be frefh clay laid all round the part. This operation flould be performed in April or May, that the graft may be perfectly united to the Aock before the enfuing winter.

Inarehing is chiefly practifed upon oranges, myrtles, jeflamines, walnuts, furs, and fome other trees which do not fucceed well in the common way of grafting. But it is a wrong practice when orange-trees are defigricd to grow large, for thefe are feldom long-lived after the operation.

INAUGURATION, the coronation of an emperor or king, or the confecration of a prelate: fo ealled from the ceremonies uled by the Romans, when they were reccived into the college of augurs.

INCA, or Ynca, a name given by the natives of Peru to their kings and the prinees of the blood. Pedro de Cisca, in his Chronicles of Peru, gives the origin of the incas; and fays, that that country was, for a long time, the theatre of all manner of erimes, of war, difiention, and the molt dreadful diforders, till at laft wo brothers appeared, one of whom was called Mangocapa; of this perfon the Peruvians relate many wonderful ftories. He built the eity of $\mathrm{Cufco}_{\text {, }}$ mase laws, eftablifhed order and harmony by his wife regulations; and he and his defcendants took the name of inra, which fignifies king or great lord. Thefe incas beeame fo powerful, that they. rendered themfelves malters of all the country from Pato to Chili, and from.

Incamera- the river Maule on the fouth to the river Augatinago
tion on the north; thefe two sivers forming the bounds dred leagues in length. This they enjoyed till the di- vifions between Inca Guafcar and Atabalipa; which the Spaniards laying linld of, made themfelves mafters of the country, and deftroyed the empire of the incas. See Peru.

INCAMERATION, a term ufed in the chancery of Rome, for the uniting of lands, revenues, or other rights, to the pope's domain.

INCANTATION, denotes certain ceremonies, accompanied with a formula of words, and fuppofed to be capable of raifing devils, โpirits, \&c. See Снаrm, \&c.

INCAPACITY, in the canon-law, is of two kinds: 1. The want of a difpenfation for age in a minor, for legitimation in a ballard, and the like : this renders the provifion of a benefice void in its original. 2. Crimes and heinous offences, which annul provifions at firit valid.

INCARNATION, in theology, fignifies the act whereby the Son of God affumed the human nature : or the myfery by which Jefus Chritt, the eternal word, was made man, in order to accomplifh the work of our falvation. The era ufed among Chrittians, whence they number their ycars, is the time of the incarnation, that is, of Chrift's conception in the virgin's womb.
'This era was firt eftablihhed by Dionyfius Exigurus, about the beginning of the fixth century, till whicl time the era of Diocletian had been in ufe.

Some time after this, it was confidered, that the years of a man's life were not numbered from the time of his conception, but from that of his birth: which occafoned them to poflpone the beginning of this era for the fpace of one year, retaiuing the cycle of Dionyfus entire in every thing elfe.

At Rome they reckon their years from the incarnation or birth of Chirit, that is, from the 25 th of December, whicl cuftom has obtained from the year 1431. In France, and feveral other countries, they alfo reckon from the incarnation: but then they differ from each other in the day of the incarnation, fixing it, after the primitive manner, not to the day of the birth, but conception of our Saviour. Though the Floremtines retain the day of the birth, and begiu their year from Chriftmas.

Incarnation (formed from in, and caro "皿efh", iu furgery, fignifies the healing and filling up of ulcers and wounds with new flefh. See Surgery.

INCARNATIVES, in furgery, modicines which aflit nature in filling up wounds or ulcers with fleft; or rather remove the obitructions thereto.

INCENLIARY, in law, is applied to one who is guilty of malicioully fetting fire to another's dwell. ing.houfe, and all outhoufes that are parcel thereof, though not contiguous to it or under the fame root, as barns and llables. A bare intent or attempt to do this, by actually fetting fire to a houre, unlefs it abfolutely burns, does not fall within the defcription of Pincendit et comlufit. But the burning and confuming of any part is fufficient; though the fire be afterwards extinguifhed. It mutt alfo to a malicious burning; $\mathrm{N}^{\circ} 165$.
ocherwife it is only a trefpafs. This offence is called arfon in our law.

- Among the ancients. criminals of this kind were to In be burnt. शui ades, acerwumque frumenti juxia domum fofitum foiens, prudenfque dolo malo combuflerit, vintlus igni nccatur.

The punifhment of arfon was death by nur ancient Saxon laws and by the Gothic conflitutions: and in the reign of Edward I. incendiaries were burnt to death. The Atat. 8 Hen. VI. c. 6. made the wilful burning of houfes, under fpecial circumitances, high treafon; but it was reduced to fclony by the general acts of Edward VI. and Queen Mary. This offence was denied the benefit of clergy by 21 Hen. VIII.c. s. which ttatute was repealed by i Edw. VI. c. 12 ; and arion was held to be oufted of clergy, with refpect to the principal, by inference from the Itat. 4 and 5 P. and M. c. 4 , which exprefsly denied it to the acceffory; though now it is exprefsly denied to the principal alfo, by 9 Geo. I. c. 22.

INCENSE, or Frankincense, in the matcria medica, \&c. a dry refinous fubftance, known among authors by the names thus and olibanum.

Incenfe is a rich perfume, with which the Pagans, and the Roman Catholics Atill, perfume their temples, altars, \&c.-The word comes from the Latin incenfum, q. d. lurnt; as taking the effect for the thing itfelf.

The burning of incenfe made part of the daily fervice of the ancient Jewih church. The prielts drew lots to know who nould offer it : the deftined perfon took a large filver difh, in with was a cenfer full of iucenfe; and being accompanied by another prieft carrying fome live coals from the altar, went into the temple. There, in order to give notice to the people, they truck upon an intrument of brafs placed between the temple and the altar; and being returned to the altar, he who brought the fire left it there, and went away. Then the offerer of incenfe having faid a prayer or two, waited the fignal, which was the burning of the holucauft ; immediately upon which he fet fire to the incenfe, the whole mulcitude continuing all the time in prayer. The quantity of incenfe offered each day was half a pound in the morning and as much at bight.

One reafon of this continual burning of incenfe might be, that the multitude of victims that were continually offered up, would have made the temple fmell like a flaughter-houfe, and confequently lave infpired the comers rather with difgult and averlion, than awe and reverence, had it nut been overpowered by the agreeable fragrance of thofe perfumes.

INCEPTIVE, a word ufed by Dr Wallis to exprefs fuch moments, or lirf principles, which, though of no magnitude thenfelves, are yet capable of producing fuch as are. Thus a point has no magnitude itfelf, but is inceptive of a line which it produces by its notion. So a line, though it have no breadih, is yet inceptive of breadth ; that is, it is capable, by its moLion, of producing a furface which has briadth, \&cc.

INCEST, the crime of venercal commerce betweea perfons who are related in a degree wherein marriage is prohibited by the law of the country.

Some are of opinion, that marriage ought to be permitted between kinsfolks, to the end that the af-
fection.
feation fo neceffary in marriage might be heightened by this double tie: yet the rules of the church have formerly extended this prohibition even to the feventh degree; but time has now brouglit it down to the third or fourth degree.

Mof nations look on inceft with horror, Perfia and Egypt alone excepted. In the hifory of the ancient kings of thofe countries we meet with inftances of the brother's marrying the filter; the reafon was, becaufe they thought it too mean to join in alliance with their own fubjects, and ftill more fo to have married into any foreign family.

Incest Spiritual, a crime committed in like manner between perfons who bave a fpiritual alliance by means of baptifm or confirmation.
Spiritual inceft is alfo underflood of a vicar, or other beneficiary, who enjoys buth the mother and daughter; that is, holds two benefices, the one whereof depends upon the collation of the other.
Such a fpiritual inceft renders both the one and the other of thefe benefices vacant.

1 NCH , a well-known mafure of length; being the twelfth part of a foot, and equal to three barly-corns is length.

Inch of Candle, (fale by). See Cannle.
INCH (contractedfrom the Gaelic innis "an ifland"), a word prefixed to the names of aifferent places in Scotland and Ireland.
$I_{N L H} \cdot$ Colm or Columba, the ine of Columba, an inand fituated on the frith of Forth in Scotland, and famous for its monaltery. See Forth.

This monaftery was founded about 11:23, by Alexander I . on the following occafion. In pafling the frith of Forth he was overtaken with a violent It orm, which drove him to this ifland, where he met with the mult hofpitable reception from a poor hermit, then refiding here in the chapel of St Columba, who, for the three days that the king continued there tempeft-bound, entertained him with the milk of his cow, and a few fhell fifh. His majefty, from the fenfe of the danger he tiad efcaped, and in gratitude to the faint to whom he atributed his fafety, vowed fome token of refpect; and accordingly founded here a monaftery of Auguftines, and dedicated it to St Culumba. Allan de Murtimer, lord of A berdour, who attended Edward III. in his Scotch expedition, bellowed half of thofe lands on the monks of this inland, for the privilege of a family burialplace in their church.--The buildings made in confequence of the piety of Alexander were very confiderable. There are titill to be feen a latge fquare tower belonging to the church, the ruins of the church, and of feveral other buildings. The wealth of this place in the time of Edward III. proved fo ftrong a temptation to his fleet, then lying in the Forth, as to fupprefs all the horror of facrilege and refpect to the fanctity of the inhabitants. Thi Englifh landed, and fpared not even the funiture more immediately confecrated to divine worthip. But due vengeance overtdok them; for in a Iturm wl icin inflantly followed, many of them perifhed; thofe who efcaped, Itruck with the juftice of the judgment, vowed to make anple recompence to the injured faint. The tempelt ceafed; and they made the promifed atonement - The Dannf monnment, $f_{1}$ gured by Sir Robert Sibbald, lies on the fouth eaff fi'se of the building, on a rifing ground. It is of a rigid Vol. IX. Part I.
form, and the furface ornamented with fcale-like figures. At cach end is the reprefentation of a human head.

INCH-Keith, a fmall ifland frtuated in the fame frith, midway between the port of Leith and Kinghorn on the oppofite fhore. See Forth.

This inand is faid to derive its name from the gal. lant Keith who fo greatly figualized himfelf by his valour in 1010, in the battle of Barry, in Angus, againt the Danes; after which lie received in reward the barony of Keith, in Lothian, and this little ifle. In 1549 the Englith fleet, fent by Edward V1. to affift the lords of the congregation agaimit the queen-dowager, landed, and began to fortify this ifland, of the importance of which they grew fenfible after their neglect of fecuring the port of Leith, fo lately in their power. They left here five companies to cover the workmen under the command of Cotterel; but their operations were foon interrupted by M. Deffe, general of the French auxiliaries, who took the place, after a gallant defence on the part of the Englifh. The Scots kept poffelfion for fome years; but at laft the fortifications were deftroyed by act of parliament, to prevent it from being of any ufe to the former. The French gave it the name of L'ife des chevaux, from its property of foon fattening horfes. - In 1497, by order of council, all venereal patients in the neighbourhood of the capital were tranfported there, ne quid derimenti refpublica caperet.

InCH Garvie, a fmall ifland, alfo lying in the frith of Forth. See Furth.

INCHANTMENT. See Witchcraft.
INCHOA'TIVE, a term fignifying the beginning of a thing or action; the fame with what is otherwife called inceptive.

Inchoative verbs, dennte, according to Prifcian and other grammarians, verbs that are characterifed by the termination foo or foor, added to their primitives: as augefco from aureo, calefio from calco, dulcefio from du'cis, irafor from ira, \&c.

INCIDENCE, denotes the direction in which one body ftrikes on another. See Oftics and Mechanics.

Angle of Incidence. See Angle.
INCIDENT, in a general fenfe, denotes an event, or a particular circumblance of fome event.

Inciofnt, in law, is a thing appertaining to, or following another, that is more wortly or principal. A court-baron is infeparably incident to a manor; and a court of pie powders to a fair.

Incinent diligence, in scots law, a warrant granted by a lord ordinary in the court of feffion, for citing witueffes for proving any point, or for production of any writing neceflary for preparing the caufe for a final determination, or belore it goes to a general proa?

Inconent, in a poem, is an epilole, or particular astion, joined to the principal action, or $\mathrm{de}_{\mathrm{i}}$ ending on it.

A good comedy is to be full of agreeable incidents, which divert the fpectators, and furm the intrigue ${ }^{\circ}$ The poet ought always to make choice of fuch incidents as are fufceptible of ornament fuitable to the nature of his poem Tlee variety of incidents we!l cons. ducted makes the beauty of an heroic poem, whics: ought always to take in a certain number of incidents

Incinera to fufpend the cataftrophe, that would otherwife break
tion
out too foon.

INCINERATION, (derived from $i n$, and cinis, "afhes,") in Chemittry, the reduction of vegetables into afhes, by burning them gently.

INCISIVE, an appellation given to whatever cuts or divides: thus, the foreteeth ate called dentes incijiav, or cutters; and medicines of an attenuating nature, incidents, or inciGve medicines.

INCLE, a kind of tape made of linen yarn.
INCLINATION, is a word frequently ufed by mathematicians, and fignifies the mutual approach, tendency, or leaning of two lines or two planes towards each other, fo as to make an angle.

INCLINATIUN in a moral fenfe. Sce Appetite.
INCLINED P PaNE, in mechanics, one that makes an oblique ancle with the horizon. See Mechanics.

INCOGNITO, or iscog, is applied to a perfon who is in any place where he would not be known: hut is is more particularly applied to princes, or great men, who enter towns, or walk the freets, without their ordinary train or the ufual marks of their diltinetion and quality.

INCOMBUSTIBILE clnth. See Asbestos. On this Cronfledt obferves, that the natural fore of the afbefti is in proportion to their economical ufe, both being very incoufiderable. "It is an old eradidion (fayshe), that in former ages they made clothes of the fibrous afoeft, which is faid to be compofed by the word bylus; but it is not very probable, fince if one may conclude from fome trifles now made of it, as bags, ribbons, and other things, fuch a drefs could neither have an agreeable appearance, nor be of any conveniency or advantage. It is more probable that the Scythians dreffed therr dead bodies, which were to be burned, in a cloth manufactured of this fone; and this perhaps has occafioned the above fable." M. Magellan confirms this opinion of Cronftedt's, and informs us that fome of the Romans alfo inclofed dead bodies in loth of this kind. In the year 1756 or 1757 he tells us, that he faw a large piece of aftetlos clotb found in a flone tomb, with the alhes of a Roman, as appeared by the epitaph. It was kept, with the tomb alfo, if our author remembers rightly, in the right-hand wing of the Vatican library at Rome. The under-librarian, in order to fhow that it was incombullible, lighted a candle, and let fome drops of wax fall on the cloth, which he fet on fire with a candle in his prefence without any detriment to the cloth. Its texture was coarfe, but much fofter than he could have expected.

INCOMBUSTIBL.E, fomething that cannot be burnt or confumed by fire. See Asbestos.

INCOMMENSURABLE, a term in geometry, uled where two lines, when compared to each other, have no common meafure, how fmall foever, that will exactly meafure them both. And in general, two quantities are faid to be incommenfurable, when no third quantity can be found that is an aliquot part of both.

Incommensurable Numbers, are fuch as have no common divifor that will divide them both equally.

INCOMPATIBLE, that which cannot fubfift with another without deftroyirg it: thus cold and heat are incompatible in the fame fubject, the Arongeit overcoming and expelling the weakell.

INCONTINENCE, inordinacy of the fexual ap-
petite; lufl. It is the oppofite of challity. See Chas tity and Continence.
Incontinence, in the eye of law, is of divers kinds; as in cafes of bigamy, rapes, fodony, or buggery, getting baftards; all which are punithed by flatute. See 25 Hen. VIII. cap. 6. 18 Eliz. cap, 7. I Jac. I. cap. If. Incontinency of priefts is punithable by the ordinary, by impritonment, \&xc. I Hen. VII. cap. 4.

Incontinence, in medicine, fignifies an inability in any of the organs to retain what mould not be difcharged without the concurrence of the will. But in. continence is moll frequently ufed with regard to an involuntary difcharge of urine otherwile called diabe. tes. See Menicine-Index.

INCORPORATION, in pharmacy, is much the fame as impaftation, being a reduction of dry fubltan. ces to the confiftence of a palle, by the admixture of fome fluid: thus pills, boles, troches, and plafters, are made by incorporation. Another incorporation is when things of different confflencies are by digeftion reduced to one common confiftence.

Ingorporation or Bady-Corporate. See Corporation.

INCORPOREAI, fpiritual; a thing, or fubltance which has no body. Thus the foul of man is incorporeal, and may fubfilt independent of the body. See Metaphysics.

INCORRUPTIBLE, that which cannot be corrupted. Thus fpiritual fubttances, as angels, human fouls, \&c. and thus alfo glafs, gold, mercury, \&c. may be called incorruptible.

INCORRUPTIBLES, Incorruptieiles, the name of a feet which fprang out of the Eutychians.Their diftinguining tenet was, that the body of Jefus Chritt was incorruptible; by which they meant, thas after and from the time wherein lie was formed in the womb of his holy mother, he was not fufceptible of any clange or alteration; not cven of any natural and innocent paffions, as of hunger, thirt, \&c. So that he eat witheut any occafion, before his death, as well as after his refurrection. And hence it was that they took their name.

INCRASSATING, in pharmacy, \&c. the rendering of fluids thicker by the mixture of otber fubftances lefs fluid, or by the evaporation of the thinner parts.

INCUBATION, the action of a hen, or other fowl, brooding on her eggs. Sce Hatching.

INCUBUS, Night-Mare, a difeale confiling in an oppreffion of the breaft, fo very violent, that the patient cannot fpeak or even breathe. The word is derived from the Latin incuobare, to "lie down" on any thing and prefs it: the Greeks call it equarins q. d. faltator, "leaper," or one that ruhheth on a perfon.

In this difeafe the fenfes are not quite loft, bus drowned and aftonifhed, as is the underftanding and imagination; fo that the patient feems to think fome huge weight thrown on him, ready to ftrangle hima Children are very liable to this dittemper; fo are fat people, and men of much ftudy and application of mind ; by reafon the fomach in all thefe finds fome difficulty in digeftion.

INCUMBENT, a clerk or miniter who is refident on his benifice; he is called incumbent, becaufe he does,

## I N D [ 17 I ] I N D

arvation or at leaf ought to, bend his whole fludy to difcharge the cure of his churel.
incurvation of the Rays of Light, their bending out of a rectilinear ftraight courfe, occafioned by refraction. See Optics.

INCUS, in anatony, a bone of the internal ear, fomewhat refembling one of the anterior dentes molares. See Anatnmy, no 14.

INDEFEASIBLE, a term in law for what cannot be defeated or made void; as an indefeafible eftate of inheritance, \& c.

Indefensible Righe to the Throne. See Heredt$\tau_{A R Y}$ Right.

INDEFINITE, that which has no certain bounds, or to which the human mind cannot affix any.

Indffinite, in grammar, is underfood of nouns, pronouns, verbs, participles, articles, \&c. which are left in an unceriain indeterminate fenfe, and not lixed to any particular time, thing, or other circumftance.
INDELIBLE, fomething that cannot be cancelled or effaced.

INDEMNITY, in law, the faving harmlefs; or a writing to fecure one from all damage and danger that may enfue from any act.

INDENTED, in heraldry, is when the outline of an ordinary is notched like the teeth of a faw.

INDENTURE, in Lazw, a writing which comprifes fome contract between two at leaft ; being indented at top, anfwerable to another part which has the fame contents. See Deed.

INDEPENDENTS, a fect of Proteftants fo ealled from thcir maintaining that each congregation of Chriffians, which meets in one houfe for publick worhip, is a complete chureh, has fufficient power to act and perform every thing relating to religious government within itfelf, and is in no refpect fubject or accountable to other churches.

The Independenta, like every other Chrifian fect, ori derive their own origin from the pactice of the apoftles in planting the firt churches; but they were unknown in modern times till they arofe in England during the reign of Elizabeth. The hierarchy ettablifhed by that prineefs in the churches of her dominions, the veltments worn by the clergy in the celebra. tion of divine worlhip, the book of eommen prayer, and above all the fign of the crofs ufed in the admimi. fration of baptifm, were very offenlive to many of her fubjects, who during the perfecutions of the former reign had taken refuge aniong the Protettants of Germany and Geneva. Thofe men thought that the church of England refembled, in too many particulars, the antichrittian ehurch of Rome; and they called perpetually for a more thorough reformation and a purer woithip. From this cireumflance they were ftigmatized by their adverfaries with the general name of Puritans, as the followers of Novatian (A) had been in
the ancient church. Elizabeth was not difoped to comply with their demands; and it is difficult to fay what might have been the iflue of the contelt, had the Puritans been united among themfelves in fentiments, views, and meafures. But the cale was quite otherwife. That large hody, compofed of perfons of different ranks, characters, opinions, and intentions, and muanimous in nothing but in their antipathy to the forms of doctrine and difcipline that were eftablifhed by law, was all of a fudden divided into a variety of fects. Of thefe the moft famous was that which was formed about the year 1581 by Robert Brozun, a man infinuating in his manners, but uniteady and inconfitt. ent in his views and notions of men and things. See Brown.
This innovator differed not in point of doctrine either from the church of England or from the refl of the Purio tans; but he had formed notions then new and fingular, coneerning the nature of the chureh and the rules of ecclefiaftical government. He was for dividing the whole body of the faithful into feparate focieties or congregations; and maintained, that fuch a number of perfons as could be contained in an ordinary place of worlhip ought to be confidered as a church, and enjoy all the rights and privileges that are competent to an ecclefiatical community. Thefe fmall focieties he pronounced independent, jure divino, and entirely exempt from the jurifdiction of the bilhops, in whofe hands the court had placed the reins of fpiritual govermment : and alfo from that of prefbyteries and fynods, which the Puritans regarded as the fupreme vifible fources of ecelefraftical authority. He alfo maintained, that the power of governing each congregation refided in the people; and that each member had an equal fhare in this government, and an equal right to order matters for the good of the whole fociety. Hence alf points both of doetrine and difcipline were fubmitted to the difcuffion of the whole congregation; and whatever was fupported by a majority of voices paffed into a law. It was the congregation alfo that elected certain of the brethren to the office of paitors, to perform the duty of public inftruction, and the feveral branches of divine worfhip; referving however to themlelves the power of difmiffing thefe miniters, and reducing them to the eondition of private members, whenever they flould think fuch a change conducive to the fpiritual advantage of the community. It is likewife to be obferved, that the right of the pallors to preach was by no means of an exelufive nature, or peculiar to then alone ; fince any member that thought proper to exhort or inftruct the brethren, was abundantly indulged in the liberty of prophefynug to the whole afembly. Accordingly, when the ordinary teacher or pattor had finithed his difcourfe, all the other brethren were permitted to communicate in public their fentiments and illufrations upon any ufeful or edifying fubject.
(A) The followets of Novatian were called Puritans, becaufe they would not communicate with the Catholic church, under pretence that her communion was polluted by admitting thofe to the facred myfleries who through infirmity had facrified to idols in times of perfecution. Thefe unlappy men were not received by the church till after a long courfe of penance. The Novatians would not receive them at all, however long sheir penance, or however fincere their forrow, for their fin. In other refpects, the ancient Puritans were, like she Englifh, orthodos in the faith, and of irreproachable morals.

## $\left.\begin{array}{lllllll}\text { I N D } & 172\end{array}\right] \quad$ I N D

3depen- The zeal with which Brown and his affociates dents. maintained and propagated thefe notions was in a high degree intemperate and extravagant. He affirmed, that all communion was to be broken off with thufe xeligions focieties that were founded upon a different plan from his; and treated, more efpecially the church of England, as a fpurious church, whofe minitters were unlawfully ordained, whofe difcipline was popifh and antichriftian, and whofe facraments and inflitutions were deftitute of all efficacy and virtue. The fect of this hot-headed innovator, not being able to endure the fevere treatment which their own violence had brought upon them from an adminilltration that was not dittinguifhed by its mildnefs and indulgenee, retired into the Netherlands, and founded churches at Middlebourg in Zealand, and at A nulturdam and Leyden in the province of Holland; hut their ellab iflhnents were neither folid nor lafting. Their founder returned into England; and having renounced his principles of Separation, took orders in the ettablilhed church, and obtained a benefice. The Puritan exiles, whom he thus abandoned, difagreed among themfelves, were fplit into parties, and their affuirs declined from day to day. This engafed the wifer part of them to mitigate the feverity of their founder's plan, and to foften the rigour of his uncharitable decifions.

The perfon who had the chief merit of bringing ahout this reformation was one of their paflors called Fohn Robinfon, a man who liad much of the fok mu picty of the times, and no incoufiderable portion of learning. This well-meaning reformer, perceiving the defects that reigned in the difcipline of Brown, and in the fpirit and temper of his followers, employed his zeal and diligence in correcting them, and in newmodelling the fociety in fueh a manner as to render it lefs odious to its adverfaries, and lefs liable to the jutt cenfure of thofe true Chrittians, who look upon charity as the end of the commandments. Hitherto the fect had been called Brownif/s; but Robiufon having, in his Apolosy, affirned, Catium quemlibet particularem effe totan, integrain, at perfetian ectlefiant ex juis partibus confantem immediate et INDEPENDENTER (quoad alias ecclefias) fuil ipfo Cbrifo,-the feet was henceforth called Independents, of which the apologit was conlidered as the founder.
The indtpendents were much more commendable than the Brownills. They furpalfed them both in the moderation of their fentiments and in the order of their difcipline. They did not, like Brown, pour forth bitter and uncharitable invectives againtt the churches which were governed by rules entirely different from theirs, nor pronounce them on that account unworthy of the Chrillian name. On the erntrary, though they confidered their own form of ecelefialtical goveinment as of divine inllitution, and as originally incroduced by the authority of the apollles, nay by the apofles themfelves, they had yet candour and charity enough to acknowledge, that true religion and folid piety might fournh in thofe communities which were under the jurifdiction of bihops or the government of fyrods and prefbyteries. This is put beyond all doubt by Robinfon himfelf, who exprufes his ewn private ientiments and thofe of his community in the following clear and precife words: "Profitemur coram Deo et
hominibus, adeo nobis convenire cum ecclefiis refor- Ia lepe matis $\mathrm{Bu} l_{g i c i s ~ i n ~ r e ~ r e l i s i o n i s, ~ u t ~ o m n i b u s ~ e t ~ f i n g u l i s ~}^{\text {a }}$ earundem ecclefiarum fidei articulis, prout habentur in harmonia confefionum fidei, parati fimus fubferibere. Ecclefias reformatas pro veris et genuinis habemus, cum üfdem in facris Dei communionen profitemur, et, quantum in nobis eft, colimus." They were alfo much more attentive than the Brownifts, in keeping on foot a regular miniftry in their conmunities : for while the latter alluwed promifcuoufly all ranks and orders of men to teach in public, the Independents had, and fill have, a certain number of minitters, chofen refpectively by the congregations where they are fixed; nor is any perfon among them permitted to fpeak in public, before he has fubmitted to a proper examination of his capacity and talents, and been approved of by the heads of the congregation.

This religious fociety ilill fubfifts, and has produced divines as enninent for learning, piery, and vistue, as any churets in Chriftendom. It is now diftinguifted from the other Proteflant communities chiefly by the two following circumftances.

1. The Independents reject the ufe of all creeds and In wh confeffions drawn up by fallible inen, requiring of their the a teachers a., other toft of orthodoxy than a declaration now of their belief in the gofpel of Jefus, and their adhe- guifhe rence to the Scriptures as the fole Itandard of faith Prote! and practice
2. Thiy attribute no virtue whatever to the nite of ordination upon which fome other churches lay fo much flrefs; for the Independents declare, that the qualifications which conftute a regular minifter of the New Teftament, are, a firm beliff in the gofpel, a primciple of fincere and unaffected piety, a competent iluck of knowledge, a capacity for leading devotion and communicating infruction, a ferous melination to engaye in the important employment of promoting the everlating falvation of mankind, and ordinatily an invitation to the patural uffice fiom fome particular fociety of Chriftians. Whete thefe thiugs concur, they confiter a perfon as fitted and authorifed for the difcharge of every duty which belongs to the miniterial function; and they believe that the impofition of the lands of bifhops or prebyters would ecnvey to him no powers or prerogatives of which he was not before poffelfed.

When the reformers feparaied from the church of Rome, they drew up public confeffions of faith or articles of religion, to which they demanded fubfeription from their refpective followers. Their purpofe in this was to guard againfl dangerous herefics, to afcertain the meaning of Scripture language, and, we doubt not, to promote the unicy of the ipirit in the bond of peace. Ithefe were laudable ends; but of the means chofen for attaining them, the late Dr Taylor of Norwich, the glory of the Independent churches, and whofe learning woold have done honvur to any church, expreffes his opinion in the following indignant language: "How much foever the Chrifitian world valueth thefe creeds and confeflions, I confefs, for my own part, chat I have no opinion of them. But we are cold that they were generally drawn up by the again ablell divines. But what viduce is thut the the are divines in vogue and power commonly the moft knowing

## I N D

n- knowing and upright? But granting that the reformers were in thofe days the ableft divines; the ablett divires educated in Popifh fchools, notwithtanding any pietended learning, might comparatively be very wrak and defective in Ccripture-knowletge, which was a thing in a manner new to them. In times of great ignorance they might be men of eminence; and yet far thort of being qualified to draw up and decide the true and prectie rules of faith for all Chriftians. Yea. their very attempting to draw up, decide, and eftablith, fuch rules of faith, is an inconteltible evidence of their furpriting ignorance and weaknefs. How could they be able divnes, when they improfed upon the confeiences of Chrultiaus thcir own decifions concaning gofpelfaith and doctrine? Was not this in fact to teach and conftram Chrittians to depart trom the moft furdanental principle of their religion, fubjestion and all:giance to Chrill, the only teather and inwziver? Bu• if they were able men, were they intallible? No: they publicly affirmed that own fallb:lity; and yet they acted as if they had been infalliole, and could not be mittaken in preferibing faith and doctrine.
"But even if they were infallible, who gave them commifion to do what the Spirit of God had done already? Sould the firlt reformers hope to deliver the truths of religion more fully and more clearly than the Spirit of God? Had they found out more apt expreffions than had occurred to the Holy Spirit? The Son of God'fpake not of timflelf; but as the Father faid unto him, fo he Spake' (John xii. 50). 'The Spirit of truth fpake not of himfelf; but whatfoever he heard, that he fpake' (John xvi. 13.). 'The things of God the apoltles fpake, not in the words which man's wifdom teacheth, but which the Holy Ghof teacheth' (1 Cor. ii. r3.). If the Chrittian revelation was thus handed down to us from the Fountain of Light with fo much care and exactncfs, both as to matter and words, by the Son of God, by the Spirit, and by the apoflis, who were the ancient doctors and bifhops? or Who were the firft reformers? or who were any fynods or affemblies of divines, that they darcal to model ChriItian faith into their own invenred forms, and impore it upon the minds of men in their own devifed terms and expreffions?
" Hath Chrilt given authority to all his minilters, to the end of the world, to new-mould his doetrines by the rules of human learning, whenever they think fit? or lath he delegated his power to any particular perfons? Neither the one nor the other. His ductrines are not ot fuch a ductile nature ; but Itand fixed, both as 10 matter and words, in the Scripture. And it is at any man's foril, who pretends to put them, as they are rules of failt, into any new drefs or flape. I conclude therefore, that the Girt reformers, and all councils, fynods, and afitmblits, who have met together to collect, determine, and decide, to preferibe and impole matters pertaning to Chrittian faith, have acted without any watrant from Chyif, and therefore have invaled the pierogative of him who is the fole Prephet and Lawgiver to the church. Peace and unity, I know, is the pretended good defign of thofe creeds and confeffons. But as God never fanctified them for thofe ends, fo all the world knows they have produced the contrary effects; difcord, divifion, and the fpilling of whote feas of Carillian blood, for $\ddagger+00$ years together."

## 173 ] I N D

Such fentiments as thefe are now maintained by Chriftians of various denominations; but they were firft avowed by the Independents, to whom therefore the mert or denmerit of bringing them to lisht properly belongs. Our readers will think differently of them according to their preconceived opinions; but it is not our province either to confirm or to confute them. They rife almolt nectflarily out of the independent feheme of eongregational churches; and we could not fupprefs them without deviating from our fixed refolution of doing jurtice to all religions parties, as well thofe from whom we differ as thofe with whom we agree. It ought not, however, to be ralhly coscluded, that the Independents of the preient age, merely becanle they reject the ufe of all creeds of human compolition, doubt or diß lieve the doctrines deened orthodox in other churehes. Their predeceffors in the laft century were thought to be more rigid Calvinitts than the Prefbyterians themfelves; as many of thofe may likewife be, who in the prefent century admit not the confe ffoons and formulas of the Calviniticic churches. They acknowledge as divine truth cvery dectrine contained in the Scriptures; but they think that fcripeure doctrines are moit properly expreffed in fcripture language; and the fame firit of religious liberty, which makes then reject the authority of bifhops and fynods in matters of difcipline, makes them reject the fame authority in matters of faith. In cither cafe, to call any man or body of men their malters, would, in their opinion, be a violation of the divine law, lince "' one is their mater, even Chrift, and tincy all are brethren."

In fupport of their fcheme of congregational churches, they ubferve, that the word $\mathrm{Ex} \mathrm{\times} \mathrm{\times norz}$, which we tran liate church, is always ufed in Scripture to tignify either a fingle congregation, or the place where a lingle congregation meets. Thus that unlawful afiembly at Ephelus, brought together againt Paul by the craftsmen, is called $x \times x \lambda \eta \pi t 2$, a church (Acts xix. $32,39,+1$.) I'he word, however, is generally applied to a moie facred ufe : but thill it fignifies either the body afitinbling, or the plase in which it affembles. The whole body of the difciples at Corinth is called the church, and fpoken of as coning together into ore phace ( 1 Cor. xiv. 23.) The place into which they came together we nind likewife called a church; " when ye come together in the charch, -- when ye come toger her into one place" ( 1 Cor. xi. 18, 20.). Wherever there were more congregations than one, there were likewife more churches than one: Thus, "Let your women keep filence in the churchies, Ev rais exannazas (i Cor. xi. 18.) The whiole nation of 1 lrael is indeed called a charch, but it was no more than a fingle congregation ; for it had but ona place of public worhip, viz. firtt the tabernacle, and atterwards the temple. The Catholic church of Chrit, his holy nation and kingdom, is likewife a fingle congregation, having one place of worthip, viz beaven, where all the members affemble by faith and hold communion; and in which, when they fhall all be fullp gathered together, they will in fact be one glorious al. feimbly. We find it called "the general allembly and church of the firt-born, whofe names are written in heaven."

Befides thefe, the Independent can find no other deiaription of a church is the New Teflament; not a

Their argu-- ment for the m 'e. pentency of congre. yational Irurchee,

Indepen- erace of a diocefe or prefoytery confifting of feveral dent:. congregati, ns all fubject to one jurifdition. The number of difciples in Jerufalem was certainly great before they were difperfed by the perfecution in which Paul bore fo active a part : yet they are never mentioned as forming diftinct affemblies, but as one affcmbly meeting with its elders in one place; fometimes in the temple, fometimes in Solomon's porch, and fometimes in an upper room. After the difperfion, the difciples who fled from Jerufalem, as they could no longer affemble in one place, are never called a church by themfelves, or one church, but the churches of Judea, Samaria, and Galilee, (Acts ix. 31. Gal i. 22.) Whence the Independent concludes, that in Jerufalens the words cburch and congregation were of the fame im. port; and if fuch was the cafe there, where the gofpel was firit preached, he thinks we may reafonably expect to find it fo in other places. Thus when Paul on his journey calls the elders of the church of Ephefus to Miletus, he fpeaks to them as the joint overifers of a fingle congregation: "Take heed to yourfelves, and to all the flock, over which the Holy G holt hath made you overfeers" (Acts xx. 28.) Had the church at Eplefus confited of different congregations united under fuch a jurifdiction as that of a modern pre!bytery, it would have been natural to fay, "Take heed to yourfelves, and to the flocks over which the Holy Gloolt hath made you overfeers:" but this is a way of fpeaking of which the Independent finds not an inftance in the whole New Teftament. The facred writers, when fpaking of all the Chriflians in a nation or province, never call them the church of fuch a nation or province, but the churches of Galatia (Gal. i. 2.), the churches of Macedonia ( 2 Cor. viii- I.), the churches of Afia (1 Cor. xvi. 10.) On the other band, when fpeaking of the difciples in a city or town, who might ordinarly affemble in one place, they uniformly call them a church; faying, the church of Antioch, the church at Corinth, the church of Ephefus, and the like.

In each
congregation nure than one elder or prefbyter, whofe rffic is to teach as well as govern.

In each of thefe churches or congregations there were elders or prefbyters and deacons; and in every church there feems to have bcen more than one elder, in fome a great many, who all " laboured in word and doctrine." Thus we read (Acts xiv. 23.) of Paul and Barnabas ordaining clders in every church; and (Acts xx. 17.) of a company of elders in the church of Ephefus, who were cxhorted to "foed the flock, and to take heed to themfelves and to all the lock over which the Holy Gholl had made them overfeers:" but of fuch elders asare to be found in modern prefleyterian churches, who neither teach nor are apt to teach, the Independent finds no veltige in the Scriptures, nor in the earlict uninfpired writers of the Chrifian church. The
rule or government of this prefoptery or elderflip in a Int. church is not their own but Chrilh's. They are nut lords over God's heritage, nor can they pretend to more power over the difciples than the apotles had. ibut when the adminitration of the apoltes in the church of Jernfalem, and other churches where they acted as elders, is inquired into by an Independent, it cioes not appear to him that they did any thing of common concern to the church, without the confent of the multitude: nay, it feems they thought it neceffary to judge and determine in difcipliae in prefence of the whole church (Actsvi. 1 -6. xv. 22. 1 Cor. v. 3, 4,5.) Excommunication and abfolution were in the power of Exen the churcb at Corinth, and not of the elders as dillin- nicati guithed from the congregation (1 Cor. v. 2 Cor, ii.) and a The apoltle indeed feeaks of his deliveriag. fome unto tom Satan (1 Tim. i. 20.): but it is by no means clear that fach be did it by himfelf, and not after the manner pointed at grega ${ }_{1}$ Cor. v. 4,5 ; even as it does not appear, from his faying, in one epiltle, that the gift was given unto 'Timothy by the putting on of bis hands, that this was not done in the preflytery of a church, as in the other epitte we find it actually was. The trying and judging of falfe apoltes was a matter of the Grit importance: but it was done by the elders with the flock at Ephefus (Rev. ii. 2. Acts xx. 28 , ; and that whole flock did in the days of Ignatius all partake of the Lord's fupper, and pray together in one ( B ) place. Even the power of binding atid looling, or the power of the keys, as it has been called, was by onr Siviour conferred not upon a particular order of difciples, but upon the church: "If thy brother thall trefpafs againit thee, go and tell him his fault between thee and him alone: if he thall hear thee, thou hat gained thy brother. But if he will not hear thee, then take with thee one or two more, that in the mouth of one or two witneffes every word may be eftablifhed. And if he thall neglect to hear them, tell it unto the church: but if he neglect to hear the church, let him be unto thee as an heathen man and a publican. Verily I lay unto you, whatfoever ye fhall bind on earth, fhall be bound, \&c. (St Mat. xviii. 15, 16, 17, 19.). It is not faid, if he thall neglect to hear the one or two, tell it to the $\%$. ders of the church; far lefs can it be meant that the oflended perfon thould tell the caure of his offence to all the difciples in a prefoytery or diocefe confifting of many congregations: but be is required to tell it to that particular church or congregation to which they both belong :' and the fentence of that affembly, pro- of nounced by its elders, is in a very folemn manner de the fin clared to be linal, from which there lies no appeal to any juriddiction on earth.

With refpeet to the confituting of elders in any church Wha or congregation, the Independent reafons in the fol fitu
lowing ders
(в) The evidence upon which this is faid by Mr Glas (for the whole of this reafoning is extracted from his works), is probably the following paffage in the epiftle of Ignatius to the Ephefians: Et rap evos xat deveppov Tposux $\chi^{n}$, \&\&. "For if the prayer of one or two be of fuch force as we are told, how much more prevalent muft that be which is made by the bithop and the whole church? Fe then that dues not come together into the fame place with it, is proud, and hath condemned himfelf; for it is written, Grod refifteth the proud. Let us not therefore refift the b:fhop, that we may be the fervants of God." The fentence, as it thus llands by itfelf, certainly countenances Mr Glas's fcheme; but the reader who thinks any regard due to the teftimony of Ignatius, will do well to perufe the whole epifte as publifhed by Voffius.

## I N D

 commiffion to thofe minillers, with whom he prumifed that, according to them, even the elcetion of a $a$
to be always prefent even unto the end of the world. gation confers upon the man whon they may
lowing manner: The officers of Chrift's appointment are either ordinary and permanent in the church, or they were extraordinary and peculiar to the planting of Chriftianity. The extraordinary were thofe who were employed in laying the plan of the gofpel churches, and in publiihing the New Teftament revelation. Such were the apoftles, the chofen witneffes of our Siviour'3 refurrection; fuch were the prophets infpired by the Holy Gholt for explaining. infallibly the Old Tellament by the things written in the New; and fuch were the erangelits, the apofles minifters. Thefe can be fucceeded by none in that which was peculiar to them, becanfe their work was completed by themfelves. But they are fucceeded in all that was not peculiar to them by elders and deacons, the only two ordinary and pernianent orders of minitlers in the church. We have already feen, that it belongs to the office of the elder to feed the flock of Chritt; and the only queltion to be fettled is, how men are ordinarily called to that effice? for about the office of the deacon there is little or no difpute. No man now can pretend to be fo called of God to the minittry of the word as the apulles and other infpired elders were, whom he chofe to be the publifhers of his revealed truth, and to whofe inifion he bore witnefs in an extraordinary manner. It is not competent for any man or body of men to add to, or diminifh from, the defeription of a gofpel minifter given in thefe places, fo as to inflit upon the neceffity of any qualification which is not there mentioned, or to difpenfe with any qualification as needlefs which is there reguired. Neither has Jefus Chrilt, the only legiflator to the church, given to any miniHers or people any power or right whatfoever to call, fend, elect, or ordain, to that office any perfon who is not qualified according to the defcription given in his law ; nor has he given any power or right to reject the leaft of them who are fo qualified, and who defire the office of a bihop or elder. Let a man have hands laid upon him by fuch as could prove an uninterrupted de. fcent by impolition of hands from the apoftles; let him be fet apart to that effice by a company of minitters themfelves, the moft conformable to the feripture chamater, and let him be chofen by the mot holy people on earth; yet if he anfwer not the New Teftament defription of a minifter, he is not called of God to that office, and is no minifter of Chrift, but is indeed runuing unfent. No form of ordination can pretend to fuch a clear foundation in the New Te氏tament as

the defcription of the perfons who hould be elders of the church; and the laying on of hands, whether by bihops or prefoyters, is of no more importance in the miffion of a minifter of Chrit, than the waving of one's hand in the air or the puitting of it into his boform ; for now when the power of miracles has ceafed, it is obvious that fech a rite, by whomfocyer performed, can convey no powcrs, whether ordinary or extraordinary. Indeed it appears to have heen fometimes ufed even in the apoflolic age without any fuch inten. tion. When Paul and Batnabas were feprated to the particular employment of going out to the Gentiles, the prophets and teachers at Antioch "prayed and laid their hands on them:" But did this ceremony confer upon the two apofles any new power or authority to act as minitters of Chrilit? Did the impolition of hands make thofe shining lights of the gofpel one whit better qualified than they were before to convert and baptize the nations, to feed the flock of God, to teach, rebuke, or exhort, with all loug fuffering and doctrine? It cannot be pretendec. Paul and Barnabas had undoubtedly received the Holy Gholt before they came to Antioch; and as they were apofles, they were of courfe authorifed to difcharge all the functions of the inferior and ordinary minitters of the gofpel. In a gation confers upon the man whon they may choofe for their pattor no new powers, but only creates a new relation between him and a particular fock, giving him an exclufive right, either by himfelf or in conjunction with other paftors conflituted in the fanse manner, to exercife among them that anthority which he derives immerliately from Chrift, and which in a greater or lefs degree is poteffed by eveiy fincerc ChriAtian according to his gifts and abilities. Were the miniters of the gofpel conllituted in any other way than this; by impofition of hands, for inflance, in fucceffion from the apofles; the cafe of Chritlians would. in the opinion of the Independents, be extremely hard, and the ways of God fearcely equal. We are ftrietly commanded not to forlake the affembling of ourfelves together, but to contimue fledfaft in the apofles doctrine and fellowhip, and in the breaking of bread, and in prayer: " but can any man (afls one of their advocates) bring himelf to believe, that what he is commanded to do in point of gratitude, what is made his owi perional act, an act expreflive of certain dutiful and pions affections, can poffibly be reftricted to the intermediate offices or inffumentality of others, who aes by gowers which he can neither give nor take away?

1. cietern: wate II Index.

To fuppofe a thing neceffary to my bappinefs, which is not in my own power, or wholly depends upon the gnod pleafure of another, over whom I have no austhority, and concerning whofe inteutions and difpofitions I can have no fecurity, is to fuppofe a conilitution the molt foolifh and ill-natured, utterly ineontiftent with our ideas of a wife and good Agent." Such are fome of the principal arguments by which the Independents maintain the divine right of congregational churches, and the inefficacy of minifterial ordination to conftitute a minifler of Chrift. We mean not to remark upon them, as the reader will find different conAtutions of the ehureh pleaded for under the words presiyterians and Episcopacy, to which wereferhim fir farther fatisfaction. We fhall only obferve at prefent, what it would be affectation to pafs unnoticed, that the mode of reafoning adopted by the laft quoted advocate for the Independents, if puihed as far as it will go, neeeffarily leads to confequences which will not yeadly be admitted by a Chriftian of any denomination, or indeed by a ferious and confiflent Theil.

INDETERMINA IE, in gencral, an appellation given to whatever is not eertain, fixed, and limited; in which fenfe it is the fame with indefinite.

INDEX, in anatomy, denntes the fore finger. It is thus ealled from indico, I point or direat; becaufe that finger is generally fo ufed: whence alfo the extenfor indicis is called indicator.

INDEX, in arithmetic and algebra, fhows to what power any quantity is involved, and is otherwife callid itsexponent. Sce Algebra, p. 412.

INDFX of a Book, is that part annexed to a book, referring to the particular matters or paffages thercin contained.

InDEx of a Globe, is a little Alyle fitted on to the northpole, and turning round with it, pointing to certain divifions in the hour-circle. It is fometimes alfo calied gnomon. Sce Globe.

Expurgutory INDEX, a catalugue of proh bited books in the church of Rome.

The fift catalnctues of this kind were made by the inquifitors; and thefe were afterwards approved of by the council of Trent, after fonse alteration was made in them by way of retrenchment or addition. Thus an inde $x$ of heretical books being forned, it was confirmed by a bull of Clement VIII. in 1595, and printed with feveral introductory rules; by the fourth of which, the ufe of the feriptures in the vulgar tongue is forbidden to all perfons without a particular licence; and by the tenth rule it is ordaincd, that no book fhall be printed at Rone without the approbation of the Pupe's vicar, or fome perfon delegated by the Pupe; not in thy other places, unlefs allowed by the bifhup of the divecefe, or tome perfon deputed by him, or by the inquifiter of heretical pravity.

The Trens index being thus publifhed, Philip II. of Spain ordered another to be printed at Antwerp, in 1571, with confiderable enlargements. Another index was publifhed in Spain in 1584; a copy of which $\mathrm{N}^{2} 165$.

## I N D

was fnatched out of the fire when the Englith plundered Cadiz. Afterwards there were feveral expurga. tory indexes printed at Rome and Naples, and particularly in Spain.

INDIA. See Hindostan.- By the name of In . dia the anciente underttood ouly the weftern peninfula, on this fide the Ganges, and the peninf lla $b$ ¢yond it, having little or no knowledge of the countries which lie farther to the eaftward; though by the moderns all thofe valt tracts from the ealtern parts of the Perfian empire to the illands of Japan, are cinfounded under the general name of Eaft Indies. Even the ancients, thougb originally they were acquainted only with the weftern parts of Hindoftan, gradually extended the name of India over the other countrics they difcovered to the ealtward; fo that probably they would have involved all the reft in the fame general defignation, had they been as well acquainted with them as the moderns are. By whom the fe conntries were originally peopled, is annj a quedtion which in all prubability will never be refulved. conc Certain it is, that fome works in thefe parts difcover the $f$ matks of allonithing !kill and power in the inhabitants, dia. fuch as the images in the ifland of Elcphanta; the rocking flunes of immenfe weight, yet fo nicely balanced that a man can move them with his hand; the obferratory at Benares, ixe. Thefe ftupendous works are by Mr Bryant attributed to the Cuthites or Dabyloniaus, the filt diltinct nation in the world, and who of confequence mult for fome time have poffeffed in a manuer the fovereignty of the whole earth; and it can by no means appear improhable, that the fubjects of Nimrod, the beginning of whofe kingdom was in Shinar, might extend themelves callward, and thus fill the fertile regions of the ealt with inhabitants, without thinking it worth while for a long time to meddle with the lefs mild and rich countries to the weftward. Thus why would be formed that great and for fome time infu-Indi perable divifion betwix: the inhabitants of India and Wift other countries; fo that the weftern nations knew not wers even of the exitence of the Indians but by obfcure re-rant port ; while the latter, ignorant of their own origin, at:os invented a thoufand idle tales coneerning the antiquity of their nation, which fome of the moderns have been eredulous enough to believe and record as facts.

The firll among the wellern nations who diftinguih ed themfelves by their application to navigation and commerce, and who were of confequence likely to difcover thefe diftant nations, were the Egyptians and Phenicians. The former, however, foon lolt their inclination for naval aftairs, and held all fea.faring people in detitation as profane perfons; though the ex- Ace teufive conquedis of $S$ fontris, if we can believe them, the mult have in a great mrafure fupplied this defect. font Without regard to the prejadice of his prople ag unt Ind: maritime affairs, he is faid to have hitted unt a feet of 400 fall in the Arabian Gulph or Red Sea, whish conquered all the countrics lying al ang the Erythrean Sea (a) to India; while the army ied by himfelf marched through Afia, and fubdued all che countries to the

Ganges;
(A) This mult not be confounled with the Red Sea, notwithfanding the fimilarity of names. The Erythrean fa was that part of the octan which is laterpofed betwixt whe ftrats of Labelnandel and the Mafabar coall, now called the Indian fea or ocean.

Ganges; after which he croffed that river, and advanced to the eaftern ocean.

Great difputes have been carried on with refpect to this conqueror. and the fanous expedition juff now r1- related; hut the larned Dr Robertfon, in his Dif. dif-quiftion concerning ancient Irdia, declares himfelf in doubt whether any fuch expedition ever was made, for the following reafons. i. Few hiftorical facts feem to be beter eftablifhed than that of the averfion the Egyptians entertained to feafaring people and naval affairs; and the Doctor conliders it as impoffible even for the moft powerful monarch to change in a few years a national habit confirmed by time and fanctified by religion. The very magnitude of the armaments is an argument againft their exiftence; for befides the 400 Thips of war, he had another flees in the Mediterranean: and fuch a mighty navy could not have been conAtructed in any nation unaccuftomed to maritime affairs, in a few years. 2. Herodotus makes no mention of the conquefts of India by Sefolris, though he relates his hiflory at fome length. Our author is of opinion that the fory was fabricated betwixt the time of Herodotus and that of Diodorus Siculus, from whom we have the firft account of this expedition. Diodorus himfelf informs us that he had it from the Egyptian priets; and gives it as his opinion, that "many things they related flowed rather from a defire to promote the honour of their country than from attention to truth:" and he takes notice that both the Egyptian prietts and Greek writers differ widely from one another in the accounts which they give of the actions of Sefôtis. 3. Though Diodorus declares that he has felected the molt probable parts of the Egyptian narrative, yet there are fill fo many improbabilities, or rather impoffibilities. contained in lis relation, that we cannot by any means give credit to it. 4. For the reafon juft mentioned, the judicious geographer Strabo rejected the account altogether, and ranks the exploits of Sefoftris in India with the fabulous ones of Bacchus and Hercules.

But whatever may be determined with regard to the Egyptians, it is certain that the Tyrians kept up a conBant intercourfe with fome parts of India by navigating the Arabian Gulf, now the Red Sea. Of this navigation they became maiters by taking from the Jdumeans fome maritime places on the coall of the Red Sea : but as the diftance betwixt the nearell place of that Sea and Tyre was fill confiderable, the landcarriage would have been very tedous and expenfive; for which reafon it was neceffary to become mafters of a port on the ealtern part of the Mediterranean, nearer to the Red Sea than Tyre, that fo the goods might be fhipped from thence to Tyre itfelf. With this wiew they took poffeflion of R.hinvelura, the neareft Fort on the Mediterranean to the Arabian Gulf; and to that port all the goods from India were conveyed by a much thorter and lefs expenfive route than over land. - This is the firft authentic account of any intercourfe betwixt India and the weftern part of the world: and to this we are without doubt in a great meafure to afcribe the vaft wealth and power for which the city of Tyre was anciently renowned; for in other refpects the whole territory of Phenicia was but of little confequence. Notwithflanding the frequency of thefe voyages, however, the ancients are able to
give little or no account of them. The moft particis- $\qquad$
lar defcription we have of the wealth, power, and commerce of ancient Tyre, is in the prophetics of Ezekiel; fo that if the Tyrians themfelves kept any journals of their voyages, it is probable that they were entirely lof when the city was deitroyed by Alexander the Grear.

Though the Jews, under the reign of David and The Jews ${ }^{6}$ Solomon, carried on an extemive and lucrative com- did not vimerce, yet our author is of opinion that they did not fit India. trade to any part of Iudia. There are only two places mentioned to which their fhips failed, viz. Ophir and Tarfhifh; both of which are now fuppofed to have been fitnated on the caftern coaft of Africa: the ancient Tarfhih, according to Mr Bruce, wasthe prffent Mucha; and Ophir the kingdom of Sofala, ईoremarkable in former tinres for its miues, that it was called by Oriental writerss the golden Sofala *.

- See Ophir

Tinus the Indians continued for a long time unknown àd Tarto the weftern nations, and undifurbed by them ; pro-fojb. bably in fubjection to the mighty empire of Babylon, from which the country was originally peopled, or in alliance with it ; and the poffefion of this valt region will eatily account for the inmenfe and otherwife almof incredible wealth and power of the ancient Babylonifh monarchs. Soon after the deftruction of that monarchy by the Perians, however, we find their monarch Darius Hyltafpes undertaking an expedition againt the Indians $\dagger$. His conquefts were not exten- dia five, as they did not reach beyond the territory watered + See Fin. by the Indies ; neverthelefs, fuch as they were, the ${ }^{\text {dy }} \mathrm{inn}, \mathrm{n}^{\circ} 2$. acquifition feems to have been very important, as the revenue derived from the conquered territory, according to Herodotus, was near a third of that of the whole Perfian empire. According to his account, however, we mult form a much more diminutive opinion of the riches of the Perfian monarchs than bas commonly been done; fince Herodotus tells us, that the empire was divided into 20 fatrapies or governments; all of which yielded a revenue of $\mathbf{x}, 5,50$ Euboic talents, amounting in the whole to $2,807,+37$ l. ferling The amount of the revenue from the conquered provinces of India therefore mult have been conliderably hort of a million. Very little knowledge of the country was diffufed by the expedition of Darius, or the voyage of Scylax whom he employed to explore the coalts: for the Greeks paid no regard to the tranfactions of thofe whom they called Barlarians; and as for Scylax himfelf, he told fo many incredible fories in the account he gave of his voyage, that he had the misfortune to be difbelieved in almolt every thing, whether true or falfe.

The expedition of Alexander is fo fully taken notice of alerani of under the article Hindostan, that nothing more re- der the mains to be faid upon it in this place, than that he went no farther into the country than the prefent territory of the Panjab, all of which he did not traverfe. Its fouth-weft boundary is formed by a rivcr anciently called the Hyfudrus, now the Setlege. The breadth of this diftriet from Ludhana on the Setlege, to Attock on the Indus, is computed to be 259 geographical miles in a flraight line; and Alexander's march, computed in the fame manner, did not exceed 200 ; neverthelefs, by the fpreading of his numerous army over the country, and the exact meafurement and delineaZ tion
tion of all bis movements by men of fcience whom he employed, a very extenfive knowledge of the weltern part of India was obtained. It is, however, furpri. fing, that having marched through fo many countries in the neighbourhood of India, where the penple mult have been well acquainted with the nature of the climate, the Macedonian conqueror did not receive any information concerning the difficulties he would meet with from the rains which fell periodieally at a certain feafon of the year. It was the extreme diftrels occafioned by them which made his foldiers finally refolve to proceed no farther; and no wonder indeed that they did adopt this refolution, fince Diodorus informs us, that it had rained inceffantly for 70 days before their departure. Thefe rains, however, aecording to the teftimony both of ancient and modern writers, fall only in the mountainous parts, little or none being ever feen in the plains. Arittobulus informs us, that in the country through which Alexander marehed, though heavy rains fell among the mountains, not a fhower was feen in the plains below. The diftrict is now feldom vifited by Europeans; but major Rennel was informed by a perfon of credit, who had refided in the Panjab, that during great part of the S. W. monfoon, or at leal in the months July, Augut, and part of September, which is the rainy feafon in mof other parts of India, very little rain falls in the Delta of the Indies, except very near the fea, though the atmofphere is generally cluuded, and very few thowers fall throughout the whole feafon. Captain Hamilton relates, that when he vifited Tatta, no rain liad fallen there for three years before. We may have forne idea of what the Macedonians fuffered by what happened afterwards to Nadir Shah, who, though poffeffed of vait wealth and power, as well as great experience in military affairs, yet loll a great part of his army in croffing the mountains and rivers of the Panjab, and in battles with the favage inlabitants who inhabit the countries betwixt the Oxus and the frontiers of Perfia. He marched through the fame countries, and nearly in the fame direction, that Alexander did.

Ey his voyage down the river Indus, Alexander contributed much more to enlarge our gengraphical knowledge of India than by all his marches and conquefts by land. According to Major Rennel, the fpace of country through which he failed on the Indus, from the Hyphafis to the ocean, was not lefs than 1000 miles; and as, during the whole of that navigation, he ntliged the nations on both fides the river to lubmit to him, we may be very certain that the country on each fide was explored to fome diftance. An exact account not only of his military cperations, but of cvery thing worthy of notice relating to the countrics through which he paffed, was preferved in the journals of his three officers, Lagus, Nearchus, and Aritobislus; and thefe journals, Arrian informs us, he followed
in the compofition of his hiftory. From thefe authors we learn, that in the time of Alexander, the weftern part of that valt traft named India was poffeffed by feven very powerful monarchs. The territory of king Porus, which Alexander firf ennquered, and then refored in him, is faid to lave contained no fewer than 2000 towns; and the king of the Prafii had affembled an army of 20,000 cavalry, 2000 armed chariots, and a great number of elephants, to oppofe the Macedonian
monarch on the banks of the Ganges. The navigable rivers with which the Panjab country abounds, afforded then, and fill continue to afford, an intercourfe from one part to another by water : and as ac that time thefe rivers probably had many fhips on them for the purpofes of eommerec, Alexander might eafily collect all the number he is faid to have had, viz. 2000 ; lince it is reported that Semiramis was oppofed by double the number on the Indus when the invaded India. When Mahmud Gazni alfo invaded this country, a fleet was collected upon the Indus to oppofe him, confitting of the fame number of veffels. From the Aycen Akbery, allo, we learn that the inhabitants of this part of India fill continue to carry or all their communication with each other by water; and the inhabitants of the Circar of Tatta alone have 40,000 veffels of various conAructions.

Under the article Hindostan we have mentioned Why Major Renncl's opinion concerning the filence of Alex- ander ander's hiftorians about the expedition of Scylax ; but no not Dr Robertfon acconnts for it in another manner. "It no not vo is remarkable (fays he), that neither Nearchus, nor of Scy Ptolemy, nor Aritobulus, nor even Arrian, once mention the voyage of Scylax. This could not proeeed from their being unacquainted with it, for Herodotus was a favourite author in the hands of every Greek who had any pretenfions to literature. It was probably oecafioned by the reafons they had to diftruft the veracity of Scylax, of which I have already taken notice. Accordingly, in a fpeech which Arrian puts in the mouth of Alexander, he afferts, that, except Bacchus, he was the firt who had paffed the Indus; whieh implies that he difbelieved what is related concerning Scylax, and was not acquainted with what Darius Hyftafpes is faid to have done in order to fubject that part of India to the Perfian crown. This opinion is confirmed by Megafthenes, who refided a confiderable tinue in India. He afferts, that, except Bacchus and Hercules (to whofe fabulous cxpeditions Strabo is aftonithed that he fhould have given any credit), Alexander was the firt who had invaded India. Arrian informs us that the Affaceni, and other people who inhabited the country now called Candabar, hal been tributary filf to the Affyrians and then to the Medes and Pirfians. As all the fertile provinces on the noth-weft of the Indus were anciently reckoned to be part of India, it is probable that what was levied from them is the fum mentioned in the tribute rollfrom which Herodotus drew his account of the annual revenne of the Perfian empire, and that none of the provinces to the fouth of the Indus were ever fubject to the kings of Perfia." - The Doetor differs from Mr Rennel with refpect to the furprife which Alexander and his army expreffed when they faw the high tides at the mouth of the Indus. This he thinks might vely naturally have been the cafe, notwithitanding what Herodotus had written concerning the flux and reflux ohfervable in the Red Sea. All that has been mentioned by Herodotus concerning this phenomenon is, that "in the Red Sea there is a regular ebb and flow of the tide every day." No wonder therefore that the Macedonians thould be furprifed and terrified at the very high tides which prefcnted thenfelves in the Indan ocean, which the few words of Herodotus above mentioned bad by no means led them to ex-
dia. peet. In the like manner the Romans were furprifed at the tides in the Atlantic, when they had conquered fome of the countries bordering upon that ocean. Cæfar defcribes the aftonifhment of his foldiers at a fpring tide in Butain which greatly damaged his fleet; and indeed, confidering the very little rife of the tide in the Mediterranean, to which alone the Greeks and Romans had accefs, we may reckon the account given us by Arrian highly probable.

The country on each fide the Indus was found, in the time of Alexander, to be in no degree inferior in population to the kingdond of Porus already mentioned. The climate, foil, and productions of India, as well as the manners and cuftoms of the inhabitants, are exactly defribed, and the deferiptions found to correfpond in a furprifing manner with modern accounts. The ftated cliange of feafons, now known by the name of monfoons, the periodical rains, the fwellings and inunlations of the rivers, with the appearance of the country during the time they continue, are particularly defcribed. The deferiptions of the inhabitants are equally particular; their living entirely upn vegetable food, their divifion into tribes or cafts, with many of the particularities related under the article $\mathrm{H}_{1 \mathrm{~N}}$ Doo, are to be wet with in the accounts of Alexander's expedition. His military operations, however, extended but a very little way inte India properly fo called; no farther indced than the modenn province of Lahor, and the countries on the banks of the Indus from Moultan to the fea; though, had he lived to undertake another expeditior as he intended, it is very probable that he would have fubdued a vafly greater tract of country; nor indeed could any thing probably have fet bounds to his conquelts but death or ievolts in diftant provinces of his empire. In orlier to fecure the obedience of thofe countries he fubdued, Alexander found it necefflary to build a number of forbuitt tified cities; and the father eaftward he extended his conquefts, the more neceflary did he find this talk.
in in- Three he built in India itfelf; two on the banks of the Hydafpes, and a third on the Acefines, both navigable rivers, falling into the Indus after they have united their freams. By means of thefe cities he intended not only to keep the adjacent countrics in awe, but to promote a commercial intercourfe betwist dif. ferent parts both by land and water. With this view alfo, on his return to Sufa, he furvesed in perfon the courfe of the Euplrates and Tigris, cauling the cataracts or dams to be removed which the Perfian monarchs had built to obftruct the navigation of thefe rivers, in confornity to a maxim of their fuperflition, that it was unlawful to defile any of the elements, which they imagined was done by navigators. After the navigation was opened in this manner, he propofed that the valuable commoditics of India frould be imported into the other parts of his dominions by means of the Perfian Gulf; while through the Red Sea they were conveyed to Alexandria in Egypt, and thence difperfed all aver Europe.

The death of Alexander having put an end to all his great fchemes, the eaftern part of his dominions devolved firft on Pytho the fon of Agenor, and afterwards on Seleucus. The latter was very fenfible of the advantages to be derived from keeping India in
fubjection. With this vicw he undertook an ex. Indian. pedition into that ccuntry, partly to eftablifh his $\underbrace{\text { and }}_{12}$ authority more perfcetly, and partly to defend the expecition Macedonian territories againft Sandracotus king of of Seleucu? the Prafii, who threatened to attack them. The par-to India. ticulars of his expedition are very little known; Jullin being the only author who mentions them, and his authority is but of little weight, unlefs corroborated by the teftimony of other hiftorians. Plutarch, who tells us that Scleucus carried his arms farther into IIt. dia than Alexander, is fubject to an imputation of the fame kind; but Pliny, whofe authority is of confiderably greater wcight, corroborates the teflimony of Plutarch in this inftance, tho' his words are fo obfcure, that learned men differ in opinion concerning thtir meaning. Bayer thinks they imply that Seleucus marched from the Hyphafis, the boundary of Alexander's conquefts, to the Hy fudrus, from thence to Palibotbra, and then to the month of the Ganges; the diftances of the principal ftations being marked, and amounting in all to 2244 Roman miles. Notwithftanding this authority, however, Dr Robertfon thinks it very improbable that the expedition of Seleucus fhould have continued fo long, as in that cafe " the ancients would have had a more accurate knowledge of that part of the country than they feem ever to have poffeffed."

The career of Seleucus in the eaft was ftopped by Antigonus, who prepared to invade the weftern part of his dominions. The former was therefore obliged to conclude a treaty with Sandracottus, whom he allowed to remain in quiet poffeftion of his territories: but Dr Robertfon is of opinion, that during the lifetime of Seleucus, which continued 42 years after the dcath of Alexander, no diminution of the Macedonian territories took place. With a view of keeping ${ }^{13}$ up a friendly intercourfe with the Indian Prince, Se- concerning leucus fent Megafthenes, one of Alexander's officers, the firmzto Palibothra, capital of the kingdom of the Prafii, in of Pa. fituated on the banks of the Ganges. This city is by Dr Robertfon fuppofed to be the modern Allahabad, feated at the conflux of the Juruna and Ganges, contrary to the opinion of Major Remnet, who fuppofes it to be Patna.* As Megalthenes refided in this city * sce Hina for a conliderable fpace of time, he had an opportunity dofan, $\mathrm{n}^{\circ}{ }_{4}$. of making many obfervations on the country of India in general ; and thefe obfervations he was induced afterwards to publifh. Unhappily, however, he mingled with his relations the moll extravagant fables. To him may be traced the ridiculous accounts of men with ears fo large that they could wrap themfelves up in them; of tribes with one cye, without mouths or nofes, \&c. whence the extracts from his book given by Arrian, Diodorus, and other ancient writers, can fearcely be credited, unlefs confirmed by other evidence.

After the embaffy of Megalthenes to Sandracottur, and that of his fon Damaichus to Allitrochidas, the fucceffir of Sandracottus, we hear no more of the affairs of India with regard to the Macedonians, until the time of Antiochus the Great, who made a fhort incurfion into India about 197 years after the death of Selencus. All that we know of this expedition is, Expedtion that the Syrian monarch, after finifhing a war he car- of Artioried on sgaintt the two revolted provinces of Parthia chus the and Dactria, entered India, where he obliged Sopha- Great into

## I $\mathrm{N} D$

India. gafenus, king of the country which he invaded, to pay e fum of money, and give him a number of elephants. It is probable that the fucceffors of Seleucus were obliged foon after his death to abandon all their Indian ter-

Account of After the lofs of India by the Syrians, an intercourfe the Grecian was kept up for fome time betwixt it and the Greek kingdom of Bactria.
kingdom of Bactria. This lait beeame an independent Hate about 69 years after the death of Alexander; and,

16
Intercourfe betwixt E. gypt and india.
according to the few hints we have concerning it in ancient authors, carried on a great traffic with India. Nay, the Bactrian monarchs are faid to have conquered more extenfive tracts in that region than Alexander himfelf had done. Six princes reigned over this new kingdom in fucceflion; fome of whom, elated with the conquefts they had made and the power they had acquired, aflumed the title of Great King, by which the Perfian monarchs were diftinguifhed in their highent fplendor. Strabo informs us, that the Bactrian princes were deprived of their territories by the Scythian Nomades, who came from the country beyond the Iaxartes, and were known by the names of Afi, Pafiani, Tachari, and Scarauli. This is confirmed by the teflimony of fome Chinefe hiftorians quoted by M. de Guignes. According to them, about 126 years before the Chiflian æra, a powerful horde of Tartars, pufhed from their astive feats on the contines of China, and obliged to move farther to the welt, paifed the laxartes, and, pouring in upon Bactria like an irrefiltible torrent, over helmed that kingdom, and put an end to the dominion of the Greeks after it had lafted near 130 years.

From this time to the clofe of the 15 th century, all thoughts of eltablifhing any dominion in India were totally abandoned by the Europeans. The only abject now was to promote a commercial intercourfe with that country; and Egypt was the medium by which that intercourfe was to be promoted. Ptolemy the fon of Lagus, and firf king of Egypt, firlt raifed the power and fplendor of Alexandria, which he knew had been built by Alexander with a view to carry on a trade to India: and in order to make the navigation more fecure, he built the celebrated light-houle at Pharos; a work fo magnificent as to be reckoned one of the wonders of the world. His fon Ptolemy Philadelphus profecuted the fame plan very vigoroufly. In his time the Indian commerce once more began to centre in Tyre; but to remove it effectually from thence, he formed a canal between Arfinoe on the Red Sea, not far from the place where Suez now Itands, and the Pelufiac or caftern branch of the Nile. This canal was 100 cubits broad and 30 deep; fo that by means of it the productions of India might have been conveyed to Alexandria entirely by water. We know not whether this work was ever finifhed, or whether it was found ufelefs on account of the dangerous navigation towards the northern extremity of the RedSea; but whatever was the caufe, it is ceitain that no ufe was made of it, and a new city named Berenice, fituated almoft under the tropic upon the weftern fhore of the Red Sea, became the Itaple of Indian commerce. From thence the goods were tranfportediby land to Coptos, a city dittant only three miles from the Nile, to which it was joined by a navigable canal. Thus, however, there was a very tedious iand-carriage of no lefs than

258 Roman miles through the barren defart of Thebais: but Ptolemy caufed diligent fearch to be inade every where for Springs, and wherever thele were fund, he built inns or caravanferas. for the accommodation of travellers ; and thus the commerce with India was carried on till Egypt became fubject to the Romans. The fhips during this period fet tail from Berenice, and coatting along the A'abian thore to the promontory of Syagrus, now Cape Rafalgate, held their courle along the coatt of Perfia till they arrived at the mouth of the weftern branch of the river Indus. They either failed up this branch till they cane to Pattata, nox Tatta, fituated at the upper part of the Dela, or continued their courle to fome other emporium on the weftera part of the Indian coalt. A more convenient courfe was afterwards found by Cailiag directiy to Zi zenis, a place concerning which there is now fome difputc. Montefquieu will have it to be the kingdom of Sigertis, on the coaft adjacent to the Indus, and which was conquered by the Bactrian monarchs; but Major Renne! is of opinion that it was a port on the Malabar cualt. Dr Robertfon dues not pretend to decide this difpute; but is of opinion, that during the time of the Ptolemies very little proyrefs was made in the difcovery of India. He contets the opinion of Major Rennel, that "under the Ptolenics the Egyptians extended their navigation to the extreme pout of the Indian continent, and even failed up the Gangea to Palibothra, now Patna." In this cale he thinks that the interior parts of India mult have beea much better known to the ancients than we have any reafor to believe they were. He owns indeed that Strabo mentions the failing up the Ganges, but then it is. only curforily and in a dingle fentence; " whereas if fuch a confiderable inland voyage of above 400 miles, through a populous and rich country, had been cultomary, or even if it had been ever performed by the Roman, Greek, or Egyptian traders, it mult have merited a particular defcription, and mult have been mentioned by Pliny and other writers, as there was nothing fimilar to it in ihe practice of navigation a* mong the ancients."-The extreme danger of navigating the Red Sea in ancient times (which even in. the prefent improved tate of navigation is not entirely got over) feems to have been the principal reafon which induced Ptolemy to remove the communication with India from Arsnoe to Berenice, as there were other harbours on the fame coalt conliderably nearer tbe Nile than it. After the ruin of Coptos by the emperor: Diocletian, the Indian commodizies were conveyed from the Red Sea to the Nile from CofTeir, fuppofed by Dr Robertion to be the Pbiloteras Portus of Ptolemy, to Cous, the Vicus Apollinis, a journey of four days. Hence Cous from a fmall village became an opulent city; but in procefs of time, the trade from India removed from Cous to Kene, farther down the river. In modern times fuch Indian goods as are brought by the Red Sea come from Gidda to Suez, and are carried acrofs the Iftimus on camels, or brought by the caravan returning from the pilgrimage to Mecca.

It was to this monopoly of Indian commerce that Why Egypt owed its valt wealth and power during the Syrian time of its Macedonian monarchs; but it appears fur-narchs prifing that no attempt was made by the Syrian mo. not art narchs to rival them in it, efpecially as the latter were

## I N D [ 181 ] I N D

lis. in poffeffion of the Perfian gulf, from whence they might have imported the Indian comnodities by a much fhorter navigation than could be done by the Egyptian :. For this neglect feveral reafons are affigned by our learned author. 1. The Egyptians, under their Greek monarehs, applied themfelves to maritime affairs; and were in poffeffion of fuch a powerful fleet as gave therna deciderf fuperiority at fea. 2. No intercourfe by fea wan ever kept up betwixt Perlia and India, on aceount of the averfion which the Perfiass had to maritime affairs. All the Indian commodities were then conveyed in the moft tedious and difficult manner ovêr land, and difperied throughout the various provinces, partly by means of navigable rivers and partly by means of the Caipian fea. 3. Many of the ancients, by an unaccountable error in geograply, imagined the Cafpian fea to be a part of the great northern ocean ; and thus the kings of Syria might hope to convey the Indian commodities tothe European countries without attempting to navigate thofe feas which the Egyptian monarchs deemed theirown property. Selencus Nicator, the firt and greatell of the Syro-Macedonian monarchs, formed a project of joining the Euxine and Cafpian feas by a navigable canal, which would have effectually aufwered the purpofe, but was affaffinated before he could put it in execution, and none of his fucceffors had abilities to execute fuch an undertaking. Alexander the Great had given orders, a little before his death, to fit out a fquadron on the Calpian fea, in order to difcover whether it had any communication with the northern ocean, the Euxine fea, or Indian ocean; but $\operatorname{Dr}$ Robertion jufly thinks it furprifing that fuch errors concerning this fea fhould have exifted among the ancients, as Herodotus had long before deferibed it properly in the following words: "The Cafpian is a fea by itfelf, unconnected with any other. Its length is as much as a veffel with oars can fail in 15 days; and its greatelt breadth as much as it can fall in eight days.". Arittotle defcribes it in like manner, and infifts that it ought to be called a great lake, and not a lea.

On the conqueft of Egypt by the Romans the Indian commodities continued as ufual to be imported to Alexandria in Egypt, and from thence to Rome ; but befides this, the moft ancient conmunication betwixt the eallern and weftern parts of Afia feems never to have been entirely given up. Syria and Palettine are feparated from Mefopotamia by a defart ; but the paflage through it was much facilitated by its affording a ftation which abounded in water. Hence the poffeflion of this flation became an object of fuch confequence, that Solomon built upon it the city called in Syria Tadinor, and in Greek Palmyra. Both thefe names are expreffive of its fituation in a fpot adorned with palm-trees. Though its fituation for trade may to us feem very unfavourable (being 60 miles from the Euphrates, by which alone it could receive the Indian commodities, and 203 from the neareft coaft of the Mediterranean,) yet the value and fmall bulk of the goods in quettion rendered the conveyance of them by a long carriage over land not only practicable but lucrative and advantageous. Hence the inhabitants became opulent and powerful, and long maintained its independence even atter the Syrian empire became fubject to Rome. After the reduction of Palmyra by the
emperor Aurelian, however, it did not any more recover its fplendor; the trade gradually turned into other channels, and the city was reduced to ruins, which fill exilt, and manifelt its former graudeur. See Palmyra.

T'he excellive eagernefs of the Romans for Aliatic luxuries of all kinds kept up an unceafing intercourfe with India during the whole time that the empire continued in its power; and even after the deitruction of the wettern part, it was kept up betwixt Conllantinople and thole parts of India which had been vilited formerly by merchants from the wellern empire. Long be. New ro fore this period, however, a mach better method of ${ }^{t_{0}}$ India dir failing to India had been difcovered by one Hippalus Hippalus, $_{\text {Hered }}$ the commander of an Indian thi $p$, wholived about 80 years after Egypt had been annexed to the Roman empire. This man having oblerved the periodical hifting of the monfoons, and how tteadily they blew from the eatt or well during fome months, ventured to leave the coaft, and fail buldly acrofs the Indian ocean from the mouth of the Arabian gulf to Muliris, a port on the Malabar coaft; which difcovery was reckoned a matter of Cuch importance, that the name of Hippalus was given to the wind by which he performed the voyage. Pliny gives a very particular account of the manner in which the Indian traffic was now carried on, mentioning the particular tlages, and the diltances between them, which are as follow. From Alexandria to Juliopolis was two miles; and there the cargo dettined for India was thipped on the Nile, and carried to Coptos, diftant 303 miles, the voyage being ufually pertormed in twelve days. From Coptos they were conveyed by land to Berenice, diftant 258 miles, and halting at different flations as oceation required. The journey was finifhed on the 12 th day; but by reafon of the heat the caravan travelled only in the night. The thips left Berenice about midfummer, and in 30 days reached Ocelis, now Gella, at the mouth of the Arabian gulf, or Cane (now cape Fartaque) on the coalt of Arabia Felix ; from whence they lailed in 40 days to Muliris already mentioned. Their homeward voyage began early in the month of Deceniber; when letting lail with a north-eaft wind, and meeting with a fouth or fouth-welt one when they entered the Arabian gulf, the voyage was completed in lefs than a year. With regard to the fituation of Muliris, as well as of Barace another Indian port to which the ancients traded, Major Rennel is of opinion, and Dr Robertfon agrees with him, that they flood fomewhere between Goa and Tellicherry ; and that probably the modern Meerzaw or Merjee is the Muliris, and Barcelore the Barace of the ancients.

Ptolemy, who flourifhed about 200 years after the Ptolemy'3 commencement of the Chrillian zera, having the ad-accounte os vantage of fo many previous difeoveries, gives a more India. partieular defeription of India than what is to be met with in any of the ancient writers; notwithllanding which, his accounts are frequently inconliftent not only with modera difcoveries, but with thofe of more ancient geographers than himfelf. A moft capital error in his geography is, that he makes the peninfula of India itretch from the sinus Barygazenus, or gulf of Cambay, from weft to ealt, inflead of extending, according to its real direction, from north to fouth; and this error muft appear the more extraordinary, when we confider that Megathenes had publifhed a meafurement of this

## I N D [182] I N D

India. pesinfula nearly confonant to truth, which had been adopted with fome variations by Eratoflhenes, Strabo, Dicdorus Siculus and Plinv. His information con cerning the fituation of places, however, was much mare accurate. With refpect to fome diftricts on the eaftern part of the peninfula, as far as the Ganges, he comes nearer the truth than in his defcriptions of any of the reft. Thefe are particularly pointed out by M. D'Anville, who has determined the modern namcs of many of Ploleny's ftations, as Kilkare, Negapatam, the mouth of the river Canveri, Mafuliparam, \&c. The river Cauvcri is the Cbabaris of Ptoleny; the kingdom of Arcot, Arcati Resio; and probably, fays Dr Robertfon, the whole coalt has received its prefent name of Coromandel from Sor Mandulam, or the kingdom of Sorx, which is fituated upon it. P'olemy had likewife acquired fo much knowlcdge concerning the river Ganges, that he deferibes fix of its mouths though his delineation of that part of India which lies beyond the Ganges is hardly lefs erroneons than that of the nearer peninfinla. M. D' Anville, however, has been at grcat pains to clucidate thefe matters, and to illuftrate thofe parts of the writings of Ptolemy which appear to be beft founded. According to lim, the goilden Cherfonefus of Ptolemy is the peninfula of Malacca; he fuppofes the gulf of Siam to be the great bay of Ptolemy; and the Sinx Metropolis of the fame writer he looks upon to be Sin-hoa in the weftern part of the kingdom of Cochin Clina, though P'tolemy has erred in its fituation no lefs than 50 degrets of longitude and 20 of latitude. M. Gofflin, however, differs from his countryman M. D'Auville, in a late work entitled "The Geography of the Greeks analyfed; or the fyitems of Eratolthenes, Strabo, and Ptolemy, compared with each other, and with the knowledge which the moderns have acquired." In the opinion of M. Goffelin, the Magnum P'romontorium of P'tolemy is not Cape Romania at the fouthern extremity of the peninfula of Malacca, as M. D' Anville fuppoles, but the point Bragu, at the mouth of the river Ava. The great bay of Ptolemy he fuppofes not to be the gulf of Siam, but of Martaban. He endeavours to prove that the pofition of Cattipnara, as laid down by Ptolemy, correfponds with that of Mergui, a fea-port on the welk of Siam; and that Thine, or Sine Metropolis, is not Sin-hoa, but Tana-ferim, a city on the fame river with Mergui; and he contends, that the 1bbadii infula of Ptolemy is nor Sumatra, as D'A nville would have it, but one of the fmall ifles which lie in a ciulter off this coaft. M. Guffelin is of upinion that the ancients never failed through the ltraits of Malacca, nor had any knowledge of the ifland of Sumatra, or of the eaftern ocean.

The errors of Ptolemy have given occafion to a miftake of mure modern date, viz. that the ancients were acquainted with China. This arofe from the refemblance betwixt the name of that empire and the Sine of the ancients. The Aycen Akbery informs us, that Cbecn was an ancient name of Pegu; whence, fays Dr Robertfon, "as that country borders upon Ava, where M. Goffelin places the great promontory, this near refemblance of names may appear perhaps to confirm his npinion that Sinæ Metropolis was lituated on this coaft, and not fo far eaft as M. D'Anville bas placed it."

Thus we fee that the peninfula of Malacca was in all probability the boundary of the ancient difcoveries by fea; but by land they had correfpondence with countries ftill farther diltant. While the Seleucidx conti- Bounda nued to enjoy the empire of Syria, the trade with In-vieation dia continued to be carried on by land in the way al. of the cants. ready mentioned. The Romans having extended their dominions as far as the river Euphrates, found this method of conveyance ftill eftablithed, and the trade was by them encouraged and protccted. The progrefs of the caravans being frequently interrupted by the Parthians, particularly when they travelled towards thofe countries where filk and other of the mot valuable manufactures were procured, it thence became an ohject to the Romans to conciliate the friendfhip of the fovercigns of thofe diltant countries. That fuch an attempt was actually made, we know from the Cbinefe hillorians, who tell us, that Antoon, by whom they mean the Einperor Marcus Antoninus, the king of the people of the wellern ocean, fent an embafly to Ounti, who reigned in China in the 16 Gth year of the Chrilitian era; but though the fact is mentioned, we are left entirely in the dark as to the iflue of the negociations. It is cettain, however, that during the times of the Romans fuch a trade was carried on; and as we cannot fuppofe all thofe who vifited that diftant region to be entirely deltitute of fcience, we may reafonably enough conclude, that by means of fome of the fe adventurers, Ptolemy was enabled to determine the fituation of many places which he has laid down in lins gengraply, and which correfpond very nearly with the obfervations of modern times.

With regard to the lndian iflands, confidering the Few little way they extended their navigation, they could inands nut be acquanted with many of them. The principal covcrea one was that of Ceglon, called by the ancients Tapro- cients. bane. The name was entirely unknown in Europe before the time of Alcxander the Great ; but that conqueror, though he did not vifit, had fome how or other Leard of it ; with regard to any particulars, however, he feems to have been very flenderly informed; and the accounts of ancient geographers concerning it are confufed and contradictory. Straho fays, it is as large as Britain, and fituated at the diftance of feven days according to fome reports, or 20 days failing accoiding to others, from the fouthern extremity of the peninfula. Pomponius Mela is uncertain whether to confider Taprobane as an ifland, or the beginning of another world; but inclines to the latter opinion, as nobody liad ever failed round it. The account of Pliny is thill more obfcure; and by his defcription he would nake us believe, that it was feated in the fouthern hemiphere beyond the tropic of Capricorn. Ptolemy places it oppofite to Cape Comorin, at no great ditlance from the continent; but errs greatly with 1 g gard to its maguitude, making it no lefs than 15 degrees in length from north to fouth. And Agathemarus, who wrote after Ptolemiy, makes Taprobane the largeft inand in the world, affigning the fecond place to Britain. From thefe difcordant accounts, Come learned men have fuppofed that the Taprobane of the ancients is not Ceylon, as is generally believed, but the'ifland of Sumatra; though the defcription of it by Ptolemy, with the figure delineated in his maps, feems to put it beyond a doubt, that Ceylon, and not

Sumatra,

## I ND

6i. Sumatra, is the ifland to which Polemy applies the defignation of 'Taprobane. The other iflands deferibed by that geographer to the ealtward of T'aprobane, are, aecording to Dr Robertfon, thofe called Andaman and Nicolar in the gulf of Bengal.

From the time of Ptolemy to that of the Emperor Juftinian, we have no account of any intercourfe of the Europeans with India, or of any progrefs made in the geographical knowledge of the country. Under that emperor one Cofmas, an Egyptian merchant, made fone soyages to India, whence he acquired the furname of Indicopleufles. Having afterwards turned monk, he publifhed fevcral works; one of which, named Chriflian Topograply, has reached as. In this, though mixed with many frange reveries, he relates with great fimplicity and appearance of truch what he had feen in his travels or lad learned from others. He defriles feveral places on the wefern coaft of the hither peninfula, which he calls the chief feat of the pepper-trade; and from one of the ports on that coalt named Molle, Dr Roberton thinks that the name Malabar may probahly be derived, as well as that of Maldives given to a clufter of iflands lying at no great diltance. Cofmas informs us alfo, that in his time the ifland of Taproban: had become a great ttaple of trade. He fuppofed it to lie about half way betwixt the Perfian Gulf and the country of the Sinx; in confequence of which commodious fituation it received the filk of the Sine, and the precious lpices of the remote regions of the ealt, which were from thence conveycd to all parts of India, Pcrfia, and the A abian Gulf. He calls it not Taprobane, but Sieldibia, deriver from Selcndib, or Serendib, the fame by which it is Atll known all over the eaft. From him alfo we learn, that the Perfians having overthrown the empire of the Parthians, applied themfelves with great diligence and fuccefs to inaritime af. fairs; in confequence of which they became formidable rivals to the Romans in the India trade. The latter finding themfelves thus in danger of lofing entitely that lacrative branch, partly by reafon of the rivalhip juft mertioned, and partly by reafon of the frequent hollilities which took place betwixt the two empires, formed a fcheme of preferving fome fhate of the trade by means of his ally the emperor of Abyfinia. In this he was difappointed, thourl afterwards he obrms tained his end in a way entirely unexpected. This was ad by means of two monks who had been employed as mif. fionaries in different parts of the eatt, and hat penetrated as far as the country of the Seres or China. From thence, induced by the liberal promifes of Jultinian, they brought a quantity of the eggs of the fiikworms in an hollow cane. They were then hatched by the heat of a dunghill; and being fed with the leaves or the mulberry, worked and multiplied as well as in thofe countries of which they are natives. Vaft num. bers were foon reared in Greece; from whence they were exported to Sicily, and from thence to Italy ; in all which countries filk-manufactures have fince been eftablithed.

On the conqueft of Egypt by the Saracens in the ara. year 640 , the India trade was of courfe transferred to them; and they foon began to purfue it with much more vigour than the Romans had done. The city of Baffora was built by the Khalif Omar upon the wettern banks of the great river formed by the union
of the Euphrates with the Tigris. Thus the command of both rivers was fecured, and the new city foon became a place of fuch confequence ay fearee to yicld to Alexandria itfelf. Here Dr Robertfon takes notice, that from the evidence of an Araliau merelant who wrote in the year 85 r , it appeare, that not only the Saracens, but the Chinefe alfo, were dettitute of the mariner's compals; contrary to the general opinion, that this inftrument was known in the ealt long before ? it made its appearance in Europe. From this rela the 'fe of tion, as well as much concurring evidence, fays our au- neres cumothor, " it is manifeft, that not only the Arabiaus but whi. the Chinefe were deflitute of this faithful guide, and that their mode of navigation was not more adventurous than that of the Greeks and Romans. They fteered fervilcly along the coait, feldom tretching out to fea fo far as to lofe fight of land; and as they flat ped their courfe in this timid manner, their mode of reckoning was defezitive, and liable to the fame crrors with that of the Greeks and Rumans." Nutwithftanding this difadvantage, however, they peretrated far beyond Siam, which had fet bounds to the navigation of the Europeans. They became acquainted with Sumatra and other India iflands; extendiug their navigation as far as the city of Canton in Cbina. A regular commerce was now carried on from the Perfian Gulf to all the countries lying betwixt it and China, and even with China itfelf. Many Saracens fetted in India properly fó called, and in the countries bcyond it. In the city of Canton particularly, they were fo mumerous, that the emperor permitted them to have a cadi or judge of their own religion; the Arabian lavguage was underftood and fpoken in every place of confequence; and flips from China are even faid to have vifited the Perfian Gulf.

According to the Arabian accounts of thofe days, stace the peninfula of India was at that time divided into four kingdoms. The firtt was compofed of the provinces finuated on the Indus and its branches, the capital of which was Moultan. The fecond had the city of Canoge, which, from the ruins of it remaning at this day, appears to have been a very large place. The Indian hilturians relate, that it contained 30,000 fhops in which betel-nut was fold, and 60,000 fiets of mulicians and lingers who paid a tax to government. The third kingdom was that of Cachemire, firlt mentioned by Malfond, who gives a thort defcription of it. The fourth kingdom, Guzerat, reprefented by the fame author as the moft powerful of the whole. Another Atab writer, who flourifhed about the middle of the 1 th century, dividas India into three parts; the northern, comprehending all the provinces on the Indus: the middle extending from Guzerat to the Ganges; and the fouthern, which he denominates Comar, from Cape Comorin.

From the relation of the Arabian merchant above mentioned, explained by the commentary of another Arabian who had likewife vifited the eaftern parts of A fia, we learn many particulars concerning the inhabitants of thefe diftant reigions at that time, which correfpond with what is oblerved among them at this day. They take notice of the generai ufe of Gilk among the Chinefe; and the manufacture of porcelain, which they compare to glafs. They alfo defcribe the tea plant, with the manner of ufing itskaves; whence it.
appears, that in the ninth century the uie of this plaut in China was as common as it is at prefent. They mention likewife the great progrefs which the Indians had made in altronony; a circumftance which feems to have been unknown to the Greeks and Romans: they affert, that in this brancl of fcience the Indians were far fuperior to the mof enlightened nations of the weft, on which account their fovcreign was called the " King of wifdom." The furperfitions, extravazant penances, \&c. known to exift at this day among the Indians, are allo mentioned by thofe writers; all which particulars manifeft that the Arabians had a knowledge of India far fuperior to that of the Greeks or Romans. Tlie zeal and induftry of the Mohammedans in exploring the moft diftant regions of the eaft was rivalled by the Chriftians of Perfia, who fent miffionaries all over India and the countries adjoining, as fas as China itfelf. But while the weftern A fiatics thue kept up a conftant intercourfe with thele paits, the Europeans had in a manner loft all knowledge of them. 'The port of Alezandria, from which they had formerly been fupplied with the Indian goods, was now thut againft them; and the Arabs, fatistied with fupplying the demands of their own fubjects, negleeted to fend any by the ufual channels to the towns on the Mediterranean. The inhabitants of Conftantinople and fome other great towna were fupplitd with. Chinefe conmodities by the moft tedious and difficult paflage imaginable. The filk of that country was purchafed in the moft wefterly pro. - vince named Chenfi ; from thence it was conveyed by a caravan, which narched 80 or 100 days, to the banks of the Oxus. Here it was embarked, and carried down the river to the Cafpian fea; whence, after a dangeruus voyage acrofs that fea, it was carried up the river Cyrus as far as that river is navigable: after which it was conducted by a land-carriage of five days to the river Phafis, then down that Atream inio the Euxine, and thence to Conftantinople. The paffage of goods from Hindoftan was lefs tedious; they being carried either directly to the Cafpian or to the siver Oxus, but by a paffage much florter than that from China; after which they were conveyed down the Phafis to the Euxine, and thus to Conttantinople.

It is evident that a commerce thus carried on muft have been liable to a thoufand difadvantages. The goods conveyed over fuch vaft tracts of land could not be fold but at a very high price, even fuppofing the journey had been attended with no danger; but as the caravans were continually expofed to the affaults of barbarians, it is evident that the price muft on that account have been greatly enhanced. In fpite of every difficulty, however, even this commerce flourifhed, and Conftantinople became a confiderable mart for Eaft Indian commodities; and from it all the reft of Europe was chiefly fupplied with them for more than swhich the Chriftians and Mohammedans were during this period engaged, contributed ftill to increafe the difficulty ; and it is remarkable, that the more this sifficulty increafed, the more defirous the Europeans feemed to be of poffeffing the luxuries of Afia.

About this time the cities of Amalphi and Venice, shith fome others in Italy, having acquired a greater $\mathrm{N}^{\circ} 185$.
degree of independence than they formenty poffered, began firft to exert themfelves in promating domeltic manufactures, and then to import the productions of India in much larger quantities than formerly Some traces of this revival of a commercial fpirit, according to Dr Robertfon, may be obferved from the end of the feventh century. The circumflances which led to this revival, however, are entirely unnoticed by hiforians : but during the feventh and eighth centuries, it is very probable that no commercial intercourfe whatever took place betwixt Italy and Alcxandria; for, prior to the period we fpeak of, all the public deeds of the Italian and other citirs of Europe had been written upon paper made of the Egyptian papyrus, but after that upon parchment.
'Ihe mutual antipathy which the Chriftians and Mohammedaus bore againft each other, would no doubt for a long time retard the progrefs of commerce between them; but at laft the khalifs, perceiving the advantage which fuch a traffic would be of to their fubjects, were induced to allow it, while the eagernefs with which the Chriftians coveted the Indian products and manufactures, prompted them to carry it un. Dut icarce was the traffic begun, when Effee it feemed in danger of being totally interrupted by the the Cr crufades. Notwithftanding the enthufiaflical zeal of the Int thefe adventurers, however, there were many to whom comme commerce was a greater object than religion. This had always been the cafe with numbers of the pilgrims who vilited the holy places at Jerufalem even before the commencement of the crufades : but thefe, after they took place, inftead of retarding the progrefs of this kind of commerce, proved the means of promoting it to a great degree. "Various circumftances (fays Dr Robertfon) cuncurred towards this. Great armies, conducted by the moft illutrious nobles of Europe, and compofed of men of the moft enterprifing fpirit in all the kingdums of it, marched towards Paleftine, through countries far advanced beyond thole which they left in every fpecies of improvement. They beheld the dawn of profperity in the republics of Italy, which had begun to vie with each other in the arts of indultry, and in their effurts to engrofs the lucrative commerce with the eaft. They next admired the more advanced ftate of opulence and fplendor in Conftantinople, raifed to a pre-eminence above all cities then known by its extenfive trade, particularly that which it carried on with India and the countries beyond it. They afterwards ferved in thofe provinces of Afia through which the commodities of the eaft were ufually conveyed, and became mafters of feveral cities which had been Itaples of that trade. They eftablifhed the kingdom of Jerufalem, which fubfifted near 200 years. They took poffeffion of the throne of the Greek enıpire, and governed it above half a century. Amid't fuch a variety of events and operations, the ideas of the fierce warriors of Europe gradually opened and improved; they became acquainted with the policy and arts of the people whom they fubdued; they obferved the fources of their wealth, and availed themfelves of all this knowledge. Antioch and Tyre, when conquered by the crufaders, were flourifhing cities inhabited by opulent merchants, who fupplied all the nations trading in the Mediterranean with the productions of the eaft; and, as far as can be gathered from incidental occurrences mentioned

## I N D

[ 1 mentioned by the hitlorians of the holy war, who be-
ing mofty prielts and monks, had their attention directed to objects very different from thofe relating to commerce, there is reafon to believe, that both in Conftantinople while fubject to the Franks, and in the ports of Syria acquired by the Chrifitians, the long. eftablifhed trade with the eaft continued to be protect. ed and encouraged."

Our author next goes on to fhow in what manner the commerce of the Italian flates was promoted by the Crufades, until at laft, baving entirely engroffed the Eaft India tiade, they flrove with fuch eagernefs to find new markets for their commodities, that they extended a tafte for them to many parts of Europe where they had formerly been little known. The rivallhip of the Italian flates terminated at lafl in a treaty with the fultan of Egypt in 1425 , by which the port of Alexandria and others in Egypt were opened to the Florentines as well as the Venetians; and foon after, that people began to obtain a fhare in the trade $t o$ India.

The following account of the manner in which the India trade was carried on in the beginning of the 14 th century, is given by Marino Sanudo a Venetian nobleman. The merchants of that republic were fupplised with the commodities they wanted in two difterent ways. Thofe of fimall bulk and great value, fuch as cloves, nutmegs, gems, pearls, \&c. were carried up the Perfian gulf to Baffora, from thence to Bagdad, and afterwards to fome port on the Mediterranean. The more bulky goods, fuch as pepper, cinnamon, and other fipiceries, wcre brougbt in the ufual manner to the Red Sez , and from thence to Alexandria. The goods brought by land, however, were always liable to be feized by barbarians; and therefore the fupply that way was fcanty, and the price extravagantly dear, while, on the other hand, the Sultan of Egypt, by impofing duties upon the Eaft India cargoes to the amount of a full third of the valuc, feemed to render it impoffible that the owners fhould find purchafers for their goods. This, however, was far from being the cafe; the demiand for India goods continually increared; and thus a communication, formerly unknown, betwixt all the nations of Europe, was begun and kept up. All this time, however, there had been no direet conmunication betwixt Europe and India, as the Moliammedans would never allow any Chriftian to pafs through their dominions into that country. The dreadful incurfions and conquefts of the Tartars under Jenghiz-khan, however, had fo booken the power of , the Mohammedans in the northern parts of Afia, that a way was now opened to India through the dominions of thele barbaiians. A bout the middle of the 13 th century, therefore, Marco Polo, a Venetian, by getting accefs to the of than of the Tartars, explored many parts of the Ealt which fad long been unknown even by name to the Europeans. He travelled through China from Pcking on its northern frontier to fome of its molt foutherly provinces. He vifited alfo differnt patts of Hindoftan, and firft mentions Bengal and Guzerat by their mociern names as great and fiourifhipg kingdoms. He obtained allo fome account of an illand which he called Zifangri, and was probably no other than Japan : he vibited Jara wihh feveral of the iflands in its neigbourLood, the inand of Ceslon, and the coaft of Malabar

Vor. LX. Part L.

185 I I N D
as far as the gulf of Cambay; to all which he gave the names they have at this day. The difcovery of fuch immenfe regions unknown before in Europe, furnifh. ed vaft room for fpeculation and conjecture; and while the public attention was yet engaged by thefe difcoveries, the deflruction of Conflantinople by the Turka Genoere gave a very confiderable turn to the Eaf India com- trade to. merce, by throwing it almolt entirely into the lands India ruinof the Venetians. Hitherto the Genoefe had rivalled taking of that fate in the commerce we feak of, and they had Contantio poffeffed themfelves of many important places on the nople. coalt of Greece, as well as of the port of Caffa on the Black Sea. Nay, they had even eftablithed themfelves at Conftantinople, in the fuburb of Iera, in fuch a manner as almoft entirely to exclude the Greeks themfelves from any fhare in this commerce: but by the deftruction of Conflantinople they were at once driven out of all thefe poffeffions, and fo thorougly humbled, that they could no longer contend with the Venetians as before; fo that, during the latter part of the 15 th century, that republic fupplied the greater part of Europe with the productions of the ealt, and carried on trade to an extent far berond what had been known in former times. The mode in which they now carried on this trade was fomewhat different from what had been practifed by ancient nations. The Tyrians, Greeks, and Romans, had failed directly to India in queft of the commodities they wanted; and their example has been imitated by the navigators of modern Europe. In both periods the Indian commodities have been paid for in gold and filver ; and great complaints have been made on account of the drain of thofe precious metals, which were thus buried as it were in India, never to return again. The Venetians, however, were exempted from this lofs; for having no direet intercourfe with India, they fupplied themfelves from the warehoufes they found, in Egypt and Syria, ready filled with the precious commodities they wanted; and thefe they purchared more frequently by barter than with ready money. Thus not only the republic of Venice, but all the citres which had the good fortune to become emporia for the 1ndia goods imported by it, were raifed to fuch a pitch of power and fplendor as fcarce ever belonged to any European flate. The citizens of Bruges, from which place the other European nations were for a long time fupplied with thefe goods, difplayed fuch magnificence in their drefs, buildings, and manner of living, as excited even the envy of their queen Joan of Navarre who came to pay them a vifit. On the removal of the flaple from Bruges to Antwerp, the later foon diflayed the fame opulence; and in fome cities of Germany, particularly Augfurg, the great mart for Indian commodities in the internal paris of that country, there are examples of merchants acquiring fuch large fortunes as intitited them to high rank and confideration in the empire. The moft accurate method, however, of attaining fome knowledge of the profits the Venetians had on their trade, is by confidering the rate of interefl on money borrowed at that time. This, from the clofe of the 1 th century to the com- Highinte: mencement of the 16 th, we are told, was no lefs than reft of mo20 fer cent. and fometimes more. Even as late as $\begin{aligned} & \text { ney in th the } \\ & \text { sen- }\end{aligned}$ 1500, it was 10 or 12 in every part of Europe. Hence tary: we are to concluce that the profits of fuch money as A a
was
$\qquad$
 -
sndia. wes then applied in trade muft have been extremely high; and the condition of the inhabitants of Venice at that time warrants us to make the conclution. "In the magnificence of their houfes (fays Dr Robertion), in richnefs of furniture, in profusion of plate, and in every thing which contributed either towarda elegance or parade in their mode of living, the nothes of Venice furpaffed the flate of the greateft monarch beyond the Alps. Nor was all this difplay the effect of an oftentatious and incontiderate diffipation; it was the natural confequence of fuccefsful induitry, which, having accumulated wealth with eafe, is intitled to cnjoy it in fplendor."

This exceffive fuperionity of wealth difplayed by the Venetians could not fail to excite the envy of the other flates of Europe. They were at no lofs to difcover that the Ealt India trade was the principal fource from whence their wealth was derived. Some of them endeavoured to obtain a fhare by applying to the fultans of Egypt and Syria to gain admiffion into their ports upon the fame terms with the Venetians; but either by the fuperior interent of the latter with thofe priaces, or from the advantages they had of being long eltablifhed in the trade, the Venetians always prevailed. So intent indeed were the other European powers in obtaining fome thare of this lucrative commerce, that application was made to the fovercign of Ruffa to open an intercourfe by land with Cinina, though the capitals of the two empires arc upwards of 6000 miles diftant from each other. This, howevcr, was theyond the power of the Ruffian prince at that time; and the Venetians imagined that their power and wealth were fully eitablifhed on the mott permanent bafis, when two events, altogether unforticen and unexpected, gave it a mortal blow, from which it
with all imaginable demonftrations of kinfricfs. The Portuguefe nation, nay all the nations in Europe, the Venetians alone excepted, rejuiced at the difcovery which had been made. The latter belheld in it the Expleiots Por certain and unavoidable downfal of thrir own pows gute in er; while the Portuguefe, prefuming apon their night of tndia. prior difeovery, which they took care to have confirmed by a papal grant, plumed shemfelves on the thoughts of having the whole Indian commerce centre in their nation. The expectaticns of the one, and the apprehenfions of the other, feemed at firf to be wellfounded. A fucceffion of gallant officers fent into the eaft from Portugal accomplifhed the greateft and moit arduous undertakings. In 24 years after the voyage of De Gama, they had made themfelves mallers of many important places in India; and among the reft of the city of Malacca, where the great Itaple of trade throughout the whole Eat Indies was eftablinhed. As this city ftands nearly at an equal diflance from the eallern and weltern extremities of all the countries comprehended under the name of Indies, it was frequented by the merchants of China, Japan, of all the kingdoms on the continent, the Moluccas and other iflands in that quarter, as well as by thofe of Malabar, Ceylon, Coromandel, and Bengal. Thus the Portuguefe acquired a moft extenfive influence over the internal commerce of India; while, by the fettlements they had formed at Goa and Diu, they were enabled to engrofs the trade on the Malabar coatl, and greatly to obftrue the long ellablifhed intercourfe of Egypt with India by the way of the Red Sea. Their thips'now frequented every port in the ealt where any valuable commodities were to be had, from the cape of Good Hope to the river of Canton in China; and all along this immenfe extent, of more than 4000 leagues, they had a chain of forts and factories eitablihed for the convenience of protecting their trade. They had likewife made themfelves mallers of feveral flations favourable to commerce along the fouthern coalt of Africa, and in many iflands lying bet ween Madagaicar and the Moluccas. In all places where they came, their arms had ftruck fucl terior, that they not only carried on their trade without any rival or control, but even preferibed to the natives the terms of their mutual intercourfe; nay, fometimes they fet what price they plafed upon the commodities they purchafed, and tius were enabled to impore into Europe the Indian commoditics in greater abundance and at a lower rate than had ever been done before. Not fatisfied with this, they formed a fcheme of exclucing all other nations from any thare of the trade they enjoyed; and for that purpofe determined to make themfelves mafters of fuch iltations on the Red Sea and Perlian Gulf as might put them in poffeffion of the navigation of both thefe fas, and enable thern not only to obltruct the ancient commerce between Egypt and India, bat to command the mouths of the great rivers which we have formerly mentioncd as the means of conveying the Indian grods through the internal parts of Afia. The conduct of thefe enterprifes was committed to Alphonfo Albuquerque, the moft dittinguifhed officer at that time in the Portuguefe fervice. By reafon of the valt number of the enemies he had to contend with, however, and the fcanty fupplies which could be derived from Portugal, he could not fully accomplifh what was expected

## I N D [ $187 \quad] \quad$ I N 1$]$

from him. However, he took from the petty princes who were tributaries to the kings of Perlia the fmall Ifland of Ormus, which commanded the month of the Perrian Gulf; and thus fecured to Portugal the poffeffion of that extenfive trade with the eatt which the Perfans had carried on fur feveral centuries. On this barren inand, almolt entirely covered with falt, and fo hot that the climate can fcarecly be borne, deltitute of a drop of freth watcr, except what was brought from the coatinent, a city was erected by the Portuguefe, which foon became one of the chief feats of opulence, fpleader, and luxuyy, in the eafiern world. In the Red Sea the Arabian princes made a much more formidable refiltaace; and this, together with the damage his fleet fultained in that fea, the navigation of which is always difficult and dangerous, obliged Albuquerque to retire withunt effecting any thing of importance. Thus the ancient channel of conveyance Atill remainod open to the Egyptians; but their commerce was greatly circumeribed and obllructed by the powerful interett of the Portuguefe in every port to which they had been accurftomed to refort.

The Ventians now began to feel thofe effects of ual De Gania's difcovery which they had dreaded from os uf the beginning. To preferve the remains of their commerce, they applied to the fultan of the Mameluks in Egypt, who was no left alarmed than themfelves at the lofs of fuch a capital branch of his revenue as he had been accuftomed to derive from the India trade. By them this fierce and barbarous prince was eafily perfuaded to fend a furious manifento to Pope Julius II. and Emmanuel king of Portugal. In this, after thating his exclufive right to the Indian trade, he informed them, that if the Portuguefe did not relinguifh that new courfe of navigation by which they had penetrated into the Indian occan, and ceafe from encroaching on that commerce which from time inmemorial had been carried on between the eaft of Afia and his dominions, he would put to death all the Chrittians in Egrpt, Syria and Paleftine, and demolith the holy fepulchre itfelf. To this threat, which forne centuries before would have alarmed all Chiiftendoni, no regard was paid; fo that the Venetians, as their laft retource, were obliged to have recuurfe to a different expedient. This was to excite the fultan to fit out a fleet in the Red Sca to attack the Portugucfe, and dive them from all their fettlements in the ealt; nay, in order to afintt lim in the enterprife, he was allowed to cut down their furefts in Dalmatra, to fupply the deficiency of Egypt intimber for fhip-building. The timber was conveyed from Dalmatia to Alexandria; and from thence, partly by water and partly by land, to Suez; where $\mathfrak{i}$ welve men of war were built, on board which a body of Mameluks were ordered to ferve under the command of an experienced efficer. Thus the Portuguefe were allinulted by a new enemy far more formidable than any they lad yet encountered; yct fuch was the valour and conduct of the admiral, that after feveral fevereengagements, the fleet of the infidels was entirely ruined, and the Portuguefe became abfolute mafters of the Indian ocean.

This difatter was followed in no long time by the total overthrow of the dominion of the Mameluks in Egypt by Sclim the Turkifh fultan; who thus alfo becanie maiter of Syria and Paleftine. As his internt
was now the fame with that of the Venetians, a leagal was quickly fornsed betwixt them for the ruin of the power of the Portuguefe in India. With this view Sedim confirmed to thie Venetians the extenfive commercial privileges they enjoyed under the government of the Mameluks; publifhing at the fame time an ediet, by which lie permitted the free entry of all the productions of the eall imported directly from Alexandria inta any part of his dominions, but impofed heary taxes upon fuch as were imported from Lifbon. All this, however, was infufficient to counteract the great advantages which the Portuguefe had obtained by the new paffage to India, and the fettlements they had eftablifhed in that country ; at the fame time that the power of the Venetians being entirely broken by the leagne of Cambray, they were no longer able to contribute any affilance. They were therefore reduced to the neceflity of making an offer to the king of Portugal to purchafe all the Spices imported into Lifbon, over and abuve what might be requifitc for the confumption of his own fubjects. This offer being reject$\epsilon$, the Portuguefe for fone time remained meontrolled mafters of the Indian trade, and all Europe was fupplied by them, excepting fome very inconfiderable quantity which was inported by the Venetians through the ufual channels.
The Portuguefe continued to enjoy this valuable why $5^{58}$ tranch of commerce undifturbed alinoit for a whole portuguefe century; to which, however, they were indebted more trade was to the political lituation of the different European na- rupted by $t$ ions than to their own prowefs. After the acceffion ocher Euvof Clarles $V$. to the throne of Spain, that kingdom was ropean either fo much engaged in a multiplicity of operations, powern. owing to the ambition of that monarch and his fon Philip II. or fo inrent on profecuting the difcoveries and conquelts in the new world, that no effort was made 10 interfere with the Eall India trade of the Tortuguefe, even though an opportunity offered by the difcovery of a fecond paffage by fea to the Eaft Indies through the Alraits of Magellan. By the acquifition of the crown of Portugal in 1580, Spain, inftead of becoming the rival, became the procectur and guardian of the Portuguefe trade. The refources of France all this time were fo much exhaulted by a continuance of long and defolating wars, that it could beflow neither much attention on objects at fuch a diftance, nor engage in any expenfive feheme. England was defola ted by the ruinous wars between the houfes of York and Lancatter; and afterwards its enterprifing' fpirit was reltrained by the cautious and covetous Henry VII. His fon Henry VIII. in the former part of his reign, by en gaging in the continental quarrels of the European princes, and in the latter part by his quarrel with the pope and cuntefts about religion, left no time for commercial fchemes. It was not therefore till the reign of Queen Elizabth that any attention was paid to the affairs of the Ealt by that kingdom. The firft who Shook the power of the Portuguefe in India were the Dutch ; and in this they were gladly feconded by the natives, whom the Portuguefe had moft grievoully oppretfed. The Englih foon fellowed their example; and in a few years the Portuguefe were expelled from their moft valuable fettements, while the moft lucrative branches of thcir trade have continued ever fince in the hands of thore two nations.

## I N D [ 188 ] I N D

India. Rivallip of the French and lempting to put in for a hare. Englifh in nies were therefore fet up in different countries: but the Eaft Indies.

It is not to be fuppofed that the other European nations would fit tiill and quietly fee thefe two engrofs the whole of this literative commeree without attempting to put in for a fhare. Eat India compait was only between France and Britain that the great rivalfip commenced; nor did this fully difplay itfelf till after the peace of Aix la Chapelle. Both nations had by this time made themfelves :naAters of confiderable fettlements in India. The principal of thofe belonging to Britain were, 1. Surat, fituated on the wettern fide of the petinfula within the Ganges, between the 21 lt and $22 d$ degrees of N. Lat. This peninfula comprehended the kingdoms of Malabar, Decan, Golconda, and Bifnagar, with the principalities of Gingi, Tanjour, and Madura; the weftern coalt being ditinguifhed by the name of Malabar, and the eaftern by that of Coromandel. 2. Bombay, a finall illand in the kingdom of Decan, about 45 leagues to the fouth of Surat. 3. Dabul, about 40 leagues farther to the fouth, in the province of Cuncan. 4. Carwar, in N. Lat. $15^{\circ}$, where tbere was a fmall fort and factory. 5. Tillicherry, to which place the Englifh trade was removed from Calecut, a large town 15 leagues to the fouthward. 6. Anjengo, between eight and nine degrees of latitude, the moft foutherly fettlement on the weftern coalt of the peninfula. 7. On the Coromandel coaft they poffeffed Fort St David's, formerly called Tegapatan, fituated in the kingdom of Gingi, in $11^{c} 40^{\prime} \mathrm{N}$. Lat. 8. Madras, the principal fettlement on this coalt, between $13^{\circ}$ and $14^{\circ}$ N. Lat. not far from the diamond mines of Golconda. 9. Vifigapatam, farther to the north. 10. Balafore, in latitude $22^{\circ}$, a factory of fmall confequence. 11. Calcutta, the capital of all the Britifh fetrlements in the Eat Indies. I'hefe were the principal places belonging to Britain which we fhall have occafion to mention in the account of the cuntefts which now took place; thofe of the French were chiefly Pondichery and Chandernagore.

Origin of the Eaft In dian war hetwixt the French and Englifh in 8747.

The war is faid to have been firt occafioned by the intrigues of the French commandant M. Dupleix; who, iminediately after the peace of Aix la.Chapelle, began to fow diffenfion among the nabobs, who had by this time ufurped the fovereignty of the country. Nizam Almuluck, viceroy of Decan, and nabob of Arcot, had, as officer for the Mogul, nominated Anaverdy Khan to be governor of the Carnatic, in the year 1745 . On the death of Nizam, his lecond fon Nazir-zing was appointed to fucceed him in his viceroyalty, and his nomination was contirmed by the Mogul. He was oppofed by his coufin Muzaphier zing, who applied to Dupleix for affillance. By him lee was fupplied with a budy of Europeans and fome artillery; after which, being alfo joined by Chunda Saib, an active Indian prince, he took the field againtt Nazir zing. 'The latter was fupported by a body of Britifh troops under Colonel Laurence ; and the French, dreading the event of an engagement, retired in the night; fo that their ally was obliged to throw himfelf on the clemency of Nazarzing. His life was fpared, though he himfelf was detained as a llate prifoner: but the traitor, forgetting the kindnefs fhowed him on this occafion, entered into a confpiracy againtt the life of Nazir-zing, and murdered him in his camp; in which infamous tranfaction
he was encouraged by Dupleix and Chunda Saib, who had retired to Pordicherry. Inmenfe riches were found in the tents of Nazir-zing, great part of which fell to the Thare of Dupleix, whon Muzapher-zing now affociated with himfelf in the government. By virtue of this affociation the Irenchman affumed the ftate and formalities of an eaftern prince; and he and his colleague Muzapher-zing appointed Chunda Saib nabob of Arcot. In 1749, Anaverdy Khan had been defeated and killed by Muzapher-zing and Chunda Saib, affilted by the French ; after which his fon Mohammed Ali Khan had put himfelf under the protection of the Englifh at Madras, and was contirmed by Nazir-zing as his father's fucceffor in the nabobthip or government of Arcot. This government therefore was difputed betwixt Mohammed Ali Khan, appointed by the legal viceroy Nazir-zing, and fupported by the Englifh company, and Clunda Saib nominated by the ufurper Muzapher-zing, and protected by Duplcis, who commanded at Dundicherry. Muzapher-zing, however, did nut long enjuy his ill-got authority; for in the year 1751, the nabubs who had been the means of railung him to the power be enjoyed, thinking themfelves ill rewarded for their fervices, fell upon tim fuddenly, defeated his forces, and put him to death; proclaiming Salabat-zing next day viceroy of the Deccan. On the other hand, the Mogul appointed Gauzedy Khan, the elder brother of Salabat-zing ; who was confirmed by Mohammed Ali Khan in the government of Arcot : but the affairs of the Mogul were at that time in fuch diforder, that he could not with an army fupport the nomination he had made. Chunda Saib in the mean time determined to recover by forse the nabobihip of Arcot, from which he had been depofed by the Mogul, who had placed Anaverdy Khan in his room. With this view he had recourfe to Dupleix at Pondicherry, who reinforecd him with 2000 Sepoys, 60 Caffrees, and 420 French; upon condition that if he fucceeded, he fhould cede to the French the town of Velur in the neighbourhoud of Pondicherry, with its dependencies, confifting of 45 villages. Thus reinforced, he defeated Anaverdy Khan who loft his life in the engagement, reaffumed the government of Arcot, and punctually performed the engagements he had come under to his 1 rench allies.

All this time Mohammed Ali Khan 'had been fup, ported by the Englith, to whom he fled after has father's death. By them he was fupplied with a reinforcement of men, money, and ammunition, under the conduct of Major Laurence, a brave and experienced officer. By means of this fupply he gained fome advantages over the enemy; and repairing afterwards to Fort St David's, he obtained a farther rcinforcement. With all this affiltance, however, he accomplifhed nothing of any moment; and the Englifh auxiliaries having retired, he was defeated by his enemies. Thus he was obliged to enter into a more clofe alliance with the Englifh, and cede to them fome commercial points which had been long in difpute; after which, Captain Cope was difpatched to put Trinchinopoli in a ftate of defence, while captain de Gingis, a Swifs officer, marched at the head of 400 Europeans to the affit. Mr ${ }^{4}$ ance of the nabob. On this oceafion Mr Clive firt firlt at offered his fervice in a military capacity. He had rance been employed before as a writer, but appeared very capaci

## I $\mathrm{N} D$

lia. little qualified for that or any other department in civil life. He now marched towards Areot at the head of 210 Emopeans and 500 Sepoys. In his firft expedition he difplayed at once the qualities of a great coinmander. His movements were conducted with fuch fecrecy and difpateh, that he made himfelf mafter of the enemy's capital before they knew of his march; and gained the affections of the people by his generofity, in affording protection without ranfom. In a fhort time, however, he found himfelf invelled in fuc- Fort St David's by Rajah Saib, fon to Chunda Saib, an Indian chief, pretender to the nabobfhip of Areot, at the head of a numerous armay; the operations of the fiege being conducted by European engineers. Thus, in fpite of his utmolt effurts, two practicable breaches were made, and a general affault given; but Mr Clive having got intelligence of the intended attack, defended limfelf with fuch vigour, that the affailants were every where repulfed with lofs, and obliged to raife the flege with the gieatefl precipitation. Not contented with this advantage, Mr Clive, being reinforeed by a detachment from 'l'rinchinopoli, marehed in quelt of the enemy; and having overtaken them in the plains of Arani, attacked and entirely defeated them on the 3d of December 175 c .

This victory was followed by the furreader of the forts of Timery, Conjaveram, and Arani; after which Mr Clive returned in triumph to Fort St David's. In the beginning of the year 1752 he marched towards Madras, where he was reinforced by a fmall body of troops from Bengal. Though the whole did not exceed 300 Europeans, with as many natives as were fufficient to give the appearance of an army, he boldly proceeded to a place called Kozrribauk, about 15 miles from Arent, where the enemy lay to the number of 1500 Sepoys, 1700 horfe, with 150 Europeans, and eight pieces of cannon. Victory was long doubtful, until Mr Clive having fent round a detachment to fall upon the rear of the enemy while the Englifh attackcd the entrenchments in front with their bayonets, a general confution enfucd, the enemy were routed with confiderable flaughter, and only faved from total deftruction by the darknefs of the night. The French to a man threw down their arms, and furrendered themfelves prifoners of war; all the baggage and cannon falling at the fame time into the hands of the vitors.

On the return of Mr Clive to Fort St David's, he naits was fuperfeded in the command by Major Laurence. By him hee was detached with 400 Europeans, a few Mahratta foldiers, and a body of Sepoys, to cut off the enemy's retreat to Pondicherry. In this enterprife he was attended with his ufual good fuccefs, took several forts, vanquifhed the French commander M. d'Anteuil, and obliged him with all his party to furrender prifoners of war.

Chunda Saib, in the mean time, lay encamped with an army of 30,000 men at Syringham, an ifland in the ncighbourhood of Trinchinopoli; but Major Lawrence having found means to intercept his provifions, he was obliged to fly. Being obliged to pafs through the camp of the Tanjore general, he obtained a pals for the purpofe; but was neverthelefs detained by the xabob; who was ap ally of the Englif, and his hicad
was Atruck off, in order to prevent any difputes that might arife concerning him.
After the fight of Chunda Saib, his army was attacked and routed by Major Lawrence; and the illand of Syringham furrendered, with about 1000 French foldiers under the command of Mr Law, brother to hina who fchemed the Miffilippi coinpany. M. Dupleix, exceedingly mortified at this ball fuccefs, proclaimed M. 1hupleis Rajah Saib, fon to Chunda Saib, nabob of Arcot; jretends and aftervards produced forged cunnififions from the conninifGreat Mogul, appointing him guvernor of all the Car- the Mrogut, natic from the river Kriltmah to the fea. The better and affects to carry on this deception, a moffenger pretended to the frue of come from Delhi, and was received with all the pomp an Indian of an ambafiador from the Great Mugul. Dupleix, mounted on an cetephant, and preceded by mulic and dancing women, after the oricntal fahion, received his commifion from the hands of this impoflor; after which he aftected the itate of an ealtern pince, kept his clurbar or court, appeared fitting crofs-legged on a fophit, and received prefents, as fovereign of the country, from his own council as well as from the natives.
Thus the forecs of the Englifh and Frencl Laft India companies were engaged in a courfe of hoftilities at a time when no war exilted between the twa nations; and while they thus continued to make war upon each other under the title of auxiliaries to the contending paties, Gauzedy Kihan took pofferfion of the dignity appointed him by the Mogul ; but had not been in poffeflion of it above 14 days when he was poifoned by his own filter. His fon Scah Abadin Khan. was appointed to fucceed him by the Mojul; but the latter being unable to give him proper affitance, Siala-bat-zing remained without any rival, ard made a prefent to the French commander of all the Englifh pofe feflions to the northward.

Thus coneluded the campaign of $\mathbf{t} 752$. Next year both parties received confliderable reiuforcements ; the Englih, by the arrival of Admiral Watfon with a fquadron of thips of war, haviag on board a reximent rive from col commanded by Colonel Aldereroon; and the French aud France. by M. Gadeheu, commiffary and gavernor-general of all their fettlements, on whofe arrival M. Dupleix departed for Europe. The new governor made the molt friendly propofals; and defired a ceffation of arms until the difputes could be adjulted in Europe. Thefe propofals being readily liftened to on the part of the Englith, deputies were fent to Pondicherry, and a provifional treaty and truce were concluded, on condition that neither of the two companies Thould for Provifionas the future interfere in any of the differences that mightitwis be take place in the country. The other articles related two nato the places or fettements that fhould be retained or tions cona poffeffed by the refpective companies, until frefh orders fhould arrive from the courts of London and Verfailles; and till then it was ftipulated, that neither of the two nations fhould be allowed to procure any new grant or ceffion, or to build forts in defence of any new eftablithment; nor fhould they proceed to any ceffion, retroceffion, or evacuation, of what they then poffifed; but every thing fhould remain on the fame forting as formerly.
The treaty was publifhed on the 1 ith of January
in tia. 1755; at the end of which month adnimel Wation returned with his fuudren from Bombay, and M. Godeheos returned to I'rance in the beginning of Februany, leaving M. Leyrit his fucceffor at Pondicherry. M. Bully, with the Soubabdar Salabat-zing, commanded in the north; and M. de Sauliay was left to command the troops at Siringham. Mutters, however, did not long continue in a Itate of tranquillity. Early in the year it appeared that the French were endeavouring to get poffifion of all the provinces of the Deccan. M. Bufly demanded the fortrefs of Golconda from Salabat-zing; and M. Leyrit encouraged the phoufder or governor who rented Velu to take up arms againt the nabob. He cven fent 300 Frencb and as many fepoys from Pondicherry to lupport this rebel, and oppofe the Englilh employed by the nabob to collect his revenues from the tributary princes. In this office they lad been employed ever lince the ceffation of hodlilities; one half of the revenue being paid to the nabob, and the other to the company, which now involved then in a kind of military expedition into the country of the Pulygars, who had been previontly fummoned to fend agents to fettle accounts with the nabob. Four of them obeyed the fummons; but one Lachenaig refuled, and it was therefore refolved to attack him. The country was very trong, being almolt entirely fortified by nature or art; for it was furrounded by eraggy hills detached from one another, and covered with buthes to as to be impaffable for any but the natives, who had thrown up works from hill to hill. Thefe works were indeed very rude, being formed of large ttones laid upon one anotber without any cement, and flanked at proper dillances by round earthen towers; before the wall was a deep and broad ditch, with a large hedge of bamboes in front, fo thick that it could not be penetrated but by the hatchet or by the firc. This was forced, though not without Come lofs; after which another work of the fame kind, but Aronger, made its appearance; but this being likewile foreed, Lachenaig was obliged to fubmit and pay his tribute.

The Englifh army now marched to Madura, a flrong Indian town about 60 miles fouth of Trinchinopoli. On their approach it fobmitted without any oppolition, and the inhabitants feemed pleafed with their change

5 s
Two nes Settlements ohtained in the Englifh.
of government. Here a deputation was rectived from a neighbouring polygar, defiring an alliance, and as a proof of his fincerity making an offer of two fettlements on the fea-coalt of his country oppofite to the inland of Ceylon, which would greatly lacilitate their future comoneree with Tinivelly. Before this time they could not have reached that city but by a cirenitous march of 400 or 500 miles ; bot from the new fettements the dittance to Tinivally was no more that 50 miles, and reinforcements or fupplies of any hind might he fent them from Madras or Fort St David in four or fire days. This ofier being accepied, Co. lonel Heron, the Engliih commander, marched to attack the governor of Madura, who lad fled to a place called Coilgoody : on the approach of the Englith be fled from this place alfo, leaving the greatelt part of his troops to defend the place. The road was fo rugged, that the carrigges of the cannon broke down; and as the troops wete not furnifhed with faling ladders, there Leemed to be little hope of graining the place, which
was very frong. The edonel, however, determined to make an afiault after the Indian manner, by burning down the gates will bundles of fraw ; and to encourage his mern in this new method of attack, he him. felf carried the tirlt torch, being followed by Moham. med 1 Stouf, who bore the fecond. The place was ta His im ken and plunderel, not fpariug even the teinples; dence in which infpired the inhabitants with the utmott abhor- flunder Ind rence of the victors on account of their contempt of emples their religion.

After this exploit the army returned to Madura; and a garrifon being left in the place, they proceeded to Tinivelly, which fubmitted without oppofition, and owned tlie jurifdiction of the nabob; though fome of the Polygars ftill evaded payment, and therefore hoftilities were commenced againt them.

The new expedition was marked by an act of the Cruef 54 moft difgracefill cruelty at a fort named Nellecotah, facre at 40 miles fouth of Tinenelly. It was fortified by a mud Nelleco wall with round towers. The affault was made with great refolution, and the troops gained poffeffion of the parapet without being repulfed. On this the garrifon called out for quarter, but it was barbarounly refufed; a general mallacre of men, women, and chitdren enfued, only lix perfons out of 400 being fuffer. ed to efcape with life.

It now appeared that the revenues collected in this expedition had not been fulficient to defray the expences of the amy ; and a report being fpread that Salabat-zing was advancing into the Carnatic at the head of his army, along with M. Buffy the French commander, to demand the Mogul's tribute, it was thought proper to recal Colonel Heron to Trinchinopoli. Before this, he had been prevailed on by the Indian chief who accompanied him, to convey to him (Mazuphe Cawn) an inveftiture of the conntrits of Madura and Tinevelly for an annual rent of 187,5001. Iterling. In his way he was likewife induccd by the fame chief to make an attempt on a ttrong fort named Nellyangavill, lituated about 30 miles well of Tinevelly, and belonging to a refractory Polygar. This attempt, however, proving unfuccefsful for want of battering cannon, the culonel returned with Mazuphe Cawn to Trinchinopoli, where he arrived on the 22 d of May 1755.

The lat expedition of this commander was againt Unfor 55 a mud fort named Voljynaium, fituated near the en- nate e trance of the woods belonging to the Colleries. Thefe dition people were lighly incenfed at the plundering of Coil- volond groody, and particularly at the lofs of their facred Heron images which the rapacious conquerors had carried uff. In confequence of this they had already flaughtered a party of fepoys whom the commanding officer at Madura had fent oot to collect cattle. In their march the Englith army had to go through the pafs of Natam, one of the molt dangerous in the peninfula. It begins about 20 miles north of Trinchinopoli, and contiaues for fix miles through a wood impaffable to Europeans. The road which lay through it was barely fufficient to admit a fugle carriage at a time, at the fame tume that a bank ruming alung eack fide rendered it impofible to widen it. In mot places the wood was quite contiguous to the road; and even where part of it had been felled, the eye could not penetrate above 30 yards.-A detachinent of Europeans, pioneers, and
fepojs,

## I N D <br> [ 101 ]

fepoys, were fent to fcour the woods hefore the main budy ventured to pafs through fuch a dangerous defile. The forner inct with no oppolition, nor did any enemy appear agsiunt the latter for a long time. At lait the march was flopped by one of the heavift tumbrils fticking in a flough, nut of which the oxen were not able to draw it. The officers of artillery fuffered the troops marching before to proceed; and the officer wha commanded in the rear of the battalion, not fufpecting what had happened, continued his march, while anoll of the fepoys who marched behind the rear divition of the artillery were likewife fuffered to pafs the carriage in the flough, which choaked up the road, and prevented the other tombrils from moving forward, as well as three field pieces that formed the rear divifion of artillery, and the whole line of baggage that follewed. In this divided and defencelefs fate the rear divifion of the bagpage was attacked by the Indians; and the whole would certainly have been deftroyed, had it not been fr the cuurage and activity of Capt. Smith, who here commanded +0 Caffres and 200 fepoys, with one fix pounder. Confiderable damage, however, was done, and the Indians recovered their gods; which certainly were not worth the carrying off, being only made of brafs, and of a diminutive fize.- Colonel Heron was tried by a court-martial for mifconduct in this expedition; and being found guilty, was declared incapable of ferving the comp ny any longer: foon after which he returned to Europe, and died in Holland.

In the mean time Nanderauze, an Indian prince, formed a feheme to get poffeffion of Trinchinopoli; and in order to compafs his end with greater facility, communicated his defign to M. de Sauflay the commander of the French troops. But this gentleman ha ving communicated intelligence to the Englifh commander, the enterprize mifcarried, and no difference betwixt there two rival nations as yet took place. It does not however appear that the Engliih were in the leaft more folicitous to avoid hoftilities than the French; for as foon as the company were informed of the acquifitions made by M. Bufly in the Deccan, it was determined to encourage the Mabrattas to attack Sala-bat-zing, in order to oblige him to difmifs the French auxiliaries from his fervice.-In order to fucceed in this enterprife, it was ncceflary to hove a commander well experienced in the political fyltems of the country, as well as in military affairs; and for this purpofe Mr Clive, now governor of Fort St David's, and invefted with a lieutenant-colonel's commiffion in the king's troops, offered his fervice. Three companies of the king's artillery, confilting of 100 men each, and 300 recruits, were fent from England on this expedition, who arrived at Bombay on the 27 th of November; when on a fudden the prefidency of Madras took it into confideration that this expedition could not he profecuted without infringing the convention made with the French commander. "This (fays Mr Grofe) was acting with too much caution ; for every thing relating to Salabat-zing and the French troops in his fervice feemed to have been Audioufly avoided. The court of direchors had explained their whole plan to the prefidency of Madras; but the fhip which had the letters on board was unfortunately wrecked on a rock about 800 miles eall of the Cape of Good Hope." The whole expedition was therefore laid afide, and the prefiency of Madras directed all their force for the
prefent again! Tulagee Angria, who had fong been a formidable enemy to the Englith commerce in thofe parts.

The dominions of this pirate conffted of feveral Account of inands near Bombay, and an extent of land on the the pirate continent about 130 miles in length and from 30 to augria. 60 in breadth. He poffeffed alln feveral forts that liad been taken from the Europeans by his anceltors; the trade of piracy having, it feems, heen hereditary in the family, and indeed followed by mot of the inhabitants of this coaf. This was the more dangerous for trading veffels, as the land breezes do not here eutend more than 40 miles ont at fea, fo that the mips are obliged to kecp within fight of land; and there was not a creek, harhour, bay, or mouth of a river along the whole coaft of his dominions, where Avgria had not erected fortifirations, both as ftations of difcovery, and places of refuge to his veflels. His theet confilled of two kinds of veffels peculiar to this country, named grabs and gallivats. The former have generally two matts, though fome have three ; the latter being about of his 300 tons burthen, and the former 150. They arefleet built to draw little water, being very broad in proportion to their length; but uarrowing from the middle to the end, where, inftead of bows, they have a prow projecting like a Mediterranean galley, and covered with aftrong deck level with the main deck of the veffel, from wheh it is feparated by a buik head that terminates the fore caftle. As this coaftruction fubjucts the grab to pitch violently when failing againtt a head fea, the deek of the prow is not inclofed with files as the reft of the veffel, but remains bare, that the water which comes upon it may pals off without interruprion. Two pieces of cannon are mounted on the main deck under the foreculle, carrying balls of nine or twelve pounds, which point forwards through port-holes cut in the bulk head, and fire over the prow: thofe of the broad-fide are from fix to aine potnders. The gallivats are large row-boats built like the grad, but fmaller; the largeft fcarce exceeding 70 tons burden. They have two mats, the mizen nightly made, and the main-matt bearing one large and triangular fail. In general they are covered with a fpar-deck made of fplit bamboes, and carry only paterreroes fixed on fwivels in the gurnel of the veffel; but thoie of a larger fize have a fixed deck, on which they mount fix or eight pieces of cannon from two to four pounders. They have to or 50 flout oars, by which they may be moved at the rate of four miles an hour.

Angria had commonly a fleet of eight or ten grabs, with 40 or 50 gallivats ; which flipped their cables and put out to fea as foon as any veffel had the misfortunc to come within fight of the port or bay where they lay. If the wind blew with any ftrength, their contruction evabled them to fail very fwiftly: but if it was calm, the gallivats rowed, and towed the grabs. As foon as thcy came withingunfoot of the enemy, they affembled aftern, and the grabs began the attack, ner of az , 60 firing at firt only at the mafts and choofing the molt $1 \cdots$ king advantageous pofitions for this purpofe. If the veffll faps. happeoed to be oifmatted, they then drew-nearer, and battesed her on all lides till the ftruck; but if the defence was oblinate, they fent a ntubrer of gallivats with two or thrce hundred foldiers in each, who boardcd from all quarters fivord in hand.

This piratical Alate had for more than 50 years been. formidabls

## I N D

Inciia. Unfuccefs ful attempts to reduce this pirate.

6
Succefo of commodore James arainft his Lorts.
formidable to all the nations in Europe; the Englinh Eaft India company had kept up a naval force for the protection of their trade at the ratc of more than $50,000 \mathrm{l}$. annually. and after all found it fcarcely adequate to the purpole. An unfuccefsful attempt had been made in 1717, by the prelidency of Bombay, againtt the forts Geriah and Kennary, the principal flrong holds of Angria.-Another was made in 1722, under Admiral Matthews, againtt a fort named Coila. bley, about is leagues fouth of Bombay : but this alfo mifcarried through the cowardice and treachery of the Portuguefe, who pretended to affitt the Englin. In 1735 fort Geriah was unfuccefsfully attacked by a Dutch armament of feven fhips, two bomb-ketches, and a numerous body of land forces; while all this time the piracies of Angria went on fuccefsfully, and not only trading veffels, but even men of war belonging to different nations, were captured by him, particularly in the month of February 1754, when three Dutch thips of 50,36 , and 18 guns, were burnt or taken by the piratical fleet.

This laft fuccefs encouraged Angria fo much, that he hegan to build veffels of a large fize, boafting that lie fhould be maller of the Indian feas. The Mahrattas having implored the affiltance of the Englifh again!t this common enemy, Commodore William James was fent from Bombay on the 22d of March 1755, with the Protector of 44, the Swallow of 16 guns, and two bomb ketches; but with inftructions not to hazard the fleet by attacking any of the pirate's forts, only to bleckade the harbours, while the Mahratta army carried on their operations by land. He had fcarce begun his voyage when he fell in with a confiderable fleet of the pirates, which he would certainly have taken, had it not been for the timidity and dilatory belaviour of liis allics, who could not by any means be indziced to follow thim. They had, however, invelted three of the forts, but after a very flrange manner; for they durt not approach nearer than two miles, and evern there entrenched themfelves up to the chin, to be fecure againf the fire of the fort, which they returned only with one four pounder. The commodore, prowoked at this pufillanimou: bchaviour, determined, for the honour of the Britilh arns, to exceed the orders he had got. Running within 100 yards of a fort named Severndroog, he in a few hours ruined the walls, and fet it on tire ; a pewder magazine alfo blowing up, the people, to the number of about 1000, ahandoning the place, and embarking on board of eight large boats, attempted to make their efcape to another fort named Goa, but were all intercepted and made priforiers by the Englif. The whole foree of the attack being then turned upon Goa, a white flag was foon hung out as a fignal to furrender. The governor, however, did not think proper to wait the event of a capitulation, but without delay paffed over to Severndroog, where he hoped to be able to maintain his ground notwithflanding the ruinous flate of the fortications. The fre was now renewed againtt this fortrefs; and the feamen laving cut a paffage through one of the gates with their axes, the garrifon foon fiurrendered, at the fame time that two other forts befieged by the Mahrattas hung out flags of truce and capitujated: and thus were four of Angria's forts, for fo many years deemed impregnable, fubdued in one day. No 165.

Thefe fucceffes were followed $b_{p}$ the furrender of Bar coote, a itrong fortified ifland now called Fort IViforia, and which the Englifh retained in poffeffion : but the The other forts were delivered up to the Mahrattas. On fine the arrival of Admiral Wation in the beginning of No- due vember 1755 , it was determined to root out the pirate Adt at once. by attacking Geriah the capital cf his domi- Wa nions; but it was fo long fince any Englifhmen had feen this place, and the reports of its Arength had been fo much exaggerated, that is was thoteght proper to reconnoitre it before any attack was made. This wat done by Commodore James; who having reported that the fort, thougt ftrong, was far from being inacceffible or impregnable, it was refolved to profecute the enterprize with the utmoft expedition and vigour. It was therefore attacked by fuch a formidable fleet, that Angria, lofing courage at their approach, fled to the Mahrattas, leaving Geriah to be defended by his brother. The fort, however, was foon obliged to furrender, with no more lofs on the part of the Englifh than 19 men killed and wounded : but it was afterwards acknowledged, that this fuccefs was owing principally to the terror of the garriion occafioned by fuch a violent cannonade; for their fortifications appeared to have been proof againt the utmoft efforts of an enemy. All the ramparts of this fort were either cut out of the folid rock, or built of flones at leaft ten feet long laid edgeways.
In this fortrefs were found 200 pieces of brafs eannon, with fix brafs mortars, and a great quantity of ammunition and military fores, befides money and effects to the value of $125,000 \mathrm{l}$. Angria's fleet was entirely deftroyed, one of the thips having been fet on Gre by a thell from the Englinh fleet, and the flames having fpread from thence to all the reft. About 2000 people were made prifoners; among whom werc the wife, children, mother, biother, and admiral of the pirate : but they were treated with the greateft clemency ; and his family, at their own requeft, continued under the protection of the Englifh at Geriah. All the other forts belonging to Angria foon fubmitted; fo that his power on the coaft of Malabar was entirely annihilated.

While the affairs of the Englifl went on thus fuc- MI. cefffully, M. Buffy had been conttantly employed near difn the perfon of Salabat-zing, whom he had ferved in much the fame manner that the Englifh had Mahomed Ali Cawn. As he made ufe of his influence with that prince, however, to enlarge the poffeflions of the French, and was continually making exorbitant demands upon him, the prime minifter of Salabat-zing at length reprefented to him the danger and fhame of allowing a fmall body of foreigners thus to give law to a great prince ; and haring formed a powerful combination againft the French, at lalt obtained an order for their difmiffion. M. Buffy took his leave without any marks of difgut, having under his command about 600 Europeans, with 5000 fepoys, and a fine train of artillery. His enemies, however, had no mind to allow him to depart in fafety; and therefore fent orders to all the Polygars to oppofe their paffage, fending 6000 Mahrattas after them to harafs them on their march.

Notwithftanding this oppofition, M. Bufly reached Hydrabad with very little lofs. Here he took pof-
feffion

## $1 \mathrm{~N} \quad \mathrm{D}$

directly to Calcutta, which he invefted on the 15 th. Though he now threatened to drive the Englifh entirely out of his daminions, yet he propofed an accommodation with Mr Drake, provided he would pay him his duty upon the trade for 15 years, defray the expences of his army, and deliver up the Indian merchants who were in the fort. This being refufed, a Catcur 68 fiege commenced, and the place was taken in three taken, and days through the treachery of the Dutch guard * number who had the charse of a rate. The nabob promif of prifonon the word of a foldicr, that no larm fhould be donecated. the Englifh ; neverthelefs they were thut up in a pri- * Sce Caffon fo ftrait, that out of $1+6$ all perifhed in a fingle ${ }^{\text {outta }}$. night for want of air but 22. It was not, however, fuppofed that any maffacre at this time was intended: and it is probable that he only gave orders to confine the prifoners clofely for the night, without taking into confideration whether the place they were confined in was large or fmall.

The news of this difatter put an end to the expedition projected againt M. Buffy; and Cutonel Clive was in tanuly difpatched to Bengal with 400 Euro- Expediticn peans and 1000 feonys, on board of the fleet com-of admiral manded by Admiral Watfon. They did not arrive Watem till the 15 th of December, at a village called Fulta, fitu- and coloated on a branch of the Ganges, where the inlabitunts arsainft the of Calcutta had taken refuge after their misfortune. nabrob. Their firf operations were againft the forts Bulbudyia, Tauna, Fort. William, and Calcutea now $i$ a the hunds of the enemy. All thefe were reduced alnoolt as foon as they could approach them. An expedition was then propofed againft Huegley, a large town about 60 miles above Calcutta, and the place of rendezvous for all nations who traded to Bengal; its warehoufes and flops being always, filled with the richelt merchandife of the country. This was likewife eafily reduced; and the city was deftroyed, with the granaries and forehoules of falt feated on each fide the river; which proved very detrimental to the nabob, as depriving him of the means of fubfittence for his army.

Surajah Dowla, enraged at this fuccefs of the Englifl, now feemed determined to crufh them at once by a general engagement. From this, however, he was intinuidated by a fucceffful attack on his camp, which foon induced him to conclude a treaty. This took place on the 9th of February 1757, on the ful- Treaty cono lowing conditions. I. That the privileges and im-cluded with munities granred to the Englifh by the king (: 1 rag...:) hime fhould not be difputed. 2. That all goods with Eaglifh orders thould pafs, by land or water, frea of any tax, fee, or impofition. 3. All the Company's factories which' had been feized by the nabob thould be rellored ; and the goods, munes, and effeits which hul been piundered, fhould be accounted for. \& That the Englifg fhould have permiffion to fortify Calcutta as they thought proper. 5. They flouid allo have liberiy to coin their own impirts of bullion and gold.

As eertain intelligence was now riceived of a war be- War wih tween France and England, the firle object that na- H.c Frencrio turally occurred. after the conchifien of this ireaty, was the reluction of the French power in the eat ; in confequence of which it was repeifented to A dar rail Watfon, by a committre of the enuncil of Benual, that this was the only opportunity he perhaps migh ever have of acting offerlively againt them. An attack

B b
would

## 1 N D

India. would therefore immediztely have been made on Chandernagore, had not a deputation arrived from that place, requetting a neutrality in this part of the world until matters thuuld be finally decided in Europe. The negociation, however, was broken off on a fugpelion that the government of Chandernagore, being ful urdinare to that of Pondicherry, could not render any cras faction of this kind valid. It remained there-
fore only to obtain the confent of the nabob to make an attack upon this piace: but this femed not likely to begot; for in ten days after the couctulion of the treaty, he fent a leter to the admiat, complaining of his intention. "It appears (fays he) that you have a defign to beliege the French factory ncar Houghley, and to commence hoptilities againft that nation. This is contrary to all rule and cultem, that you fhould hring your animodities and differences into my country ; for it has never been known, fince the days of Timur, that the Europeans made war upon one another in the king's duminions. If you are determined to befiege the French factories, I thall be necefficated, in honour and duty to my king, to affilt them with my troups. You are ecrtainly bound to abide by your part of the . reaty ftrictly, and never to attempt or be the occalion of any troubles or difturbances in future within the provinces under my jurifdiction, \&c." To this Admiral Watfon replied, that " be was ready to detift from his intended enterprize if the French would agree to a folid treaty of neatrality ; or if the nabob, as foubaldar (viceroy) of Pengal, would, under his hand, guarantee this treaty, and promifc to protect the Englifh from any attempts made by the French againf their fettlements in his abfence." This letter did not prove fatisfactory; the naboh having been informed by the French agent, that the Englifh defigned to tuin their arms againt him as foon as they had made themfelves matters of Chandernagore. This was flienuoufly denied by the admiral; and a number of letters paffed between him and the nabob, in one of which the latter made nic of the following expreflions, which were fuppofed to imply a tacit confent that Chandernagore thould be attacked. "My forbidding war on my borders was becaufe the French were my temants, and upon this affair detired my protection: on this I wrote to you to make peace, and no inten. tion had I of favouring or affitting them. You bave underttanding and generofity: if your enemy with an upright heare claims your protection. you will give him his life; but then you mull be well fatisfied of the innocence of his intentions; if not, then whatfoever you think right, that do."
Having thus, as was fuppofed, obtained the confent of the nabob, an attack was made on Chandernagore, which was foon reduced to the neceffity of capitulating ; though the French made a gallant defence, and, as Mr Ives informs us, "flood to their guns as long as they had any to fire." A meffenger was difpatched with the news to Surajah Dowla three days after the place had furrendered, intimating alfo that the French bad been purfued fome way up the country. This intelligence, howevcr, feemed to be by no means agreeable, as the could fcarce be induced to return an anfwer. At laft he pretenided difpleafure on account of the defign of the Englith to infringe the treaties, and complained that they had ravaged fome parts of
his dominions. This was denied on the part of the admiral; who in his turn acculed the nabob of breach of promife, and neglect in fulfilling his engagenents. The laft letter fent by Admiral Watfon to the nabob, of date 19th April 1757, concludes in this manner. "Let me again repeat to you, that I have no other views than that of peace. The gathering together of riches is what I defpife; and I call on God, who fees and knows the fpting of all our actions, and to whom you and I muft one day anfwer, to witnefs to the truth of what I now write: therefore, if you would have me believe that you wifh for peace as much as I do, nolonger let it be the fubject of our corvefpuadence for me to afk the fulliment of our treaty, and you to promife and not perform it; but immediately fulfil all your engagements: thus let peace flourifh and fpread throughout all your country, and make your people happy in the reeflablifhmenc of their trade, which has fuffered by a ruinesus and deltruclive war." From this time both parties mate preparations for war. The nabob returned no anfwer till the 13 th of June, when he fent the following declaration of war. "According to my promifes, and the agrecment made between us, I have duly rendered every thing to Mr Watts, except a very fmall remainder: Notwithfanding this, Mr Watts, and the reft of the council of the factory at Caffembuzar, under the pretence of going to take the air in their gardens, fled away in the night. This is an evident mark of deceit, and of an intention to break the treaty. I am corivinced it could not have bappened without your knowledge, nor without your advice. I all along expected fomething of this kind, and for that reafon I would not recal my forces from Plaffey, expecting fome treachery. 1 praife God, that the breach of the treaty has not been on my part," \&c.
Hothing lefs was now refolved on in the Englifh council at Calcutta than the depofition of the nabob; which at this time appeared practicable, by fupporting the pretenfions of Meer Jaffier Ali Cawn, who had with other noblemen entered into a confpiracy againft him. Meer Jaffier liad married the fifter of Aliverdy Cawn, the predeceftor of Surajah Dowla; and was now fupported in his pretenlions by the general of the horfe, and by Jugget Sect the nabob's banker, who was reckoned the richeft merchant in all India. By thefe three leading inen the delign was communicated to Mr Watrs the Englifh refident at the nabob's court, and by him to Colonel Chive and the fecret committee at Calcutta. The management of the affair being left to Mr Watts and Mr Clive, it was thought proper to communicate the fecret to Omichund, through whom the neceffary correfpondence might be carrited on with Meer Jaffier. This agent proved fo avaricious, that it was refolved to ferve lim in his own way; and by ous and a piece of treachery to him alfo, to gain their point reanche with both parties. Two treaties were therefore writ. behavic ten out; in one of which it was promifed to comply of omid with Omichund's demand; but in the other his name the En was not even mentioned; and both thefe treaties were lifo. figned by all the principal perfons concerned, Admiral Watfon alone excepted, whom no political motives could influence to fign an agreement which he did notmean to keep. Thefe treaties, the fame in every refpect excepting as to Omichund's affair, were to the

lis. following purpofe: 1. All the effects and factories bulonging to the province of Bengal, Bahar, and O. risa, hall remain in poffeffion of the Englifh, nor d with fhould any more French ever be allowed to fettle in Jaf- thefe provinces. 2. In confideration of the loffes fuAained by the Englifh company by the capture and plunder of Caleutta, he agreed to pay one crore of rupees, or L. 1,250,000 iterling. 3. For the effects plundered from the Englifh at Calcutta, he engaged to pay 50 lack of rupees, or L. 625,000. 4. For the effects plundered from the Gentoos, Moors, and other inhabitants of Calcutta, 20 lack, or L. 2;0,000. 7. For the effects plundered from the American merchants, inhahitants of Calcutta, feven lack. or L.87,500. 8. The diftribution of all thefe fums to be left to Admiral Watfon, Col not Clive, Roger Drake, William Watts, James Kilpatrick, and Richard Becher, Efquires, to be difpoled of by them to whom they think pro. per.

All things being now in readiners, Colonel Clive began his mareh againti Surajah Dowla on the $13^{\text {th }}$ of June, the very day on which Surajah Dowla fent off his latt letter for Adiniral Watfon. Before any act of hofility was committel, however, Colonel Clive wrote the nabob a letter, upbraiding him with his conduct, and telling him at lati, that "the rains being fo near, and it requiring many days to receive an anfwer, he had found it neceffary to wait upnn him immediately." This was followed by the decifive action at Plaffey; in which the treachery of Meer Jaffier, who commanded part of the nabob's troops, and ftood neuter during the engagement, undoubtedly rendered the victory more eafily acquired than it would otherwife have been. The unfurcunate nabob fled to his capital with a few that continued faithful to him. He reached the city in a few hours; but not thinking himfelf fafe there, left it the following evening, difguifed like a Faquir, with only two attendants. By thefe he appears to have been abandoned and even robbed; for on the 3 d of July he was found wandering forfaken and almolt naked on the road to Patna. Next day he was brought back to Muxadabad; and a few hours af. ter privately beheaded by Meer Jaffer's eldeft fon, to whofe cate he had been committed. The ufurper took poffelfion of the capital in triumpli; and on the 29 th of June Colonel Clive went to the palace, and in prefence of the rajahs and grandees of the conrt folemnly handed him to the mulnud or carpet and throne of Itate, where he was manimounly faluted Coubahdar or nabob, and received the fubmilfion of all prefent.

While thefe tranactions were going forward with the nabob, the utmolt efforts were ufed to expel the French entirely from Bengal. By the articles of capitulation at Chandernagore, the whole of that garrifon were to continue prifoners of war ; but about the time of ligning the trtaty, Mr Law with a finall body of troops made his efcape out of Caffembusar, and bent his march towards Patna. There he had been protected by the late nabob; and on the commencement of freh hofilities, bad collcted about 200 French, the only remains of that nation in Bengal, to make an attempt to fuccour him. With thefe he was within two hours mareh of Surajah Dowla's camp when the battle of Plaffey was fought: on liearing the news of which le flopped ; but atterwards being in-
formed of the nahob's efeape, he mavched again to his afflance, and was within a few hours of joining him when he was taken. Three days after he was purfued by Major Eyre Coote at the head of 223 . Europeans, three companies of Sepoys, 50 Lafcars or Indian failors, and 10 Marmutty men or pioneers to clear the roads, together with two pieces of cannon, fix pounders. On this expedition the major exerted his utmoft diligence to overtake his antagonilt, and fpent a very confiderable fpaec of time in the pufuit; for though he fet out on the Gth of July, he did not return to Muxadabad till the itt of September. Mr Law, however, had the good fortune to efcape ; but though the major did not fucceed in what was propo. fed as the principal end of his expedition, he was neverthelefs, fays Mr Ives, of confiderable fervice to the company and to his country in general. He had obliged Ramnarain, the moit powerful rajah in the cotntry, to fwear allegiance to Meer Jaffier; he laid open the interior fate of the northern provinces; and, in conjurction with Mr Johntlone, gave the company fome infight into the faltpetre bulinefs, from which fuch advantages have fince been derived to the public.

Before the return of Mijaor Coote, Admiral Pocock had fucceeded to the command of the fleet, in confequence of the deceafe of Admiral Watfon, who died on the 1 oth of Auguft. The joy of the Britifh was confiderably damped by the lofs of this gentleman, who had gained a great and deferved reputation both in the military line and every other. News were alfo re. ceived, that the French had been very fuccefsful on the coalt of Coromandel. Salabat-ziug, as has already been obferved, had applitd to the Euglifh for affil. ance againlt the French; but as they were prevented from performing their agrecment by the diatter at Calcutta, he found himfelf under a nectfity of accom:modating the differences with his former friends, and to admit them again into his fervice. M. Bulfy was now reinforced by the troops under M. Law; who had collected as many Europeans in his journey as made up 500 with thofe he had at firt. With thefe he undertook to reduce the Englinh factories of Inge Buecefo of ram, Lator to the two furmer places were in any llate of defence, the romandel greateit part of the company's effects wete put on ${ }^{\text {coalt. }}$ fhipboard on the Gift alarm; but as Vizagapatnan was garrifoned by 1,40 Europeans and 420 Sepoys, it was fuppufed that it would make fome defence. If any was made, however, it appears to have beta vely tritling ; and by the conquell of this the French be. came mafters of all the coalts from Ganjam to Maflulipatnam. In the fouthern provinces the like bad fuc* cefs attended the Britifh caufe. The rebel Polygars having united their forces againft Mazuphe Cawn, obtained a complete victory over him; after which the Englih lepoys, being prevailed upon to quit Ma. dura, the conqueror frized upon that city for himfelf.

In the beginning of 1758 , the French made an attempt on Princhinopoli. The command was given to M. d'Autrenil, who invefted the place with yoo men in battalion, with +000 fepoys, 100 huffars, and a great body of Indian horfe. 'Trinchinopoli was then in no condition to withfiand fuch a formidable power, as molt of the garifion had gone to beliege Madura Bbz
bdia. under Captain Caillaud; but this commander having reccived intelligence of the danger, marched back with all his forces, and entered the town by a difficult road which the enemy had neglected to guard; and the French general, difconcerted by this fuccefsful marepuvre, drew off his forces, and returned to Pondicherry.

This fortunate tranfaction was fucceeded by the fiege of Madura in which the Engtih were fo vigooufly repulfed, that Captain Caillaud was obliged to turn the fiege into a blockade in order to reduce the place by famine. But before any progrefs could be made in this way, Mazuphe Cawn was prevailed upon to give it up for the fum of 170,000 rupees. A large garrifon of fepoys was again put into the place, and Captain Caillaud returned to Trinchinopoli.

An unfuccefsful attempt was now made by Colonel Ford on Ncllore, a large town furrounded by a thick mud-wall, with a dry ditch on all fides hut one, where there is the bed of a river always dry hut in the rainy feafon. The enterprife is faid to have proved unfuccefsful through the unheard- of cowardice of a body of fepoys, who having theltered themfelves in a ditch, abfolutely refufed to ftir a flep farther, and rather chole to allow the reft of the army to march over them to the affanlt, than to expofe themfelves to danger. Several ntleer fnterprifes of no great moment were undertaken; hut the event was on the whole unfavourable to the Englifh, whofe force by the end of the campaign was reduced to 1718 men , while that of the French amounted to 3400 Europeans, of whom 1000 were fent to Pondicherry.

82
French de. feated at rea by ardniral fo. socts.

Both parties now received confiderable reinforcements from Europe ; Admiral Pocock being joined on the $24^{\text {th }}$ of March by Commodore Stevens with a fquadron of five men of war, and the French by nine men of war and two frigates, having on board General Lally with a large body of troops. The Englifh admiral no fooner found hinafelf in a condition to cope with the enemy than he went in queft of them; and an engagement took place, in which the French were defeated with the lofs of 600 killed and a great many wounded, while the Englifh had only 29 killed and 89 wounded. The former returned to Pondicherry, where they landed their men, money, and troops. After the battle three of the Britifh Captains were tried for mifbehaviour, and two of them difmiffed from the command of their fhips. As foon as his veffels were refitted, the admiral failed again in quett of the enemy, but could not bring them to an action before the $3 d$ of Auguft, when the French werc defeated a ficond time, with the lofs of 251 killed and 602 wounded.

Notwithtanding this fuccefs at fea, the Englifh were greatly deficient in land forces; the re-eftablifhment of their affairs in Bengal having almoft entirely drained the fettlements on the coaft of Cotomandel of
treat with lofs from before Tanjore, his arony being greatly diftreffed for want of provifions; and money in particular being fo deficient, that on the 7 th of Aligult the French reized and carried into Pondicherry a large Dutch hip from Batavia, bound to Negapatnam, and took out of her about L. 5000 in specie.

From this time the affairs of the French daily declined. On their retreat from Tanjore, they aban. doned the ifland of Seringham; however, they took Tripaffore, but were defeated in their defigns on the important poft of Chinglapet, fituated about 45 iniles fouth-well of Madras. Their next enterprizes on Fort St George and Madras were equally unfuccelsful. The latter was belieged from the $12 t h$ of December 1758 to the 17th of February 1759, when they were obliged to abandon it with great lofs; which ditatter greatly contributed to deprels their โpirits, and abate thofe fanguine hopes they had entertained of becoming inaflers in this part of the world.

The remainder of the year 1759 proved entirely favourable to the Britifh arms. M. d'Ache the Fiench admiral, who had been very roughy handled by Admiral Pocock on the 3 d of Augult 1758, having refitted his fleet, and being reiwforced by three men of war at the iflancis of Mauritius and Bourbon, now ventured once mose to face his antagonill, who on his part did nut at a!? decline the combat. A third battle French enfued or the 10th of Stptember 1.759, when the fested French, notwithitanding their fuperiority buth iu num. third ber of hips and weight of metal, were obliged to re-by adr treat with contiderable lufs; havingr 1500 men killed and wounded, while thone on board the Englifh fleet did not exceed 569 . By the 17 th of October the Englith flett was complerely refted; and Admiral Pocock having been joined by a eeinforcement of four men of war, foon after retuned to England.

All this time the unforturate General Lally had been employed in un uceeffful endeavours to retrieve the affars of his countrymen: flill, however, he attempted to act on the offontive; but his fate was at latt decided by laying liege to Wandewaih, which had Genera lately been taken by Colonel Coote. The advantage feated in numbers was entirely in favour of the French ge. Wande neral ; the Englifh army couliting only of 1700 Eus wafh. topeans incluting artillery and cavaliy, while the French amounted to 2200 Europeans. The auxiliaries on the Euglifh fide were 3000 black troops, while thofe of the French amounted to 10,000 black troops and 300 Caffres; nor was the odds lefs in proportion in the artillery, the Englifh bringing into the field only it pieces of cannon and one lowitzer, while the French had 25 pieces in the field and five on their batteries againtt the fort. I'he battle began about eleven o'clock on the 22 d of January 1760 , and in chree hours the whole French army gave way and fled towards their camp; but quitted it on inding themfelves purfued by the Englith, who took all their cannon except three fmall pieces. They collected themfelves under the walis of Cheltaput, about 18 aules from the tield of battle, and foon after retired to Pondicherry. Colonal Coote cauled the country to be wafted to the very gates of this fortrefs by way of retaliation for what the Frouch bad done in the neighbourhood of Madras. He then fet about the fiege of

## 1 N D [ 197 ] I N D

dia. Cheltaput, which furrendered in one day: a confiderable detachment of the entmy was intercepted by Captain Smith; the Fort of Timmery was reduced by Major Monfon, and the city of Arcot by Captain Wood. This latt conquell enabled the Englifh to refore the nabob to his dominions, of which he had been deprived by the Freuch; and it greatly weakened both the French force and intereft in India. M. Lally, in the mean time, had recalled his forces from Seringham, by which means he augmented his army with 500 Europeans. All thele were now fhut up in Pondicherry, which was beeome the laft hope of the French in India. To complete their misfortunes, Adrriral Cornith arrived at Madras with fix men of war; and as the Prench had now no fleet in thefe parts, the adninal readily engaged to co-operate with the land forces. The confequence was the reduction of Cancal, Chellambrum, and Verdachellum, by a firong detachment under Major Monfon ; while Colonel Cuote icduced Permucoil, Alainperva, and Waldour. Thus he was at lait enabled to lay fiege to Pondicherry itfelf. Previous to this, however, it had been blockaded by fea and land, which reduced the place to gieat flraits for want of provilions, and induced a mutinous difpofition among the garrifon. The batteries were not opened till the beginning of Decenber 1760 ; and the place caputulated on the 15 th of January 176 r , by which an end was put to the power of the Fiench in this pant of the world.

While the lirglith were thus employed in effectually reducing the power of their rivals in every part of India, Neer Jaffier, the nabob of Bengal, who had been raifed to that dignity by the ruin of Surajah Dowla, found himfelf in a very difagrecable fituation. 'The treafure of the late nabob bad been valued at no lefs than 64 ciore of rupecs, about 80 milions fterling; and in expectation of fuch a vall lum, Meer Jafficr had no doubt thoughthesly fubmitted to the enormons ex. actions of the Englifh, already mentioned. On his acedion to the goverument, however, the treafure of which he became matter fell fo nuch fhort of expectation, that he could by no means fulfil his engagements to them and fupply the expences of government at the fame time. This foon reduced him to the ueceflity of mortgaging his revenus to fupply prefent demands; and by this hanous expedient be put it out of his own power ever to extricate hinfelf. In this dilemma his granders became factious and difoontented, his amy n.utinous for want of pay, and he rendered himfelf odious to his fubjects ty the exacions he was nectifitated to lay upon them. The Englifh, who for their own interelt had raifed him to the fupreme power, no fooner found that he was incapatle of anfuering their purpufe any lonecr, than they began to cheme againk him: and in order to have fome colour of reafon for pulling duwn the man whon they had jut fet up, they either invented or gave ear to the moft malicions caa ards lurnits againf him. The charges breught againt him were fhortly thefe: 1. That fuen after his advancement be had refolved to reduce that power wheh raifed him to the dignity. 2. That, to effect this, he aftafinated or banithed every perfon of impurtance whem he fuffected of being in the Englifh interett. 3. That he wegeciated with the Dutch in introduce anamanant for the expullicn of the Eaglifhe fo That
he had in different inttances been guilty of the India. deepett deceit and treachery towards the Englifh, his bett benefactors and allies. 5. That at three different periods the Englifh commander in chisf had been bafely deferted both by the uaboi and his fon, when he and the troops were hazarding their lives for them. 6. That he meditated a feeret and feparate treaty with Shah-Zaddah, the Mogul's fon, and had intended to betray the Eos?lifh to him. 7. That the whole term of his government had been one uninterrupted chain of cruclty, tyranny, and oppreflion. 8. That he meditated, and was near carrying into execution, an in. famous fecret treaty with the Mahrattas, whieh would have proved the total deftruction of the country if it lad taken place. 9. That he threw every pultite ohflruction in the way of the collcetion of the Englith tunkas or affynments upon lands. 10. That he encouraged the obftructions given to the fice curr-ncy of the Euglith ficcas ; by which the company fuffered heavy loffes. It. That by his cruclties he had rendered it feandalous for the Englifh to fupport his goverument any longer ; and, 12 . That by bis mifconduct, he had brought the affiers of the company as well as his own inta the utmoft danger of ruin.

In what manner thefe charges were fupported it is dificult to know, nor perhaps were the accufts very folicitous about the llrength of their evidence. This feems the more probable, as the accufations of cruclty were, in fome inftances at laft, void of foundation. On the $13^{\text {th }}$ of June 1760 , Mr Holwel wote From Calcutta to Mr Warren Hallings, that by exprefs he had received intelligence of the murder of the princeffes of Aliverdy Khan and Shah Amet, in a molt intuman manner, by Meer Jaffier's orders. He was faid to have fent a Jemmatdaar with 100 honfe to Jefferaut Khan to carry this bloody fcheme into execurion; with feparate orders to the Jemmatdaur to put an end to their lives. He refufed acting any part in the tragedy, and lefi it to the other; who carried them ont by night in a boat, tied weights to their legs, and threw them overboard. They fiuggled for fone time, and held by the gunwale of the boat ; but by ftrokes on their heads, and cutting off their hands, they were at latt forced off and drowned. In like manner we were told that many others of Surajah Dowla's relations had perifled; yet when it was thought proper to replace Mecr Jiffice in 1761 , all thefe dead perfuns were found alive exceping two. It mult alfo be remembertd, in behalf of the unfortunate nabob, that beliues the foms exacted of hin by the Englifh at his accellion, he had ceded to them a large extent of territery, and granted them fo many immunities in trace, that he had in a manner deprived himfelf of all his refonies ; and it was impolfible for him to defray the ructiory expences withcut tither extorting money frum his fubjects, or infringing the privileges he had fo inconliderately granted.
There whe two accounts of this remarkable revolu- Different tion publifhed, materially difftring from one another. Dife unts The lirtt was given in a memorial drawn up at a of his dew coufultation at Fort William, Nuvenber 10. 1760 , pofition. where were picfint Henry Vanfitat, Efor prefodent; William Ellis, B. Sumner, William N•Guire, Henry Vereft, and Henry Sinyth, Eifs. "We refolved (Gys the fovernor) to give the natob the nex: d.by (Ucto-
ber 19. 1760) to reflect upon the lettars I had delivered him, propoling fome meafures fur regulating thefc abufes. I heard nothing from him all that day; but found by my. intelligence that he had been in council at his old advifers, whofe advice, I was fure, would be contrary to the welfare of the country and of the company. I therefure determined to act immediately on the nabob's fear. There coul. 1 not be a better opportunity than the night of the 19 th of fered, it being the conclufion of the Gentou feat, when all the piincipal pecple of that calt would be pretty well fatigued with their ceremonies. Accotd. ingly I agreed with Colonel Caillaud, that he hould crofe the river with the detachment between three and four in the morning ; and having joined Coffm Ali IIhan and his people, march in the nabob's palace, and furround it juft ar day-break. Being extremely delirous to prevent dillurbance of bloodhed, I wrote a letter to the nabob, telling him, I had been waiting all the day in expectation that he would have fettled the urgent affairs upon which I conferred with him ytllenday; but his having fivoured me with no anfwer, plainly thowed that all I could reprefent to him for the good of his country would have no effect, as long as his evil counfellors were about his perfon, who would in the end drprive him of his government and ruin the company's affairs. For this rcafon I had ftat Colonel Cailland with forces to wait upon him, and to expel thofe had comnfellors, and place his af. fairs in a proper flate, and I would thortly follow. This letter I gave to the colonel, to fend to the nabob at fuch a time as he fould think moft expedient. Meafures were taken at the fame time for feizing his three unwortly minitlers, and to place Coffim Ali Khan in the full management of all the affairs, in quality of deputy and fucceffur to the nabob.
"The neceffary preparations being madc with all care and fecrecy poffible, the colonel embarked with the truups, joined Collim Ali Khan without the leaft alarm, and mached into the court-yard of the palace juft at the proper inflant. , The gates of the inner court being fhut, the colonel formed his men without, and fent the letter to the nabob, who was at firit in a great rage, and long threatened that he would make what refiftance he could, and take his fate. The colont forbore all hoftilitirs, and feveral meffages paffed between him and the nahob. The affair remained in this doubtful llate for two hours, when the nabob, finding his perfiling was to no purpofe, fent a meflage to Coffim Ali Khan, informing him that he was ready to fend the fals and all the enfigns of dignity, provided he would agree to take the whole charge of the government upon him, to difcharge all arrears due to the troops, to pay the ufual revenue to the king, to fave his life and honour, and to give him an allowance fufficient for his maintenance. All thefe conditions being agreed to, Coflim Ali was proclaimed; and the old nabob came out to the colonel, declaring that he depended on him for his life. The troops then took poffeflion of all the gates; and the old nabob was told, that not only his perfon was fafe, but his gevernment too it he pleaftd, of which it was never intended to deprive him. He anfivered, that he had now no more buliness in the city, where he fhould be in con-
tinual danger from Colfin Ali Khat ; and if le was permitted to go and live at Calcutta, he fhould be contented. Coffin Ali Khan was now placed on the mufnud, and the people in general feemed much pleafed with the repolution. The oll nabob did not think himfelf fafe eveu for one night in the city. Cofftm Ali Khzn fupplied him with boats, and permitted him to take away about 60 of his family, with a rea. fonable quantity of jewels. He begred that he mizht neep in his boat that night; which he accordng did, and on the morning of the 22 d of O -tober he fet out for Calcutta, and arrived thare on the $2 g i t$. He was met by a deputation from the council, and treated with every mark of refpect due to his former dignity."

The fecond account of this affair was not problithed till the 11th of March 1762 , and was ligned Eyre Coote, P. Amyatt, John Caynac, W. Ellis. S. Bation, H. Verell. "In September 17 万o (fay they), when there was not the lealt appearance of a rupture or difgul between us and the naboh, hut friendhip and harmony fubitling, Meer Coflim Khan his fon in law came down in Calcutta. and having flaid a hort time returned to Moonhebad. A few days after, Mr Vanfittart went up to that city on the pretence of a vilit to the nabub Meer Jafficr. Colontl Caillaud, with 200 Enmpeans and fome Repoys, a:tended him; who, it was pretended, were going to join the army at latna. When Mr Vanfittart arrived at Moradbaug, the nabob paid him two vilits: at the lall of which Mr Vanfittart gave him three letters, propofing the reformation of the abufes in his government, infitted on his naming fome perfon among his relations to take charge of the fubahthip, and particularly recommended Coflim Ali Khan, who was fent for, and the nabob defited to flay till he came: But the nabob, being greatly fatigued, was fuffered to depart to his palace. The night and following day paffed in concerting meafures with Colfim Ali how to put in excution the plan before agreed on in Calcutta, where a treaty was figned for this purpofe. In confequence of thefe deliberations, our troups croffed the river next night, and being joined by Coffim and his party, furrounded the nabob's palace. A letter from Mr Vanfittart was fent in to the nabob, demandiug his compliance with what had been propofed to hin. To this the nabob returned for anfwer, " that he never expected fuch ufage from the Englifh; that while a force was at his gates, he would enter into no terms.' A meffage was fent in, that if he did not directly comply, they thould be obliged to florm the palace. Aftonimed and terrified at this menace, he opened the gates, exclaiming, that - he was betrayed; that the Englifh were guilty of perjury and breach of faith; that he perceived their defigns againtt his government; that lue had friends enough to hazard at leaft one batule in his defence: but although no oaths were facred enough to bind the Englifh, yet as he had fworn to be their faithful friend, he would never foerve from his engagement, and rather fuffer death than draw his fword againtt them.' So fufpicious was he of being fold, that he delired to know what fum of money Coffim Ali Khan was to give for the fubahfhip, and he would give half as much more to be continued. He hoped, however, if they

## I N D

fia. intended to dethrone him, that they would not leave him to the mercy of his fon in haw, from whom he feared the wort; but wifhed they would earry him from the city, and give him a place of fafety in Calcutta. " This latt requeit of the nabob was conftrued in the light of a voluntary refignation. Our troops took puffeffion of the palace; Meer Colfim was raifed to the mulnud; and the old nabob hurried into a boat with a few of his domettics and neceflaries, and fent away to Calcutta in a manner wholly unworthy of the high rank he fo lately held, as was alfo the fcanty fubfittence allowed him for his maintenance at Calcutta by his fon-in-law. Thus was Jaffer Ali Khan depofed, in breach of a treaty founded on the moft folemn oaths, and in violation of the national faith."

According to this account, the fervants of the Company, who were the prujectors of the revolution, made no fecret that there was a prefent promifed them of 20 lacks of rupees from Coffita, who was defirous of naking the firft act of his power the affifination of Jaffier, and was very nouch difpleafed when he found that the Englifh intended giving him protection at Calcutta.

It could fcarce be fuppofed that Meer Coffim, raifed to the nabobifh in the manner we have related, could be more faithful to the Englinh than Meer Jaffer had been. Nothing advantageous to the interelts of the company could indeed be reafonably expected from fuch a revolution. No fucceffor of Meer Juffier could be more entirely in fubjection than the late nabob, from his natural imbecility, had been. This laft confideration had induced many of the council at firft to oppofe the revolution; and indeed the only plaufible pretence for it was, that the adminitration of Meer Jaffier was fo very weak, that, unlefs he was aided and even contruuled by fome perfons of ability, he himfelf muft foon be ruined, and very probably the inr. terells of the company along with him. Meer Coffin, emes however, was a man of a very different difpofition
the from his father-in law. As he knew that he had not been ferved by the Englinh out of fiendfi ip, fo he did not think of making any return of gratitude; but inftead of this, confidered only how he could mof eafily get rid of fuch troublefome allies. For a while, however, it was neceffary for him to diffemble, and to take all the advantage be could of the power of his allies whillt it could be ferviceable to him. By their affiftance he cleared his dominions of invaders, and Itrengthened his frontiers againft them; he reduced, by means of the fame affiftance, the rajahs or independ ent Indian chiefs who had rebelled in the time of his predeceffor, obliging them to pay the ufual tribute; by which means he repaired his finauces, and thercby fecured the difcipline and fidelity of hiz troops. Having thus, by the affiltance of the Engliff forces, brought his government into fubje:tion, he took the moft effectual means of fecuring himfelf againft their power. As the vicinity of his capital, Muxadabad, to Calcutta, gave the Euglith factory there an opportunity of iufpecting lis actions, and interrupting hus defigns when they thought proper, he took up his refidence at Mongheer, a place 200 miles farther up the Ganges, which he fortified in the beft and molt ex. peditious manner he could. Being very fenfible of the advantages of the European difcipline, he refolved
to form his arrny on a new model. For this purpofe he collected all the Armenian, Perfian, Tartar, and other foldiers of fortune, whofe military characters he fuppofed might ferve to raife the fpirits of his Indian furces, and abate their natural timidity. He alío carefully collected every wandering European who had borne arms, all the Sepoys who had been difmilled from the Englifh frvice, diltributing them among his troops, in order to teach them the Englith exercife. He changed the fafhion of the Indian mufkets from matchlocks to firelocks; and as their cannon were almof as deficient as their fmall arms, he procured a pattern of one from the Englith, by which he foon formed a train of artillery: and having thus done every thing in his power to euable himfelf to withtand the Englifh hy force of arms, he refolved alio to free his court from their emiffaries, by imprifoning or putting to deatl every perfon of any confequence in his dominions who had hown any attachment to their interefl.

His next ltep was to free himfelf from fome of thole reftraints which his predeceffor Meer Jaffier, and even he himlelf, had been obliged to lay upon the trade of the country, in order to gratify the avarice of his European allies. At his acceffion indeed he had ceded to the company a tract of land worth no lefs than 700,000 1. annually, betides 70,000 l. a-year on other accounts. All this, however, was not fufficient ; the immunities granted them in trade were of ftill worfe confequence than even thufe valt conceffions. He knew by experienee the diftefs which thefe immunities had brought upon his predeceffor, and therefure determined to pui an end to them. In purfuance of He lay this refolution, he began, in the year 1762 , every dutics ort where to fubject the Englifts traders to the payment the eng: of cortain duties throughout his dominions, and re= lifh traz quired that their difputes, if beyond the limits of their own jurifdiction, fhould be decided by his magiftrates. This gave fuch an alarm at Calcutta, that, in November $1 / 62$, the governor Mr Vanlittart waited on him in perfon at Mungheer, in order to expoftulate with him upon the fubject. The nabob anfwered his remonftrances in the following manner. " If (haid he) the fervants of the Englid. company were perinitted to irade in all parts, and in all commodities, cuttom free, as many of them now pretend, they mut of courfe draw all the trade into their own hands, and $m y$ cuttoms would be of fo little value, that it would be much more for my intered to lay trade entirely open, and collect no cuftoms from any perfon whatever upon any kind of merchandize. This would draw a number of merchants into the country, and increale my revenues by encouraging the cultivation and manufacture of a large quantity of goods for fale, at the fame time that it would effectually cut off the principal fubject of difputes which had difturbed the good underilanding between us, an otjeet which I have more than any other at heart."

By thefe intimations Mr Vanfittart was very much difconcerted; nur indeed was it in any perfon's power to devife a plaulible anfwer. What the nabob had threatened was evidently in his power ; and though he had laid the trade entirely open, no reafonable fanlt could have been found with him. The proceeding, however, tended evidently to deftroy the private trade
carried on by the gentlemen of the factory; and even to prejulice, as they faid, that of the company itfelf. Mr Vanfittart therefore thought proper to fubmit to certain regulations. by which the trade of the Englith was put under cettain reftrictions.

This new agreement being inflantly put in execurtion on the part of the nabob, excited the utmoft indignation at Calcutta. On the $\mathrm{r}_{\mathrm{pt}}$ th of January $17 \mathrm{~F}_{3}$, the council paffed a refolution, difavouing the treaty made by the governor, and affirmed that he affumed a right to which he was by no means authorized; that the regulations propofed were difhonourable to them as Englifhmen, and rended to the ruin of all public and private trade; and that the prefident's iffuing out regulations independent of the council was an abfolute brach of their privileges. They fent orders therefore to all the faciories, that no part of the agreement between the governor and nabob thould be fubmitted to. Application was again made to Meer Coflim to perfrace thim to a third agreement ; but hefore the fuccefs of this negnciation could be known, hofilities commeuced on the part of the Englifh.

There was at that time in the city of Patna (fituated on the Ganges, abollt 300 miles above Calcutta), a fortified factory belonging to the Eaft India company, where were a few European and Indian foldiers. By this factory the city was fuddenly attacked on the 2 th of June 1763 , and inftantly taken, though it was defended by a frong garrifon, and the fortifications had been newly repaired. The governor and garrifon fled ont into the country on the firt appearance of danger: but perceiving that the vitors tork no care to prevent a furprife, he fuddenly returned with a reinforcement from the country, retook the city, and either cut in pieces or drove into their fort all the Englifh who were in it, after having been only four hours in poffeflun of the place. The Englith, difheartened by this difafter, did not now think themfelves able to defend their fort againft the Indians; for which reafon they left it, with a defign to retrcat into the territories of a neighbouring nabob; but being purfued by a fuperior force, they were all either killed or taken.

This piece of perfidy, for fuch it certainly was, the nabob repaid by another, viz. flaughtering the deputies who nad been fent him ly the council of Calcutta to treat about a new agreement with regard to com. mercial affairs. They fet out from Mongheer on the $z^{2}$ th of June, having been unable to bring Mecer Coffim to any terms; and though he furnifhed then with the ufual paffports, yet, as they wore paffing the city of Muxadabad, they found themfelves attacked by a number of troops affembled for that purpofe on both fides of the river, whofe fire killed feveral gentlemen in the boats. Mr Amyatt, the chief of the embarfy, landed with a few fepoys, whom he forbid to fire, and endeavoured to make the enemy's troops underfland that he was furninted with the nabob's pafforts, and had un defign of committing any hoftilities; but the enemy's horfe advancing, fome of the fepoys fired netwithtanding Mr Amyatt's orders to the contrary. On this a general confufion enfued, and Mr Amyatt, with molt of the fmall party who attended him, were cut in pieces.

Thefe acts of trecherous honility were foon foliow. $\mathrm{N}^{\circ} 165$.
ed by a formal decharation of war. Meer Jaffier, notwitbfanding the crimes formerly alleged againft him, was proclaimed nahob of Bengal, and the army im- Mte mediately took the field under the command of Major fiet Adams. The whole force, however, at firft confifteditoci only of one regiment of the king's troops, a few of nutho the company's, two troops of European cavalry, ten companies of fepoys, and 12 pieces of cannon. Thefe Maj very foon came to action with the enemy; and having matar got the better in two fkirmithes, cleared the country agan of them as far as Caffimbuzar river, a branch of the Mee Ganges, which lay between Calcutta and Muxadabal, fina. or Murhudabad, the capital of the province.

The war was now carrie. $i$ on with uninterrupted fuccefs on the part of the Englifh; nor does is appear that all the pains taken by Meer Coffim to difcipline his tronps had made them in the lealt more able to cope with the Europeans. The Englifh were fuffered to pafs the river without oppofition; but an army of 10,000 Indians were adrantageoufly pofted between the river and the city. Thefe wire entirely, defeated, The and Mujor Adams puhhed on directly for the capital, ciante In his way he found the Indians again ftrongly polted feate with intrenchments 15 feet high, and defended by a numerous artillery: This ftrong polt was taken by flratagem ; a feint being made with a fmall body of troops againf that part where the enemy had collected their greateft frensith. Thus the attention of the enemy was drawn entirely to that place, without regarding others where no attack was apprehended. The greatell part of the Enghill army, howercr, had in the night time marched wound the indian fortification, and by day brak made a furious affault on a place where there was only a night guard. Thefe inttantly fled; the inirenchments were abandoned; and the city, which was protected only by them, fell of courfe into the hands of the conquerors.

This fuccefs of the Englifh ferved only to make them redouble their diligence. They now penetrated into the heart of the province, crofled the numerous branches of the Ganges, and traverfed moraffes and foretts in quell of their enemy. Micer Cu.ffim, on the other hand, was not wanting in his defence; but the utmoft efforts he could ufe were tutally infufficient to flop the career of an enemy fo powerful and now fluthed with victory. The two armies met on the banks of a river called Nu . Me neas Nullas, on the 2d of Auguft:763. The Indians ind had chofen their poft with grear judgment, and lad at much more the appearance of an Ewiopean army than Nul ever was obferved before, not only in their arms and accoutrements, but in their divifion into brigades, and even in their clothing. The battle was much more cibfliwate than ufual, being continued for four hours; but though the Indian army confilted of no fewer than 20.000 harfe nus 8000 foot, the Eng. lifh proved in the end vifiorruus, and the eremy were obliged to quit the field with the lofs of all their cannon.

From this time the Indians did not attempt any regular elgagemert with the Englifh. They marle a Hand indeed at a plice called Auda Nulla, which they had fortifitdinfuch a manner that if feemed proof ag init any fudden arack. But here alfo they fuffered themfelves to be deceived in a manner fin ilar to that aborementioned, and the place was taken with great flangh-
ter. They now abandoned a vaft tract of country; and tho there were feveral very defentible pofts one behind another, fo much were they difheartened by this miffortune, that they never attempted to ftop the progrefs of the Englifl, but laid open the whole country to the very gates of Mongheer.

The next operation was the fiege of Mongheer itfelf; which, notwithfanding all the pains Meer Coffim had been at to fortify it, held out no more than nine days after the trenches were opened: fo that nothing now remained to complete the conqueft of Bengal but the reduction of the city of Patna. The unfortunate Meer Coflim, in the mean time, euraged at the irrefiftible progrefs of the Englifh, vented his rage on the unhappy prifoners taken at Patua; all of whom, to the number of abcit 200 , he caufed to be inhumanly murdered. This villany was perpetrated by one Somers, 2 German, who had originally been in the French fervice, but deferted from them to the Englifh Eaft In dia company, and from the company to Meer Coffial. This affaffin, by the Indians called Soomeroo, having invited the Englifh gentlemen to fup with him, took the opportunity of borrowing their knives and forks, on pretence of entertaining them after the Englifh manner. At night, when he arrived, he flood at fume dittance in the cook-room to give his orders; and as foon as the two firt gentlemen, Mr Ellis and Luhington, entered, the former was feized by the hair, his head pulled baek ward, and his throat cut by another On this Mr Luthineton knocked down the murdercr with his fift, feized his fword, wounded one and killed two before he himfelf was cut down. The other gentiemen being now alarmed, defended themfelves, and even repulfed the fepoys with plates and bottles. Somers then ordered them on the top of the houle to fire down on the prifoners; which they obeyed with reluitance, alleging that they could not think of murdering them in that manner, but if he would give the prifoners arms, they would fight them; on which he knocked feveral of them down with bamboes. The confequence was, that all the gentlemen were cither fhot or had their throats cut. Dr Fullarton was the only perfon who efcaped, having received a pardon from the tyrant a few days before the maflaere.

This inhumanity was far from being of any fervice to the caufe of Meer Ci.flim. Major Adams marched without delay from Monglieer to Patna; and as the place was but indifferently fortified, it could make but a feeble refiftance. The cannon of the Englifh foon made a practicable breach, and in no longer time than eight days this great eity was taken by itorm. Thus the nabob was deprived of all his fortified places, his 11 army reduced to a fmall body, and himfelf abliged to he Ry to sujah Dowla nabob of Oude, who acted as grand vizier to the Mogul. Here he was kindly received, and an afylum promifed for his perfon, but admittance was refufed to his army, nor would this prince confent at any rate to make his country a feat of war. The Englih were now entire mafters of Bengal ; for though Meer Jafier was proclaimed nabob, it is not to be foppofed that he had now any authority farther than what they pleafed to give him. Major Adams did not long furvive the conqueft of Patna, which was taken on the 6th of November 1763; he dicd in the month of March $17 \sigma_{4}$.

Meer Coffim being thus driven out, an agent was אent Vol. IX. Part I.
from Calcutta to Sujah Dowla, proporing an alliance with him and the Mogul, who was along with him, and offering to affit them againft Meer Coffim or any other enemy who fhould attempt an invation of their dominions; in return for which, it was expected that they fould declare themfelves open enemies to Meer with Sujaz Coffim, and ufe their utmolt endeavours to feize and deliver him up with all his effects. This defign was communicated to Major Adams on the 8th of IDecermber 1763 ; but as he was next day to refign the command of the army, Major Carnac was defired to take the command upon him, and to watch the motions of Meer Cuffim, as well as to guard the dominions of Meer Jaffier againft any hoftilities which might be attempted. It was alfo refolved, that in cafe Mter Coffin fhould prevail upou the Mogul and Sujah Dowla to affit him, Major Carnac was defired to advance to the banks of the river Carumnaffa, and there oppofe the entrance of any holtile army.
It foon appeared that the friendhip of the Englifh was not what Sujah Duwla defired. He confidered them as rapacious nfurpers, who having got a fouting in the country under pretence of commerce, could be fatisfied with nothing lefs than the entire poffeffion of it, to the ruin of the natural inhabitants. In the pron 104 beginning of February 1764, therefore, it was known alliance rethat Sujah Dowla had determined to affift Meer Coffim jected by in atterrpting to recover Bengal. The prefident and ${ }_{\text {laja }}$. Dows council on this wrote him, that though they heard fuch a report, they could not believe it, conlidering the former connections fubfilting between lim and the chiefs of the company, and were perfuaded he would not att in fuch an unjult manner: but if it really was his intention to efpoufe the caufe of Meer Coffin, they informed him that they were refolved to keep Bengal free from troubles, and carry the war into the dominions of Sujalı Dowla himfelf. To this the nabob replied by enumerating the many favours conferred on the Englifh by the Mogul. "Notwithfanding thefe (fays he) you have interfered in the king's cuuntry, poffeffed yourfelves of diftriets belonging to the government, and turned out and eftablifhed nabobs at pleafure, without the confent of the imperial court. Since you have imprifoned dependants on the court, and expofed the government of the king of kings to contempt and difhonour ; fince you have ruined the trade of the merchants of the country, granted protection to the king's fervants, injured the revenues of the imperial court, and cruflied the inlabitants by your acts of violence ; and fince you are continually fending frof people from Calcutta, and invading different parts of the royal dominions; to what can all thofe wrong proceedings be attributed, but to an abfolute diffegard to the court, and a wicked deign of feizing the country to yourfelves? If thefe dilturbances lave arifen from your own improper defires, defilt from fuch behavicur in future; interfere not in the affairs of government; withdraw your people frome every part, and fend them to their own country; carry on the company's trade as formerly, and contine gourfelves to commercial affairs," \&c. Auother letter, much to the fame purpofe, was fent to Major Carnae ; but the prefident and council of Calcutta, inftead of paying any regard to the remonftrances of the nabob, determined to commence an immediate and offenfive war againft him.

Nowwithfanding this refolution, feveral difficulties C c occurred

## 1 N D $\left[\begin{array}{lll}202 & \mathrm{I} & \mathrm{N} \text { D }\end{array}\right.$

occured in carrying on a war at this time. The principal were the death of Major Adams, whofe name liad become formidable to the Indians, and the mutinous difpolition of the army. The former was obviated by the appointment of Colonel Hector Munro, who, in military fkill, appeared nothing inferior to his predeceffor; and the mutinous difpolition of the foldiery was got the better of by a mott fevere example of the mutincers, 24 of whom were blown away from the mouths of cannon. Hoftilities were commenced on the part of Meer Coffim, who cut off a finall party of Englih troops, and fent their heads to the mogul and Sujah Dowlah. An army of 50,000 men was collected, with a molt formidable train of artillery, fuch as might de fuppofed to follow an European army of equal numbers. 'This prodigious armament feems to have effaced all the caution of Meer Coffim; for though he had formenly experienced the bad eflects of engaging the Englifh in a pitched battle, yet he now thought proper to try lis fortunc a fecond time in the fame way. The two armies met on the 22d of October $17^{6}+$, at a place called Buxard, on the river Carumnafla, about 100 miles above the city of Patna. The event was fimilar to that of other engagements with the Englifh, to whom it never was poffible fur any advantages either in fituation or number to make the Indians equal. The allied army was defeated witly the lufs of 6000 killed on the fpot, 130 pieces of cannon, a proportionable quautity of military llares, and all theil tents ready pitched; while, on the fide of the conquerors, only $3^{2}$ Europeans and 239 Indians were killed, and 57 Eurnpeans and 473 Indians wounded.

The only place of Arength now belonging to the allies on this lide the river was a fort named Chanda Geer. The reduction of this place, however, might well have been dcemed impracticable, as it ftood on the top of a high hill, or rather rock, lituated on the very brink of the Gances, by which it could be conftantly fupplied with provifions; and as to military ftores, it could not fand in need of any as long as flones could be found to pour down on the affailants. Notwithftanding all thofe difficulties, however, Colonel Munro caufed his foldiers advance to the attack; but they were received with fuch vollies of ftones, which the Indians threw both with hands and feet, that they were repulfed in a very fhort time; and though the attack was renewed the next day, it was attended with no better fuccefs ; on which the Englifh commander encaraped with his army under the walls of Benares.

Sonn after this, Colond Munro being recalled, the command of the army devulved on Sir Robert Fletcher, a major is the company's troups. The nabub in the mean time, inllead of attacking the Englifh army at orce, contented himfelf with fending out parties of ligh: horfe to hirmith with their advanced polls, while the main body lay at the diflance of about 15 miles from Benares, which rendered it very dangerous for them to move from their place. On the 14th of January 1765, however, Sir Kobert ventured at midnight to Break up his camp under the walls of Benares, and to march off towards the enemy. leaving a party to protect thet place againt any attempt during his abfence. In three days he came up with the main body of Indiaris, who retreated betore him; on which he refolved to make another attempt on Chanda Geer,
before which the late commander had been foiled. His fuccefs would in all prubability lave been no better than that of his predeceffor, had not the garrifon mutinied for want of pay, and obliged the commander to furrender the place.

The reduction of Chanda Geer was followed by ber that of Eliabad, the capital of the enemy's country, a cher large city on the Ganges, between 60 and 70 miles a. bove Chanda Geer, delended by thick and high walls and a ltrong fort; foon after which Sir Robert was feperfeded in the command of the army by Major Carnac. Sujah Dowla in the mean tume had been abandoned by the Mogul, who concluded a treaty la all with the Englifh foon after the battle of Busard. He did not, however, give himfelf up to defpair, but ga. thered together, with great affiduity, the remains of his routed armies; and feeing that his own territories could not fupply him with the requilite number of troops, he now applied to the Mahrattas for aflilance. But thefe people, though very formidable to the other nations of Indoltan, were far from being ahle to cope with the Englifb. On the 20th of May 1765 , Gene- Who
ral Carnac having affembled his tronps, marched im- defea mediately to attack them; and having gained a com- a plete victory at a place called Calpi, obliged them to retreat with precipitation acrofs the Yumna into their own countiy.

Sujalı Dowla, now ${ }^{-}$deftitute of every refource, determined to throw himfelf on the clemency of the Englifh. Previous to this, however, he allowed Meer Coffim and the affaffin Somers to efcape; nor could any confideration ever prevail upon him to deliver them up. Ihree days after the battle of Calpi, the nabob furrendered limfelf to General Carnac, without fipulating any thing in his own favour, farther than that he Thould await the determination of Lord Clive concorring him.

In the beginning of February this year died Meer Your Jaffier Ali Cawn, nominal nabob of Bengal. The hoh fucceffion was difputed betwixt his eldeft furviving fon wfed Najem il Doula, a youth of about I 8 years of age, and Engl a grandion by his eldell fon Miran, at that time only feven years old. As the Englifh were in reality abfolute fovereigns of the country, it was debated in the council of Calcutta whether Meer Jaffier's fon fhould be allowed to fucceed, according to the cuftom of the country, or the grandfon, according to the Englifh cultom. The point being carried in favour of Najem, it was next debated on what terms he fould be admitred to the fucceflion. The late nabob, among other impofitions, had obliged himfelf to fuppost ant army of 12.000 horfe and as many fuot. It was alleged on this occalion, that he had not fulfilled his engagement ; that he had difbanded not of the troops; that at beft they were but an ufelefs burden, having never anfwered any purpofe in real fervice, for which reafon the company had been obliged to augment their military eftablifhnent : it was there. fore now judged expedient that the nabob hould fettle a fum, upwards of 800,0001 . annually, on the company, to be paid out of the treafury; that he fhould alfo difeard his prime miniter and great favourite Nuncomar, and receive in his place a perfon appointed by the council, who was to act in the double capacity of minitter and governor to affit and initruct him.
is. The council were alfo to have a negative upon the romination of all the fuperintendauts and principal of. ficers employed in collesting or receiving of the revenues; that he fhould take their advice, and have their confent to fuch nominations whenewr they thought proper to interfere in them. He was alfo to receive their complaints, and pay a due attersion to them upon the mifothaviour of any of the officers who either were appointed already or fhould be in time to come.

With thefe extravagant requiftions the young nabob was obliged to comply, though he had ditcern. mont enough to perceive that he was now an alfolute Have to the comeil of Calcutta. Though ohliged by treaty to difnifs Nuncomar from the oflice of prime minitter, he flill continued to fhow him the fame favoor, until at laft he was charged with earrying on a treafon able curretpondence with Sujah Dowld, for which the nabob was enjoirits to fend him to Calcutta to take his trial. The unfortunate prince ufed every method to deliver his favourite from the impending danger, but to no purpofe: he was obliged to fubmit to the mottification of having ail his offers with regard to his releafe rejected, though the commitice at Calcutta afterwards thought proper to fet him at liberty without any trial.
Thefe extracidinary powers, exerted in fuch a defpotic manner by the council of Calcutta for fuch a length of time, could not but at laft induce their fuperiors to circumferibe them in fome degree, by appointing others who floould act independently even of this council, and who might be fuppofed to be actuated by nore upright and honourable principles than had hitherto appeared in their conduct. Thic great character which Lord Clive had already gained iu the ealt, juilly marked him out as a proper perfon for adjulling the Hive affairs of Bengal. On the 3 d of May $1765^{\text {he }}$ he arrived in in the eaf, with full powers as commander in ehief, prefident, and governor of Bengal. An unlimited power was alfo cominitted to a felect committee, confilling of his lordhip and four gentlemen, to act and determine every thing themfelves, withont dependence on the council. It was, however, recommended in their inAtructions, to confult the council in general as often as it could be donc conveniently; but the fole power of determining in all cafes was left with them, until the troubles of Bengal fhould be entirely ended. By thefe gentemen a plan of reformation was inltantly fet about; by which, however, violent difputes were occafioned : but the committee, difregarding thefe impotent efforts, exerted their authority to the full extent, feldom even acquainting the council with their tranfactions, and never allowing them to give their opirion on any ocealion.
On taking the affairs of Bengal into thorough conred. fideration, Lord Clive found that the fuceffs of the Britifh arms could be productive of nothing but wars; that to ruin Sujah Dowla was to break down the ftrongett barrier which the Bengal provinces could have againt the incurfions of the Mahrattas and other barbarous people to the wefl ward, who had lony defolated the northern provinces; and the Nogul, with whom the compay had concluded a areaty, was utterly unable tofupport himfelf, and would require the whole Englifh power in the eaft to fecure him in his dignity. His lo:dfhip therefore found it neceflary to conclude a
trcaty with Sujah Dowla. The Mogul was fatisfed by wbtaining is more ample revenue than he had for fome time cinjuyed ; by which means 1 le might be erabled to march an army to Dellii to tate poff fio ffars of his enapire. Fur the company his lurd aip the office of duan or collector of revenues for the Lord Clives province of Bengal and its dependencies. Thus Sujih Dowla was aygain put in poffeffion of his domimons, excepting a fmall territory which was referved to the Mogul, and ellimated at 20 lacks of rupees, or 250,000 1. annually. The company were to pay 26 lacks of rupecs, anounting to 325,0001 . Aerling. They engaged allo to pay to the natob of Derigal and anaual fum of 53 lacks, or 662,500 l. fur the expences of government, and the fupport of his dignity. The remainder of the revenues of Bengal were allotted to the company, who on their part quaranteed the territories at that tine in poffefion of Sujah Dowla and the Mogul.
Thus the E2.f India company acquired the forereignty of a territury equal in extent to the mol fourifhing kingdom in Europe. By all this, however, tley were fo far from being enriched, that the diforder of their affairs atiracted the attention of government, and gave the Bitihh minillry an opportunity at latt of depriving them of their territorial poffeflions, and fubjecting the province of Bengal to the authority of the crown *. New misfortunes alfo \{peedily occurred, and 'Sce E $\sigma$ ? the company found a molt formidable enemy in Hy der ${ }^{I}$ rdia Corso Aly, or Hyder Naity. This man, from the rank of a pary. common fepoy, lad raifed himfulf to be one of the war with moll confiderable princes in the empire of Indoftan. Hyder Alyo. Being fenfible tbat the power of the Englifh was an infuperable bar to his ambitious defigns, he practifed on the mizan of the Decan, and partly by promifes partly by threats, engaged him to renounce liis alliance with the company, and even to enter into a war againt them. As he had been at great pains to introduce the Eurupean difcipline among his troops, and had many renegadoes in his fervice, he imagined, that with the advantage of numbers he thould certainly be atle to cope with his antagonits in the open fiell. In this, however, he was deceived; for on the He is ${ }^{18}$ 2 6th of September 1767, his army was entirely defeat- feated by ed by colnuel Smith at a place called Errour near Tri- Colonel nousalee ; aiter which the nizam thought it advifable to defert his new ally, and conclude another treaty with the Englifh. From the latter, however, he did not obtain peace but at the expence of ceding to them the Duanny of the Balegat Carnatic, which includes the dominions of Hyder Aly and fume petty pinces.

Hyder, thus deferted by his ally, transferred the feat of war to a mountainous country, where, during the year $\mathbf{2 7 5 7}$, nothing decifive could be effected; while the Indian cavalry was fometimes enabled to cut off the fapplies. and interrupt the communications of their antagonifts. During thefe operations fome fhips were fitted out at Bombay, which convejed fou European foldiers and about 800 fepoys to attack Mangalore, one of Hyder Aly's principal fea-purts, where all his thips lay. Tris cniterprize proved fuccefoful, and mine Ships were brought away ; but too Imall a garrifon having beeri left in the place, it was almult inmediately after retaken, and all who were in it made prifonets by Hyder Aly.

## I N D [ 204 I N D

 fuccefs.In the mean time, an injudicious meafurc, adopted by the Englifh in their method of managing the army, proved not only of the ut molt detriment to their caute, but occalioned difgraces hitherto unbeard of in the hiflory of the nation, viz. the defertion of officers from the fervice of Britain to that of a barbarous prince, and the giving up of forts in fuch a thameful manner as could no: Lut fuggelt a fufpicion that they had been betrayed. - The original caute of all this mitchief was the appointment of feld ditisulies to attend the atmy, and to control and fupcrintend the conduct of the commander in chief; and thefe, in the prefent inftance, being deeply concerned in the contracts for the army, took care to regulate its motions in fuch a manner as beft fuited their privatc intueft or convenience. Hyder Aly did not fail to improve the errors cunfuquent upon this kind of management to his own advantage. General Smith had penetrated far into his country, taken ieveral of his for treffes, and was in a fair way of becoming mafter of his capital, when all his operations were clecked at unce by the field-deputies. His antagunif being thus allowed fome refpite, fuddenly entered the Carnatic with a numercus army of horfe, ravaging and detroying every thing at pleafure. Thus the Englifl uere obliged to relinquifh all their conquefts in order to defend their own territories; while this reverfe of fortune not only difcomraged the allies of the Englifh, but even produced in them an inclination to defert their caufe, and go over to Hyder Aly, while thofe who remained faithful paid deariy for their attachment. The nabob of Arcot, the moft faithful ally the Englin ever had, fuffered extremely on this occafion. Hyder sly had long entertained a violent enmity againft this prince; molt probably on accuunt of his inviolable attachment to the En flifh. His dominions were therefure ravaged without mercy ; and thus, while Hyder gratified his perfonal refentment againft hiint, he cut off from the Englifh one of the principal refources they had for carrying on the war.
On the return of the company's forces to the defence of the Carnatic, they found themfelves very little able to cope with their adverfary; for, befides the continuance of the fame caufes which liad formerly contributed to their want of fuccefs, they had been very much weakened in their expedition. Hyder Aly had alfo the prudence to avoid a general engagement, but frequently intercepted the convoys of the Euglifh, cut off their detached parties, and wearied them out with loug and continual marches. The news of his fuccefs againlt an enemy bitherto invincible by all the powers of India, fo raifed his reputation, that adventurers flocked to him from all parts; by which means his cavalry were foon increafed to upwards of 90,000 ; to which, however, his infantry bure no proportion.

Notwithfanding all his fuccefs, it appears that the forces of Hyder Aly were altogether unable to cope with thofe of Britain, even when there was the greateft imaginable difparity of numbers. A detachment of the company's forces had made an affault upon a fort called Mulwaggle, in which they were repulfed with fome lofs. This, with the fmall number of the detachment, encouraged Hyder Aly to march, at the head of a great part of his army, to the protection of the fort. The commanding officer, however, Colonel Wood, did not hefitate, with only 460 Earopeans and

2300 fepors, to attack this army, confiting of 14,000 horfe, 12,000 men armed with matchlock guns, and fix battalions of fepoys. The engagement latled fix Hyc hours; when at laft Hyder Aly, notwithllanding his defe numbers, was obliged to retreat, leaving the field co- Siols vered with dead bodies; the lofs of the Britith being wo upwards of 300 thed and wounded. This engagement, however, was attended with no confequences affecting the war in gencral, which went on for fome time ill the fame manner, and greatly to the difadvantage of the company. The divifions and difcontenta among the officers and comeil daily inereafed, the foldiers deferted, and every thing went to suin. The sevenues of the eflatlifhnent of Madras being at latl unequal to the expences of the war, large remittances were made from Bengal to anfwer that purpofe; and as thefe were made in a kind of bafe gold coin, the company is faid by that means alone to have loft +0.0001 . in the difference of exchange only. At lalt Hyder Aly having given the Enylith army the nip, fuddenly appeared within a few miles of Madras; which occationed fuch an alarm, that the prefidency there were induced to enter into a negociation with him. 1 he Indian prince, on his part, was viry ready to hearken to propoials of peace upen any reafonable teras. An oifinive and $A$ defenfive treaty was therefore concluded on the $3^{d}$ of con April 1764, on the fimple condition that the forts and wit places taken on both fides fhould be reltored, and each party fit down contented with their own expences.

By this treaty it was particularly ftipulaced, that in BrC cafe of either party being at acked by their enemies, the the other fhould give them affllance; and in this cafe lifh even the number of troops tu be fuppled by each was fpecihed. It foon after appeared, however, that the prelidency of Madras were refolved to pay very little regard to their engagements. Hyder Aly having in a little time heen involved in a war with the Mahrattas, applied for affitance, according to agreement; but was refufed by the prefidency, whu pretended to fear a quarrel with the Mahrattas themfelves. As the lattcr are a very poweaful and warlike nation, Hyder Aly fornd himfelf overmatched, and therefore applied feveral times to the Englifh for the affiftance he had a right to expect ; but was conllantly refufed on varions pretences: which convinced him at laft that he could place no dependence on the friendifhip of the Englifh, and filled him with an implacable hatred againf them. As foon, therefore, as he could make up his difference with the Mahrattas, he refulved to recover his loffes, and revenge himfelf on thofe faithlefs allies. With this view he applied himfelf to their rivals the French; whom no Indian nation ever found backward in fupplying them with the means of defence againtt the Englifh. By their means he obtained military ftores in the greatent abundance, a number of experienced officers and roldiers; and the European difcipline was brought to much greater perfection than even he himfelf had ever been able to bring it before this period. Thus, in a fhort time, imagining himfelf a match for the Mahrattas, he renewed the war; and gained fuch decilive advantages, as quickly obliged them to conclude à advantageous treaty with him.

It now appeared that the Englifh, notwithftanding w their pretended ill-will to quarrel with the Mahrattas, tu had not the leall hefitation at doing fo when their in. Min tercit ${ }^{M}$

Trctis.
rereft was concerned. In order to underitand the fub. commanded by colonel Lally, a man of great bravery fequent tranfactions, however, we muit obferve, that the Mahrattas, like other nations of Indoftan, were originally governed by princes called Rajabs, who reigned at Setterah; and though in procefs of time they came to be divided into a number of petty tlates, yet they paid a nominal refpect to the ram.rajalh, who had a right to alfemble the chiefs, and order out their troups on any necéflary occafion. By degrees this dig. nity of ram-rajah or fou-rajah (as he was alfo called), became merely titular, the adminiftration being entirely poffeffed by the pailhwa or chancellor. This office being ufurped by one paricular family, Nana-row, the rcigning paifhwa, feized the ram-rajah, and confined him in a fortrefs near Sttreral. At his death he left two fons Madarow and Narain-row; of whom the former, as being the elder, fucceeded him in the paifhwaflip. Ionogee Boofla, or Buuncello, the imundiate predeceflor of Moodagree Buola, rajah of Berar, was one of the pretenders to the dignity of ram rajah, as being the nearell of kin; at the fame time that Koganaut-row, calied alio Ragobah, uncle to Madarow hinfflf, pretended to the painwalhip. On this account the latter was confined by Mada-row, but who it...prudently releafed him a little before his death, and even recommended to him in the molt affectionate manner the care of his brother Narain-row, who was to fucceed to the paihwafhip. The care he took in confequence of this recommendation was fuch as might talily lave been imagined; the unhappy Narain-row was murdered, and Ruganaut row the affaffin fled 2o Boubbay; where, on promifing a ceffion of territory, he was protected and encouraged in his pretenfions. The Mahrattas remonitrated againß this behaviour; but the Englinh had determined at all events to profit by the civil diftenfions of the Indians, and therefore paid no regard to the jultice or injultice of their caufe. The Mahrattas therefore not only made up their differences with IIyder Aly, as has been already mentioned, but became determined enemies to the Englifh, at the fame time that a dangerous confederacy was formed among the moft powerful princes of India to expel from that part of the world thofe intrudets whofe avarice could be fatisfied with no conceffions, and whom no treaties conld bind when it ferved their rurn to break them.

The refentment of Hyder Aly was particularly directed againft the preficency of Madras for the reafons already given; he had alfo received frefh provocation by their caufing a body of troops march through his dominions without his leave, and that to the affiltance of a prince for whom he had no great friendfhip; alfo by the capture of the French fettement of Maliie, on the coaft of Malabar, which he faid was within his dominions, and confequently that the French were under his protection. His troops were therefore affembled from every quarter, and the greateft preparations made for a powerful invafion. The prefidency of Madras in the mean time fpent their time in mutual altercations, neglecting even to fecure the paffes of the mountains, through which only an invafion could be made, until their active antagonit, having feized and
and experience in war.
The alarm was given on the 24 th of July 1780 that Hyder Aly's horfe were only nine miles ditant from Madras. The inlabitants inflautly deferted their houfes and fled into the furt; while the unrefited barbarian bumt the villages, reduced the inferior forts, and prepared to lay fiege to the capital. It being now abfolutely neceflary to make fome refiftance, meafures were takea for affembling the troops; in doing which an exprefs was fent to colonel Baillie, at that time at Gumeroponds, about 28 miles from Madras, to proceed from thence directly to Conjeveram with the corps under his command, where the inain body was to meet him But when the latter was under marching or- Unfortu ders, the firft regiment of cavalry pofitively refufed to nate expe, move without money; and as they perfifted in their dition of refolution, were at laft made prifoners and fent to Ma- Buillie dras. The main body, then, confifting of 1500 Europeans and 4200 fepoys, under Sir Hector Munro, with their train of artillery, proceeded towards Conjeveram: and fuch were the fatigues of their marcli, that 200 men belonging to the 73 d regiment were left lying on the road. On their arrival at Conjeveram, they found the town in flames, great bodies of the enemy's cavalry advancing on both flanks, and no appearance of colonel Baillie's detachmeat. The march of this body had been impeded by a fmall river fwelled by a fudden fall of rain. On this occafion, the o.t.cer who gives the account of his difafter makes the following obfervation. "In this incident we have a molt remarkable proof and example of the danger of procraftination, and on what minute circumtlances and fudden fprings of the mind the fortune and the general iffue of war may depend. Had colonel Baillie paffed over the Tripaficre without halting, as fome advifed, and encamped on its fouthern inflead of its northern banks, the difalter that foon followed would have been prevented, and an order of affairs wholly different from that which took place would have fucceeded."

Hyder Aly having now raifed the liege of Arcot, in which he had been employed, marched towards Conjeveram ; in the neighbourhood of which he encamped, and in the courie of feveral days, at different times, offered battle. On the 6th of September he detached his fon Tippoo Saib with the flower of his army to eut off the detachment under colonel Baillie, who was now at Perrambaukam, a fmall village diftant from the main body about 15 miles, he himfelf remaining in the neighbourhood of Conjeveram, in order to waich the motions of Sir Hector Munro.

The detachment under Tippoo Saib confilted of He is ato 30,000 horfe, 8000 foot, with 12 pieces of cannon. tacked by Notwithftanding this fuperiority in number, however, fippoo they were bravely repulfed by Colonel Baillie's hand-repulfs ful of troops; and a junction was effected with a de-hum. tachment under Sir Robert Fletcher, fent by Sir Heco tor Munro on firlt hearing the noife of the engage: ment.
This junction was effected on the gth of September, and next morning orders were given for the whole army to march; Colonel Flecther's detachment being difperfed in different parts of the line. From then 125 moment they began to march the enemy played fragainaza their rockets, which, however, did but little execu-

## I N D [ 206$] \quad$ I N D

tion; but about ten at night feveral guns began to open on the rear of the Euglih. Culonel Laillie, therefore, after fome proper mancouvres, cauled his troops form a line, while the enemy cannonaded them inceffantly with great execution. On this Colonel Baillie detached Captain Rumley ivith five companies of fepoy grenadiers to form their guns; which fervice they would have undoubtedly accomplifhed, had not their march been interrupted by a torrent of water which at that time happened to be unfordable. Captain Rumley therefore returned about half an hour after eleven, when the guas of the enemy were heard drawing off towards the Euglifh front, and a general alarm was perceived throughout their camp; owing, as was fuppofed, to their having received intelligence of the party that had been fent to florm their guns. "From their noife, confution, and irregular liring (fays our author), one would have imagined that a detaclment of our men had fallen upon them with fixed bayonets. At that critical moment, had a party of grenadiers been fent againft them, they would have ronted without difficulty the whole of Tippoo's army. Having about ten o'clock in the evening advanced a few hundred yards into an avenue, the detachment remained there in perfect filcnce till the morning.
"Colonel Fletcher being afked by fome officers, why Colonel Baillie halted? modeftly anfwered, that Colonel Baillie was an officer of eltabliflued reputation, and that he no doubt had reafons for his conduct. It cannot, however, be concealed, that this hale afforded an opportunity for Tippoo Sarb to draw off his cannon to a very flrong poft by which the Englifh were obliged to pafs; and at the fame time of informing Hyder of their fituation, and Fuggefting to him the expediency of advancing for the improvement of fo favourable a conjuncture.
"Oa the 1 cth of September, at five o'clock in the morning, our little army marched off by the right in fubdivifions, having their baggage on their right flauk and the enemy on their left. A fow minutes after fix two guns opened on their rear, on which the line halted a few minutes. Large bodies of the enemy's cavalry now appeared on their right flank; and juft at the moment when the pagodu of Conjeveram appeared in view, and our men had begun to indulge the hopes of a sefpite from toils and dangers, a rocket-boy was taken prifoner, who informed them, that Hyeler's whole army was marching to the affiftance of Tippoo. Four guns now opened on their left with great effect. So hot was the fire they fuftained, and fo heavy the lofs, that Colonel Baillie ordered the whole line to quit the avenue, and prefent a front to the enemy; and at the fame time difpatched Captain Rumley with ten companies of fepoy grenadiers to flerm the enemy's guns.
"Within a few minutes after Captain Rumley had left the line Tippoo's guns were filenced. Rumley's little detachment immediately took poffeffion of four of the enemy's guns, and completely routed the party attached to them. Captain Rumley, overcome with fatigue, ordered Captain Gowdie, the officer next in
conimand, to lead on the party, and take poffeffion of fome more guns placed a few hundred yards in their front. But in a few minutes after, as they were advancing for this purpofe, a fudden cry was heard a-
mong the fepoys, of horfe! horfe! The camp fullow. ers, whofe numbers were nearly five to one of the troops under arms, were driven on a part of our line by the numerous and furrounding forces of Hyder Aly; who being infurmed of the embarraffug lituation of Colonel 13aillie, had left his camp without flriking his tents, with a vicw to conceal his march from the Englifh. A great confufion manong our troops was the unavoidable confequence of this ludden onfet. The Europeans were fuddenly left on the field of action alone: and at that critical moment a detachment from the advanced guard of Hyder's army prefled on with great celerity between our line and Captain Rumley's party. 'I'he commanding officer, therefore, apprehenfive of being cut off from our little arny, judged it molt prudent to retieat.
"Colonel Ballie, when he was informed that an immenfe body of horfe and infantry was marching towards him, and that this war fuppofed to be Hyder's main army, faid, 'Very well, we thall be prepared to receive them.' Hyder's whole forces now appeared incontellably in view; aud this barbarian chief, who, as was obferved of the Roman general by Pyrrhus, had nothing barbarous in his difcipline, after dividing his guns agreeably to a preconcerted plan, opened fro:n 60 to 70 picces of cannon, with an innumerable quantity of rockets.
" Hy der's numerons cavalry, fupported by his regular infantry and Europcan troops, driven on by threats, encouraged by promifes, and led on by his moft diitinguithed officers, bore on our little army in different quarters without making the lealt impreffion. Our men, both Europeans and fepoys, repcatedly prefented and recovered their fire-arms as if they lad been manceuvring on a parade. The enemy were re. pulfed in every attack; numbers of their beit cavalry laverunt were killed, and many more were wounded; even ith in, their infantry were forced to give way: and Hyder would have ordered a retreat, had it not been for the advice of General Lally, who informed him that it was now too late, as General Munro was molt probably advanciug on their rear from Conjeveran ; for which reafon nothing remained but to break the detachment by their artillery and cavalry.
" Tippoo Saib had by this time collected his party together, and renewed the cannonade ; and at the lame time that the Englifh were under the neceffity of fuftaining an attack both from the father and fon, two of their tumbrils were blown up by Hyder's guns, and a large opening made in both lines. They had now no other ammunition than grape; their guns difcontinued firing : and in this dreadful fituation, under a terrible fire not only of guns but rockets, lofing great numbers of officers and men, they remained from half paft feven till nine o'clock.
"On this Hyder Aly, perceiving that the guns were quite filenced, came with his whole army round their right flank. The cavalry charged then in diftinct columns, and in the intervals between thefe the infantry poured in vollies of muketry with dreadful effect. Mhiar Saib, with the Mogul and Sinvor cavalry, made the firft imprefion. Thefe were followed They by the elephants and the Myforean cavalry, which completed the overthrow of the detachment. Colonel Bail. lie, though grievoully wounded, rallied the Euro-
ridia. peans, and once more formed them into a fquare and with this handful of men he gained an eminence, where, without ammunition, and moft of the people weunded, he refifted and repulfed 13 feparate attacks; but freh bodies of cavalry continually pouring in, they were broken without giving way. Many of our men, defperately wounded, raifing themfelves from the ground received the enemy on their bayonets.
"Captain Lucas's battalion of fepoys, at the time when our men moved up to a rifing ground, was fationed to the right of the European grenadiers; but that corps, fecing the Europeans ia motion, and mif. underltandiug perhaps this evolution for a retreat, broke in the utmott confulion. The Eurepeans, bravely furtaining their reputation for intrepid valour, remained in this extremity of diffrefs fleady and undaunted, though furrounded by the French troops, and by Hyder's cavalry to the number of 40,000 . They even expreffed a delire, though their number did not exceed 400, of being led on to the attack. A party of Topaffes, who lay at the diftance of about 30 yards i., our front, kept up an inceffant fire of frall arms with great effect. Miny attempts were made by the ene-
my's cavalry to break this fmall body of men; but by the fteady conduct of both our officers and men they were repulfed.
"Colonel Baillie, finding that there was now no profpect of being relieved by General Munro, held up a llag of truce to onc of the chiefs of Hyder's army. But this was treated with contempt, and the furdar endeavoured at the fame time to cut off the colonel. The reafon the enemy aftigned for this was, that the fepoys had fired after the iignal was hoilted. A few minutes after this, our men received orders to Throw lay down their arms, with intimation that quarter down theis would be given. This order was farcely complied arms, hut with, when the enemy rufhed in upon them in the areced. molt favage and brutal manner, fpaning neither age nor infancy nor any condition of life; and, but for the humane interpolition of the French commanders Lally and Pimoran, who implored and intilted with the conqueror to fow mercy, the gallant remains of our little army mult have fallen a facrifice to that farage thirft of blood with which the tyrant difgraced his victory." (A)

In this unfortunate action near $\% \infty$ Europeans were killed
(A) In a narrative of the fufferings of the Erglith who furvived this fatal day, faid to be publifhed by an of ficer in Colonel Baillie's detachment, we find it related, that "Hyder Aly, feated in a chair in his tent, enjoyed the fight of the heads of the Alain, as well as of his prifoners. Colonel Baillie, who was himfelf very much wounded, was brought to his camp on a cannon, and with feveral other gentlemen in the fame fituation laid at the tyrant's feet on the ground and in the open air. In this fituation they faw many of the heads of their countrymen prefented to the conqueror, fome of them even by Engiifh officers, who were forced to perform that horrid tafk; in a little time, howcver, Hyder ordered no more heads to be brought to him while the Englifh gentlemen were prefent. A tent was fitted up for Colonel Baillie and his officers, but without fraw or any thing elfe to lie upon, though many of them were dangeroufly wounded; and as the tent could only contain 10 perfons, the reft were obliged to lie in the open air. When the prifoners were removed from phaie to place, they were wantonly infulted, and even beaten by thofe who had the charge of them. If the I tt-r balted to refreh themfelves under a tree, they would be at the trouble of carrying their prifoners to the fd. next the fun, left they frould enjoy the benefit of the fhade. Sometimes they were tormented with thirf, at others the people allowed them to drink water out of the falms of their hands, it being reckoned a profanation to allow an European to drink out of a veffel belonging to an Indian," \&c.

In this narrative are likewife mentionted fome examples of a recovery from wounds, which, if we can depend on their authenticity, mult undoubtedly fhow a reftorative power in the human body altogether unknown in this climate.
" Lieutenant Thomas Bowfer received a mufket ball in his leg, and after that eight defperate wounds with a fcymitar. He lay for feven hours on the fpot, deprived of all fenfation; hut, towards evening, awakened from his trance, fripped of a!! lis clothes, except a pair of under dravers and part of his fhirt, with an in. terfe thirft, calling out, and imploring a little water from the enemy. Sume were moved with compafion, while others anfwered his intreaties only with infulss and threats of immediate death. Some water, however, was brought from a pool in the field of battle, about 50 or 60 yalds from the place where he lay. It was deeply tinged with blood; neverthelefs, Mír Bowfer being furnithed by one of Hyder's foldiers with an earthen chatty, or pot containing about a pint, and directed to the place, crawled thither as well as he could. I hough fruck with horror at the gight of the dead and wounded with which it was flled, he quenched his thirf with the liquid; and having filled his chatty, endeavoured to proceed towards Conjeveram. He had not, however, moved from his place abore 300 or 400 yards, when, being quite overcome, he was obliged to lie all nigh: in the open air, during which time there fell two heavy thowers of rain. Nex: morning he proceeded to Conjeveram ; but after walking about a mile, was met by fome of the enemy's horfemen, by whom he was brought back prifoner, and obliged to walk without any affiftance. When delivered up to the enemy's fepoys,
he was fo fliff with bis wounds, that he could not foop or even bend his borly in the fmallef dearee he was fo lliff with bis wounds, that he could not foop or even bend his body in the fmallef degree.
"The quarter-mafter ferjeant of artillery received fo deep a cut acrofs the back. part of his neck, that he was obliged to fupport his head with his hands in order to keep it from falling to a fide all the jeurney. The lealt ihake or unevennefs of the ground made him cry out with pain. He once and again ceafed from all attempts to proceed; but being encouraged and conjured by his companions to renew his efforts, he did fo, reached the camp, and at laft, as well as Mr Bowfer, recovered." - It is alfo remarkable, that, according to our author, cut of 32 wounded perfons only fix died; though one would be apt to think that the excefivel... ferere ufage they met with would have killed every one?

India. killed on the fpot: the lofs on Hyder Aly's part was fo great that he induftrioufly concealed it, being enraged that the conqueft of fuch an inconfiderable body flould coll him fo many of his bravelt troops. He feemed ever after to confider the Englith with an extrense degree of terror; infomuch that, notwithftanding his pretended exultation on account of the prefent victory, he no fooner heard a report of Sir Hector Munro's march to attack him, than he left his camp in the utmoft confufion, abandoning great part of bis tents and baggage, as well as the vaft numbers that had been

130
Sir Eyre Coute appoirted to the command of the army.

On the news of Colonel Baillie's difafter, the fupreme council of Bengal requelted Sir Ayre Coote to take upon him the management of the war; for the carrying on of which a large fupply of men and money was inflantly decreed. This was readily undertaken by the illuftrious officer juft mentioned, notwithftanding his very precarious ftate of health at that time; and from the moment he took upon him the management of affairs, the fortune of the war was changed.

The fpirit of diffention, which for a long time had infected the prefidency of Madras, was indeed the true canfe of all themisfortunes that had happened. This was found by Sir Eyre Coote to be even greater than he had heand by report : the refpect and confidence of the natives was wholly loft; the complaints of the officers and foldiers were loud and acrimonious; an inactivity prevailed in all the councils and operations, while the enemy carricd every thing before them. Sir Hcetor Munro had been greatly haraffed on his march to Madras, whither he had retreated after Colonel Baillie's difaller; the forces of Hyder Aly had infelled all the places in that neighbourhood in fuch a mander as in a great mealure to cut off all Supplies ; and Arcot, the capital city of the mof faithful ally the Britifh ever had, was taken by form, together with an adjoining fort, by which means an immenfe quantity of ammunition and military tores fell into the hands of the enemy.

No fooner had Sir Eyre Coote taken upon him the command of the Britifh forces, than his antagonits thought proper to change his plan of operations entirely. He now detached large parties of his numerous forces to lay fiege to the principal fortreffes belonging to the company; while, with the bravelt and belt difciplined part, he $k \mathrm{cept}^{t}$ the field againlt the Britifh commander in perfon. On the very firft appearance of the Britifh army, however, his refolution failed, and he abandoned the fiege of every place he had invefted, retiring to a confiderable diftance on the other fide of the river Palaar, without even difputing the paflage of it, as it was expected he would have
done.

A refpite being thus obtained from the incurfions of this formidable enemy, the next operation was to fecure Pondicherry, whofe inhabitants had revolted. They were, however, eafily difarmed, their magazines feized, and all the boats in their poffeflion deftroyed; in confequence of which precaution, a French fquadron that foon after appeared off Pondicherry was obliged to depart without being furnifhed with any neceffaries. But in the mean time Hyder Aly having drawn large reinforcements from all parts of his domipions, refolved to try his fortune is a pitched batlie.

His army amounted to 200,000 men, 40,000 of whom were cavalry and 15,000 well difciplined fepoys. Still, however, he durft not openly attack the Britifh army in the field, but took a frong polt from whence he might harafs them on their march. Sir Eyre Coote, however, was not on his part backward to make the attack; and on tlie other hand Hyder Aly prepared to engage him with all poffible advantage. The battle was fought on the ift of July 178 i ; and notwithftanding the valt fuperiority of Hyder Aly's army, he was routed with great flaughter. The Indians, Defeats however, made a much more obitinate refiltance than Hyder ufual ; the engagement lafted from nine in the morning till four in the afternoon, and the deficiency of the Englifh in cavalry prevented them from purfuing the advantage they had gained.

Notwithtanding the lofs of this battle, Hyder Aly Gains a was foon encouraged to venture another. This was cond vi fought on the 27 th of Augult the fame year, on the ${ }^{\text {ry. }}$ very fpot where Colonel Baillie had been defeated. It was more obftinately contelted than even the former, being continued with great fury from eight in the morning to near dufk. A number of brave officers and foldiers fell on the part of the Britifh, owing chiefly to the terrible fire of the enemy's artillery and the advantareous pofition of their troops. At lat, however, the Indian army was totally defeated, and driven from every polt it had occupied; though from the obftinate refiftance made at this time, Hyder began to entertain hopes that his forces might, by a fucceffion of fuch battles, be at lafl enabled to cope with the Englifh. He therefore ventured a third battle in Hyder fome weeks after, but was now defeated with greater feated: lofs than before. Undifcouraged by this bad fuccefs, third ti however, he laid fiege to Vellore; and expecting that the relief of it would be attempted, feized a ftrong paf8 through which he knew the Britith army mult direct their march. The Britifh commander accerd. ingly advanced, and found the enemy in polfefmon of fome very Itrong grounds on both fides of a malfh through which he was obliged to pals. Here he was attacked on all fides, but principally on the rear, the enemy directing their force principally againtt the baggage and convoy of provifions defigned for the garrifon. Their utmolt eftorts, however, were unfuccefsful, and Sir Eyre Coote forced his way to Vellure in Spite of all oppofition. Hyder Aly did not fail to wait his return through the fame pafs; and having exerted his utmolt kill in poiting his troops, attacked him with the utmoft vigour: but though the Englifh a foure were affaulted in frunt and in both flanks at once, and vietory a heavy canonade kept up during the whole time of the En the engagement, the Indians were ar laft defeated with hith. great flaughter.

By thele fucceffes the prefidency of Madras were now allowed fo much refpite, that an enterprife was planned againft the Dutch fettlement of Negapatam, fituated to the fouth of Marlras, and in the neighbourhood of Tanjour. A very inconfiderable force, however, could yet be fpared for this purpofe, as H yder Aly, though to often defeated, was fill extremely formidable. Sir Hector Murro had the management Dutch of the expedition : and fo furious was the attack of element the Britilh failors, that the troops left to guard the Negapa avenues to the place were defeated at the very firt

## I N D

onfet. A regular fiege enfued; which, however, was of very flort duration, a breach being foon made, and the gatrifon furrendering prifoners of war.

The lofs of Negapatam was quickly followed by that of Trincomale. Admiral Hughes, who had conveyed Sir Hector Munro with the land forces to that place, and affited him with his failors, immediately after its furrender fet fail for Trincomale, where he arrived about the middle of January 1782 . The fort of that name was quickly reduced; but the main frength of the fettlement confilted in a fort named Oltenburgh, the principal place on the ifland, and by the capture of which the whole fettlement would be reduced. This fort ftands on a hill which commands the harbour, but is itfelf overlooked by another hill at the diflance of no more than 200 yards Though the gaining of this poit was undoubtedly to be attended with the lofs of the fort, it does not appear that the governor even attempted to defend it. A Britifh detachment of failors and marines therefore touk pofleffion of it, when the admiral fent a fummons of furtender, reprefenting the inutility of making any farther defence after the lofs of fuch a poit ; and being extremely defirous of avoiding an effufion of blood, repeated his arguments at feveral different times. The governor, however, proving obftinate, the place was taken by florm, with the lofs of about 60 on the part of the Britiih, and very little on that of the Dutch, the victors giving quarter the moment it was alked. Four hundred Europcans were taken prifoners; a large quantity of ammunition and military ftores, with a numerous artillery, were found in the place; and two Indiamen richly laden, with a number of fmall trading veffels, were taken in the harbour.

A more fornidable enemy, however, now made his appearance on the coaft of Coromandel. This was Suffrein the French admiral; who fetting out from his native country with $1!$ thips of the line and feveral fout frigates, had fallen in with the Hannibal of 50 guns, and taken her when feparated from her conforts. This hip, along with three others, a 74, a 64 , and a 50, had been fent out to the affintance of Sir Edward ; and the threc latt lad the good fortune to join him before the arrival of M. de Suffrin. The latter, fuppofing that he had not yet received this reinforcement, bore down upon the Englifh fquadron at Madras, to which place they had failed immediately after the capture of Trincomale. Perceiving his miflake, however, he inftantly bore away. The Englifh adminal purfued, took fix veffels, tive of them Englifh prizes, and the fixth a valuable tranfport laden with gunpowder and other military flores, befides having on board a number of land officers and about 300 regular troops. This brought on an engagement, in which M. Suf. frein, perceiving the rear divifion of the Britifh fleet unable to keep up with the rett, directed his force principally againat it. The Chips of Adnuiral Hughes himfelf and Commodore King fattained the mott viownt efforts of the Frenth, having mofly two, and fometimes three, veffels to contend with. Thus the commodore's fhip was reduced almoit to a wreck; but about fix in the evening, the wind becoming more favourable to the Engliih, the fquadron of the enemy were obliged to draw off. The lofs of men on the part of the Britifh amounted to little more than 130

[^2]killed and wounded, but that of the French exceeded India. 250.

After the battle Sir Edward returned to Madras: but meeting with no intelligence of Suffrcin at that place, he made the beft of his way for Trincomale, being apprehenfive of an attack upon that place, or of the intercepting of a convoy of ftores and reinforcements at that time expected from England. Suffrein had indeed got intelligence of this convoy, and was at that time on lis way to intercept it. This brought the hottile fleets again in fight of each other ; and as the Britifh admiral had been reinforced by two hips of the line, he was now tetter able to encounter his adverfary. A defperate battle enfued, which conti- a fecond nued till towards niglt, when the fhips on both fides battle. were fo much flattered, that neither could renew the engagement next day.

Though thefe engagements produced nothing decifive, they were neverthelefs of the utmont prejudice to the affairs of Hyder Aly, who was thus prevented from receiving the fuccours he had been promifed from France; and he was ftill farther mertified by the defeat of his forces before Tellicherry, which place he ${ }_{\mathrm{Hy} y \mathrm{der}}^{\mathrm{r} 4 \mathrm{r}}$ had blocked up fince the commencement of hoitilities. Aly's forces This laft misfortune was the more fenfibly felt, as an deteared at open paffage was now left for the Englifa into thofe countries beft affected to Hyder. His bad fuccef ${ }_{3}$ here, however, was in fome meafure compenfated by the entire defeat of a detachment of about 2000 Englifh infantry and 300 cavalry under Colonel Braith. waite, a brave and experienced officer. This detach- Colonel ment, confinting of chofen troops from Sir Eyre Coote's waite's do. army, lay encamped on the banks of the Coleroon, ta hment which forms the northern boundary of Tanjour. Tip cur off by poo Saib having procured exact intelligence of the it. Tippoo tuation of this party, formed a defign of attacking it while no danger was furpected on account of the diflance of Hyder Aly's army. He fet out on this defign with an army of 15,000 horfe and 5000 foot, accompanied by a body of Fiench regulars; and having croffed the Colcroon, fudderly furrounded the Britifh forces on all fides. The colonel, perceiving his danger, formed his men into a \{quare, dillributing the artillery to the feveral fronts, anti keeping his cavalry in the centre. In this filuation he refilied for three days the utnoft efforts of his numerous enemies, always compelling them to retreat with great lofs. At laft General Lally, rightly conjecturing that the ftrength of the Engliih muit be exhauiled and their numbers thinned by fuch defperate fervice, propofed that the French infautry, which was frefh and entire, Thould attack one of the fronts of the fquare, while the forces of T'ippoo flould do the lame with the other three. This laft attack proved fuccefsful; the Britifh forces were broken with great faughter, which however was llopped by the humanity of the French conmander : who even obtained from Tippoo Saib the care of the prifoners, and treated them with a tendernefs and humanity they certainly would not otherwife have experienced. A number of Britifh of. ficers, however, perilhed in the engagement, and only one remained unwounded.

In the mean time, the fuccours from France, fo culdalore: long expected by Hyder, made their appearance. As taken. foon as a junction was formed, they proceeded, under

D d
the

India. The command of M. Duchemin, to inveft Cuddalore; which not being in any fituation to Rand a fiege, was furrendered on capitulation. In like manner fome other places of fmaller confequance were reduced, utntil at laft being joined by Hyder's numerous forces, they determined to lay fiege to Vandervafh, a place of creat importance, and the lofs of which would have heen extremely detrimental to the Englih. This enickly brought Sir Eyre Coote with his army to its iclief; but Hyder Als, notwithfanding his being reinforced by the French, durit not yet venture a battle in the open field. On this the Britifn commander proceeded to attack Arnce, the principal depofit of Hy der's warlike llores and neceffaries. Thus the latter was oblig€d to quit his advantageons ground ; but he did fo with fuch fecrecy and fpeed, that he came upon

144
Hyder
Aly defeat

## ed a firth

time by Sir
Eyre Cootc. the Bitith army unawares while preparing for its laft march to Arnee, now only five miles ditant. Perceiving that the march of the Britifl troops was thro' low grounds, encompaffed on mott parts with high hills, he planted his cannon upon the latter; from which he kept a continual and heavy fire on the troops below, while his numerous cavalry attacked them on every fide. Notwithltanding all difadvantages, the Britifh commander at laft clofed in with the enemy; and after an obftinate difpute completely routed them. Neither this, however, nor any other engagement with Hyder Aly, ever proved decilive; for as the want of cevalry prevented the Britifh general from purfuing his advantage, fo that of his antagonilt was io numeruns, that by it he always covered his retreats in fuch an effectual minner as to lofe but few men, and in a Thort time to be in a condition to act again on the offenfive. This was remarkably the cafe at prefent; for notwithftanding this defeat, which happened on the 2d of June 1782, he cut off an advaneed body of the Britih army five days after; and haraffed the whole in fuch a manner, that Sir Fyre Coote, unt wilitanding his fuccefs, was obliged to move nearor Madras; foon after which, he was obliged, on account of his bad tate of health, to relinquifh the command of the army to Gemeral Stuart.

Hyder Aly now perceiving that he was likely to be attended with ro fuccels by land, negan to reti his hopes on the fuccefs of the Frencl by fea. He therefore earneflly requetted M. Suffrein, who poffeffed at that time a decifive fuperiority in the number of thips, to lofe no time in attacking the Britin fquadron be-
т年; fore it could be joined by a reinforcement which was A thirdfear then on its way, and was reported to be very formifiplitereare dable. As the French commander was by no means lyturtuane deficient in courage, a third engagement took place antrattage of the lisuct.
on the 5 th of July 1783 . At this time the Britifh had the advantage of the wind, the battle was much more clofe, and the victory more plainly on their fide. It is faid indeed, that had not the wind fortunately fhifted in fuch a manncr as to enable the French to difengage their thips, a total and ruinous defeat would have enfued. After the engagement, the French admiral proceeded to Cuddalore, having received intelligence that a large body of French troops in tranfports was arrived off the ifland of Ceylon, in company with three thips of the line. As this feemed to aftord hopes of retaliation, he ufed fuch dilgence in refitting his thips, that the flet was able to put to fea in the be-
ginning of Augut. His intention was to make an attempt on Trincomale ; and fo wcll were his defigno conducted, that Sir Edward ifceived no intelligence of the danger, till a Britifh frigate chafing a French one, which took fhelter with the fquadron at Trincomale, difcovered it by this accident, and hallened back with the news to Madras. It was now, however, too late; the place was not in a condition to refit a fiege; and the French batteries having filenced thofe of the fort in two days, a capitulation took place on the laft day of Auguft.

Sir Edward Hughes having been detained by contrary winds, did not arrive at Trincomale before the 2d of September, when he had the mortification to fee the fors in the hands of the French, and that Suffrein was in the harbour with 15 fail of the line while he had only 12 . He did not hefitate at venturing an engarement with this inferiority, nor did M. Suffrein decline the combat. The event of the battle was no other than Mattering the fleets and killing and wounding a number of men on botk uides. In this, however, Engh as well as in the other engagements, the fuperiority of leets the Englifh was very manifitt; and in entering the harbour of Trincomale the French loft a 74 gun flip.

I'he lofs of Trincomale was feverely feit by the Englifh; for while the Erench lay fafely in the harbour refitting their Cquacron, the Englinh werc obliged for that purpofe to fail io Madras. Here the fleet was affailed by one of the mofl dreadful tempefts ever tered known on that coaft. Trading veffels to the number dreac of near 100 were wrecked, as well as thofe for Madras temp laden with rice, of which there was an extreme fcarcity at that place. Thus the fcarcity was augmented to a famine, which carried off valt numbers of the inhabitants before fupplies could arrive from liengal. The continnance of the bad weather obliged Sir Edward with his whole fquadron to fail to Bombay; and there he did not arrive till towards the end of the year, when his fquadron was fo much thattered, that, in order to repair it with proper expedition, he was obliged to diAribute it between the dock-yards of Bombay and the Portuguefe fettlement at Goa.

In the mean time Sir Richard Bickerton arrived at Bombay from England with five men of war, having on board 5000 troope, after a very favourable paffage; having neither fien nor heard of the bad weather which had defolated the coalts of India. It was likewife the intention of France to fignalize the campaign of this year by an immenfe furce both by fea and land in lncia. Exclutive of the forces already on the coaft of Coromandel, they were to be joined by 5000 more, all regulars, from their illands on the African coatt. Suffrein was to be reinforced by feveral hips of the line, when ic was hoped that a decided fuperiority at fea would be obtained over the Englifh; while their fuperior numbers and artillery on flore would render them invincible by any force that could be brought againft then. To oppofe thefe deligns it was deemed nece fary by the prelidency of 3 omhay to make a powcrful diverfion on the coall of Malabar. Here was fituated the kingdom of Myfore, the fovereignty of which had been ulurped by Fyder Aly under the title of Dayza, as that of the Mahrattas was by a perfon ftyled Paiforu. This kingdon is rearly in the fome parallel

## I N D

witls Arcot. To the northward is the kingdom of Canara, which is faid to have been the favourite poffeffion of Hyder Aly; the name of its capital is Bidnore, which alfo gives name to an extenfive territory, and was by Hyder changed to that of Hydernagur. The expedition had been fet on foot as early as the end of the year 1781; a flrong body of forces under the command of Colonel Humbertone had taken the two cities of Calicut and Panyan, befides others of leffer note, and penetrated into the inland country, which is there difficult and dangerous. Having here made himfelf matter of a place called Mongarry Cotta, of which the fituation commanded the entrance into the inner parts of the country, he proceeded to attack Palatacherry, a confiderable town at fome miles diftance; but being fuddenly environed with a numerous and hoftile army, inftead of makiug himfelf matter of the place, it was not without the utmoft difficulty that he made his efcape after lofing all his provifions and baggage. A great almy, confifting of 20,000 foot and 10,000 horfe, under Tippoo Saib, alfo advanced againt him with fuch celerity, that the colonel had only time to retreat to Panyan, where he was fuperfeded in the command by Colonel Macloed, and foon after the place was invelted by the forces of the enemy, among whom was General Lally with a confiderable body of French. Two Britifh frigates, however, having come to the affiflance of the place, rendered all the attempts of the enemy to reduce it abortive. At laft, Tippoo Saib, impatient of delay, made a vigorous effort againft the Britifl lines; but though both the Indian and French commanders behaved with great bravery, the attack not only proved unfuccefsful, but they were repulfed with fuch lofs as determined Tippoo to abandon the fiege of the place, and retire beyond the river of Panyan.

As foon as the prefidency of Bombay were acquaint. ed with the fuccefs of Colonel Humbertone, General Matthews was difpatched to his affilance with a powerful reinforcement. This expedition, which began the compaign of 1783 in the kingdom of Canara, has been related with circumitances fo difgraceful, and fo exceedingly contrary to the behaviour for which the Britifh troops are remarkable, that we are totally at a lofs to account for them. On the one hand, it feems furprifing how the national character could be forfeited by a particular body, and not by any other part of the army; and on the other, it feems equally furprifing why fuch calumnies (if we fuppofe them to be fo) fhould have arifen againft this particular body and no other part of the army. Such accounts of it, however, were publifhed as raifed the indignation of the military gentlenicn, who thought proper to publifh a vindication of themfelves. In the Annual Rugillers, from whence, next to the Gazettes and News-papers, the generality receive what they look upon to be authentic intelligence, the charaEter of this army is treated with the higheft afperity. "In the flory of the couquelt and recovery of Canara (fays the New Annual Kegifter), the Spaniards may be faid to be brought a fecond time upon the feene, but not to fit down in fullen and infolent profperity after all their crimes. The Spaniards of Britain were overtaken in the midlt of their career; and he who is more of a man than an Englifhman, will rejoice in the irregular and unnea-
fured, but at the fame time the juft and merited, ven. geance that was iullicted upon them by the prince whofe dominions they were ravaging!" In fupport of this dreadful exclamation the following account is given of the expedition. It began with the putting in execution a defign formed by General Matthews of carrying the war into the heart of Hyder Aly's dominions. For this purpufe the Englith invefted the city of Onore, fituated about 300 miles to the fouth of Bombay, and one of the principal places in the country of Canara. "It was taken by affault (fays 1)r Andrews) with great flaughter, and plundered with circumftances of a varice and rapine that difgraced the vic. tors; among whom, at the fame time, great difcontents arofe concerning the divifion of the fpoil." "No quarter (fays the Annual Regitter) was given by the victorious Englifi; every man they met was put to the fword. Upon this occalion we beg leave to tranfcribe three lines from the private letter of one of the officers concerned in the expedition. "The carnage (fays he) was great: we trampled thick on the boo dies that were flrewed in the way. It was rather fhocking to humanity; but fuch are only fecondary confiderations, and to a foldier, whofe bofom glows with heroic glory, they are thought only accidents of courfe; his zeal makes him afpire after farther victory.' This part of the peninfula had hitherto been untouched by the barbarous and unfparing hands of Europeans, and of confequence was full of riches and fplendor. In the fortrefs of Ouore were found fums of money to an unknown amount, befides jewels and diamonds. A confiderable part of this appears to have been fecured as pivate plunder by General Matthexs. The complaints of the military were loud; they thought, and naturally, that the acquifition of riches was the fair and reafonable confequence of the perpetration of bloodihed. But their commander turned a deaf ear to their reprefentations; and hatlened, by adding new laurels to his fame, to hide the flander that might otber. wife reft upon bim."

From Onore the army proceeded to the neareft fortreffes on the fea-coaft, More and Cundapour. Here they were joined by a reinforcement from Bombay un. der the command of Colonels Macleod and Humberfton, with pofitive orders to proceed for Bidnore or Hydernagur the capital of Canara. On this General Matthews marched for the mountains called the Chouts, where there is a pafs three miles in length, though only eight feet wide, and which was then Arongly fortified and defended by a vaft number of the natives. "The Englifh (fay our authors), however, had already obtained a confiderable reputation by their executions; and the ufe of the bayonet, the moft fatal inftrument of war, and which was employed by them on all occafions, created fuch an extreme terror in the enemy, as to enable them to furmount this otherwife impregnable defile."

The gaining of this pafs laid open the way to Bid. nore the capital, to which a fummons was now fent. An anfwer was returned, that the place was ready to fubmit, provided the inhabitants were not molefted, and the gnvernor was permitted to fecure his property. The wealth of this city was undoubtedly great, but the eftimates of its amount are very different. By the accouuts of Eombay it was thated only at 175,0001 .

Entia while the officers concerned in the expedition fay that it was not lefs than $1,200,0001$. or even $1,920,0001$.; nud even this was only public property; that feized upon by the foldiers, and which belonged to private perfons, was undoubtedly very confiderable alfo.

This treafure was at firft fhown by the general to his officers, and declared to belong to the army; but he afterwards told them that it was all the property of the Mahommedan governor, and lad been fecured to him by the terms of the furrender. It was therefure fent to Cundapour under the convoy of Lieutenant Mathews, brother to the general, to be thence tranfmitted to Bombay; but whether any part of it ever reached that fettement or not was never known. The difcontents of the army were now carried to the utmof height; and the conteft became fo ferious, that Colonels Macleod, Huniberfione, and Shaw, quitted the fervice altogether, and returned to Bombay. The officers charged their general with the mott in 「atiable and fhameful avarice ; white he, in teturn, accufed his whole army of doing every thing difrefpeciful and injurious to him: of paying no regard to order and ditcipline, and of becoming lowfe and unfeting as the molt licentious freebooters.

From Bidnore detachmerts were fent to reduce feveral fortreffes, the principal of which was Ananpour or Anantpore. Here orders were iffued for a form and no quarter. Every man in the place was put to death, except one horfeman who madc his efcape after being wounded in three places. "The women, unwilling to be feparated from their relations, or expofed to the brutal licentioufnefs of the foldiery, threw themfelves in multitudes into the moats with which the fort was furrounded. Four lundred beautiful women, pierced with the bayonet, and expiring in one another's arms, were in this fituation treated by the Britifh with every kind of outrage."

This exploit was fueceeded by the reduetion of Carwa and Mangalore, which completed the reduction of Canara, when General Matthews put his army in cantonments for the rainy feafon.

This rapid fuccefs was owing to the death of Hyder Aly, which happened in the end of the year 1782. His fon Tippoo Saib, however, having taken pofferfion of the government, and fettled his affairs as well as time would allow, intantly refunied his military operations. On the 7 th of April 1783 he made his appearance before Bidnore, fo that General Matthews had fcarce time to collect a force of 2000 men, and to write to Bombay for a reinforcement. But, however neefflary the latter muft have been in his cirrumftances, the prefidency were fo much prejudiced agaiult him by the unfavourable reports of his officers, that they fufpended him from his commiffion, appointing Colonel Macleod to fucceed to the command of the army.

Tippoo Saib now advanced with a vaft army, fuppofed not to be fewer than 150,000 men, covering the hills on each fide of the metiopolis as far as the eye could reach. The army of General Matthews, altogether unable to cope with fuch a force, were quickly driven from the town, and forced to take refuge in the citadel. Tippoo having cut off their retreat by gaining poffeffion of the Ghauts, laid clofe fiege to she fortrefs; which in leis than a fortnight was obliged
to capitulate. The terms propofed were, that all public property fhould remain in the fort; that the Englifh mould engage not to act againet Tippoo for a ftipulated time; that they foould march out with the honours of war; that they fhould pile their arms, and have full liberty to proceed unmoleited with their pilvate property to the fea coaf, from thence to embark for Bombay ; and in this capitulation the garrifons of Annanpour and other inland fortreffes were alfo included.

All thefe terms were broken by Tippoo, who faid that they had forfeited their title to liberty by a breach of the articles of capitulation, in embezzling and fecreting the public money, which was all, in good faith, to be delivered up. That this was really the cafe feems to be univerfally acknowledged. In the Annual Regiter we are told, that "to prevent too much money being found $\mathrm{ir}_{2}$ the poffeffion of one man, the general ordered his officers to draw on the paymafter-general for whatever fums they wanted. When the fort was furrendered to the Sultan, there was not a fingle rupee found in it." By this circumfance the fate of the garrifon was decided. General Matthews was fent for next morning to a conference. He was not, however, adnitted to his prefence, but immediately thrown into chains. Moft of the other principal officers were, on various pretencss, feparated from the army. 'The general and his companions were conducted to Seringapatnam the eapital of Myfore; and after having experienced a variety of feverities, were at laft put to death by poifon. In this manner the general and 20 officers perifhed. The poifon adoviniftered was the milk of the cocoa-tree, which is faid to be very deadly.

The above account was repeatedly complained of as partial, and at laft openly contraiited in a pamphlet intitled "A Vindication of the Conduct of the Englifh Forces" employed in that expedition, and publifhed by order of the Eaft India Company. In this pamphlet the circumfance moft found fault with was that regarding the women at Anantpore, which was pofitively contradicted. On this account therefore the publifhers of the above-mentioned work retract that part of their narrative, as being founded in mifreprefentation. Notwithftanding this vindication, however, they fill draw the following conclufions. " it is already fufficiently evident, how little has been effected by this vindication of the Bombay officers. The great outlines of the expedition remain unaltered. It is fill true that a remarkable degree of feverity was employed in the field ; that, in the capture of the fortrefies of Canara, the principle of a ftorm and no quarter was very frequently applied; and that the acquifition of money was too much the governing object in every flage of the undertaking. The vindication of the of. ficers has therefore done them little fervice; and it. happens here, as it generally does in the cale of an im. perfect reply, that the majority of the facts are rather itrengthened and demonftrated by the attempt to refute them. With refpect to the conclufion of the flory, the treafures of Hydernagur, and the charge brought againft them by "Tippoo, that they had broken the terms of the capitulation, and that when the fort was furrendered not a rupee was to be found in it; thefe circumftances are paffed over by the officers in the prom foundeft filence. It was this that roufed the Sultan to
dia. vengeance; and it is to this that he appeals for his juftification in difregarding a capitulation which had been firf diffolved by the vanquifhed Englifh."
The vindication above alluded to was figned by one major and 52 fubaltern officers. It feems not, however, to have given entire fatisfaction to the military gentemen themfelves, as other viodications have appeared faid to be written by officers; but thefe being anonymous, can be fuppofed to add very little weight to that alrcady mentioned, where fuch a refpectable body have figned their names. We fhall therefore drop a fubject fo difagreeable, and the inveftigation of which at the fame time is entirely foreign to the plan of this work.
It now remains to give fome account of the war with the Mahrattas, begun, as was formerly hinted, on account of the protection afforded to the affaffin Roganaut-row. This man had formerly obliged the Mogul to take fhelter in the Euglifh factory at Bengal; but being unable to keep up his credit annong his countrymen, was expelled as already related. On his arrival at. Bombay, an alliance was formed betwixt him and the Englih government; by which the latter engaged to replace him in the Mahratta regency in confideration of fome valuable ceffions of territory. The fupreme council of Bengal, however, difowned this treaty, and concluded one with the Mahrattas in the month of March 1776 ; by which it was agreed that they fhould provide for Ragobah's fubfiltence according to his rank, on condition of his refiding in their country. This being not at all agreeable to Ragohah, he fied once more to Bombay, where a new confederacy was entered into for his reftoration. The council of Bengal approved of this on account of the approaching rupture with France; and in confequence of this, a detachment was, in February 1778, ordered to march acrofs the continent of India. By fome mifmanagements in this expedition the whole army was obliged to capitulate with the Mahratta geveral on the gth of January 1779. One of the terms of the capitulation was, that a body of troops which were advancing on the cther fide fhould be obliged to return to Bengal. But General Goddard, the commander of thefe fories, denying the right of the council of Bengal to remand him, procceded on his march, and arrived on the 1 Sth of Februay. Here he received orders to conclude a new treaty, if it could be obtaincd on eafier terms than that of the capinnlation by which it had been engaged to cede all our acquifitions in the country of the Mahrattas.
Such extreme difregard to any !tipulations that could be made, undoubtedly provoked the Mahrattas, and induced them to join in the confederacy with Hyder Aly already mentioned. The war, however, was fuecefsfully begun by General Goddard in January 1780. In three months he reduced the whole province of Guzerat. Madajee Sindia the Mahratta general advanced to oppofe him; but as he did not choofe to venture a batule, the Englith general formed his camp, and totally routed hinn. Other explaits were performed in the courfe of this campaign ; during which the go-vernor-general (Mr Haltings) feeing no hopes of an accommodation, enterco into a treaty with the rajah of Golud, and with his confent Major Poplam reduced a
fortrefs in his dominions named Guallior, garrifoned by the Mahrattas, and hitherto reckoned impregnable.
Thefe fucceffes were followed by the dreadful incurfions of Hyder Aly already related, which put a ttop to the conquells of General Goddard; all the foreces he could fpare being required to affilt the arny under Sir Eyre Coote. The laft explait of General Goddard was the reduction of the illand of Salfette, and of a ftrong fortrefs named Bufficin in its neighbonrhood. The army of Siudia, conliting of $30,0=0$ men, was alfo defeated this year by Colonel Caruac; and the Mahrattas, diheartened by their loffes, confented to a Ceparate peace with the Englifh, leaving Hydsr Aly to manage the war as he thonght propet.

In the mean tine, however, the expences incurred by thefe wars were fo ligh, that Mr Hattings, who was obliged to furnifh them fome how or other, was reduced to the greateft difficultics. For this purpofe not only all the treafure of Bengal was cahaulted, but it was found neceffary to draw extraurdinary contributions from the Britifh allies, which was produtive of ${ }_{\text {Revolt }}^{153}$ many difagreeable circuinflances. One of the molt Revarts. remarkable was the revolt of Benares. She rajah of this country liad formerly put himelf under the protection of the Englifh, who on their part agreed to fecure his duminions to him on condition of his paying an annual fubfidy to the nabob of Oude. In 1770 the rajah died, and was fucceeded by his fon Chit Sing, who held the fovereignty at the time we fpeak of. On the death of the nabob in 1775, a new treaty was made with his fucceffor, by which the fovereignIy of Beuares was transferred to the Eaf India company, an acquifition equivalent to 240,000 l. per annum; at the fame tinne that the fubfidy paid by Suja Dowla, and which, by Lord Clive, had been fixed at $36,000 \mathrm{l}$. and afterwards raifed to 252,0001 . was now augmented to 312,0001 per annum.
On receiving intelligence in July $17 \% 8$, that war had. actually commenced between Ftance and England, Cheit Sing was required to pay 50,0001 , as his thare of the public burdens. Such a demand was paid with extreme reluctance on the part of a prince who already contributed $2,40,0001$. and probably thought that an abundant equivalent for the protection enjoyed. The fame requifition, however, was made the two fucceeding years, but with a promife that the demand fhould ceafe when peace was reflored. Intlead of any prefent alleviation, however, a body of troops was alio quartered upon him, and he was likevile ob!iged to pay for their maintenance, left he fhould not volunatatly pay the additional 50,0001 . In Nuvember 1780 , in addition to all thefe demands, he was alfo required to fend into the field fuch a body of horfe as he could fpare; but this requifition, owing to fome mifunderftanding, was never conplied with.
In July ${ }_{17} 8 \mathrm{rar}$ Mraltings lhaving, it is faid, re-cheit siag ceived fome intelligence that the oppreffed rajah me- arrelled ditated rebellion, fet out on a vifit to the aibub of and depoOude, and in his way propofed to clear up the mir. icd. underflanding with him. The method by which he intended to clear up this mifunderfanding was to lay a fine upon the poor prince of 400,0001 . or 500,0001 .; and as a reafon for doing fo, it was alleged that the late rajah had left a milliou flerling in his treafury ; a

Trdia. Tum which was continually increaling. Cheit Sing, advanced to the borders of his ienitories to meet the governor general, behaved with all inaginable fobmilion; and having got private intelligence of what was meditated againft him, offered to pay down 200, cool. This was refuled; and the governor gene"ral having reached the capital, forbid the rajah his prefence, and by a letter acquainted him with his caules of complaint. Cheit Sing fent a very fubmifive anfwer; but as he endeavoured to exculpate

- Limfelf, Mr Hallings was fo far from being fatisifed, that he put the prince under an arreft.

Such an mheard of proceeding excited the utmott furpife and refentment in fubjects accuftomed to regard their foveteign with a degree of reverence little thort of adoration. On the very day of the arreft they affembled tumultuoufly, cut in pieces the guard which had been fet on the palace, and carried off their prince in triumph. It does not appear, however, that this was any other than a tranfitory tumult; for though they could calily have cut of the governor-general, they made no attempt againt him. Cheit Sing protected his imnocence, and made the molt unlimited offers of fubmiffion, but all in vain. His goverument was declared vacant, and the zemindary beftowed on the next heir ; the annual fubfidy to the government of Bengal was augmented from 240,0001 . to 400,0001 . annually. The miferable rajah was forced to ny his country; and his mothor, though promifed leave to retire upon conditions, was attacked in her retreat and plundered by the foldiers. After all his endeavours to procure money, however, Mr Hallings found this adventure turn out much Icfs profitable than he had expected; for the treafury of the fugitive prince was
feized and retained by the foldiery.

As to the nabob of Oude, a oew treaty was concluded with him; the defign of which was evidently to eafe him of fome of the burdens to which he was at that time fubjected. Part of the Britith troops were therefore withdrawn from his dominions. As Fizulla Khan, the molt profperous of his dependents, had been called upon to furnifh a body of 5000 horde to join the nabob's army, and had not complied with the requilition, the guarantee of his treaty with the nabob, formerly executed, was withdrawn; but it being afterwards difcoveted that his territory was not equivalent to the claims of the governor, the treaty was renewed on payment of a flight fine. As the widow of Sujah Dowla was fufpected of favouring the late rajah Cheit Sing, the reigning prince was allowed to reclaim the treafures of his father in her poffelfion, and likewite to deprive her of a fmall province fhe had in pofleflion, on condition of paying her a certain ftipulated allowance annually. The trealures were feized as payment of the debts of the prince to the company.

Fioltilitics continued in India between the French and Englifh tiil the year 1783 was far advanced, and long after tranquillity had been rellored to other parts of the world. In the beginning of the feafon for action the governor and council of Bengal determined to fend an ampie fupply to the prefidency of Madras, that fo they might be enabled to put an end to the war, which Tippoo feemed willing to profecute with even mote viguur than his father had done. For this
purpofe Sir Eyre Conte, who, for his health, had gone to Eengal by fa, fet fail once more for Madras, being intrufted with a large fum of money for the neceffary expences of the war. In his paftage he was chaced for $\psi^{8}$ hours by two French men of war. The folicitude and fatigue he underwent during this time, being almoft conftantly upon deck, oceafioned a relapfe, fo that he died in two days after his arrival at Madras. His death was greatly lamented, as the greatef expectations had been formed of an happy conclufion being put to the war by his extraordiary military talents, for which he had already acquired fo great reputation in India.

The invation of Tippoo's dominions having called him off from the Carnatic, general Stuart took the opportunity of attacking him in another quarter. Colo. nel Fullarton was difpatched with a large body of troops to invade the province of Coimbatour. This he executed with great fuccefo; over-running the country, taking feveral fortreffes, and making a very alarming divertion on this fide of 'lippoo's dominions. General Stuart, however, having fill greater defigns in view, was obliged to recal this gentleman in the midit of his fuccefs. The fiege of the ftrong fortrefs of Cuddalore was the operation which now engaged his attention. It was unfuc now become the principal place of arms belonging to fully the French; was itrongly fortified, and garrifoned by fieger a numerous body of the belt troops in France, as well hifh. as a confiderable number of Tippon's choicelt forces. The fiege therefore proved fo difficult, that though the Englifh difplayed the utmolt valour and military Akill, they were not able to reduce the place until hoAtilities were interrupted by the news of a general pacification having taken place in Europe. In this fiege a remarkable circumblance took place, viz. that of a corps of fepoy grenadiers encountering and overcoming the Frencli troops oppofed to them with fixed bayonets. For this remarkable inftance of valour, they not only received the highelt applaufe at the time, but provition was made for themfelves and families by the prefidencies to which they belonged.

After the reduction of Hydernagur, and the deAtruction of the army under general Matthews, the Englin poffefled only three places of confequence in the kingdom of Canara. Thefe were Mangalore, O . nore, and Carwa. The fiege of all thefe places was undertaken at once. Mansalore, the principal port in the country, was defended by a very numerous garrifon under Major Campbell. T'ippoo fat down before it on the 19 th of May; and the attack and defence were both conducted with the greatef 〔pirit and activity. Notwithllaoding the numoft efforts of the befiegers, however, and that the garrifon were reduced to the latt extremity for want of provifions, they held out in fpite of every difficulty, until the general pacilication being concluded, the place was afterwards delivered up. In other parts nothing more happened than an indecifive engagement between M. Suffrein and admiral Flughes; fo that the Britifh empire in Bengal was for that time fully eltablifhed, and has fince continued unmoletted by foreign enemies, till very lately, that the ambition ot Tippon Saib has again prompted him to invade the territories of the nabob, an ally of Britain. This has again brouglit on a war with that retlefs, but able prince: whom the Britulh, however, ia conjunction with the

Mah-

Mahrattas, under the conduct of Lord Cornwallis, are purfuing towards his capital; of the reduetion of which, as well as of the entire ruin of Tippoo, the moft fanguine hcpes are entertained.

INDICATION, in phyfic, whatever ferves to dired the phyfician how to act.

INDICATIVE, in grammar, the firt mood or manner of conjugating a verb, by which we fimply affirm, deny, or afl fomething: as, amant, they love; zon am.ant, they do not love; amantne? do they love? See Grammar.

INDICTION, in chronology, a cycle of 55 years. See Cyele.

INDICTMENT, in law, one of the modes of profecuting an offender. See Prosecution.

In Englifh law, it is a written accufation of one or more perfons of a crime or mifdemeanor, preferred to, and prefented upon oath by, a grand jury. To this end, the fheriff of every county is bound to return to every feffion of the peace, and every commiffion of oyer and terminer, and of general gaol-delivery, twentyfour good and lasful men of the county, fome out of every hundred, to inquire, prefent, do, and exesute all thofe things, which on the part of our lord the king flall then and there be commanded them. They ewght to be freeholders : but to what amount is uncertain: which feems to be cafus omifus, and as proper to be fupplied by the legiflature as the qualifications of the petit jury; which were formerly rqually vague and uncertain, but are now fettled by feveral acis of parliament. However, they are ufually gentlemen of the bett figure in the county. As many as appear ufon this pamel, are fworn upon the grand jury, to the amount of twelve at the leaft, and unt more than twenty-three ; that twelve may he a majolity. Which number, as well as the conititution ittelf, t $L$. we find exactly defcribed fo carly as the laws of king Ethelred: Exeant Senicres duodiciom thani, et frafotius cum eis, zt jurent fuper fanauarium quol eis in manus dio. tur, quod nolin:s himim innocentem actufare, niec aliquent noxiumn celare. In the time of king Richad I. (according to Hoveden), the procefs of electing the grand jury, ordained by that prince, was as follows:. Four knights wore to be taken from the chunty at large, who chufe iwo mure out of every hundred; which two affociated to themflwes ten other priscipal freenien, and thofe twalve were to anfiwer concerning all particuiars rela. ting to their own dillrift. This number was probably found too large and inconvenient ; but the traces of this inftitution till remain, in that fome of the jury must be fummoned out of esery hundred. 'This grand jury are previounly inflructed in the articles of their inçuiry, by a charge from the jubje who prefide upor the
bench. They then withdraw to fit and receive indict- Indiennem: ments, which are preferred to them in the name of the king, but at the fuit of any private profecutor; and they are only to hear evidance on behalf of the profecution: for the finding of an indictment is only in the nature of an inquiry or acculation, which is afterwards to be tried and determined; and the grand jury are on. $l_{\text {ly }}$ to inquire upon their oaths, whether there be fuffcient caufe to call upon the party to anfwer it. A grand jury, however, ought to be thoroughly perfuaded of the truth of an indiatment, fo far as their evidence goes; and not to reft fatisfied merely with remote probabilities : a doetrine that might be applied to very oppreffive purpofes.

The grand jury are fworn to inquire only for the body of the county, pro corpore conitatus; and therefore they cannot reqularly inquire of a fact done out of that county for which they are fivorn, unlefs particularly enabled by act of parliament. And to fo high a nicety was this matter anciently carried, that where a man was wounded in one county, and died in another, the offender was at common law indietable in neither, becaufe no complete act of felony was done in any one of them: but by flatute 2 and 3 Ed. VI. c. 21 . he is now indictable in the county where the party died. And, by flatute 2 Gco. II. c. 21. if the flroke or poifoning be in England, and the death upon the fea or out of England, or vice surfu, the offenders, and their acceffories, may be indicted in the county where either the death, poifoning, or Itroke, fliall happen. And fo in fome other cafes ; as particularly, where treafon is committed out of the realm, it may be inquired of in any county withiu the reain. as the king flall direct, in purfuance of flatutes 26 Hen. VIII. c. 13.33.; Hen. VIII. c. 23.35.; Hen. TIII.c. 2. 5.6.; Edw. Vi. c. 1 I. Aud counterfiters, wahers.. or miniflers, of the current coin, together with all manner of felons and their acceffories, may, by flatute 26 Hen. VIII. c. 6. (contirmed and ter, jained by 34 and 35 Hen . VIII. c. 26. § 75.7 f.) be in. dicied and iried for thofe ofiences, if conmitted in any part of Wales, hefore the jutices of gaol-delivery and of the peace, in the next adjoining county of England, where the king's writ runneth : that is, at prefent in the county of Herefard or Salop; and not, as. it fhould feem, in the coun! $y$ of Chener or Monmouth: the cre being a county palatine where the king's writ did not rum; and the other a part of Wales, in 26 Hcn . VIII. hiurcers aifo, whether committed in England or in foreign parts, may, by virtue of the flatute 33 hicn. VIII. c. 23. be inquired of and tried by the hing's fpecial commition in any flire or place in the kingdom. By flatute 20 and II W. III. c. 25 . all robberies, and ether capital crimes, committed in Newfoundland, may be inquired of and tried in any county in England. Offences againit the black act, 9 Geo. I. c. 22. may be inquired of and tried in any countr of England, at the option of the profecutor. Su felosics, in detroxing tumpikes, or works upon mavigable rivers, erefted by authority of parliament, may, by flatutes 8 Geo. II. c. 20. and 13 Geo. III. c. 84. be inquited of atd tried in any adjacent county. By fatute 25 (Veo. II. c. 19. plandering or ftealing from any veflel in diftrefs or w recked, or breaking any hip contary to 12 Am, f. 2.
intintent ć, 18. may be profecuted either in the county where the fact is commited, or in any county next adjoining: and if committed in Wales, then in the next adjoining Enclifl county: by which is underilood to be mean, fuch Englift county as, by the fatute 26 Hen. VIII. above mentioned, had before a coucurrent jurifdiction of felonies committed in Wales. Felonics committed out of the realm, in burning or dethoying the king's fhips, magazines, or flores, may, by ftatute 12 Geo III. c. 24. be inquired of and tried in any county of itngland, or in the place where the offence is counmitted. Dy ltatute $I_{3}$ Geo. III. c. $6_{3}$. mifdemeanors committed in India may be tried upon information or indictment in the court of king's bench in England; and a mode is marked out for examining witneffes by commiffion, and tranfmitting their depofitions to the court. But, in general, all offences muit be iaquired into, as well as tried, in the county where the fact is committed. Yet if larciny be committed in onc cointy, and the goods carried into another, the offender naty be indicted in cither; for the offence is complete in borh. Or he may be indicted in Eugland for larciny in Scotland, and carrying the goods with him into England, or vice verfa; or for receiving in ene part of the united kingdom goods that have been folen in another. But for robbery, burglary, and the like, he can only be indicted where the fact was actually committed: for though the carrying away and keeping of the goorls is a continuation of the original taking, and is therefore larciny in the fecond county, yct it is not a robbery or burglary in that juriddiction. And if a perfon be indicted in one county for larciny of goods originally taken in another, and be thereof convitted, or ilands mutc, he fhall not be admitted to his clergy; provided the original taking be attended with fuch circumftances as would have oulled him of his clergy by virtue of any ttatute made previous to the year 3621.

When the grand jury have heard the evidence, if they think it a groundle fs accufation, they ufed formerly to endorfe on the back of the bill, Ignoramus; or, We know nothing of it: iutimating, that though the fects might poff:bly be true, that truth did not appear to them. But now they affert in Englifh more abSolutcly, Not a true bill; or (which is the better way) Not found: and then the party is difcharged without farther anfwer. But a frefh bill may afterwards be preferred to a fubfequent grand jury. If they are fatisfied of the truth of the accufation, they then endorfe upon it, "A true bill;" anciently, Billa vera. The indictment is then faid to be found, and the party dtands indicied. But to find a bill, there mult at lealt twelve of the jury agree: for fo tender is the law of England of the lives of the fubjects, that no man can be convicted at the fuit of the king of any capital offence, unlefs by the unanimous voice of twentyfour of his equals and neighbours; that is, by twelve at lealt of the grand jury, in the firft place, affenting to the accufation ; and afterwards by the whole petit jury of twelve more, finding him guilty upon his trial. But if twelve of the grand jury affent, it is a good prefentment, though fome of the relt difagree. And the indictment, when fo found, is publicly delivered into court.
Inditiments muft have a precife and fufficient cer-
Nf 166 .
tainty. By flatute 1 Hen. V. c. 5 . all indictments Ind muft fet forth the Chriltian name, furname, and addition of the flate and degree, my ftery, town, or place, and the county of the offender; and all this to identify his perfon. The time and place are alfo to be afcertained, by naming the day and townfhip in which the fact was committed : though a millake in thefe points is in general not held to be material, provided the time be laid previons to the finding of the indictment, and the place to be within the jurifdiction of the court; unlefs where the place is laid, not merely as a venue, but as part of the defcription of the fact. But fometimes the time may be very material, where there is any limitation in point of time affigned for the profecution of offenders; as by the flatute 7 Will. III. c. 3. which enacts, that no profecution fhall be had for any of the treafons or mifprifions therein mentioned (except an affaffination delifged or attempted on the perfon of the king), unlefs the bill of indictment be found within three years after the offence committed: and. in cafe of murder, the time of the death muft be laid within a year and a day after the mortal ftroke was given. The offence itfelf mutt alfo be fet forth with clearnefs and certainty; and in fome crimes particular words of art mult be ufed, which are fo appropriated by the law to exprefs the precife idea which it entertains of the offence, that no other words, however fynonymous they may feem, are capable of doing it. Thus, in theafon, the facts mult be laid to be done " treafonably, and againt his allegiance ;" anciently, proditoriè et contra ligeantia fure debithm;"" elfe the indictment is void. In indictments for murder, it is neceffary to fay that the party indicted "murdered," not "killed" or "flew," the other; which, till the late Itatute, was expreffed in Latin by the word murdravit. In all indictments for felonies, the adverb "felonioully," felonice, muit be ufed; and for burglaries al!o, burglariter, or, in $\mathrm{En}_{5}$ lifh, "burglarioully :" and all thefe to afcertain the intent. In rapes, the word rapuit, or "ravihed," is necelfary, and munt not be expreffed by any periphrafis, in order to render the crime certain. So in larcinies alfo, the words felonicè cepit et afportavit, "felonioufly took or carried away," are neceffary to every indictment ; for thefe only can exprefs the very offence. Alfo, in indictments for murder, the length and depth of the wound flould in general be expreffed, in order that it may appear to the court to have been of a mortal nature : but if it gocs through the body, then its dimenfions are immaterial; for that is apparently fufficient to have been the caufe of the death. Alfo, where a limb, or the like, is abfolutely cut off, there fuch defcription is needleis. Lafty, in indictments, the value of the thing which is the fubjec or initrument of the offence muft fometimss be expreffed. In indictments for larcinies this is neceffary, that it may appear whether it be grand or petit larciny; and whether intitled or not to the benefit of clcrgy. In homicides of all forts it is neceffary; as the weapon with which it is committed is forfeited to the king as a deodand. For the manner of procefs upon an indictment, fee Process.

Indictment, in Scots law, the name of the fummons, or libel, upon which criminals are cited bufore the court of jufticiary to itand tianl. Liee Law, Part III. $n^{\circ}$ clxxxvi. $4+$.

Plea

$$

an owal form, fmooth, foft to the touch, furrowed Indigofera. abore, of a deep green on the under-file, and conneeted by a very flort peduncle. Fram about one third of the ftem to the extremity there are ears that are luaded with very fmall Mowers from a dozen to 15 , buit deftitute of fmell. The pifil, which is in the midt of each flower, changes into a pod, in which the feeds are inclofed.

This plant requires a fmooth rich foil, well tilled, and not too dry. The feed of it, which, as to figure and colour, refembles gun-powder, is fown in little furrows that are about the breadth of the hoe, two or three inches deep, at a foot's diftance from each other, and in as flraight a line as poffible. Continual attention is required to pluck up the wecds, which would foon choak the plant. Though it may be fown in all feafons, the fpring is commonly preferred. Moitlure caufes this plant to floot above the furface in three or four days. It is ripe at the end of two months. When it begins to flower, it is cut with pruning. knives; and cut again at the end of every fix weeks, if the weather is a listle rainy. It lafts about two years, after which term it degenerates; it is then plucked up, and planted afrefl. As this plant foon exlaufts the foil, becaufe it does not abforb a fufficient quantity of air and dew to muillen the earth, it is of advantage to the planter to have a valt fpace which may remain covered with trees, till is becomes neef $[-$ fary to fell them in order to make room for the indigo.

Indigo is difinguifhed iuto two kinds, the true and the boflard. Though the firt is fold at a higher price on account of its fuperiority, it is ufually advan. tageous to cultivate the other, becaufe it is heavier. The lirt will grow in many different foils ; the fecond fucceeds belt in thofe which are mofl expofed to the rain. Both are liable to great accidents. Sornttimes the plant becomes dry, and is deftroyed by an infect frequencly found on it ; at other times, the leaves, which are the valuable part of the plant, are devoured in the face of $2+$ hours by caterpillars. This lat misfortune, which is but too common, las given occalion to the faying, "that the planters of indigo go tu bed rich, and rife in the morning totally ruined."

This production ought to be gathered in with great precaution, for fear of making the farina that lies on the leaves, and is very valuable, fall off by flaking it. When gathered, it is throwninto the iteeping-vat, which is a lerge tub filled with water. Here it undergoes a fermentation, which in $2_{4}$ hours at furthel is cumpleted. A cock is then turned, to let the water run into the fecond tub, called the mortar or pounding bub. The ftecping-vat is then cleaned out, that ireth plants may be thrown in; and thus the work is continued without interruption.

The water which has run inco the pounding-tub is found impregnated with a very fuh:ile earth, which alone conllitutes the dregs or blue fublance that is the object of this procefs, and which mult be feparated from the ufelels fait of the plant, becaufe this makes the dregs fwim on the furface. Do effect this, the water is forcioly agitated with woous n buckets, that are full of holes and fixed to a long handle. This part of the procefs requires the greatef precautions.

E e

Wriggofera. If the agitation be difcontinued too fon, the part that is ufed in dying, not being fufficiently feparated from the falt, would be loft. If, on the other hand, the dye were to be agitated too long after the complete feparation, the parts would be brought together again, and form a new combination; and the falt reacting on the dregs would excite a fecond fermentation, that would alter the dye, fooil its colour, and make what is called lurnt indiso. Thefe accidents are prevented by a clofe attention to the leaft alterations that the dye undergoes, and by the precaution which the workmentake to draw out a little of it from time to time in a clean veffel When they perccive that the culoured particles collect by feparating from the rell of the liquor, they leave off thaking the buckets, in order to allow thinie to the blue dregs to precipitaie to the botton of the tuh, where they are left to fettle till the water is quite clear.Holes made in the tub, at different heights, are then opentd one after another, and this ufelefs water is let out.

The blue dregs remaining at the bottom having acquired the confiftence of a thick mudly liquid, cecks are then opened, which draw it off into the fetter. After it is 11 in more cleared of much fuperfluous water in this third atd laft tuh, it is drained inte facks; from whonce, when water no longer filters through the cloth, this matter, now become of a thicke: confitence, is put into che!ls, where it entirely lofes its moifture. At the end of three months the indigo is fit for fale.

It is ufd, in wafhing, to give a bluith colnur to linen: painters alfo emplyy it in their water celours; and dyers cannot make fine blue without indigo. The ancients procured it from the Eall-Indies; in modern times, it has been tranfplanted into Ainerica. The cultivation of it, fuceeflively attempted at different places, appears to be fixed at Carolina, St Domingo, and Mexico That which is known under the name of Guatimala inaigo, fiom whence it cones, is the moft perfect of all.

There are two kinds of indigo prepared in the Eaft Indies, paticularly on the coalt of Coromandel, at Pondichery, \&e. Of thefe the woift kind is ufed for giving the body of colour to the dyed fubfance, the other being employed only to give it a glofs afterwards The finefl is prepared on the coalt of Agra, Mafulipatam, and A yanoo, but efpecially in the inand of Java; but this laft, being extremely dear, is very little ufed by the dyers. The beft ought to foat on the furface of water; its calour ought to be a very dark blue inclining to violet, bright and faarkling, efpecial'y when broken. It may be tried by diffolving a little in a glafs of water: if pure, it will mix equably with the liquor; but if otherwife, will feparate and fall to the bottom. Another method of rrying the goodnefs of this fubflance is by fire ; for the pure indigo will be entirely confumed, while the extraneous particles will remain. The pounded ind:go is much more futje ct to adulteration than fuch as is fold in cakes or tablers; as the athes or dirt with which it is mixed are very apt to feparate from the pure colouring fubtance when ftanding in a liquid thate, as it muft always do before the moifure is evaporated: whence, on brcaking a bit of indigo fo adul-
terated, the extraneous matter will be perceived in frata $I_{u}$ of a different colour.

INDIVIDUAL, a particular being of any fpecirs, or that which canuot be divided into two or more beings equal or alike.

The ufual divifion in logic is made into genera, or into genufes; thofe genera intu $\int_{p}$ eccics ; and thofe $\int p e-$ cies into in tividuals.

INDIVISIBLE, among metaplyficians - A thing is faid to be abfolutely indivifible, that is a fimple beink, and confilts of no parts into which it may be divided. Thus, God is indivifible in all refpects; as is alfo the human mind; not having extenfion, or other properties of body.

Indivisibles, in geometry, the elements or principles into which any body or figure may be ultimately refolved; which elements are fuppofed to be infinitely fmall: thus, a line may be faid to confitt of pouts, a furface of paraliel lines, and a folid of parallel and fimilar furfaces.

INDORSEMENT, in law, any thing written on the back of a deed; as a receipt for money received.

There is likewife an indorfement, by way of affignment, on bills of exchange and netes of hand; whicle is done by writing a perfon's name on the back thereof.
indostan, or Hindostan, proper India, or the Enfire of the Great Mogul. See Hindostan.

INDUCTION, in logic and rhetoric, a confequence drawn from feveral propofitions or principles firft laid down. See Logic; and Oratory, $n^{\circ} 32$.

Induction, in law, is putting a clerk or clergyman in puffeflion of a benetice or living to which he is collaterl or prefented. See the article Parson. Induction is performed by a mandale from the bilhop to the arch-deacon, who ufually iftues out a precept to $w$ her clergymen to perfurm it for dim. It is done by giving the clerk corporal poffefion of the church, as by holding the ling of the door, tolling a bell, or the like; and is a form required by law, with intent to give all the parifhioners due notice and fufficient certainty of their new miniter, to whom their tythes are to be paid. This therefore is the invettiture of the temporal part of the bencfice, as inititution is of the fipiritual. And when a clerk is thus prefented, inlituted, and inducted into a rectory, he is then, and not before, in full and complete pofferfion; and is called in law perfona imperfonata, or parfon imparfonee.

INDULGENCES, in the Romifh clurch, are a remiflion of the funifloment due to fins, granted by the church, and fuppofed to fave the finuer from Purgatory.

According to the ductrine of the Romifh chuch, all the good works of the faints over and above thofe which were neceffary towards their own jultification, are depofited, together with the infinite merits of Jefus Cluift, in one inexhaultible treafury. The keys of this were committed to St Peter, and to his fueceffors the popes, who may open it at pleafure, and by tranfferring a portiou of this fuperabundant merit to any particular perfon, for a fum of money, may convey to him either the pardon of his own fins, or a releafe for any one in whom he is interetted, from the pains of Purgatory. Such indulgences were firt invented

Igen in the tith century, by Urban II. as a recompence for thofe who went in perfon upon the glorious enterprize of conquering the Holy Land. They were afterwards granted to thofe who hired a foldier for that purpole; and in procefs of time were beftowed on fuch as gave money for accomplifhing any pious work enjoined by the Pope.

The power of granting indulgences has been greatly abufed in the church of Rome. Pope Lco $X$. in order to carry on the magnificent Atructure of St Peter's at Rome, publifhed indulgences, and a plenary remiffion, to all fuch as fhould contribute money towards it. Finding the project take, he granted to Albert elector of Mentz, and archbifhop of Magdeburg, the benefit of the indulgences of Saxony and the neighbouring parts, and farmed out thofe of other countries to the highen bidders; who, to make the belt of their bargain, procured the ablett preachers to ery up the value of the ware. The form of thele indul. gences was as follows: "May our Lord Jefus Chrift have mercy upon thee, and abfolve thee by the merits of his molt holy paffion. And I, by his authority, that of his blefted apoftes Peter and Paul, and of the mot holy Pope, granted and committed to me in thefe parts, do abfolve thee, firft from all ecclefialtical cenfures, in whatever manner they have been incurred; then from all thy fins, tranfgreffions, and exceffes, how enormous foever they may be, even from fuch as are referved for the cognizance of the holy fee, and as far as the keys of the holy church extend: I remit to you all punifhment which you deferve in Purgatory on their account; and I reftore you to the holy facraments of the church, to the unity of the faithful, and to that innocence and purity which you poffeffed at baptifm; fo that when you die, the gates of punifhment fhall be fhut, and the gates of the paradife of delight thall be opened: and if you fhall not die at prefent, this grace fhall remain in full force when you are at the point of death. In the name of the Father, and of the Son, and of the Holy Ghoft."

The terms in which the retailers of indulgences defcribed their benefits and the neccflity of purchaling them, are fo extravagant, that they appear almoft incredible. If any man (faid they) purchafes letters of indulgence, his foul may reft fecure with refpect to its falvation. The fouls confined in Purgatory, for whofe redemption indulgences are purchafed, as foon as the money tinkles in the chelt, inflantly elcape from that place of torment, and afcend into heaven. That the efficacy of indulgences was fo great, that the molt heinous fins, even if one fhould violate (which was impolfible) the mother of God, would be remitted and expiated by them, and the perfon be freet both from punifment and guilt. That this was the unfpeakable gift of God, in order to reconcile men to himfelf. That the crofs erected by the preachers of indulgences was equally efficacions with the crofs of Chrift itfelf. "Lo! the heavens are open; if you enter not nov, when will you enter? For twelve peace you may redeem the foul of your father ont of Pur. gatory ; and are you fo ungrateful, that you will not refcue you: parent from torment? If you had but one coat, you ought to Arip yourfelf infantly, and fell it, in order to purchafe fuch benefits," \&c.

It was this great abufe of indulgences that contti-
$219] \quad \mathrm{N} \mathrm{E}$
buted not a little to the firt reformation of religion in Gerinany, where Martin Luther began firlt to declaim againft the preachers of indulgences,' and afterwards againt indulgences themfelves: but fince that time the popes lave been more foaring in the exercife of this power: however, they fill carry on a great trade with them to the Indies, where they are purchafed at two rials a-piece, and fometimes more.

Tbe pope likewife grants indulgences to perfons at the point of deatb; that is, he grants them, by a biief, power to choofe what confefior they pleafe, who is authorized thereby to abfulve them from all their fins in general.

INDULT, in the church of Rome, the power of prefenting to bcuetices granted to certain perfons by the pope. Of this kind is the indalt of kings and fovercign princes in the Romifh communion, and that of the parliament of Paris granted by feveral popes. By the concordat for the abolition of the pragmatic fanction, made between Francis I. and Leo X. in 1516 , the French king has the power of nominating to bifhoprics, and other confiftorial benefices, within his realm. At the fame time, by a particular bull, the pope granted him the privilege of nominating to the churches of Brittany and Provence. In : 648 pope Alexander VIII. and in 668 Clement IX. granted the king an indult for the bihhoprics of Metz, Toul, and Veıdun, which had been yielded to him by the treaty of Muntter; and in 1668 the fame pope Clement IX. granted him an indult for the benefices in the counties of Roufillon, Artois, and the Netherlands. The cardinals likewife lave an indult granted them by agreement between pope Paul IV. and the facred college in 1555, which is always confirmed by the popes at the time of their election. By this treaty the cardinals have the free difpofal of all the benefices depending on them, and are empowered likewife to bettow a benefice in commen. dam.

INDULTO, a duty, tax, or cultom, paid to the king of Spain for all fuch commodities as are imported from the Welt Indies in the galleons.

INDUS, a large river of Alia, which rifes in the mountains which feparate Tartary from India, and difcharges itfelf into the Indian ocean. See Hindostan and India.

INEBRIANTS, are defined to be fuch things as affect the nerves in a particular and agreeable manner, and through them alter and difturb the functions of the mind. They are properly divided into native and artificial ; the former chiefly in ufe anong the oriental and other nations, the latter principally throughout Europe.

Natural Inebriants, are, 1. Opium ; in ufe all over the eaft, and of which the Turks, through cultom, fwallor a drachm. 2. Peganum harmala, Syrian rue. The feeds are fold in Turkey for this purpole ; and with thefe, as Bellonius relates, the Turkilh emperor Solyman kept himfelf intoxicated. 3. Mallac of the Turks, or bangue of the Perfiams ; prepared from the duft of the maleflower of hemp, or from the leares. 4. Bangue of the Indians, from the leaves of the hibicus fabdariffa. 5. Seeds of various fpecies of the datura, or thorny apple. 6. Pinang, or betel of the Indians. 7. Roots of black henbane. 8. The hyofeyamus phytaloides. 9. Bcrries of the deadly nighthade. 10. Leaves of E e 2 millfoils
millfoil, are ufed by the Dalekarlians to render their beer intoxicating. 11 . Tobacco, and feveral others lefa material are mentioned; fuch as clary, faffron, and darnel.
Artificial Inebriants, are fermented liquors from fari. nacenus feeds ; wines, and firits drawn by ditillation. Wirh thefe is ranked the nectar of the gods, and the anodyne medicine of Homer, conmonly called neperthes: and the fipells by which Medea and Circe produced their inchantiments.
lNERTIA of Matter, in philufophy, is defined by Sir lface Newton to be a pafive principle by which bodies perfit in their motion or reft, receive motion in proportion to the force imprefling it, and refilt as much as they are refinted. It is alfo defined by the fane author to be a power implanted in all matter, whereby it refilts any change endeavoured to be made in its fate. See Mechanics.

INESSE is applicd to things which are actually exifting.

Authors make a difference between a thing in eff, and a thing in poffe: a thing that is not, but may be, they fay is in polfe, or potentia; but a thing apparent and vifible, they fay is in effe, that is, has a 1 tal being eo infanti; whereas the other is cafual, and at belt but a puffibility.
iNFALISTACIO, an ancient puniflment of felons, by throwing them among the rocks and fands, cuftomarily ufed in port-towns. It is the opiuion of fome writers, that infulifatus did imply fome capital punifhment. by exporing the malefactor upon the fands till the next tide carried him away; of which cuttom, it is faid, there is an old tradition. However the penalty feems to take its nanue from the Norman falefe, or falefia, which lignified not the fands, but the rocks and cliffs adjoining, or impending on the fea-hore. Commijut felonian ob quam fuit fufpenfius, utlegatus, vel alio modo morti dannatus, \&e. vel apud Dover infalitatus, apud Soutbampion fubnerfus, \&cc.

INFALLIbLE, fomething that cannot err, or be deceived.

One of thie great controverfies between the Proteflants and Papifts, is the infallibility which the latter attribute to the pope; though, in fact, they themfelves are not agreed on that head. fome placing this pretended infallibility in the pope and a general council.

INFAMY, in law, is a term which extends to forgery, peljury, grofs cheats, \&c. by which a perfon is renacred incapable of being a witnefs or juror, even though he is pardoned for his crimes.

INFANCY, the firt part of life.-Fred. Hoffman fays, that the luman fpecies are infants until they begin to talk, and children to the age of puberty.--Anatomy difcovers to us, that during infancy there is much imperfection ou the human frame; e. g. its parts are difproportioned, and its organs incapable of thofe functions which in future life they are defigned to perform. The head is larger in proportion to the bulk of the body than that of an adult. The liver and pancreas are much larger in proportion than in advanced life; their fecretions are more in quantity alfo. The bile is very inert; the heart is ftronger and larger than in future life ; the: quantity of blood fent through the hcart of an infant, in a given time, is alfo more in proportion than in adults, Though thefe circum-
flances have their important ufefulnefs, yet the imperfection attending ther fubjects this age to many injuries and darrgers from which a more perfeet tate is exempted. Dr Percival obferves, in his Efiys Med. and Exp. that of all the children who are born alive, two thirds do not live to be two vears old.
Infants have a larger proportion of brain than adults, hence are molt fubject to nervous diforders; and hence the diagnoftics of difcafes are in many refpects obfcure or uncertain, as particularly thofe taken from the pulfe, which, from the irritability of the tender bodies of in. fants, is fuddenly affected by a variecy of accidents too numerous, and feensingly too trivial to gain our attention. However, no very great embarraffiment arifes to the practitiones from hence; for the diforders in this ftate are generally acute, lefs complicated than thofe in adulte, and are more cafily difeovered than is generally apprehended.

INFANr, denotes a young child. See Infancy.
Infants, amongt the Juws, Greeks, and Romans, were fwadled as foon as they were born, in a manner fimilar to that practifed by the moderns. The Jews circumcifed and named their infant children on the 8th day from the birth. Upon the birth of a fon, the Grecians crowned their doors with olive-of a daughter, with wool. The infant was wafhed in warm water, and anointed with oil-by the Spartans with wine; it was then dreffed, and laid in a balket, or on a thield if the father was a warrior, particularly among ft the Spartans. At five days old they ran with it sound the fire, and the mother's relations fent prefents. The Greeks named their children on the tenth day, the Romans on the ninth: The naming was attended with facrifices and other demonftrations of joy. The maternal office of fuckling their own children was never declimed, when circumftances would permit. How much different is this from the unnatural delicacy obferved by modern mothers, a delicacy which to the child is cruelty! The foth day was a day of folemsity for the mother. The names of children were regiftered both by the Greeks and Romans. See Register.

For an account of the cuftom of expofing infants, fee Exposing.

Infants were kept from crying in the ftreets by means of a fponge foaked in honey. Nurfes had alfo their bugbears and terrible names to frighten the chilo dren into peace:--The figure with which they were principally incimidated was Mop,uopuctov, a fort of rawhead and bloody banes.

Infant, in law, is a perfon under $2 t$ years of age; whofe capacities, incapacities, and privileges, are various.

1. In criminal matters. The law of England does in fome cafes privilege an infant urder the age of 21, as to common mifdemeanours; fo as to efcape fine, imprifonment, and the like: and particularly in the cafes of omiffion, as not repairing a bridge, or a high way, and other fimilar offt nces; for, not having the command of his fortune till the agc of 21 , he wants the capacity to do thofe things which the law requires. But where there is any notorious breach of the peace, a riot, battery, or tbe like, (which infants when fullgrown are at leaft as liable as others to commit) ; for thofe, an infant above the age of 14 is equally liable to fuffer, as a perfon of the full age of 2 I ,
nfant. With regard to casital crimes, the law is nitl more minute and circumppet: diltinguithing with greater nicety the feveral degrees of age and diferetion. By the ancient Saxon law, the age of twelve years was eftablifhed for the age of poffible diferetion, when firft the undertanding might open: and from thence till the offender was 14, it was clas pubertati proxima, in which he might, or might not, be guiliy of a crime, according to his natural capacity or incapacity. This was the dubions farge of difcretion : but, under twelve, it was held, that he could not be guilty in will, neither after fourteen could be fuppofed innocent, of any capital crime which he in fact committed. But by the law, as it now fauds, and has flood at leaft ever fince the time of Edward III. the capacity of doing ill, or contracting guilt, is not fo muclı meafured by years and days, as by the flrength of the delinquent's undertlanding and judgenent. For one lad of 11 years old may have as much cunning as another of 14 ; and in thefe cafes our maxim is, that malitio fupplet atatem. Under feven years of age, indeed, an infant cannot be guilty of felony; for then a felonious difcretion is almolt an impofifibility in nature ; but at eight years old, he may he guilty of felony. Alfo, under 14, though as infant fhall be prima focie adjudged to be doliz in capax, yet if it appear to the court and jury that he was doli cofax, and could difcern between good and evil, he may be convicted and fuffer death. Thus a girl of 13 has been burnt for killing her miltrefs: and one boy of ten, and another of nine years old, who had killed their companions, have been fentenced to death, and he of ten years actually hanged; becaufe it appeared upon their trials, that the one hid himfelf, and the other hid the body he had killed; which hiding manifefted a confcioufnefs of guilt, and a difcretion to difcern between good and evil. And there was an inflance in the laft century, where a boy of eight years old was tried at Abingtun for firing two barns; and, it appearing that he had malice, revenge, and cunning, he was found guilty, condemned, and hanged accordingly. Thus alfo, in very modern times, a bay of ten years old was convicted on his own confeffion of murdering his bedfellow ; there appearing in his whole behaviour plain tokens of a mifchievous difpofition; and, as the fparing this boy increly on account of his tender years inight be of dangerous confequence to the public, by propagating a notion that children might commit fuch atrocious crimes with inpunity, it was unanimounty agreed by all the judges, that he was a proper fubject of capital punifhment. But, in all fich cafes, the evidence of that malice, which is to fupply age, nught to be flrong and clear beyond all doubt and contradiction.
2. In civi/mattere. The ages of male and female are different for diferent purpores. A male at 12 years old may take the oath of allegiance; at 14 is at the years of diferetion, and therefore may confent or difagree to marriage, may choofe his guardian, and, if his difcretion be actually proved, may make his teftament of his perfonal ellate; at 17 may be an executor; and at 21 is at his own difpofal, and may aliene his lands, goods, and chatels. A fumale alfo at fevery years of age may be betrothed or given in marriage; at nine is intitled to dower; at 12 is at years of maturity, and therefore may confent or difagtee to marriage, and, if proved
to have fufficient difcretion. may bequeath her perfonal eftate; a: 4 is at years of 1 sgal difcretion, and may chorle a zuardian: at 17 mav be executrix; and at 21 may difpofe of herfelf and her lands. So that full ore in mate or female is 21 years, which age is completed on the day preceding the anniverfary of a perfon's birth ; who till that time is an infant, and fo llyled in law. Anong the ancient Greeks an Romans, women were never of age, but fubject to perputhal gua: dianMip, unlefs when married, nija convon:Tont in manum viri: and, when that perpetual turelare wore awn in procefs of time, we find that, in females as well as inales, full age wis not till 25 years Thus by the contlitution of different kingdoms, this period, which is mertly arbitrary, and juris fofitor, is fixed at difo ferent times. Ssotland agrees with England in this point; (both probably copying from the old Sasun contlitutions on the continent, which extended the age of minority ald anmun vioffumen primom, et eo ufque juremes fub hutchans eponuat ): but in Naples perfons are of full age at 18 ; in France, with regard to marsiage, not till 30 ; and in Hollaid at 25 .
The very difabilities of infants are privileges ; in order to fecure them from liurting themfelves by their own improvident acts. An infant cannot be fued but under the protection, and joining the name, of his guardian ; for he is to defend bim againft all attacks as well by law as otherwife: but he may fue either by his guardian, or procbein amy, his next fiiend who is not his guardian. This prochein amy may be any perfon who will undertake the infant's caufc; and it frequently happens, that an infant, by his prochein any, inllitutes a fuit in equity againft a fraudulent guardian.

With regard to eltates and civil property, an infant hath many privileges. In general, an infant thall lofe nothing by nonclaint, ot neglect of demanding his iight; nor thall any other laches or negligence be imputed to an infant, except in lone very particular cafes.

It is generally true, that an infant can neither aliene his lands, nor do any legal act, nor make a deed, nor indeed any manner of contrace, that will bind him. But fill to all thefe rules there are fome exceptions: part of which were jult now mentioned in reckoning up the dificrent capacities which they aflume at different ages: and there are others, a few of which it may not be improper to rccite, as a gencral Гpecimen of the whole. And, firf, it is true, that infants cannot aliene their enates; but infant-trmitees, or mortgapees, are enabled to convey, under the direation of the cuurt of chancery or exchequcr, or other courts of equity, the ctlates they hold in truit or mortgage, io fuch perfon as the court flall appoint. Alfo it is generally true, that an infant can do no legal act : yet an infant, who has an advowfon, may prefent to the bencfice when it bccomes void. For the law in this cafe difpenfes with one rule, in order to maintain others of far greater confequence: it permits an infant to prefent a clerk (who, if unft, may be rejected by the bihop), raiher than either fuffer the church to be unferved till he comes of age, or perniz the infant to be debarred of his right by lapfe to the lifhop. An infant may alfo purchafe lands, but his purchafe is incomplete; for, when he comes to age, he may either agree or difagree to it, as he thinks prudent or proper, without alleging

Infante any reafon; and fo may his heirs after him, if he dics without having completed his agreement. It is, farther, generally true, that an infant, uader 21 , can make no deed but what is afterwards voidable : yet in fome cafes he may bind himfelf apprentice by deed indented or indentures, for feven years; and he may by deed or will appoint a guadian to his children, if he has any. Lafly, it is generally true, that an infant can make no otiser contract that will bind him: yet he may bind limfelf to pay for his neceffary mcat, drink, apparel, phyfic, and luch other neceffaries; and likewife for his good teaching and inftruction, whereby he may profit himfelf afterwards.

INFANTE, and Infanta, all the fons and daughters of the kiugs of Spain and Portugal, except the eldeft : the princes being called infantes, and the princefles infintas.

INFANT'RY, in military affairs, the whole body of foot-foldiers, whether independent companies or regiments. - The word takes its origin from one of the infantas of Spain, who. linding that the army commanded by the king lier father had been defeated by the Moors, affembled a body of foot-foldiers, and with them engaged and totally routed the enemy. In memory of this event, and to diftinguifh the foot-foldiers, who were not before held in much confidetation, they received the name of infantry.

Hoavyarmed INFANTRT, among the ancients, were fuch as wore a complete fuit of armour, and engaged with broad hields and long fpears. They were the flower and frength of the Grecian armies, and had the higheft rank of military honour.

Light-Aimed Infantar, among the ancients, were deligned for tkirmihes, and for fighting at a dilance. Their weap ins were arrow's, darts, or nings.

Licht INFANTET, among the moderns, have only been in ufe lince the year 1656. They have no campequipage to carry, and their arms and accultrements are much lighter than thofe of the infantry. Liglit infantry are the eyes of a general, and the givers of neep and fafety to an army. Wherever there is found light eavalry, there fhonld be light infantry. They fhould be aceu!lomed to the pace of four miles an heur, as their ufual marching pace, and to be able to marel at five miles an hour upon all particular occafions. Mof of the powers on the continent have light infantry. It is only of late years that light infantry came to be ufed in the Britilh army: But now every regiment has a company of light infantry, whofe ftation is on the left of the regiment, the right being occupied by the grenadiers.

INFATUATE, to prepoffefs any one in favour of forme pelfon or thing that does not deferve it, fo far as that he cannot ealily be difabufed. - The word infatuate comes from the Latin faturs "fool ;" of fari, "to fpeak out." which is borrowed from the Greck sach, whence sams, which fignifies the fane with vates in Latin, or propbet in Englifh; and the reafon is, bccanfe their prophets or pritits ufed to be feized with a kind of madnefs or folly, when they began to make their predictions, or deliver oracles.

The Romans called thofe perfons infatuati, who fancied they had feen vifions, or imagined the god Faunus, whom they called Fatnes, had appeared to them.

INFECTION, amorg phyficians. GION.
INFEFTMENT, in Scots law, the folemnity of the delivery of an heritable fubject to the purchafer.

INFERI尼, facrifices offered by the Romans to the Dii Manes, or the fouls of deceafed heroes or other illuftrious perfons, or even any relation or perfon whofe memory was hyld in veneration. Thefe facrifices confilted of honey, water, wine, milk, the blood of victims, variety of balfamic unguents, chaplets, and loofe flowers. The victims upon thefe occafions were generally of the fmaller cattle, though in ancient times they facrificed flaves or capoives: But what a fhocking view does this give us of their fentiments of human nature, as if nothing but murder, cruelty, and human blood, could fatisfy or prove acceptable to an human foul! The facrifices were ufually black and barren. The altars on which they were offered were holes dug in the ground.

The honey, water, wine, \&ic. were ufed as libations, and were poured on the tombs of children by children, on thofe of virgins by virgins, and on thofe of married men by women. The inferie were offered on the 9 th and 3oth days after interment smongit the Greeks, and repeated in the month Anthetterion. The whole of this article applies equally to the Greeks and the Romans.

INFIBULATION, in antiquity. It was a cufom among the Romans to infibulate their finging boys, in order to preferve their voices: for this operation, which prevented their retracting the prepuce over the glans, and is the very reverfe to circumcifion, kept them from injuring their voices by premature and prepoterous venery: ferving as a kind of padlock, if not to their inclinations, at leat to their abilities. It appears by fome paffages in Martial, that a lefs decent ufe was made of intibulation among the luxurious Ro. mans: for fome ladies of diftinction, it feems, took this method of confining their paramours to their own embraces. Juvenal alfo hints at fome fuch practice. Celfus, a chalte author, faysinfibulation was fometimespractifed for the fake of health, and that nothing deftroys it more than the filly practice this operation feems intended to prevent. This practice is not perlaps likely to be revived; if, however, any one who has fuffered in his conftitution by prepofterous venery, fhould be able to get children, and fhould be inclined to prevent the fame misfortune in them by infibulation, the method of doing it is thus: 'The flin which is above the glans is to be extended, and marked on both fides with ink, where it is perforated, and then fuffered to retract itfelf. If the marks recur upon the glans, too mach of the fkin has been taken up, and we muft make the marks farther ; if the glans remain free from them, they fhow the proper place for affixing a fibula : then pafs a needle and thread through the fkin where the marks are, and tie the threads together; taking care to move it every day, until the parts about the perforations are cicatrifed: this being effected, take out the thread, and put in the fibula; which the lighter it is the better.

Authors have not determined what the fibula of the ancient furgeon was, though no doubt it was for different purpofes. In the prefent cafe, the fibula

## I N F

fifdel, Ceems to mean a ting of metal, not unlike what the country people put through the noles of fwine.

INFIDEI, a term applied to fuch perfons as are not haptized, and that do not believe the truths of the Chriftian religion. See Deist.

I EIDELIIY, in a general fenfe, denotes want of faith or belief in regard to any fuhject or tranfaction.

Religious Infidelity fignifies a dibelief of Chriltia. nity.
Of all the methods (fays an elegant modern Ef. fayit *) which the varity of man has devifed with a view to acquire ditinction, there is none eafier than that of profeffing a difbelief of the eftablifhed religion. That which flocks the feelings of thofe with whom we converfe, cannot fail of attracting notice; and as the vain are ufur!ly confident, they utter their doubts with an air fo oracular and decifive, as induces the fimple to think them profoundly wife. Audacity, with littic ingennity, will attract the eyes of fpectators, and this will fufficiently anfwer the purpole of many among the profeffed unbelievers. One might he diverted, if one were not hurt, at feeing a circle of frliy admirers, grping and fixing their eyts on fome halk-learned and impudent prater, who throws out oblique infulutions againt the Bible, the clergy, or the facrament. Thefe are fertile topics of wit and ingenuity ; but it might mortily the ranity of fome very vain writers and talkers, if they were to recollect, what is undubtedly trne. that it is a 货ecies of wit and ingenuity which not only the vileft, but the moft llupid and illiterate of mankind, have frequenly difplayed in a.l its pofible perfcetion.

There is indeed no doubt, but that vanity is one of the principal caufes of infldelity. It mult be the fole caufe of commameating it to others, by writing or converfation For let us fuppole the cafe of a very humane, judicious, and learned man, entertaining doubts of the truth of Chritianity: if he cannot clear his duubes by examination, he will yet recolleet that doubts are no certainties; and, before he endeavours to propayate his fcepticifm, he will ank himfelf thefe quedions: "Am I quite convinced that what I doubr of cannot polibly be true? If I am convinced of it, am I fure that the publication of my opinions will not do more harn than good? Is not the difurbing of any long-ellablihed civil con'titution attended with confuhion, rebellion, bloodihed, and ruin? And are not the majurity of men more ftrongly attached to the religion tham the government of their furefathers? Will it ferve my country to introduce difcontent of any fpecies? May not thofe iunovations in religion, which difcontent may introduce, lead to all the evils which are caufed by frenzy and fanaticirm? Granting that I were able to make a party formidable enough to cruh oppofition and to exterminate Cliriflianity, flill am I certain that I act, in this inftance, like a good member of focicty ? Fur is not this fyftem, whether well or ill founded, friendly to fociety? I mut confels it ; its greateft enemies have acknowledged it. What motive then can induce ine to divulge my duabts of its authenticity? Not the good of mankind ; for is is already allowed by unbelievers, that the good of mankind is intere!led in the belief of its divine original. Is it for n!y own good, and with a view to be convinced? I will nut deceive ryfelf: my motive, I fufpec, is of
another kind; for do I read thofe bouks which have Infidelity. been already uritten to fatisfy fimilar doubts? No. thing but the vanity of appearing to be wifer than my credulous neighbours can induce me to interrupt the happinefs of their belief. But vanity of this fort, which tends to difturb fociety, to injure the national morals, and to rob many thoufand individus; of a copious fource of fweet and folid comfort, mult be pronounced extreme wickednefs, even according to the obvious dictates of natural religion. I thall act the part of a good citizen and a good man, by conforming to a fyftem whole beneficial influence I feel and confefs, and by endeavouring to acquire a belief in that which has for fo many centuries been etlabiathed, and which promifes to foothe me in ditrefs with the fweetct confolations, and to brighten the difmal hour of death, by the hope of a more glorious and happy Hate of exillence. At all events, I thall have the fatiofection of having commanded myfelf fo far, as not to have run the hazard of endangering the welfare of my tellow-creatures, either lere or hereafter, by indulging a degree of vanity, which, in a creature fo weak and fo thort-lived as myfelf, is a folly very inconfitient with the fuperior wifdum which I feen to arrogate.
6I will venture to repeat (continues our author), that all writers againf Chrifianity, however they nay affect even the extremes of benevolenice, honour, plilofohpy, and enlargement of mind, are actuated by vanity and wickednefs of lieart. Their motives are as mean, fellih, narrow, and in every refpet urjuilifable, as the tendency of their writings is mifchievous. Their malice is often impotent, through the foolith Cophitry of their arguments; but, if ever it be fuccefsful, it is higlly injurious: and indeed, confidering their motives and the probable confequences of their endeavours, the infidel writer is a greater enemy to fuciety, and consequently guiltier, according to ali the priaciples of focial union, than the thief or the traitur. Perfecuionwould, however, only promote his caufe, and his proper punifhrent is contempr.
"It is certainly no derogation from the character of a man of [enfe, to conform, even while he is lo unfortunate as to donbt their iruth, to the opinions of his country. His conformite will probably lead him to a train of actions and of thought, which, in due time, will induce him to believe. But, if that thuuld not happen, yet he will act, as very wife and very great men have aeted. in paying a refpectful delience to the avowed convistion of others. The mol intelligent and powerful men of ancient Rome, not only appeared to believe a very abfurd and hurtful fyttem, but affifted in. all its ceremonies as prietts. Even Sucrates, who evidently entertained fome notions adequate to the dignity of the one great and fupreme Being, yet thought it was a duty which he owed to his country, fo far toconform to the wretched cftiblithment, as to order in his dying words a facrifice to Elculapius. This external couformity to the national religion ought not to be confounded with hypucrify. If indeed it is carried to extremes, or zealoufly affected, it certainly is very blameable and contemptible deceit; but while it keeps within the bounds of reafon and moderation. it-ought to be called a decent defetence to the opinions of the majority, ariling fiom humitity, and from a defire to.

Infidity. maintain the tranquillity of the flate, and to continue an innoeent and ufeful fyten, which has and will always greatly contribute to leffen the quastity and degree buth of mual and of natural evil.
" The eafielt, after all, or at leall the moll effectual method of appearing in any character, is really to be what we wifh to appear. But belief, you will fay, is not in our power, and how can we believe what appears to us incredible? Certainly you cannot while it appears ineredible. But let me ank you, whether you have taken any pains to believe, or have at once and at a glance perfuaded yourfelf, that the Chrittian religion is totally falfe? It is probable that a great number of fceptical writers never gave themfelves the trouble to read thofe feriptures which they warmly uppofe. They hear objections, they read objections, and they find, that from men of reputed wit and ingenuity the objections often originate. They alfo wilh to be reputed men of wit and ingenuity, and therefore eagerly adopt the lauguage and fentiments of the order. Perhaps the vanity and pride of this clafs of men will render all attempts to convince them abortive ; but to modef doubters, and to thofe whofe good fenfe and good difpolitions lead them to wifh to adopt the religion of their counsry, it may not be ufelefs to fuggelt advice, with a view to facilitate their conviction.
" The chief thing required is to free themfelves from the pride of human reafon. Humility (and furely our blindnefs and imperfections are fufficient to render us humble, if we would be reafonable), humility will open our hearts, and belief will find admifion. Sincere endeavours, feconded by prayers, will never fail to help our unhelief. But, alas! a fine, gay, fpirited, liberal, and enlarged modern philofopher, would be afhamed to be found on his knees, or with a Teflament in his pofffion. There is fcatcely any vicious act, or any vicious book, which would put him fo much to the blung.
"A modeft well-meaning man might, however, one fhould think, divet himfelf of thofe prejudices which prevent the poffibility of belief, by the following foliloquy: 'I find myfelf placed in a world abounding with evil and mifery. Under the immediate preffure of it, I feel my lecart inelining, like the needle to the north, by its natural tendeacy, to the Deity for fupport Man, of all animals, is the only one who has the fenfe of religion. Ferling this diftinctive propentity of my nature, I look around to difcover to what object, and in what manner, that part of my fellow credtures, who live in the fame fociety with myfelf, pay their adoration. I find a fyltem of religion already eftahlifhed, and which has been eftablifhed in the molt enlightened counties of the earth ncar 2000 years. I refolve to examine it. It clains that refpect from its antiquity and univerfality. Many difficu!tics appear on the firf infpection. My reafon is uftert Itartled, and my belief wavers. But I will not yet give up a poine of fo ferions impottance, without further and clofer attention to it. I reflect, that 2000 years is a valt fpace in the age of the world. How many myriads of men like myfelf tave lived and died in the faith daring that time! And were all of them fouls or hypocrites? It could not bave heen. Can the underlianding of a poor individual, juft come into the world, and $\mathrm{N}^{\circ} 166$.
hardly knowing where he is, comprehend on intuition an object of fuch magnitude, and make the mighty difeovery which has efcaped millions of the wifelt and mof learned of mortals? Or, fuppofing that they all perceived the deception, am I thern at lalt the only honelt man who will confefs it? I am athaned to avow fuch an idea to myfelf. But yet, if I reject what they received, furely I avow it in the more expreffive language of my conduct. Pride, I fear, is the foundation of my feepticiin; and humility mult form the bafis of my belief. I will check my own prefumption, and reject the cavils of vain and foulith philofophy. Shall a poor weak crcature, who cometh up like a flower, and is cut down, who fleeth as a fhadow, and never continueth in one flay, prefume to pronounce decifively in that little period, in which he has fcarcely time to look about him before he dies, agaia? a fyAtem which has ftrong internal and external evidence of divine original, which is moll ufeful and comfortable, and which has been admitted among a great portion of mankind during almof 20 centuries? No, it is the firlt wifdom to be humble. Humility will be followed by grace, and grace by faith, and faith by falvation. It plaiuly appears, that I can lofe nothing by belief, but lome of thofe exceffive and irregular enjoyments, which would dellroy my health and life; but 1 may poflibly gain a glory and a happiiefs which fhall contisue to all eternity."

INFINI'TE, that which has neither beginning nor end: in which fenfe God alone is infintite.

Infinite is alfo ufed to lignify that which has had a begimning, but will have no end, as angels and human fouls. This makes what the fchoolmen call infritum $a_{1}$ sarte poff; as, on the contrary, by infnitum a parte ante, they mean that which has an end, but had no beginning.

Inbinits Quantities. The very idea of magnitudes infinitely gieat, or fuch as excced any affinable quantities, does include a negation of limits; yet if we nearly examine this notion, we fhall find that fuch magnitudes are not equal among themilelves, but that there are really, befides infinite length and infinite area, three feveral forts of intinite folidity; all of which are quantitates fui generis, and that thofe of each fpecies are in given proportions.
Infinite length, or a line infinitely long, is to be confidered either as beginning at a priut, and fo infinitely extended one way, or elic buth ways from the fame point; in which cafe the one, which is a beginning infinity, is the one half of the whole, which is the fum of the beginning and cealing iutinity; or, as may be faid, of infinity a parte ante and a parte pof, which is analogons to cternity in time and duation, in which there is always as much to follow as is pall, from any puint or moment of time; nor doth the addition or fubduction of finite length, or fpace of time, alter the cafe either in infinity or eternity, fince both the one or the other cannet be any part of the whole.
INFINITESLAALS, among mathematicians, are defined to be infinitely limall quantities.

In the method of ininitefinals, the eiement, by which any quantity increafes or decreafes, is fuppofed to be infinitely fmall; and is generally expreffed hy two or more terms, fome of which are infinitely lefs than the reft ; which being neglected as of no importance, the

## I N F

remaining terms form what is called the difference of the propefel quanity. The terms that are neglected in this manner, as infinitely lefs than the other terms of the element, are the very fame which arife in confequence of the acceleration, or retardation, of the generating motion. during the infinitely fmall time in which the element is generated; fo that the remaining terms exprefs the elements that would have been produced in that time, if the generating motion had continued uniform : therefore thofe dilferences are accurately in the fame ratio to each oiher as the generating motions or fluxions. And hence, though in this method infinitefinal parts of the elements are neglected, the conclufions are accurately true without even an infinitely fmall error, and agree precifely with thofe that are deduced by the method by fiuxions. See Flux. rows.

INFINITIVE, in grammar, the name of one of the moods, which ferve for the conjugating of verbs. Sec Grammar.

INFINITY, the quality which denominates a thing infinite. See Metaphysics.

INFIRMARY, a kind of hofpital, where the weak and fickly are properly taken care of.

INFLAMMABILITY, that property of bodies which difpofes them to kindle or catch fire. See Fire, Flame, Phlogiston, \&゙c.

INFLAMMATION, in medicine and furgery, a rednefs and fwelling of any part of the body, attended with heat, pain, and fymptoms of fever. See (the In--de: fuhjoined to) Medicine.

Inflammation of Oils by concentrated Acids. See Chemistry, ${ }^{\circ} 778$.

INFL.ATION, formed from in and flatus; of flo, * I blow:" blowing up, the act of ftretching or filling any flaccid or dittenfible budy with a Hatulent or windy fubilance.

INFLECTED rays. Sce Inflected Rars.
INFLECTION, called alfo a diffration, and defection, in optice, is a property of light, by reafon of which, when it comes within a certain diflance of any body, it will either be bent from it, or towards it; which is a kind of imperfect reflection or refraction. -See Optics.

INFLECTION, or Point of Inflection, in the higher grometry, is a point where a curve begins to bend a contrary was.

Isflfction, in grammar, the variation of nouns and verbs, by declenfion and conjugation.

JNFI UENCE, a quality fuppofed to flow from the heavenly bodies, either with their light or heat; to which aftroltgers idly afcrine all fublunary events.

Alchemitts alfo, who to this aferibe the philofophers flone, tell us, that every thing in nature is produced by the infuence of the fars, which, in their paffage through the atmolplere, imbibe many of its moitt parts, the grufteft whercof they depofit in the fands and earths $u$ here they fall; that thefe, filtrating throu: $h$ the pores of the earth, defcend eren to the centre, wbence they are diven. by the central fire, back again to the furface; and in their afcent, by a natural kind of fublimation, as they find earths suly difpofed, they form natural hodies, as metals, minerals, and vegetables, \&c. Thus, it is pretended, that chemiltry, Vol. IX. Part I.
confiting of an artificial imitatuou of thefe natural operations, an ! in applying attive principles to paffive prin. ciples, can form natural bodies, make gold. Exc.

INFORMATION, in law, is nearly the fame in the crown office, as what in other courts is called a declaratioy. Sce Prosecution.
Informations are of two forts; firf, thofe which are partly at the lint of the king, and partly at that of a fubject; and fecondly, fuch as are only in the name of the king. The forner are ufually brought upon penal Atarutes, which inflict a peralty upon convietion of the offender, one pant to the ufe of the king, and another to the ufe of the informer. By the flatute 31 Eliz. c. 5. no profecution upon any penal fatate, the fuit and benefit whereof are limited in pant to the king and in part to the profecutor, can be hrought by any common inturmer after one ycar is expired fince the commiftion of the oftence : nor on behalf of the crown after the laple of two years longer; nor, where the forfeiture is origioally given only to the king, can fuch profecution be liad after the expiration of two gears from the commifion of the offence.

The informations ihat are exhibited in the name of the king alone, are alfo of tano kinds: frft, thofe which are truiy and properly his own fuits, and filed ex officio by his own immediate officer, the attorneygeneral: fecondly, thofe in which, though the king is the nominal profecutor, yet it is at the relation of fome private perlon or common informer; and they are filed by the king's coroner and attorney in the court of king's bench, ufually called the mafler of the crowr. offre, who is for this purpofe the ftanding officer of the public. 'The objects of the king's own profecutions, filed ex officio by his own attorney general, are properly fuch enormous mifdemeanors, as peculiarly tend to diflurb or endanger his government, or to moletr or affront him in tbe regular difcharge of his royal functions. For offences fo high and dangerous, in the punifling or preventing of which a moment's delay would be fatal, the law has given to the crown the power of an immediate profecution, without waiting for any previous application to any other tribunal: which power, thus neceflary, not only to the eafe and fafety, but even to the very exiftence, of the executive magiftrate, was originally referved in the great plan of the Englifh conflitution, wherein provifion is wifely made for the due prefervation of all its parts. The objects of the other fpecies of informations, filed by the mafter of the crowno office upon the complaint or relation of a private fubject, are any grofs and notorious mifdemeanors, riots, batteries. libels, and other immoralities of an atrocious kind, not peculiarly tending to difturb the government (for thole are left to the care of the attorneygeneral), but which, on account of their magnitude or pernicious example, deferve the moft public animad. verfion. And when an information is filed, either thus, or by the attorney-general ex officio, it mull be tried by a petit jury of the county where the of fence arifes: after which, if the defendant be found guilty, he muft refort to the court for bis punifhment. See a hifory and vindication of this mode of profeculion in the work cited on the margin, vol, jv. P. 3C $9,-312$.

INFORMER, (informator), in law, a perfon tbat EE
informs

Informs. tion, Informer.

## I $N G$

Eufration informs againf, or profecutes in any of the king's courts, thofe that offend againit any law or penal tatute. See Information.

Informers were very common both in Greece and Rome. Every corner of the ftreets was peflered with Swarms of turbulent rafcals, who made it their conftant bufnefs to pick up flories and catchat every occafion to accufe perfons of credit and reputation: Thefe by the Greeks were called Euxogavas; for a mose particular account of whom, fee the article Sycormant.

Amongit the Romans, informers were of two forts, mandatores and delatores. Thefe played into each other's hands; the former marking down flich perfons as they pretended to have found guilty of any mifdemeanor, and the other profecuting them. What teaded to increafe the number of thefe peftilent fellows was, that the informers were entitled to a fourth part of the efiects of the perfons convitted. Wicked princes rewarded and countenanced this mifchievous tribe; but Titus fet on foot a moll diligent fearch after them, and punined fuch as he found with death or baninhment. Trajan alfo is praifed by Pliny for a fimilar conduet.

INFRACTION, (formed from in, and the fupine of frango, "I break,") a rupture or violation of a treaty, hw, ordnance, or the like.

INFRALAPSARII, the name of a fect of predcflinaiatis, who maintain, that God has created a certain number of men only to he damned, withont allowing them the means neceflary to fave themfllves, if they would; and they are thus called, becaufe they hold that God's decrees were formed infiul lapfum, after his knowldge of the fall, and in confequence thercof; in contradillinetion to the Supralapsarians.
infrascapularis, in anatomy. See Anatomy, Table of the MTuples.

Inera Spinatus, in anatomy. Sce Anatomy, iud.
1NFULA, in antiquity, was a mitre worn by the Ronans and Grecian priefts, upon the head, from which on each fide hung a ribband. The covering the head with a mitre was rather a Roman than a Grecian cuttom, introduced into Italy by Eneas, who covcred his head and face at the performance of facrifice, left any ill-boding omen frould diflurb the rites. The infulx were commonly made of wool, and were not only worn by the priefts, but were put upon the forns of the victims, upon the altar and the temple. The infulx were alfo called vilta.

INFUNLIBULIFORM, in botany, an appeliat:on given to fuch monopetalous or one-leaved flowers as refemble a funnel in fhape, or which have a narrow tube at one end, and gradually widen towards the limb or month.

INFUSION, in pharmacy, an operation whereby the virtues of plants, roots, and the like, are drawn out, by letting them ftcep in fome convenient fluid menfruusa, without boiling them therein; fince boiling is found to ditlipate the fizer parts of many bitter and aromatic fubflarices, villout carefully extracting their medicinal priuciples.

INGELSHEIM, a town of Germany, in the palatinate of the Rhine, remarkable for having been the refidence of the emperors; feated on the river Salva, on an eminence, from whence there is a charming profreet. E. Long. 8. 5. N. Lat. 49. 58.

INGENUOUS, in a general fenfe, fignifies open, Ingenu fair, and candid.

Ingenvous, (ingenuus), in Roman antiquity, an ${ }^{1}$ appellation given to perfons born of free parents, who had never been flaves: for the children of the ïberti, or perfons who had obtained their liberty, were called libertini, not ingenui; this appellation of ingenuus being referved for their children, or the third generation.

INGESTA, is ufed by forme authors to exprefs all forts of aliment taken into the body.
INGLIS (Sir James), a Scottifh poet who fourifhed towards the middle of the 16 th century- According to Mackenzie, he was defcended from an ancient family in Fifchire, where he was born in the reign of James IV. He was educated at St Andrew's, went to Paris, and returned in the minority of James V. inta whofe favour he ingratiated limfelf by his poetry, having written fundry tragedies and comedies, and other poems, that were much applauded by good judges. He joined the French faction againt the Engliih; and, in fome firmihtes preceding the fatal hattie of Pinkie, fo diftinguithed himfelf, that he was knighted on the field. After the lofs of that day, he retired into Fife, and amufed himfelf with his favourite fudies; and in 1548 publifhed at St Andrew's his noted Complaint of Sicotland. This is a well written work for the time; and hows abundance of learning. He appears from it to have read much both in Greek and Latin. authors, to have been well fkilled in mathematics and philofophy, and to have been a great lover of his country. Uupublithed and in MS. (fays Mackenzie) are Porms, confilting of Songs, Ballads, Plays, and Farceso He died at Culrofs in 1554 .

INGLUVIES, the crop or craw of granivorous birds, ferving for the immediate reception of the food, where it is macerated for fome time before it is tranfmitted to the true fomach.

INGOLSTADT, a handiome town of Germany, and the ftronget in Bavaria, with a famous univerfity and a handiome church. The houfes are built with tlone, and the Areets large. It is feated on the Danube in E. Long. II. IO. N. Lat. $4^{8} .42$.
INGOT, a mafs of gold or filver melted dowa, and caft in a mould, but not coined or wrought.

INGRAFTIIGG, in gardening. See Grafting.

INGRATITUDE, the oppofite of gratitude. See Gratitude.

Ingratitude is a crime fo flameful, that there never was a man found who would own himfelf guil. ty of it ; and, though too frequently practifed, it is fo abhorred by the general roice, that to an ungrateful perfon is imputed the guilt or the capability. of all other crimes.

The ungrateful are neither fit to ferve their Maker, their counsry, nor their friends.

Ingratitude perverts all the meafures of religion and fociety, by making it dangerous to be charitable and good-naturcd. (See Gratitude). However, it is. better to expofe ourfelves to ingratitude than to be wanting in charity and benevolence.

[^3]
## I $\mathrm{N} \quad \mathrm{G}$

1. In a little work intitled Friendly Cautions to Officers, the following atrocious inflance of ingratitude is related. An opulent city in the weft of England, little ufed to have troops with them, had a regiment fent to be quartered there : the principal inhabitants and wealthiell merchants, glad to fhow their hofpitality and attacliment to their fovereign, took the firft opportunity to get acquainted with the efficers, inviting them to their houfes, and fhowing them cevery civility in their power. This was truly a defirable fituation. A merchant, extremely eafy in his circumfiances, took fo prodigious a liking to one officer in particular. that he gave lim an apartment in his own houfe, and made him in a manner abfolute matter of it, the officer's friends being always welcone to his table. The merchant was a widower, and had only two favourite daughters; the officer in fo comfortable a tlation caft his wanton eyes upon them; and too fatally fucceeding, ruined them both. Dreadful return so the merchant's mifplaced friendnip! The confequence of this ungenerous action was, that all officers ever after were fhunned as a public nuifance, as a peit to fociety: nor have the inhabitants perhaps yet conquered their averfion to a red coat.
2. We read in Rapin's Hiftory, that during Monmouth's rebellion, in the reign of James II. a certain perfon snowing the humane difpofition of one Mrs Gaunt, whofe life was one continued excrcife of beneficence, fled to her houfe, where he was concealed and maintained for fome time. Hearing, however, of the proclamation, which promifed an indemnity and reward to thofe who difcovered fuch as harhoured the rebels, he betrayed his benefactrefs; and fuch was the Spirit of jultice and equity which prevailed among the minifters, that he was pardoned and recompenfed for his treachery, while fhe was burnt alive for her charity!
3. The following inflance is alfo to be found in the Same Hiftory. - Humphry Bannifter and his father were both fervants to and raifed by the duke of Buckingham; who being driven to abfcond, by an unfortunate accident befalling the army he had raifed againit the ufurper Richard III. he without footman or page retired to Bannifter's houfe near Shrewbury, as to a place where he had all the reafon in the world to expect fecurity. Bannifter, however, upon the king's proclamation promiling 10001 . reward to him that fhould apprehend the duke, betrayed his mafter to John Merton high fheriff of Shropfhire, who fent him under a ftrong guard to Salifbury, where the king then was, and there in the market-place the duke was beheaded. But Divine vengeance purfued the traitor Bannifter; for demanding the 1000 l. that was the price of his matter's blood, King Richard refufed to pay it him, faying, "He that would be falfe to fo good a matter, ought not to be encourased." He was afterwards hanged for manflaughter, his eldeft fon run mad and died in a hog.fly, his fecond became deformed and lame, and his third fon was drowned in a fmall puddle of water. His eldeft daughter was got with child by one of his carters, and his fecond was feized with a leprofy whereof the died.-Hijl. of Eng. 8vo. vol. 1. p. 304 :

The following barbarous inflances are from ancient Niftory.
4. When Xerses king of Perfia was at Celcne, a fnguatitude city of Phrygia, Pythius, a Lydian, who had his refidence in that city, and next to Xerxes was the molt $\qquad$ opulent prince of thofe times, entertained him and his rit, Herod whole arnyy with an incredible magnificence, and mate 1. 7 c. 38. him an offer of all his wealth towards defraying the S :neca de expences of his expedition. Xerxes, furpifed and c. 37. charmed at fo gencrous an offer, had the curiofity to inquire to what a fum his riches amounted. Pythius made anfwer, that having the defign of offering them to his \{ervice. he had taken an exact account of then, and that the flver he had by him amounted to 2000 talents (about 255,0001 . Sterling), and the gold to 4,000,000 of daries (about 1,700,000 l. Sterling), wanting 7000 . All this meney he offered him, telling him, that his revenue was fuflicient for the fupport of his houfehold. Xerxes made him very hearty acknowledgments, and entered into a parcicular friendihip with him, but declined accepting his prefent. The fame prince who had made fuch obliging offers to Xerxes, having defired a favour of him fome time after, that out of his five fons who ferved in his army, he would be pleafed to leave him the eldeft, in order to be a comfurt to him in his old age : the king was fo enraged at the propofal, thaugh oo reafonable in itfulf, that he caufed the eldelt fon to be killed before the eyes of his father, giving the latter to underitand, that it was a favour he fpared him and the rett of his children. Yet this is the fame Xerxes who is fo much admired for his humane reflection at the head of his numerous army, "That of fo many thoufand men, in 100 years time there would not be one remaining; on which account he conld not forbear weeping at the uncertainty and inttability of human things." He might have found another fubject of reflection, which would have more juftly merited his tears and affiction, had he turned his thoughts upon himielf, and confidered the reproaches he deferved for being the inftrument of haltening the fatal term to millions of people, whom his cruel ambition was going to facrifice in an unjuft and unneceffary war.
5. Bafilius Macedo the emperor, exercifing himfelf in $Z$ oner. A*s hunting, a fport be took great delight in, a great flay nat. tom. .3. running furioully againit him, fattened one of the P. 155 . branches of his horns in the emperor's girdle, and pulling him from his horfe, dragged him a good diftance, to the imminent danger of his life; which a gentleman of his retinue perceiving, drew his fword and ${ }_{6}^{k}$ cut the emperor's girdle afunder, which difengaged him from the beatt, with little or no hurt to his perfon. But obferve what reward he had for hus pains: "He was fentenced to lofe his head for puttang his fword fo near the body of the emperor ;" and fuffied death accordingly.

INGRESS. in aftronomy, fignifies the fun's entering the firt fcruple of one of the four cardinal figns, efpecially Aries.

ING RIA, a province of the Ruffian empire, lying on the gulf of Finland, being ab vut 130 miles in length, and 50 in breadth. It abounds in game and fifh; and here are a great number of eliks, which come in troops from Finland in the fpring and autumn. It was conquered by the Czar Peter the Great, and Pee terßurgh is the capital town. It is bounded by thriver Nieva, and the gulf of Finland, on the north;

Ingromer by Great Novogorod, on the eaft and fuuth ; and by gulphus. Livoniz, on the wett.
ingrosser, or Engrosser, in cummon law, is one who buys up corn growing, or any provifions by wholefale, before the market, to fell again. See Forestalling.

It alfo fignifies a clerk who writes records or inftruments of law on tkins of parchment. See Engrossing.

INGUEN, in anatomy, the fame with what is otherwife called groin.

INGULPIIUS, abbot of Croyland, and author of the hiftory of that abbey, was born in London about A.D. 1030. He received the firt part of his education at Weftminller; and when he vifited his father, who belonged to the court of Edward the Cunfeflor, he was fo fortunate as to engage the attention of quieen Ed, itha. That amiable and learned princefs took a pleafure in examining our young fcholar on his pragrefs in grammar, and in diffuting with him in logic ; nor did the ever difmifs him without fome prefent as a mark of her approbation. From Weftininfter he went ta Oxford, where he applied to the iludy of rhetoric, and of the Ariltotelian philofophy, in which he made greater proficency than many of his contemporaries. When he was about 21 years of age, he was introcuced to William duke of Normandy (who vifited the court of England, A.D. 1051), and made himfelf fo agrecable to that prince, that he appointed him his lecretary, and carried him whth him into his own dominions. In a litte time he hecame the prime favourite of his prince, and the difpenfer of all preferments, humbling fome, and exalting others, at his pleafure; in which difficult tlation, he confeffeth, he did not behave with a proper degree of modefty and prudence. This excited the envy and hatred of many of the courtiers; to avoid the effects of which, he obtained leave from the duke to go in pilgrimage to the Holy Land, which was then become fafhionable. With a company of 30 horfemen, he juined Sigfrid duke of Mentz, who. with many German nobles, bifhops, clergy, and others, was preparing for a pilgrimage to Jerufalem. When they were all united, they formed a company of no fewer than 7000 pilgrims. In their way they fent fome time at Conlantinople, performing their devotions in the feveral churches. In their paffage through Lycia, they were attacked by 3 tribe of Arabs, who killed and wounded many of them, and plandered them of a prodigions mafs of moncy. Thofe who efcaped from this difatter, at length reached Jerufalem, vifited all the holy places, and bedewed the ruins of many churches with their tears, giving money for their reparation. They intended to have bathed in Jordan ; but being prevented by the roving Arabs, they embarked on board a Ge noefe fleet at Joppa, and landed at Brundufum, from whence they travelled through Apulia to Rome. Having gone through a long courfe of devotions in this city, at the feveral places diftinguifhed for their fanctity, they feparated, and every one made the beft of his way into his own country. When Ingulph and his company reached Nurmandy, they were reduced to 20 half flarved wretches, without money, cloaths, or horfes: A faithful picture of the foolifh difaftrous
journeys into the Holy Land, fo common in thofe times. Lugulph was now fo much difgufted with the world, that he- refolved to forfake it, and became a the monk in the abbey of Fontenelle in Normandy; in which, after fome years, he was advanced to the office of prior. When his old mather was preparing fur his expedition into Eugland, A. D. 1065 , he was fent by his abbot, with 100 merks in money, and 12 young men, nohly mounted and completely armed, as a prefent from their abbey. Ingulph having found a favourable oppurtunity, prefented his men and money to his prince, who received him very graciunly; fome part of the former affection for him revivin: in his bofom. In confequence of this he raifed him to the government of the rich abbey of Croyland in Lincolnfliire, A. D. 1076, in which lie fpent the lat1 34 years. of his life, governing that fociety with great prudence, and protecting their poffeflions from the rapacity of the neighbouring barons by the favour of his royal matter. The lovers of Englifa hiftory and antiquities are much indebted to this learned abbot, for his excellent hiftory of the abbey of Croyland, from its foundation, A.D. 664 , to A. D. 1091, into which he hath introduced much of the general hillory of the kingdom, with a variety of curious anecdotes that are nowhere elfe to be found. Ingulph died of the grout, at his abbey, A. D. 1109, in the 79th year of his. age.

INHALER, in medicine, a machine far breathing in warm Iteams into the lungs, recommended by Mr Mudge in the cure of the eatarrhous cough. The body of the inftrument bolds about a pint; and the handle, which is fixed to the fide of it, is hollow. In the lower part of the veifel, where it is foldered to the handle, is a hole, by means of which, and three others. on the upper part of the handle, the water, when it is poured into the inhaler, will rife to the fame level in bath. To the middle of the cover a fiexible tube about five or fix inches long is fixed, with a mouth-piece of wood or ivory. Underneath the cover there is a valve fixed, which opens and fhuts the communication. between the upper and internal part of the inhaler and the external air. When the montb is applied to the end of the tube in the act of infpiration, the air rufhes into the handle, and up through the body of warm water, and the lungs become, coufequently, filled with hot vapours. In expiration, the mouth. being fill fixed to the tube, the breath, togetherwith the fleam on the furface of the water in the inhaler, is farced up through the valve in the cover. In this manner, therefore, the whole act of refpiration is performed thro:sh the inhaler, without the neceflity, in the act of expiration, of eitherbreathing through the nofe, or removing the pipe from the mouth.

IIJHERITANCE, a perpetual right or intereft in lands, invefted in a perfon and his heirs. Sec Descent.

INHIBITION, a writ to inhibit or forbid a judge from farther proceeding in a caufe depending-before him.

Sometimes prohibition and inhibition are put togethel, as of the fame import; but inhibition is mott commonly a writ iffuing out of a higher court-chrittian.
uns- to a luwer: and prohibition out of the kinc's court to an inferior court.

Inhibition, in Scots law, a diligence obtained at the fuit of a creditor again!t his debtor, prohibiting him from felling or contracting debts upon his ellate to the crerlitor's prejudice.

INHUMALION, in chemitry, a method of di. gefting fubllances, by burying the veffel in which they are contained in horfe-dung or eath.

INJEC IION, the forcibly throwing certain liquid medicines into the body by means of a fyringe, tube, clyter-pipe, or the like.

Injzction, in furgery, the throwing in fome liquor or medicine into a vein opened by incifion. This practice, and that of transfution, or the conveying the arterial blsod of one man, or other animsl, intu another, were ouce greatly practifed, but are now laid afide.

Sinatomical Ingection, the filling the veffels of a human, or otter animal body, with fome culuared fubftance, in order to make their figures and ramifications vifible.
I. Tbe bell account of the method of injecting the funguiferous veffels of animals, is that by the late Dr Monro, publilhed in the Medical Effays, vol. i. p. 99.
"The inftrument with whien the liquor is communly thrown into the veffels is a tight eafy going fyringe of brafs. to which feveral fhurt pipes are fitted, and can be fixed by fcrews, the other extremities of thefe pipes bting of different diameters without any ferew, that they may fide into cther pipes, which are fo exactly adapted to them at one end, that when they are prelfed a little together, nothing can pafs between them: and becaufe their cobelion is not fo great as to refilt the pufhing force of the injection, which would drive off this fecond pipe, and fpuil the whole operation; therefore the extremity of this fecond fort of pipes, which receives the firfl kind, is formed on the outhie into a fquare, bounded behind and before by a riling circle, which hinders the key that cijely grafps the fquate part from fliding backwards or furwerds; or a bar of brafs mult itand out from each fide of it to be held with the fingers. The other extremity of each of thefe fecond furt of pipes is of different diameter ; and near it a circular notch. capable of allowing a thread to be sunk into it, is formed; by this, the thread tying the veffel at which the injection is to be made, will not be allowed to flide off.
"Befides this form defcribed, common to all this fecond fort of pipes, we ought to have fome of the larger ones, with an additional mechanifm, for particuIar purpofes; as, for inftance, when the larger veffels are injected, the pipe fallened into the veflel ought either to liave a valve or a flop-cock, that may be turn. ed at pleafure, to hinder any thing to get ont from the veflel by the pipe; otherwife, as the injection, in fuch a cafe, takes time to coagulate, the people employed in making the injection muit either continue all that while in the fame pofture; or, if the fytinge is too foon taken off, the injected liquor runs out, and the larger veifels ate emptied. When the fyringe is not large enough to hold at once all the liquor neceffary to fill the veffels, there is a neceffity of filling it again. If, in order to do this, the fyringe was to be ta.
ket off from the pipe fixed in the veffel, fome of the Injem:nom. iniection would be loft, and what was expofed to the air woutd coot and tididsu, therefore fome of the pipes ought to have a reflected curve tube coming out of their fide, with a valve fo difpofed, that no liquor can come from the llraight pipe into the crooked oue, but, on the contrary, may be allowed to pafs from the crooked to the ftraight one: the injeCtor then, taking care to keep the extremity of the reflected pipe immerfed in the liquor to be injtcted, may, as foon as he has pufhed out the firt fyringeful, fill it again by only drawing back the fucker; and, repeating this quickly, will be able to throw feveral fyringefuls into the veffels.
"All thefe different forts of pipes are commonly made of brafs.
"The liquors thrown into the veffels, with a defige to fill the fmall capillary tubes, are either fuch as will incorporate with water, or fuch as are oily; both kinds have their advantages and inconveniences: which I thall mention in treating of each, and fhall conclude with that which I have found by experience to fucceed bell.
"All the different kinds of glue, or ichthyocolla, fyths, common glue, \&c. diflolved and pretty much diluted, mix eatily with the animal-fuids, which is of grcat advantage, and will pafs into very fmall veffels of a well-chofen and prepared fubject, and often anfwer the intention fufficiently, where the defign is only to prepare fome very fine membrane, on which no velfels can be expected to be feen fo large as the eye can difcover whether the traniverfe fections of the veffels would be circular, or if their fides are collapfed. But when the larger velfels are alfo to be prepared, there is a manifell difadvantage to the ufefulnefs and heauty of the preparation; for if nothing but the glutinous liquor is injected, one cannot keep a fubject fo long as the glue takes of becoming from ; and there. fore, in diffecting the injected part, fereral veffels will prubably be cut and emptied. To prevent this, one may indeed either foak the part well in alcohol, which coagulates the glue; but then it becomes fo brittle, that the leat handling makes it crack : and if the preparation is to be kept, the larger veflels appear quite thricelled, when the watery part of the injection is evaporated : or the eflux of the injection may be prevented, by carefully tying every veffel before we are obliged to cut it ; fill, however, that dues not hinder the veffls to contract when the glue is drying. If, toobviate thefe difficulties, the glutinous liquor fhould frll be injected in fuch quantity as the capillary veffels will contain, and the common oily or waxy injection is pufhed in afterwards to keep the larger veffels diftended. the wax is very apt to harden before it has run far enough; the two forts of licuors never mifs to mix ir regularly, and the whole appears interrupted and broken by their foon feparating from each other; which is fill more remarkable afterwards, when the watery particles are evaporated.
"Spirits of wine coloured mixes with water and oils, and fo far is proper to flll the very fmaller velfels with: but, on the other hand, it coagulates any of our liquor it mcets, which fometimes blocks up the veffels fo much, that no more injection will pafe; then.

Iniention, it fcarce will fufpend fome of the powders that prove the moft durable colours ; and as it entirely evaporates, the veffels muft become verv fmath, and the fuall quantity of powder lett, having nothing to ferve for connecting its particles together, generally is feen fo interrupied, that the fmall ramifications of veffels rather have the appearances of random feratches of a pencil, than of regular continued cansits.
"Melted tallow, with a little mixture of oil of turpentine, may fometimes be made to fill very fmall vefiels, and keeps the larger ones at a full ftretch; but where any quantity of the animal liquors are till in the veffels, it is liable to tlop too foon, and never can be introduced into numbers of vefiels which other liquors enter; and it is fo brittle, that very little handling makes it crack, and thereby renders the preparation very ugly (A).
"The method I have always fucceeded beft with, in making what may be called fubile or fine injerions, is, firt to throw in coloured oil of turpentine, in fuch a quantity as mightit fili the very fmall veffels; and, immediately after, to pulh the common coarfe injection into the larger ones. The oil is fubtile cnough to enter rather fmaller eapillary tubes than any colouring can ; its refinous parts, which remain after the fpirituous are evaporated, give a fufficient adhefion to the particles of the fubllance with which it is coloured, to kcep theny from feparating, and it intimately incorporates with the coarfer injection; by which, if the injection is rightly managed, it is impoffible for the fliarpeft eye to difcover that two forts lave been made ufe of (B).
" All the liquors with which the veffels of animals are artificially filled, having very faint, and near the fame colours, would not all appear in the very fmall veffels, becaufe of their becoming entirely diaphanous, without a mixture of fome fubflance to impart its coJour to them; and where feveral forts of even the largeft veffels of any part were filled, one fort could not be difinguifted from another, unlefs the colour of each was different; whicb has likewife a good effect in making preparations more beautiful. Wherefore anatomifts have made ufe of a variety of fuch fubftances, according to their different fancies or intentions; fuch as gamboge, faffron, ink, burnt ivory, \&c. which ean be eafily procured from painters. My defign being only to confider thofe that are fit to be mixed with the injecting liquors propofed to fill capillay veffels. which is fcarce ever to be done in any other, except the branches of the arteries and of fome veins, I thall confine myfelf to the common colours employed to thefe lat named two forts of veffels, which colours are red, green, and fometimes blue, without mentioning the others, which require very little choice.
"Anatomiro luave, 1 imagine, propofed to inicate the natual colours of the arteries and veins in a living creature, by filling the arteries with a red fubftance, and the veins with a blue or green: from which, however, there are other advantages, fuch as the ftrong reflection which fuch bodies make of the rays of light, and the unaptnefs moft fuch bodies have to tranfmit thefe fame rays, without at lealt a confiderable reflection of the rays peculiar to themfelves; or, in other words, their unfitnefs to become completely pellucid; withont which, the very fine velfels, after being injected, would ftil! be irperceptible. The animal or vegetable fub:lances made ufe of for colouring injections, fuch as chochineal, laque, rad. auchuff, brazilwood, indigo, \&c. have all one general fault of being liable to run into little knots which flop fome of the veffels; their colour fades fooner when kept dry; they more eafily yield their tincture when the parts are preferved in a liquor ; and rats, mice, and infects, will take them for food: for which reafons, though I have frequently fucceeded in injecting them, I rather prefer the mineral kind, fuch as minium or vermilion for red; of which this laft is, in my opinion, the beft, becaufe it gives the brightelt colour, and is commonly to be bought finely levigated. The green-coloured powder generally ufed is verdigreafe; but I rather choofe that preparation of it called difilled verdigreaje; becaufe its colour is brighter, and it does not fo often ruu into finall knots as the commoo verdigreafe, but diffolves in the oily liquors.
"The method of preparing the injection compofed of thefe materials, is to take for the fine one, a pound of clear oil of turpentine, which is gradually poured on three ounces of vermilion, or diftilled verdigreafe finely powdered, or rather well levigated by grinding on marble; ftir them well with a fmall wooden fpatula till they are exactly mixed, then frain all thro' a fine linen rag. The feparation of the groffer particles is, however, rather better made, by pouring fome ounces of the oil upon the powder, and, after ttirring them together llrongly, flop rubbing with the fpatula for a fecond or fo. and pour off into a clean veffel the oil with the vermilion or verdigreafe fufpended in it; and continue this fort of operation till you obferve no more of the powder come off; and all that remains is granulated. The coarfer injection is thus prepared: Take iallow, I pound; wax, bleached white, 5 ounees; fallad oil, 3 ounces; melt them in a Akillet put over a lamp: then add Venice turpentine, 2 ounces; and as foon as this is diffolved, gradually fprinkte in of vermilion or verdigreafe prepared, 3 ounces; then pafs all through a clean, dry, warmed linen cloth, to feparate all the groffer particles; and, when you defign to make it run far into the veffels, fome oil
(A) Rigierus (Introduct. in notitiam rerum natur, \&e. 4to. Hagae, 1743, titul. Balfamum) gives Ruyfeh's method of injecting and preferving animals, which, he fays. Mr Blumentront, prefident of the Peterforgh academy, affured him was copied from the receipt given in Ruych's own land-writing to the Czar. According to this receipt, melted tallow, coloured with vermilion, to which, in the funmer, a little white wax was added, was Ruyfch's injecting ceracia nateries.
(B) Mr Ranby's injecting matter, as publihed by De Hales, (Hemafl. Ex. 21.), is white rofin and tallow, of each two ounces, melted and trained through linen; to which was added three ounces of vermilion, or finely ground indigo, which was firf well rubbed with eight"ounces of turpentine varnifh.
in. of turpentine may be added immediately before it is ufed.
"The next thing to be confidered, and indeed what chiefly conttibutes to the fuccefs of injections, is the choice and preparation of the fubject whofe veflels are to be filled.
" In chooling a fit fubjeEt, take thefe few general rules: t. The younger the creature to be injected is, the injection will, cateris paribus, go farthelt, and vice verfa. 2. The more the creature's fluids have been diffolved and calautted in life, the fuccefs of the operation will be greater. 3 . The lefs folid the part defigned to be injected is, the more veffels will be filled. 4. The more nembranous and tranfparent parts are, the injeetion fhows better; whereas, in the folid very hard parts of a rigid old creature, that has died with its veflels full of thick Arong blood, it is fearce poltible to inject great numbers of fmall veffels.
"Therefore, in preparing a fubject for injecting, the principal things to be aimed at, are, To diffolve the fluids, empty the veffels of them, relax the folids, and prevent the injection's coagulating too foon. To anfwer all thefe intentions, authors have propoled to inject tepid or warm water by the arteries, till it returns clear and untinged by the veins, and the veffels are thereby fo emptied of blood, that all the parts appear white; after which, they pufh out the water by forcing in air; and, laftly, by prefling with their hands, they fqueze the air alfo out. After this preparation, one can indeed inject very fubtilely ; but generaly there are inconveniences attend it . Fol in all the parts where there is a remarkable tunica cellulofa, it never miffes to be full of the water, which is apt to fpoil any parts defigned to be preferved either wet or dry ; and fome particles of the water feldom mifs to be mixed in the larger as well as fmalier veffels with the oily injection, and make it appear difcontinued and broken: wherefore it is much better to let this injection of water alone, if it can be poffibly avoided, and rather to macerate the body or part to be injected a confiderable time in water, made fo warm (c) as one can hold his hand eafily in it; taking care to keep it of an equal warmth all the time, by taking out fome of the water as it cools, and pouring in hot water in its place; by which the veffels will be fufficiently foftened and relaxed, the blood will be melted down, and the injection can be in no danger of hardening too foon; whertas, if the water is too hot, the veflels fhrink, and the blood coagulates. From time to time we fqueeze out the liquids as much as poffible at the cut veffel by which the injection is to be thrown in (D). The time this macesation is to be continued, is always in proportion to the age of the fubjcet, the bulk and thicknefs of what we defign to inject, and the quantiryof blood we obferve in the veffels, which can only be learned by ex -
perience; at leaf, however, eare ought to be taken, lnjtcion. that the whote fubjec, or part inseerated, is perfectly well warmed all through; and that we continue the preffure with our hands till no more blood can be brought away, whatever pofition we put the fubject in.

When the fyringe, injections, and fubject, are all in readinefs, one of the fecond fort of pipes is chofen, as near to the diameter of the veffel by which the injection is to be thrown as poffible; for if the pipe is too large, it is almolt needlefs to tell it cannot be introduced. If the pipe is much imaller than the veffel, it is fcarce poilible to tie them fo firmly together, but, by the wrinkling of the coats of the veffel, fome fmall paflage will be left, by which part of the injection will fpring back on the injector in the time of the operation, and the nearell veffels remain afterwards undiflanded, by the lofs of the quantity that oozes out. Having chofen a fit pipe, it is introduced at the cut orifice of the veffel, or at an incifion made in the fide of it: and then a waxed thread being brought round the veffel, as near to its coats as pofible, by the help of a needle, or a flexible eyed probe, the furgeon's knot is made with the thread, and it is drawn as firmly as the thread can allow; taking eare that it fhall be funk into the circular notch of the pipe all round, otherwife it will very eafily jlide off, and the pipe will be brought out probably in the time of the operation, which ruins it.
" If there have been large veffels cut, which com municate with the veffels you defign to inject, or is there are any others proceeding from the fame trunk, which you do not refolve to fill, let them be all care. fully now ticd up, to fave the injected liquor, and make the operation fucceed better in the view you then have.
"When all this is done, both forts of injeftionsare to be warmed over a lamp, taking care to ftir them contantly, left the colouring powder fall to the bottom and burn (E). The oil of turpentine nceds be made no warner than will allow the finger to remain in it, if the fubject has been previouly well warmed in water; when the maceration has not been made the oil, ought to be fcalding hot, that it may warm all the parts which are deligned to be injected. The coarfe injection ought to be brought near to a boiling. In the mean time, havine wrapt feveral folds of linen round the parts of the fyringe which the operator is. to gripe, and fecured the linen with thread, the fyringe is to be made very hot by fucking boiling water feveral times up (F), and the pipe within the veffel is to. be warmed by applying a fponge dipped in boiling water to it (c).
"' After all is ready, the fyringe being cleared of the water, the injector fills it with the ह月er injection:
(c) Ruyfeh orders a previous maceration for a day or two in cold water; which mult have a better effect in melting the blood thain warm water has.
(D) When Ruylch intended to inject the whole body, he put one pipe upwards, and another downwards, in the defernding aorta.
(E) Ruyfch melts his tallow by the heat of warm water, into which he puts the veffel containing the ino jection.
(F) He warms his fyringe by laying it on hot coals.
(6) He warms his pipe, by putting the body, atter the pipe is fixed in the veffel, into hot water. When

Tnjection. and then introducing the pipe of the fyringe into that in the veffel, he preffes them together, and either with one hand holds this laft pipe firm, with the other gripes the fyringe, and with his breall pufles the fucker; or, giving the pipe in the velfel to be held by an aftillant, in any of the ways mentioned in the defcription of thefe forts of pipes, he gripes the fyringe with one land, and pufhes the fucker with the other, and confequently throws in the injection, which ought to he done flowly, and with no great force. but proportioned to the length and bulk of the part to be injected and flrength of the veffels. The quantity of this fine injection to be thrown in is much to be learned by ufe. The onty rule 1 could ever fix to myfelf in this matter was to continue pufhing till I was fenfible of a flop which would require a confiderable force to overcome. But this will not hold where all the branches of any veffel are not injected; as for inflance, when the veffels of the thorax only are to be injected: for the aorta bears too great a preportion to the branches fent from it, and therefore lefs fine injection is requifite here. As foon as that flop is felt, the fucker of the fyringe is to be drawn back, that the neareft large veffels may be emptied. Then the fyringe is taken off, emptied of the fine injection, and filled with the coarfer, which is to be pufhed into the veffels quickly and forcibly, having always regard to the flrength and firmnefs of the veffels, bulk, \&c. of the part. Continue to thrutt the fucker, till a full flop, or a fort of pufh backwards, is felt, when you muft beware of thrufting any more, otherwife fome of the veffels will be burfted, and the whole, or a confiderable fare of the preparation you deligned, will be fpoiled by the extravafation, but rather immediately fop the pipe by the turn-cock, and take out the fyringe to clean it, and allow fufficient time for the coarfe injection to coagulate fully, before any part is diffected. Ruyfch, immediately after throwing in the injection, put the body into cold water, and ftirred it continually for fome time, to prevent the vermilion to feparate from the tallow."
II. The injection of the lymplatic fy lem is much more difficult thas that of the fanguiferous, on account of the extreme fmallnefs of the veffels; fo that till very lately it was almoft quite impracticable. Methods indeed had been attempted for this purpofe; but by rea. fon cf the improper form of the inltruments, and the inferior fkill of anatomifts in former times, we may juftly look upon this as one of the moft modern improvements in anatomy.

The firlt thing tu be confidered, when the lymphatics are to be injected, is a proper method of difcovering them; for this is by no means an eafy matter, on account of their fmallnefs and tranfparency. -- To find out thefe veffels, the fubject muft be viewed in a proper place, where the light is neither very ftrong nor very weak. Mr Sheldon, who has written a treatife upon this fubject, recommends a winter forenoon from ten to two ; it being chiefly in the winter feafon that anatomical preparations are made, and becaufe at that time of the day the light is more clear and fteady. He fays alfo from his own experience, that the light paffing through the glafs of a window is better for this purpofe than the open air, as the veffels are more dif$\mathrm{N}^{\text {i }}{ }^{166 .}$
tinctly feen. The injecting of the veffels is likewife rendered more dificult in the open air by the eafe with which the humidity is evapurated from them. It will likewife be necefary to incline the part in various ways to the light, as fome of the veffels are moft eafily difcoverable in one pofition and fome in another, The lacteal trunks undre the peritioneal coats of the inteftines, and the lymphatics on the external furface of the liver, \&c. particularly require this method. He difcommends the ufe of magnifying glafles. "J am perfuaded (fays he), that thofe who attempt to find them through this medium, will not acquire that vifus eruditus which is obtained to a furpriting degree by thofe who have been much experienced in injecting lymphatic veffels. A lateral light is likewife preferable to an horizontal, or even to an oblique fky light.
"The fubjects muft be laid upon a table of fufficient height, which might be contrived with a ledge fixed to the table in fuch a manner as to be water proof; which would be uleful for preventing the quickfilver, which is alnott always neceflary for injecting thefe veffels, from being loft. The furface of the table fhould likewife be hollowed, fo that the mercury which falls may be collected in the middle, where an hole with a ftopper may be made to take out occalionally the quickfilver which collects. Such a table would alfo be convenient for holding water for the purpufe of Heeping membranous parts which are frequently to be injected; and which, from being expofed to the air, become dry; which alfo it is inconvenient and hazarious to move into water during the time of operation. Even a common table with a hole cut in the middle may anfwer the purpofe: the hole may be round or fquare according to the fancy of the anatomit; but the table mutt be conflrueted of fueh materials as are not liable to warp in warm water. Should the anatomitt not be provided with either of thefe tables, the parts mult be laid in a tray or earthen difh, that the quick filver may be faved."

The materials for injecting thefe veffels are only quickfilver, and the ceraceous or coarfe injection of anatomifts; the former being always ufed in injecting the lymphaties and lacteals, it being almol impuffible to fill them with anather fluid in the dead body. The ceraceous injection is chiefly uled for the thoracic duct; and in fome particular inflances, where the lymphatic trunks have been found larger than the ordinary fize, a coarfe injection has been made ufe of.

Injections of the lymphatics may be made even while the animal is alive, and that without any great cruelty, by feeding it with milk previous to its being ftrangled. Of all the barbarous muthods of opening the animal while alive, the moft uffeul feems to be that of Mr Hunter, who directs to perforate the fraal! inteftines, and throw in flarch water with folutions of mufk, or indigo and tarch-water. "In a word (fays Mr Sheldon). any gelatinous fluids rendered opaque with fuch colours as will be abforbed, are extremely ufeful for experiments of this kind; for much more may be feen by examining the veffels di,tended with a coloured fluid from natural abforption, than by ana-
tomical

## I N J

on. tomical injection practifed in the dcad body." Liberkuhn firft diftovered the ampullule by feeding chil. dren in whom the lacteal glands were obllructed previous to their death with milk; by which means not only the lacteal trunks became diftended with chyle, but likewife the ampullulx. Thus abforbing mouths of the lacteal veffels were difcovered by Liberkuhn; and in a fimilar manner Afellius difcovered the lacteals themfelves. Thus alfo Euftachius difcovered the thoracic duct in a horfe; and Mr Hewfon traced the lacteal ${ }^{\circ}$ veffels, lymphatics, and thoracic duct, in birds, by making ligatures on the root of the mefentery, and other parts, which lad been previoufly fed with barley. Mr Hunter likewife was enabled to obferve the lacteals of a crocodile when diftended with chyle.

The coarfe injection for the lymphatics is made of mutton-Cuet and yellow refin, in the proportion of two thirds of refin to one of fuer. If required of a thickcr confiftence, we may add a fmall quantity of pure wax; if of a fofter quality, we may augment the quantity of fuet: Orpiment or king's yellow is generally made ufe of; though others are equally proper, provided they be fine enough.

The inftruments neceffary for injecting the lymphatic veffels are the injecting tube and pipes, lancets, blow-pipes, knives, fciflars, forceps, needles, and thread. The old injecting tube has been found in a manner entirely wiclefs, the pipe being fixed in a glafs tube two or three feet long; which is one of the reafons why, before the time of Hewron, fo little of the lymphatic fy ftem could be injected. Tubes of fuch a length are entirely unmanageable by one perfon, and it is imporfible to perform the operation properly with two. To perform it in the beft manner, the infrument fhould be held in the hand like a pencil or pen. The inflruments ufed by our author are tubes made either of glafs or of brafs; which, when filled with mercury, may be held in the hand like a pen: a glafs tube, however, is preferable to the metallic one. It is fomewhat in the fhape of a trumpet; fix inches and an half in length, an inch and an half broad where broadeit, and three eighths of an inch where narroweft. A collar of fteel half an iuch broad and three quarters of an inch long is cemented to this pipe, and a fmaller tube of the fame metal. is ferewed upon the end of the collar; the whole terminating in a capillary tube about an inch in length. This laft is the moll difficult part of the whole work to execute ; it hould be drilled out of a folid piece of metal, and not made of a thin bit of plate foldered, as thefe are apt to turn ragged in the edges, and the folder is alfo liable to be deltroyed by the mercury. Thofe ufed by Mr Sheldon were made by drilling a fmall hole lengthwife through a bit of well-tempered wire. It is cleaned by means of a very fmall piece of fteel-wire capable of paffing through the bore of the tube. This ought to be annealed left it fhould break ; in which cafe the broken bit could not eafily be got out. Very fmall tubes may be made of glais drawn out as fine as we choofe; and though very apt to break, they are eafily repaired. They ought to be very thin, that they may be eafily melted. Sometimes it has been found convenient to fit the collar with a fleel flop-cock.

The brafs tube reprefented by our author is about Vol. IX. Part I.
nine inches and an half in length, and half an inch wide Injecion. where wideft. The collar is a full quarter of an inch $\underbrace{}_{-}$ broad, and three quarters of an inch long; a fteel piece and capillary tube being ferewed to it as in the other.

The lancets are to be exquifitely fharp, in order to cut into the lymphatic veffels. The latter are eafily inflated by the fmall filver blow-pipes ufually put up in the diffecting cafes by the London mathematical inftrument makers: diffecting knives, fine pointed feiffars, accurately made diffecting forceps, with ftraight or crooked needles, are likewife fubilituted with advantage, as not being affected by the quick filver.
We mutt next confider the proper fubjects for injection. Mr Sheldon recommends, that they fhould be as free from fat as poffible: he has always found in the human fubject thofe who died univerfally dropfical, or of an afcites or anafarca, to be the beft, for the following reafons, viz. in fuch there is little or no animal oil, and but a very fmall quantity of red blood; both of which, when they occur in great aburdance, very much impede the difcovery of the lymphatic veffels; but when the cellular veffels are loaded with water, the abforbents are more readily traced, and with lefs rilk of wounding them in diffection: the preparations alfo, particularly the dried ones, are more lathing. This circumftance is found to be of moft confequence in preparing the abforbent veffels of the trunk and extremities of the human fubject. Of all the vif. cera in young fubjects, only the liver and lungs can be injected with fuccefs; and thefe may be fuccefsfully injected even in the foctus. It will be moft proper to begin the operation upon the fubject immediately afier death, as lympin or chyle will then be mure readily found in the veffels, than when we wait a longer time. In preparing the lacteals, previoully diftended with milk in the living fubject, it is proper to have the inteflines and mefentery plunged (with the ligature upon the root of the latter) into rectified fpirit of wine. This procefs will coagulate the cbyle; and the fluid being opaque, the veffels will be beautifully feen when we mean to prepare the parts, by preferving them in proof-fipirit as wet fpecimens: "In this way (fays Mt Sheldon) 1 have made in the dog ore of the molt natural preparations that can be feen of the lacteals injected from their orifices by the natural abforption." We may alfo prepare the lacteals by the method ufed by Mr Hunter, already mentioned; by which they will be very confpicuous, by the indigo abforbed from the cavity of the inteftines. By tying the thoracic duct near its infertion into the angle formed between the fubclavian and jugular veins on the left fide, or by tying thefe veins on both fides, we may diftend almoft all the abforbents of the animal. Thus we are enabled to purfue thefe veffels in many parts where they lave not yet been difcovered, where they can fearcely be traced by injection, and even in fome parts where it is utterly imponible for the injections to reach them.

Another method fometimes fuccefsfully ufed by our author, was firil practifed by Malpighi. In this the part is to be fteeped in water, and the liquid changed as long as it appears tinged with blood; fuffering the parts afterwards to remain in the fame water till the putrefaction begins. As foon as this begins to take place, the air which is extricated will diftend the lym-
phatics,

Injection. phatics, fo that they may be eafly feen, and then in. jected with quickfilver. lt is, however, remarkable, that this metiod will not in general anfwer fo well in the human fpecies as in quadrupeds; the air having never paffed by putrefaction into the human lactals in any of the fubjects which Mr Sheldon tried, though it will take place in thofe of the horfe or afs, and many other animals: drawing of the lateals may likewife be made in this method to very great advantare. In fome parts of the human body alfo, this method may be employed to advantage; as the liver, heart, \&ic. It may likewife be ufeful to make ligatures on the large trunk, of the veffels previous to the maceration, that thus the air may be confined as foon as it is extricated from the coats by putrefaction. Our anthor adds, that if ligatures were mide upon the writts and legs in articulo mortis, or immediately after death, the lymph would be fopped in the veffels, the latter would become diftended, and might be injected with the greateft facility by the com non method after taking off the ligature. Mr Shetlon in fuch a cafe recommends the tourniquet. "I have reafon (fays he) to believe, that ahforption goes on as long as mufcular irritability remains; which laft continues a confiderable time after the general life of the animal is loft." On this, however, we cannot forbear to remark, that making ligatures for fuch purpofes upon a human creature in articulo mortis, or even immedrately after death, favours fo much of barbarity, that we cannot think it will be often practifed. In fome cafes, even in the dead fubject, ligatures are ufeful ; as when we are fearching for the lymphatics in the fingets and toes. In thefe it is ufeful to ftrnke up the parts with the finger, by which means the fmall quantity of lymph remaining in the veffels will be forced upwards, and ftopped hy the ligature; after which the veffels may be eafily injected with quickfilver, as already men. tioned.

To inject the veffels, we mutt open one or more of them, directing the point of the lancet almofl always towards the trunk or trunks of the veffels, and taking care not to carry the incifion through the opponite fide. If the veffels happen to lie under the peritoneum as the lacteals, or under the pleura as the lymphatics of the lungs, we may cut into their cavity through thefe membrancs. In injecting thofe of the extremities, however, and in many other parts of the body, it is abfolutely neceflary to diffect the veffels we defign to fill away from the fat and reticular fubflance before we attempt to open them with the lancet. The tube with the pipe affixed to it is previoully to be fill©d with mercury: the anatomif then inflates the veficl by means of the blow-pipe, takes the tube from the aifrikant, and introduces the fmall tube into the puncture. In this operation it will be found neceffary not to sarry the tube farther into the veffel than is fufficient to give the mercury a free paffage; for if we introduce it farther, the paffage of the mercury will be impeded by the pipe being pufhed againft the fide of the veffel. Should not the fluid be able to effect a paffage, it will then be neceflary to prefs upon the furface of it in the tube with our fingers. If it defcend freely, and without any of it paffing between the fide of the veffel and fmall pipe, we have only to fill up the tube with mercury as the latter defcends; but if it gets out, we murt
then tie the veffel. This, however, fonold always be Injs
avoided if poffible; becaufe, if not very destcroufly per avoided if poffible; becaufe, if not very destcroufly perforned, the operator will be apt to feparate the tube from the veffel; and on ihis accourit the pun-lure ought always to be very finall, no largur indeed than is neceffary to allow the pipe to get in with difficulty. As the injection proceeds, the preffure upon the furface of the quickfilver mult be carried on higher and higher in the courfe of the lymphatic, till we come near the gland or glands into which the veffels terminate; otherwife we fhall feldon get the cells of the glands, or the veftels emerging from the oppofite fide of the glands, well injected In injecing the lymphatic efficls of the extremities, it will be ufefal to raife the part where the pipe is inferted higher than the other end of the limb, and to make the affitant prefs with his hands along the fkin in the courfe of the veffels, which will favour the progrefs of the injection. When the veff Is are fufficiently filled, which may be known by the fivelling of them, and by the refitance the mercury metts with, the affitant paffes a ligature about the veffel and ties it above the puncture before the anatomilt withdraws the injection ploe.

The method of injecting the larger trunks or tho. racic duct with the coarfe injection is exaetly timilar to that already deferibed for the fanguiferous veffels. Mr Sheldon, however, recommends the ufe of fome pipes of a particular conftruction invented by himfelf. The improvement confifts in fhaping the ends of the pipes like a pen; taking care to make the edges and point blunt, to avoid cutting the veffll when we introduce them. Thus much larger tubes than thof: en: monly in ufe may he admitted; and there is no occa. fion to make any bulb or rifing near the extremity of thefe fmall pipes to prevent the thread from nipping off: for this will certainly hinder us from inferting pipes of fuch diameter as might otherwifc be done.

Having thus fhown the method of injecting the lymphatics, our author next proceeds to defcrise the method of diffecting and preparing them either for immediate demonfltration, or for prefervation for any length of time. In the dificetion, great care is requifite, on account of the exquifite thinnefs of their coats: but if this fhould happen by accident, it will then be ncceffary to introduce the pipe at the ruptured part ; and having fecured it above and below with ligatures, to fill it again as before directed. Our author recommends, for the purpofe of difiection, fuch knives as are made ufe of by the Germans and French in tracing the nerves. They muft be male thin in the bladic like lancets, and not much larger. A variety of different fhaped blades, fome fingle and others doubleedged, will be neceffary for various parta of the body; the fault of the common diffecting knives being that they are roo thick in the blade, which makes them foon blunt, and occafions the trouble of perpetual grin ling, which is not the cafe with thofe juit recom. mended. A fharp-pointed furceps is neceflary, in order to lay fatt hold of the fmallett portion of cellular fubftance; but they ought not to be fo tharp as to erdanger the puncturing of the veffels: nor fhould they by any means be bowed or fliff in the fpring, to prevent the fingers of the operator from being wearied in the operation. They flould alfo be made in fuch a manner as to hold large as well as fmall portions of re-

## I N J

ieetion. ticular fubflance. For diffetions of this kind, finepointed feiflars and lancets fixed in handles are fometimes neseffary; and it is frequently of ufe to plunge the parts into water, in order to loofen the reticular membrane connested with the outide of the coats of the veffels; by which means they may be diffected more eafily, and with lefs danger of wounding them. The blood may be extracted by frequently changing the water. After being injected with quickfilver, the parts thould not be allowed to remaia long in the water, becaufe the volatile alkali formed by putrefaction is apt to change the colour of the mercury.

The diffection being performed, the preparation is then to be preferved cither in a wet or diy flate, according to its nature. Preparations of the larger parts, as the truuk or extremities, fhould be preferved dry ; and to dry them effectually, they fhould be expofed to a free curient of air, but not to the rays of the fun; and the veffels fhould be difplayed in their natural fituation. When fully dried, they ought then to be varnithed over with tranfparent fpirit or copal varnifh ; which will not only preferve them from infects, but reader them more beautiful, and the veffels more confpicuous. They fhould then be inclofed in glafs cafes, where they are to be placed in a horizontal pofition, and handled as little as poffible.

To make preparations of the thoracic duct, wet mult in the firlt place fill the aorta, vena cava fuperior, and vena azygos or intereoftalis, with coarfe injection; then fill, with the fanie, the veffels below the right crus or little mufcle of the diapbragm. The duct is rometimes prepared with quickfilver; but Mr Sheldon recommends to anatomitts to make drawings of any thing new or remarkable in their preparations of the lymphatic veffels with quickfilver; as mon of thofe specimens, particularly fueh as are dried, become at lait totally ufelefs by reafon of the drying of the veffels and the efeape or blackening of the mercury ; or from the varnif growing more and more opaque with age. The quickiliver injection, however, in fome cafes is very ufeful. Thus, for inftance, if we will to demontrate the valves in the thoracic duct, or any other large abforbent veffel, we need only inject the veffels with quickfilver, diffect and dry them, then cut then open, and let the mereury run out; after which the valves will appear by making fections in the eoats of the vefels. This may be done ftill better by varnifhing the velfels three or four times before the fections are made; tecaufe the warnifh will ftrengthen the fides of the veffel. In wet preparations the valves in the cavities of thefe parts may likewife be demonftrated by opening them; or by inverting the veffels and fufo pending the in in proof malt-firits. Thus the valves that cover the terminations of the thoracic fluct on the infide of the angle formed between the jugular and fubclavian veins on the left fide, and thofe which terminate the lymphatics on the right fide of the neck, arm, and lungs, may be beautifully demonftrated. specimens of the lacted veffels, of the abforbents of the heatt, lungs, liver, fpken, diaphragm, kidneys, \&c. may be kept wet or dry, according to the particular nature of the preparation or view of the anatomil. Some preparations are the better for being dried and afterwards immelfed in vials full of oil of turpentine; by which means the flefh will be rendered tranfparent,
the veffels diftinctly feen, and the veffels appear cx- Injeeinn tremely beautiful. The only difadvantage of this method is, that the parts on which the vefels pafs, do not at all preferve their natural bulk by reafon of their fhrinking up; and as the wet preparations are free from this inconvenience, Mr Sheldon does not hefitate at affigning then a deeided fuperiority over the dry ones.-Sometimes it is neceffary to fix the preparations upon fliff paper or patteboard, on account of their weight after being injected with mereury. The paper or pafteboard on which they are faftened ought to be of various eulours, according to the nature of the preparation, in order to form a proper ground for thowing the lymphatic veffels. Such fmall preparations as are preferved in fpirits, or oil of turpentine, may be kept in bottles welí clofed with ftoppers; and the larger in common apreparation glaffes. Our author deferibes a limple method of fopping the mouths of thefe preparation glaffes, by which means the ftopper is rendered nearly as durable as the glafs itfelf." "In order to exccute it, let the anatomitt take care to lave the upper furface of his bottles made plane, by dellinag the workmen at the glafs-houfe to flatien them in the ma. king. This they will eafily do in forming the round ones, but the flat bottles are attended with confiderable difficulty. 'The light way to make them, I believe, would be to blow them in moulds of various fizes; the workman thould likewife form the bottons of the bottles perfectly flat, that the may ftand upight and fleady. Bottes of this form being provided for the larger preparations, we grind the upper furfaee of them on a plain plate of lead, about a quarter of an inch thick, and two feet in diameter; firlt with fine emery and water, then with powdered rotten flone, or putty firf wet with water and at late dry; fo that the filiface may be reduced to an exact horizontal plane, and of as fine a polifh as plate-glafs. This will foon be done, as the manocuvre requires but little dexterity ; and the anatomit fhould be provided with a confilerable number of thefe glaffes prepared as above directed. To the top of eacla bottle a piecte of plate-glafs, cut by a diamond, is to be adapted fo as completely to cover, but not projuct over, the edge of the bottle. When thefe two fmouth furfaces are put upon each other, with a drop of water between, the attraction of cohefion is ro contiderable, that it requires great force to feparate them."
Many prepaations of the lymplatics, and other parts preferved in botcles, do nor require any frings to fufpend them; particularly when fixed on paftebnard or paper: fuch as require fufpention flould be tied to flrings fised to the preparation below, and to fmall looles diilled in the fubtlanec of the glafs at the botion of the neck; or to fmall bits of glafs that may be fixed on the infide of the fame part. The preparation is thus fufpended in limpid proof malt-fpirit, the bottle being almoft completely filled; the upper and polifhed furface of the bottle, and the plate of glafs, are to be wiptd clean and dry; a drop of folution of gum arabic is to be put on the polifhed furface of the bottle, the top ftrongly and fteadily prefled upon it, fo as to bring the two furfaces into as clofe contact as poffible; after which the bottle is to be placed in a cool airy place to dry. A piece of wet ox-bladder, freed from fat, and loaked in water till it becomes mu-

G $\mathrm{E}_{2}$
cilaginous,

## 1 N I [ 236 7 <br> 1 N K

Injection cilaginous, is then to be placed over the top, the air II Initiat=d. preffed out from between it and the glafs; after which it muft be tied with a pack-thread dipped in the folution of gum arabic. The bladder being cut off neatly moder the laft turn of the thread, is then to be dried, the fring taken cautiouly off, and the top and neck painted with a compofition of lamp, black mixed with japanners gold fize: this fopn drics, and leaves a fine fmooth glufly furface, from which the dirt can at any time be as readily wiped off as from a inirrer. By this method large bottles are as eafily and effectually fecured as fmall ones; and it is fonud to anfwer as weil as the hermetical fealing of glaffes, which in large veffels is altogether impracticable. If the bottoms have any inequalities which prevent them from Itanding the dy, they may be earily made perfectly flat by grinding them with emory on the plate above mentioned. The tops, if well gummed, will even remain perfectly fixel on the glaffes without the bladder: thongh in the common upright ones it may be advíable to put it on as a defence. Our author informs us, that fince his making this difoovery, he has ufed glafs faucurs; with flat tops gummed on. In thefe veffels the preparations, by reaton of their horizontal pofture, appear to great advantage. Thus he has exhibited very early abortions in their membraties, and fome other preparations that cannot be fufpended or viewed conveniently in the perpendicular direction. Some very delicate preparations, particularly thofe intended to be viewed with the microfcope, thofe of the ampullula lacere of Liberkuhn, and of the valves of the abforbents, naly be preferved either in fpirts or dry in tubes clofed in the magner juft mentioned, and will appear to great advantage. Some of the dry ones may alfo be advantagecunty placed in fquare oblong boxes, made of pieces of plate or white glafs neatly gumined together, with narres flips of white or co. toured paper, and the objeets may be conveniently viewed in this manner. With refpect to the ftopper buttes, which are very convenient for holding fmall preparations, our author advifes the Atoppers to be perfectly well ground ; that they pafs rather lower duwn than the neck of the bottle for the convenience of dilling two holes obliquely through the inferior edge of the lubtance of the ftopper, oppofite to each other, for the convenience of fixing theads to hold the fubject; for if the threads pafs tetw en the neek and fopper, a fpace will be left; or if the thopper be well ground, the neck of the bottle will be broken in en. davouring to prels it down. On the other hand, if any fpace be left, the thread, by its capillary attraction, will act from capillary attraction, raife the fpirits from the bottle, and caufe evaporation, which willikewife take place from the clink between the flopper and neck.

INISTIOGE, a polt town of Kilkenny, in the province of Leinfter; $\sigma_{3}$ miles from Dublin. It is alfo a borough, and returns two members to parliament ; patronage in the reprefentative of Sir Willian Fownts. - It has two fairs.

INITIATED, a term properly ufed in fpeaking of the religion of the ancient heathens; where it lignities beng admitted to the participation of the facred myfteries. The word comes from the Latin initiafus, of initiare, initiari; which properly fignifies to begin facrificing, or to receive or admit a perfon to the begin.
ning of the mytteries, or of ceremonies of lefs import- Injung ance.

The ancients never difcovered the deeper myteries of their religion, nor even permitted fome of their temples to beopen, to any but thufe who had been initiated. See Mystery.

INJUNCTION, in law, a writ generally grounded upon an interlocutory order or decree out of the court of chancery or exchequer, fometimes to give poffeffion to the plaintiff, for want of the defenclant's appearance; fumetimes to the king's ordinary court, and lometimes to the court-chritian, to fop proceedings in a caule, upon fuggeltion made, that the rigour of the law, if it take place, is againit equity and confcience in that cafe, that the complainant is not able to make his defence in thefe courts, for want of witneffes, \&c. or that they act erroneoufly, denying him fume juft advantage. The writ of injumetion is directed not only to the party himfelf, but to all and fingular his counfellors, attornies, and folicitors; and if any attorney, after having been ferved with an injunction, proceeds afterwatd contrary to it, the court of chancery will commit the attorney to the Fleet for contempt. But if an injunction be granted by the court of chancery in a criminal matter, the court of king's bench may break it, and protect any that proceed in contempt of $i t$.

INJURY, any wrong done to a man's perfon, reputation, or goods. See Assault.

INK, a black liquor ufed in writing, genetally made of an infufion of gallis, copperas, and gum arabic.

The properties which this liquor ought to have, are, 1. To flow freely from the pen, and link a little into the paper, that the writing be not eafily difcharged. 2. A very deep black colour, which fhould be as deep at firt as at any time afterwards. 3. Durability, fo that the writing may not be fubject to decay by age. 4. Ink fhould be dettitute of any corrofive quality, that it may not deltroy the puper, or go through it in fuch a manner as to render the writing illegible. No kind of ink, however, hath yet appeared which is poffeffed of all thefe qualities. The ink ufed by the ancients was poffefed of the fecond, third, and fourth qualities above-mentioned, but wanted the firt. Dr Lewis thath difcovered its compulition from fome paffages in ancient authors. "Pliny and Vitruvius (lays he) exprefsly mention the preparation of foot, or what we now call lamp-black, and the compofition of writing ink from lanip-black and gum. Diofcorides is more particular, fetting down the propurtions of the two ingredients, viz. three ounces of the font to one of the gum. It feems the mixture was formed into cakes or rolls; which being ditied in the fun, were occationally tempered with water, as the cakes of Indian ink are among us for painting."

In Mr Delaval's Treatife on Colours, p. 37. he acquaints us, that with an infufion of galls and iron filings, he had not only miade an exceejingly black and durable ink, but by its means, without the addition of any acid, dyed filk and woollen cloth of a good and lating black. This kind of ink, however, though the colour is far fuperior to that of any other, hath the inconvenience of being very eafly difclarged, either by the fmalleft quantity of any acid, or even by fimple water ; becaufe it doth not penetrate the paper

## I N K

in fuch a manner as is neceffary to preferse it from the intlantaneons action of the acid or of the water. During the action of the infution of galls upon the iron in making this kind of ink, a very confiderable effervelcence takes place, and a quantity of air is difcharged, the nature of which hath not yet been examined.

The materials ufually employed fur the making of ink ate, cummon green vitriol, or copperas and galls; but almoft all of them are defieient in durability, which is a proputy of fuch importance, that Dr Lewis hath thought tin fubject of ink-making not unworthy of his atterition From expeciments made by that auther, be infers, that the decay of inks is chiefly owing to a deficiency of galls; that the galls are the molt perifhable ingredient, the quantity of thefe, which gives the greatell blacknefo at firfl (which is about equal parts with the virriol), being infufficient to maintain the colou : that, for a durable ink, the quantity of galls cannot be muchlefs than thrce times that of the vitriol; that it cannor be much greater without leffening the blacknefs of the ink: that by diminifhing the quanticy of water, the ink is rendered blacker and more durable; that diftilled water, tain-water, and hatd fpring-water, have the tame effects; that white-wine produces a deeper black colour than water; that the colour produced by vinegar is deeper than that by wine; that prooffpirit extracts only a reddinh brown tinge; that the laft-mentioned tincture finks into, and fpreads upon, the paper; and hence the impropriety of adding ( Ppi rit of wine to ink, as is frequently directed, to prevent mouldinefs or freezing: that other aflingents. as oakbark, billort, floe-bark, \&c. are not fo effectual as galls, nor give fo good a black, the colour produced by molt of thefe, excepting oak-hark, being greenifh : that the juice of floes do not produce a black colour with martial vitriol; but that, neverthelefs, the writing made with it becomes black, and is found to be more durable than common ink : that inks made with faturated folutions of iron in nitrous, marine, or acetous acids, in tartar, or in lemon-juice, were much inferior to the ink made with martial vitriol: that the colour of ink is depraved by adding quicklime, which is done with an intention of dellroying any fuperabundant acid which may be fuppofed to be the caufe of the lofs of the colour of ink: that the heit method of preventing the effeets of this fuperabundant acid is probably by arding piects of iron to engage it ; and that this conjecture is confirmed by an inftance the author had heard, of the great durability of the colour of an ink in which pieces of iron had been long immerfed: and lafty, that a decoction of logwood ufed inftead of water, fenfibly improves both the beauty and deepnefs of the black, without difpofing it to fade. The fame author obferves, that the addition of gum-arabic is not only ufeful, by keeping the colouring matter fufpended in the fluid, but alfo by preventing the ink from fpreading, by which means a greater quantity of it is collected on each Atroke of the pen. Sugar, which is $f$ metimes added to iak, is found to be much lefs effectual than gims, and to have the inconvenience of preventing the drying of the ink. The colour of ink is found to be greatly injured by keeping the ink in veffels made of copper or of tad, and probably of any other metal, cxcepting iron, which the vitriolic acid can difolve.

The foregoing experiments point out for the beft proportions of the ingredients for ink, One part of green vitriol, one part of powderel logwood, and three parts of powdered galls. The belt menflrum appears to be vinegar or white-wine, though for common ufe water is fufficient. If the ink be required to be of a full colour, a quart, or at molt three pints, of liquor, may be allowed to three ounces of galls, and to one ounce of each of the other two ingredients. Half an ounce of gum may be added to each pint of the liquor. The ingredients may be all put together at once in a convenient veffel, and well haken four or five times each day. In 10 or 12 days the ink will be fit for ufe, though it will improve by remaining longer on the ingredients. Or it may be made more expeditioufly, by adding the gu:n and vitriol to a decoction of galls and logwood in the menfrumm To the ink, after it has been feparated from the feculencies, fome coarfe powder of galls, from which the fine duft has been fifted, together with one or two pieces of iron, may be added, by which its durability will be fecured.

In Come attempts made by the Doctor to endow writing ink with the great durability of that of the ancients. as well as the properties which it has at prefent, he firft thought of ufing animal glues, and then of oily matters. " I mixed both lamp.black (rays he) and ivory-black with folution of gum arabic, madeof fuch confifence as jult to flow fufficiently from the pen. The liquors wrote of a fine black colour; but when dry, part of the colour could be runhed off . efpecially in moitt weather, and a pencil dipped in water wafhed it away entirely.
" I tried folutions of the animal-glues with the fame event. IGinglafs or fifh - glue being the mot difficultly diffuluble of thefe kinds of bodies, I made a decoction of it in water, of fuch flrength that the liquor concreted into a jelly bufore it was quite cold : with this jelly, kept fluid hy fufficient heat, I mixed fone ivory-black : characters drawn with this mixture on paper bore rubbing much bettet than the others, but were difcharged without much difficultyby a wet pencil.
" It was now furpected, that the colonr could not be fufficiently fixtd on paper without an oily cement. As oils chemfelves are made mifcible with watery thuids by the intervention of gum, I mised fome of the fofter painters varnifl, after mentiuned, with about half its weight of a thick mucilage of gum arabic, working thein well together in a mortar tiil they united into a fmooth uniform mafs: this was beaten with lamolizek, and fome water added by little and little, the rubbing being continued till the mixture was diluted. to a due confiflence for writing. It wrote freely, and of a full brownifi black colour: the claraCters could not be difcharged by rubbing, but water waned them out, though not near fo readily as any of the foregoing. Inftead of the painters varnuth or boiled oil, I mixed raw linfeed oil in the fame manner with mucilage and lamp-black; and on diluting the mixture with water, obtained an ink not greatiy different from the other.
"Though thefe oily mixtures anfwered better than thofe with iimple gums or gltres, it, was apprehended that their being dilchargeable by water would render them unfit for the puppofes intended. The only way
2.s. if obviating this imperfection appeared to be, hy uifing a paper which hould admit the black liquid to fink a little into its fubfance. Accordingly 1 touk fome of the more finking kinds of paper, and common paper made damp as for printing; and had the fatif. faction to find, that neither the oily nor the fimple gummy mixtures fpread upon them fo much as might have been expected, and that the claracters were as fixed as could be defired, for they could not be wafhed out without rubbing off part of the fubftance of the paper ittelf.
"All thefe inks mult be now and then flirred or fhakeu during the time of ufe, to mix up the black powder, which fettles by degrees to the bottom: thofe with cil muft be well fhaken alfo, though not ufed, once a-day, or at leaft once in three or four days, to keep the oil united with the water and gum; for if once the oil feparates, which it is apt to do by flanding at reit for fome days, it can no longer be mixed with the thin fluid by any agitation. But though this imperfect union of the ingredients renders thefe inks lefs fit for general ufe than thofe commonly employed, I apprehend there are many occafions in which thefe kinds of inconveniences will not be thought to counterbalance the advantage of having witings which we may be affured will be as lafting as the paper they are written upon. Aad indeed the inconvenience may be in a grcat meafure obviated by ufing cotton in the inkfland, which, imbibing the fluid, prevents the feparation of the black powder diffufed through it.
" All the inks, however, made on the principle we are now fpeaking of, can be difcharged by wafhing, unlefs the paper admits them to fink into its fubftance. The ancients were not infenfible of this imperfection; and fometimes endeavoured to obviate it, aacording to Pliny, by ufing vinegar, inftead of water, for tempering the mixture of lamp-black and gum. I tricd vinegar, and found it to be of fome advantage, not as giving any improvement to the cement, but by promoring the finking of the matter into the paper. As this wafhing out of the ink may-be prevented by ufing a kind of paper eafy enougb to be procured, it is fcarcely to be confidered as an imperfection ; and indeed, on other kiuds of paper, it is an imperfection only fo far as it may give occafion to fraud, for none of there inks are in danger of being otlierwife difcharged than by defign. The vitriolic inks themfelves, and thofe of printed books and copperplates, are all dicchargeable; nor can it be expected of the ink-maker to render writings fecure from frauds.

- But a further improvement may yet be made, samely, that of uniting the ancient and modern inks together; or ufing the common vitriolic ink inflead of water, for tempering the ancient mixture of gum and lamp-black. By this method it fhould feen that the writings would have all the durability of thofc of former times, with all the advantage that refults from the vitriolic ink fixing itfelf in the paper. Even where the common vitriolic mixture is depended on for the ink, it may in many cafes be improved by a fmall addition of the ancient compofition, or of the common Indian ink which anfwers the fame purpofe: when ihe vitriolic ink is dilute, and flows fo pale from the pen, that the fine Arokes, on firft writing, are fcarcely vifible, the addition of a litule Indian ink is the readieft
means of givirg it the due blacknefs. By this admixture it may be prefumed alfo that the vitriolic ink will be made more durable, the Indian ink in fome meafure covcring it, and defending it from the action of the air. In all cafes, where Indian ink or other fimilar compofitions are employed, cotton thould be ufed in the inkftand, as already mentioned, to prevent the fettling of the black powder."

Since the invention of printing much lefs attention than formerly has been paid to the making of ink, fo that now the art feems to be in a great meafure loft. This will appear from a comparifon of fome ancient manufcripts with the writings of modern times. It being of the utmult importance, however, that public records, wills, and other valuable papers, which cannot admit of being printed, fhould be written with ink of a durable quality, this inattention feems to have been very culpable, and a reftoration of the méthod of making writing ink a very valuable acquifition. "The neccffity (fays Mr Altle *) of paying greater attention to * Oris this matter may readily be feen, by comparıng the rolls Aliphid and records that have been written from the $15^{\mathrm{ch}}$ Writin century to the end of the 17 th, with the writings we have remaining of various writings from the 5th to the 12 th centuries. Notwithfanding the fuperio: ant quity of the latter, they are in excellent prefervation; hut we frequently find the former, though of more modern date, fo much defaced that they are fcarcely legible."

Our author agrees with Dr Lewis in the opinion that the ancient inks were compofed of foot or ivory black inftead of the galls, copperak, and gums, which form the compofition of ours. Befides their black inks, however, the ancients ufed various nher colours, as red, gold and filver, purple, \&cc. Green ink was frequently ufed in Latin manufcripts, efpecially in the latter ages; and it was frequently employed in fignatures by the guardians of the Greek emperors till their wards were of age. Blue or yellow ink was feldom ufed except in manufcripts; but (fays Mr Aftle) "the yellow has not been much in ufe, as far as we can learn, thefe 600 years." Some kinds of characters, particularly the metallic, were buninihed. Wax was vied by the Latins and Grecks as a parnih, but efpecially by the former, and particularly in the gth century. It continued a long time in vogue.

A treatife upon inks was publifhed by Peter Caniparius profeffor of medicine at Venice; of which an edition was printed at London in 1660 . It is divided into fix parts. The firit treats of inks made from pyrites, Rones, and metals; the fecond of fuch as are made from metals and calces; the third from fouts and vitriols; the fourth of the different kinds of inks ufed by the librarii or book-writers, by printers, and engravers; likewife of faining or writing upon marble, Alucco, or featiolia, and of cncautic modes of writing; alfo of liquids for painting or colouring leather and linen or woollen cloths; reitoring inks that had been decayed by time; together with many methods of effacing writing, reftoring decayed paper, and different modes of fecret writing. The fifth treats of writing inks made in different countries from gums, woods, the juices of plants, $\& \mathrm{c}$. as well as of different kinds of varnifhes. The fixth treats of the different methods of extracting vitriol, and the chemical ufes of it.

Weckerus

## I N K

IFeckerus de Secretis, a treatife printed at Bafil in they were wafhed over with fome kind of varnim, thu'

1612 , contains a number of curious particulars concerning ink. He gives alfo receipts for making gold and filver inks, compofed both with thefe metals and without them; directions for making inks for fecret writing, and for defacing them; though in this latt part there are many particulars bordering too nuch on the marvellous.

In the Philofophical Tranfactions for $1787, \mathrm{Dr}$ Blag. den gives forme account of a method of reltnring decayed inks fo as to render them legible. His experiments originated from a converfation with Mr Alle already quoted, on the quettion whether the inks made eight or ten centuries ago, and which are found to have preferved their colonr very well, were made of the fame materiats now employed or not? In order to decide the queftion, Mr Aftle fum nited the Doctor with fcveral manuferipts on parchment and vellum from the 9 th to the 15 th centurics incluively. Some of thefe were ftill very black; others of different fiades, from a deep yellowifh brown to a very pale yellow, in fome parts fo faint that it cotld fcarcely be feen. This was tried with fimple and phlogitlicated alkalies, the mineral acids, and infurion of galls. From thefe ex. periments it appeared that the ink anciently employed was of the fame nature as at prefent: the letters turned of a reddith or yellowith hrown with alkalies became pale, and were at lergeth obliterated by the dilute minerat acids. The drop of acid liquor, which had been put upnn a letter, changed to a deep blue or green on the addition of phlngiticated alkali ; with an infufion of galls, in fome cafes the letters acquired a deep tinge, in others a night one. "Hence (fays the Doctor) it is evident, that one of the ingredients was irnn, which there is no reafon to dou't was joined with the vitriolic acid; and the colons of the more perfect MSS. which in fome was a deep black, and in others a purplifh black, together with the reficution of that colour in thofe which had loot it by the infufion of galls, fufficiently proved that another of the ingredients was aftringent matter, which from hiftory appears to have been that of galls. No trace of a black pigment of any fort was difcovered; the drop of acid, which had completely extracted a letter, appearing of an uniform pale and ferruginous colour, without an atom of black powder, or other extraneous matter floating in it."

As this account differs very materially from the former extracted from Mr Aftle's writings, fo the reafon given for the continuance of the colour differs no lefs. This, according to Dr Blagden, "feems to depend very much on a better preparation of the material upon which the writing was made, namely the parchment or vellum; the blackeft letters bcing generally thofe which had funk into it the deepert. Some degree of effervefcence was commonly to be perceived when acids were in contadl with the furface of thefe old vellums. I was led, however, to fufpect, that the ancient inks contained rather a lefs proportion of iron than the more modern; for, in general, the tinge of coloar produced by the pblogifficated alkali in the acid laid upon them, feemed lefs deep; which, however, might depend in part upon the length of time they had been Ecpt: and perhaps more gum was ufed in them, or not fuch as gave any glofs."

Among the fpecimcne with which our author was favoured by Mr Aftle, there was one which differed very materially from the ieft. it was faid to be a ma. nufcript of the 15 th century: the letters were of a full engroffing hand, angular without any fine flrokea, brnad, and very black. None of the chemical folvents above mentioned feemed to produce any effect. Mort or them feemed rather in make the letters blacker, probably by cleaning the furface; and the acids, after having been rubbed Atrongly upon the letters, did not Arike any deeper tinge with the phlogilticated alkali. Nothing could obliterate thefe but what took off patt of the vellum ; when fmall rolls of a dirty matter were to be perceived. "It is therefore enque!!ionable (fays the Ductor) that no iron was ufed in this ink; and. from its refillance to the chemical folvents, as well as a certain clotted appearance in the letters when examined clofely, and in fome places a flight degree of glofs. I have little doubt that they were formed of a footy or carbonaceous powder and oil, probably fome. thing like ourprefent printer's ink; and am not without furpicion that they were aEvally printed."

On examinint this MS. more fully, our author was convinced that it was really a part of a very ancient printed book. In confidering the methods of reftoring the legibility of decayed writings, our author obferves, that perhaps one of the belt may be to join phlo, ifticated alkali with the calx of iron which remains; becaufe the precipitate formed by thefe two fubtances greatly exceeds that of the iron alone. On this fubject Dr Blagden difagrees with Mr Bergmann; but to bring the matter to a teit, the following experiments were made.
r. The phlngificated alkali was rubbed in different quantities upon the bare writing. This, in general, produced little effect though, in a few inflances, it gave a bluifh tinge to the letters, and increafed theis intenfity; " probably (fays the Doctor) where fomething of in acid nature had contributed to the dimint. tion of their colour." 2. By adding, befides the alkali, a dilute mineral acid to the writing, our anthor found his expectations fully anfwered; the letters then changing quickly to a very ceep and beautiful blue. It is but of liztle confequence whether the acid or phlogillicated alkali be firfl added; though upon farther confideration the Doctor inclined to begin with the alkali. The reafon is, that when the alkali is firt put on, the colour feems to fpread lefs, and thus not to hurt the legitility of the writing fo much as would otherwife be done. His method is to fpread the alkali thin over the writing with a feather, then to touch it as gently as poffible upon or nearly over the letters with the diluted acid by means of a Seather or bit of Aick cut to a blunt point. The moment that the acid liquor is applied, the letters turn to a fine bluc, beyond comparifon flronger than the original trace of the letter; and by applying a bit of blotting-paper to fuck up the fuperfluous liquid, we may in a great meafure avoid the flaining of the parchment : for it is this. fuperfluous liquor which, abforbing part of the colouring matter from the letters, becomes a dye to what ever it touches. Care ought, however, to be takens

## I N K

Ink. not to allow the blotting paper to come in contae with the letters, becanfe the colouring matter may eafily be rubbed off while foft and wet. Any one of the three mineral acids will anfwer the purpofe effectually: Dr Blagden commonly ufes the marine. But whichever of the three is ufed, it ought to be diluted fo far as not to be in danger of corroding the parchment ; after which the degree of ttrength feems not to be a matter of great nicety.

Another method of reftoring the legibility of old writings is by wetting them with an infufion of galls in white wine : but this is fubject to the fame inconvenience with the former and is befides lefs efficacious. The Doctor is of opinion that the acid of the galls by itfelf would be better for the purpofe than the infufton of the whole fubftance of them; and he thinks alfo that a preferable kind of phlogitticated alkali might be prepared either by purifying the common kind from iron as much as poffible, or by making ufe of the volatile alkali in!tead of the fixed Mr Aftle mentions a method of reftoring the legibility of decayed writings; but fays that it ought not to be hazarded left a fufpicion of deceit fhould arife.

In the Monthly Review of this volume of the Tranfactions, we find a method propofed of preventing ink from decaying, which feems very likely to anfwer the parpofe. It confifts in wafhing over the paper to be written upon with the colouring matter of Prulfian blue, which will not deprave it in colour, or any other refpect. By writing upon it with common ink afterwards, a ground of Pruffian blue is formed under every ftroke; and this remains flrong after the black has been decayed by the weather, or deftroyed by acids. Thus the ink will bear a larger proportion of vitriol at frlt, and will have the advantage of looking blaçker when firf written.

Indian $I_{N K}$, a valuable black for water-colours, brought from China and other parts of the Ealt Indies, fometimes in large rolls, but more commonly in fmall quaurangular cakes, and generally marked with Chinefe characters. Dr Lewis, from experiments made on this fubftance, hath fhown that it is compofed of fine lamp-black and animal-glue : and accordingly, for the preparation of it, he defires us to mix the lampblack with as much melted glue as is fufficient to give it a tenacity proper for being made into cakes; and thefe when dry, he tells us, anfwered as well as thofe imported fiom the Eaft Indies, both with regard to the colour and the freedom of working. Ivory black, and other charcoal blacks, levigated to a great degree of finenefs, anfwered as well as the lamp black; but in the ftate in which ivory-black is commonly fuld, it proved much too gritty, and leparated too hattily from the water.

Printing $I_{N K}$, is totally different from Indian ink, or that made ufe of in writing. It is an oily compofition, of the confiftence of an ointnient: the me. thod of preparing it was long kept a feeret by thofe whofe employment it was to make it, and who were in. terefted in concealing it; and even yet is but imperfectly known. The properties of good printing-ink
are, to work clean and eafily, without daubing the types, or tearing the paper; to have a fine black colour; to wafh eafily off the types; to dry foon; and to preferve its colour, without turning brown." This latt, which is a moft neceffary property, is effectually obtained by fetting fire to the oil with which the printing ink is made for a few moments, and then extinguifhing it by covering the veffel (A). It is made to wafh eafily off the types, by ufing foap as an ingredient; and its working elean depends on its having a proper degree of Arength, which is given by a certain addition of rofin. A good deal, however, depends on the proportion of the ingredients to cach other ; for if too much foap is added, the ink will work very foul, and daub the types to a great degree. The fame thing will happen from ufing too much black, at the fame time that both the foap and black hinder the ink from drying; while too much oil and rofin tear the paper, and hinder it from wafhing off.--The following receipt has been found to make printing ink of a tolerable good quality. " Take a Scots pint of linfeed oil, and fet it over a pretty brifk fire in an iron or copper veffel capable of holding three or four times as much. When it boils ftrongly, and emits a thick fmoke, kindle it with a piece of paper, and immediately take the ver. fel off the fire. Let the oil burn for ahout a minute; then extinguifh it by covering the veffel. after it has grown pretty cool, add two pounds of black rolin, and one pound of hard foap cut into thin flices. If the oil is very hot when the foap is added, almoft the whole mixture will run over the veffel. The mixture is then to be fet again over the fire; and when the ingredients are thoroughly melted, a pound of lampblack, previoufly put through a lawn fieve, is to be firred into it. The whole ought then to be ground on a marble ftone, or in a mill like the levigating mill defcribed under the article Cemistry, n ${ }^{\circ} 599 . "$

Though the above receipt is greatly fuperior to any that hath been hitherto publifhed, all of which are capitally deficient in not mentioning the necef: fary ingredients of rofin and foap; yet it muft be acknowledged, that ink made in this manner is inferior in point of colour, and is likewife more apt to daub the types and make an indiftinct imprelfion, than fuch as is prepared by fome of thofe who make the manufacture of this commodity their employment ; fo that either a variation in the proportion of the ingredients, a nicety in the mixture, or fome additional ingredient, feems neceffary to bring it to the requifite perfection.

INK for the Rolling Prefs, is made of lintfeed oil burut in the fame manner as that for common printingink, and then mixed with Fiancfort-black, and tincly grourd. There are no certain proportions which can be determined in this kind of ink; every workman adding oil or black to his ink as he thinks proper, in order to make it fuit his own talte.-Some, however, mix a portion of common boiled oil, which has never been burnt: but this muft neceffarily be a bad practice, as foch oil is apt to go through the paper; a fault very common in priats, cfpecially if the paper No 186.
(A) This is mentioned by Dr Lewis in his Philofophical Commerce of Arts; but he feems not to have been acquainted with the method of giving it the other neceflary properties.

## 1 N K

is not rery thick. No foap is added; becaufe the
ink is not cleared off from the copperplates with alkaline ley as in common printing, but with a bruh dipped in oil.

Ink is alfo an appellation given to any coloured liquor ufed in writing, whether red, yellow, green, \&c. Many different kinds of thefe inks may be prepared by the directions given under the article Co-cour-Making, which it would be fuperfluous here to repeat.

Sympatbetic $I_{N K}$, a liquor with which a perfon may write, and yct nothing appear on the paper after it is dry, till fome other means are ufed, fuch as holding the paper to the fire, rubbing it over with fome other liquor, \&ec.

Thefe kinds of ink may be divided into feven claffes, and that with refpect to the means ufed to make them vifible ; viz. I. Such as become viâble by paffing another liquor over them, or by expofing them to the vapour of that liquar. 2. Thofe that do not appear fo long as they are kept clofe, but foon become vifible on being expofed to the air. 3. Such as appear by trewing or fifting fome very tine powder of any colour over them. 4. Thofe which beeome vifible by being expofed to the fire. 5. Such as become vifible by heat, but difappear again by cold or the moitture of the air. 6. Thofe which bccome vifible by being wetted with water. 7. Sucl as appear of various colouss, red, yellow, blue, \&c.
I. The firt clafs contains four kinds of ink, viz. folutions of lead, bifmuth, gold, and green vitriol. The firt two become vifible in the fame manner, viz. ty the contact of fulphureous liquids or fumes. For the frit, a folution of common fugar-of lead in watcr will anfwer as well as more troublefome preparations. If you write with this folution with a clean pen, the writing when dry will be totally invifible: but if it be wetted with a folution of bepar fulphuris, or of orpiment, diffolved by means of quick-lime; or if it be expofed to the flrong vapours of thefe folutions, but efpecially to the vapour of volatile tincture of fulphur; the writing will appear of a brown colour, more or lefs deep according to the Atrength of the fulphureous fume. By the fame means, what is wrote with the folution of bifmuth in fpirit of nitre will appear of a deep black.

The fympathetic ink prepared from gold depends on the property by which that metal precipitates from its folvent on the addition of a folution of tin. If yous write with a folution of gold in aqua regia, and let the paper dry gently in the flade, nothing will appear for the firlt feven or eight hours. Dip a pencil or a frall fine fponge in the folution of tin, and drawing it lighty over the invifible characters, they will immediately appear, of a purple colour.

Characters wrote with a folution of grcen vitriol carefully depurated, will likewife be invifible when the paper is dry; but if wetted with an infufion of galls, they will immediately appear as if wrote with common ink. If, intead of this infufion, a folution of the phlogifticated alkali, impregnated with the colouring -matter Pruffian blue is made up of, the writing will appear of a very deep blue.
11. To the fecond clafs belong the folutions of all thofe metals which are apt to attract phlogitton from Vol, IX, Part I.
the air, fuch as lead, bifmuth, filver, \&c. The fyrspathetic ink of gold already mentioned belongs alfo to this clafs; for if the characters wrote with it are long expofed to the air, they become by degrees of a deep violet colour, nearly approaching to black. In like manner, characters wrote with a folution of filver in aquafortis are invifible when newly dried, but being expofed to the fun, appear of a grey colour like flate. To this elafs alfo bclong fulutions of lead in vinegar: copper in aquafortis; tin in aqua regia; emery, and fome kinds of pyrites, in fpirit of falt ; mercury in aquafortis; or iron, in vinegar. Each of thele has a particular colour when expofed to the air; but they have the difagreeable property of corroding the paper. fo that after fome time the characters appear like holes cut out of the paper.
III. The third clafo of fympathetic inks contains fuch liquids as have fome kind of glutinous vifcofity, and at the fame time are long a drying; by which means, though the eye cannot difcern the charakers wrote with them upon paper, the powders ftrewed upon them immediately adhere, and thus make the writing become vifible. Of this kind are urine, milk, the juices of fome vegetables, weak folutions of the deliquefecit falts, \&c.
IV. This clafs, comprehending all thofe that become vifible by being expofed to the fire, is very extenfive, as it contains all thofe colourlefs liquids in which the matter diffolved is capable of being reduced, or of reducing the paper, into a fort of charcoal by a fmall heat. A very eafily procured ink of this kind is oil of vitriol diluted with as much water as will prevent it from corroding the paper. Letters wrote with this fuid are perfectly invifible when dry, but intantly appear as black as if wrote with the fineft ink on being held near the fire. Juice of lemons or onions, a folution of fal-ammoniac, green vitriol, \&xc. will anfwer the fame purpofe, though not fo eafily, or with fo little heat.

V . The fifth clafs comprehends only folutions of regulus of cobalt in fpirit of falt; for the properties of which, fee Chemistry, ${ }^{\circ} 822$.
VI. This clafs comprelends fuch inks as become vifible when characters wrote with them are wetted with water. They are made of all fuch fubilances as depofit a copious fediment when mixed with water, diffolving only imperfectly in that fluid. Of this kind are dried alum, fugar of lead, vitricl, \&c. We have therefore only to write with a flrong folution of thefe faits upon paper, and the characters will be invifible when dry ; but when we apply water, the fmall portion of dried falt cannot again be difiolved in the water. Hence the infoluble part becomes vifible on the paper, and fhows the characters wrote in white, grey, brown, or any other colour which the precipitate affumes.

V1I. CharaEters may be made to appear of a fine crimfon, purple, or yellow, by writing on paper with folution of tin in aqua regia, and then paffing over it a pencil dipt in a decoction of cochineal, Brazil-wood, logwood, yellow wood, \&c.-For an account of the nature of all thefe fympathetic ink: however, and the principles on which they are made, fee the articles Сhemistry and Colour-Muking, pa/fim.

## I N N [ 242 ] I N N

red, grey, yellow, or black, colour, containing a quantity of native martial vitriol, whence they derive the property of making ink, and from thence their name. They are almoft entirely foluble in water, and beficies their other ingredients, contain alfo a portion of copper and zinc.
tRIS-Stone. See Moon-Sione.
INLAND, a name for any part of a country at a diffance from the fea.

Inland Navigation. See Canal and (Inland) Navigation.
Incazio Trade, that kind of trade carried on between the different parts of the fame kingdom, whether over land, or by means of inland navigation.
inlaying. See Veneering, Mosaic, and Marcuetry.

INLEASED, in our old writers, fignifies entangled or enfnared. It is ufed in the champion's oath.
inlisting, in a military fenfe. See Listing.
INMATES, fuch perfons as are admitted for their money, to live in the fame houfe or cottage with another man, in difterent rooms, but going in at the fame door; being ufually fuppofed to be poor, and not able to maintain a whole houfe themfelves. Thefe are inquirable in a enurt-leet. - No owner or occupier of a cottage flall fuffer any inmates therein, or more families than one to inhabit there, on pain of forfeiting tos. per month to the lord of the leet.

INN, a place appointed for the entertainment and relief of travellers.

Inns are lieerfed and regulated by juftices of the peace, who oblige the landlord to enter into recognizances for keeping good order. If a perfon who keeps a common inn, refufes to receive a traveller into his houfe as a gueit, or to find him victuals and lodging on his tendering a reafonable price for them, he is liable to an action of damages, and may be indicted and
fold by ima-kcepers, according to our ancient laws, may be affified: and inn-keepers not Felling their hay, oats, beans, \&c. and all manner of victuals at reafonable prices, withour taking any thing for litter, may he fined and imprifoned, \&c. by 2 I Jac. I. c. 2 t. Where an inn-keeper harbours thieves, perfons of infamous chara Ger, or fuffers any diforders in his houfe, or fets up a new inn where there is no need of one, to the hindrance of ancient and well governed inns, he is indictable and fineable: and by tatute, fuch inn snay be fuppueffed. Action upon the cafe lies againtt any inn-keeper, if a theft be committed on his gueft by a fervant of the inn, or any other perfon not belonging to the gueft; though it is otherwife where the fruet is not a traveller, but one of the fame town or village, for there the inn-kceper is not chargeable; nor is the maller of a private tavern anfwerable for a robbery committed on his guelt : it is faid, that even tho' the travelling gueft does not deliver his goods, \&c. into the inn-keeper's poffeffion, yet if they are ftolen, he is chargeable. An inn-keeper is not anfwerable for any thing out of his inn, but only for fuch as are within it; yet, where he of his own accord puts the gueft's horfe to grafs, and the horfe is folen, he is anfwerable, he not having the gueft's orders for putting fuch horfe to grafs. The inn-keeper may juftify
the flopping of the horfe, or other thing of his gueft, for his reckoning, and may retain the fanue till it be paid. Where a perfon brings his horfe to an inn, and leaves him in the flable, the inn-keeper may detain him till fuch time as the owner pays for his keeping ; and if the horfe eats out as much as he is worth, after a reafonable appraifement made, he may fell the horle and pay himfelf: but when a guef brings feveral horfes to an inn, and afterwards takes them all away ex. cept oue, this horfe fo left may not be fuld for payment of the debt for the others; for every horfe is to be fold, only to make fatisfaction for what is due for his own meat.

Inns. Our colleges of municipal or common lawo profeflors and fiudents, are called inns: the old Englifh word for houfes of moblemen, bifhops, and others of extraordinary note, being of the fame fignification with the French word botel.

InNs of Court are fo called, as fome tbink, becaufe the Itudents there are to ferve and attend the courts of judicature; or clfe, becaufe anciently thefe colleges received none but the fons of noblemen, and better fort of gentlemer, who were here to be qualified to ferve the king in his court ; as Fortefcue affirms. And, in his time, he fays, there were about 2000 fudents in the inns of court and chancery, all of whom were filii nobilium, or gentlemen born. But this cultom has gradually fallen into difufe; fo that in the reign of queen Elizabeth, Sir Edward Coke does not reckon above 1000 ftudents, and the number at prefent is very confiderably lefs; for which judge Blackftone afligns the following reafons. 1. Becaufe the inns of chancery, being now almoft totally filled by the inferior branches of the profeffion, are ncither commodious nor proper for the refort of gentiemen of any rank or figure; fo that there are very rarely any young fudents entered at the inns of chancery. 2. Becaufe in the inns of eourt all forts of regiraen and academical fuperintendence, either with regard to morals or Itudies, are found impracticable, and therefore entirely neglected. Laftly, becaufe perfons of birth and fortune, after having finifhed their ufual courfes at the univerfities, have feldom leifure or refolution fufficient to enter upon a new feheme of fudy at a new place of inflruction; wherefore few gentlemen now refort to the inns of court, but fuch for whom the knowledge of practice is abfolutely neceffary in fuch as are intended for the profeflion.

Our inns of court, jully famed for the production of men of learning in the law, are governed by mafters, principals, benchers, flewards, and other officers : and have publie halls for exercifes, readings, \&c. which the Audents are ohliged to attend and perform for a certain number of years, before thcy can be admitted to plead at the bar. Thefe focieties have not, however, any judicial authority over their members; but inftead of this they have certain orders among themfelves, which have by confent the force of laws. For lighter offences perfuns are only excommoned, or put out of commons; for greater, they lofe their chambers, and are expelled the college; and when once expelled out of one fociety, they are never received by any of the others. The gentlemen in thefe focities may be divided into benchers, utter-barrilters, inner-barrifers, and ludents.

## I N N [ 243 ] I N N

The four principal inns of court, are the Inner Temple and Middle Temple, heretofore the dwelling of the Kinights Templars, purehafed by fome profeffors of the common law about 300 years ago ; Lincoln's Inn, and Gray's Inn, anciently belonging to the earls of Lincoln and Gray. The other inns are the two Serjeants Inns.
lans of Chancery were probably fo called, becaufe anciently inhabited by fuch clerks as chiefly ftudied the forming of writs, which regularly belonged to the curfitors, who are officers of chancery.
The firtt of theie is Thavies Inn, begun in the reign of Edward III. and fince purchafed by the fociety of Lineoln's Inn. Befide this, we have New Inn, Symond's Jnn, Clement's [nn, Clifford's Inn, anciently the houfe of the Lord Clifford; Staple Inn, belonging to the merchants of the ftaple ; Lion's Inn, anciently a common inn with the fign of the lion; Furnival's Inn, and Bernard's Inn.

Thefe were heretofore preparatory colleges for younger ftudents; and many were entered here, before they were admitted into the inns of court. Now they are moflly taken up by attornies, folieitors, \&c.

They all belong to fome of the inns of court, who formerly ufed to fend yearly fome of their barrifters to read to them.

INNATE Ideas, thofe fuppofed to be famped on the mind, from the firlt moment of its exiftence, and which it conllantly brings into the world with it: a dočrine which Mr Locke has taken great pains to refute.

INNERKEITHING. See Inverkfithing.
inNerlochy. See Inverlochy and Fort.
Willam.
INNTS. See Inch.
inNisclochran, or the Stoney Island, an inand in Lough Ree, in the river Shannon, between the counties of Welt meath and Rofcommon, at which place a monaftery was founded by St Dermod, about the beginning of the Gth century.

INNISFAlL (derived from hiis Bheal, that is, "the illand of Bheal"), one of the ancient names of Ireland, fo denominated from Beal, the principal object of adoration among the ancient inhabitants of the Britifh ifles. Innisfail has heen erroneoufly tranflated the Ifand of $D_{e} f$ finy, as Bheal was fumetimes taken for Fate or Providence.

INNISFALLEN, an ifand in the lake of Killarney, in the county of Kerry and province of Munfler: in it are the ruins of a very ancient religious houfe, founded by St Finian, the patron faint of thefe parts, and to him the cathedral of Agladoe is allo dedicated. The remains of this athey are very extenfive, its fituation romantic and retired. Upon the diffolution of religious houfes, the poffeffions of this abbey were granted to Captain Robert Coflam. The ifland contains about 12 acres, is agreeably wooded, and has a rinmber of fruit trees. St Finian flouriked about the middle of the Sth eentury; he was firnamed in Irifh Loóbar, his father's name was Conail the fon of Efchond; defcended from Kian the fon of Alild, king of MunAter. There was formerly a ehronicle kept in this abbey, which is frequently cited by Sir J. Ware and other antiquaries under the title of the Annals of $I n$ misfallcn. They contain a Reetch of univerfal hitory,
from the creation of the world to the year 430 or Inninanthereahouts, bnt from thence the annalift has amply enough profeeuted the affairs of Ireland down to liis own times. He lived to the year 1215. Sir J. Ware had a copy of them, whereof there is an imporfect tranfcript among the MSS. of the library of TrinityCollege, Dublin. They were continued by another hand to the year 1320. Bifhop Nicholfon, in his Irifh hiftorical library, informs us, that the duke of Chandos had a complete copy of them down to 1320 in his poffeffion. Thefe annals tell us, that in the year 1180 , the abbey, which had at that time all the gold and filver and richeft goods of the whole country depofited in it, as the place of greateft fecurity, was plundered by Mildwin fon of Daniel O'Donoghoe, as was alfo the church of Ardfert, and many perfons were flain in the very cemetery by the M•Cartys; but God, as it is faid in this chronicle, punifhed this impiety by the untimely end of fo:ne of the authors of it.

INNISHANNON, a town in the county of Cork and province of Munfter, 134 miles from Dublin; fituated on the river Bandon, fix miles from Kinfale. Here is a charter fehool for above 30 boys. The linen manufacture has been much encouraged by the late Mr Adderly. The river is navigable to Collier's quay, about half a mile below the place. On the welt fide of the town is a ftone bridge. This place was formerly walled, and of fome note, as appears by the foundations of feveral eafles and large buildings difcovered in it. The town of Innifhannon, together with its ferry, were granted to Philip de Barry by Hen. V. by letters patent, amo 1412 . It has two fuirs.

INNISHIRKAN, an ifland fituated between Cape Clear Ifland and Baltimose Bay, in the county of Cork and province of Munfter. In this iflanit hood the cattle of Dunelong, poffeffed by the O'Drifcolls, which was furrendered after the defeat of the Spaniards to Captain Hervey on 23 d Feb . sGo2. There was afterwards a regular Sortification erected on part of the ifland, which was garrifoned in Queen Ann's time, but it has been for feveral ycars ditmantled; about a mile to the fouth are the remains of an ancient abbey, founded 1460, for Franeifcans, by Florence O'Drifcoll. This ifand has very good land, and is vally preferable to that of Cape Clear iflands. To the nort hweft of Innifhirkan illand lies Hare inland, a large fruitful fpot; and near ic are four finall inands called the Scbermes: alfo along the coatt, in the following order from eaft to weit, are Horfe inland, contzining 100 acres; Cafle ifland, containing 19 acres; Long ifland, containing 316 acres; and welt of all thefe is a fmall fpot called Goat inand. All thefe illands, together with the adjacent coaft, produce large crops of fine Englifh barley.

INNISKILLING, a borough, market, fair, and polt town of Ireland, in the county of Fermanach and province of Ultte, lying between three lakes. It is about $2+$ miles eaft of Ballyfhannon, and i9 north-welt of Dublin. It fends two members to parliament ; patron Lord Innifkilling; this place giving title of vifcount to the family of Cole. Its inhabitants diftiuguifhed themfelves in feveral confiderable engagcments in the wars of Ireland at the revolution, out of which a regiment of dragoons, bearin the title of the Innifilleners, was moflly formed. They form the 6 th regi-

Innnenots ment of dragoons in the Britifh army. It has a barDay rack for three companies of fuot. tion.

INNOCENT's DAY, a feltival of the Chrifian cburch, obferved on December 28 th, in memory of
the maffacre of the innocent children by the command of Hurod king of Judæa. See Fesu's Chrifl; and Jews, $115^{\circ} 2+$ par. ult. The Greek church in their kalendar, and rlue Abyfinians of Ethiopia in their offices, commemorate 14,000 infants on this occafion.

INNUENDO (ef innuo "I nod or beckon"), is a word frcquently ufed in writs, declarations, and pleadings, to afcertain a perfon or thing which was named, but left doubtful, before: as, he (innuendo the plaintiff) dic fo and fo: neention being before made of another perfon. - In common converfation or writiog, an innuendo denetes an oblique bint or difant eferenc:, in contraditinction to a direct and politive charge.

INO (fao. hint.), a óaughter of Cadmus and Harmunia, who nurfed Bacchus. She married Athamas king of 'Thebes, after he had divorced Nephele, by whium he had two children Phryxus and Helle. Ino became mother of Mflicerta and Learchus; and foon conceived an implacatle hatred againt the childen of Nephele, became they were to afeend the throne in preference to her own. Phryxus and Helle were intormed of Ino's machinations, and they efcaped to Colchis on a golden ram. Juno, zealous of Ino's profperity, refolved to diturb her peace; and more particularly becaufe fhe was of the defcendants of her greatelt enemy, Venus. Tifiphone was fent by order of Juno to the houfe of Athamas; and the filled the whole palace with fuch fury, that Athamas taking Ino to be a lioncfs and her children whelps, purfued her and dathed her fon Learchus againtt a wall. Ino eicaped from the fury of her hufoand; and from a high rock the threw herfelf into the fea with Melicerta in her arms. The gods pitied her fate; and Neptune made her a fea deity, wbich was afterwards called Leucothoe. Melicerta became alfo a fea god, known by the name of Palemon.

INOA, feftivals in memory of Ino, celebrated yearly with fperts and facrifices at Corinth. An anniverfary facrifice was alfo offered to lno at Megara, where fhe was firft worhipped under the name of Leucothoe. -. Another in Laconia, in honour of the fame. It was ufual at the celebration to throw cakes of flour into a pond, which if they funk were prefages of profperity, but if they fwam on the furface of the waters they were inaufpicious and very unlucky.

INOCARPUS, in botany: A genus of the monogynia order, belonging to the decandria clafs of plants. The coolla is funnel-fhaped; the calyx bifid; the Hamina are placed in a double feries; the fruit is a monofpermous plum.

INOCULATION, or BUDDING, in gardening, is commonly prachifed upon all forts of flone fruit; as nectarines, feaches, apricots, plums, cherries, as alío upon oranges and jafmines : and indeed this is preferable to any fort of grafting for molt forts of fruit. The method of performing it is as follows: You muit ve provided with a Marp pen-krife with a flat haft, which is to raife the bark of the ftock to admit the bud; and fome found tafs-mat, which mould be foaked in water, to increale its thength, and render it more gijable: then laving taken of the cuttings from the
you would propagate, you mut choofe a fmooth hocu part of the flock, about five or fix inches above the furface of the ground, if defigned for dwarfs; but if for tlandards, they fhould be budded fix feet aboveground. Then with your knife make an horizontal cut acrofs the rind of the fock, and from the middle of that cut make a hit downwards, two inches in length, that it may be in the form of a $T$; but you mult he careful not to cut too deep, lef you wound the fock: then having cut off the leaf from the bud,
 crofs eut, about half an inch below the eye, and with your knife llit off the bud, with part of the wood to it : this done, you mult with your knife pull off that part of the wood which was taken with the bud, obferving whether the eye of the bud be left to it or not ; for all thofe buds which lofe their eyes in tirip. ping, are good for nothing: then having gently raifed the bark of the ftock with the flat laft of your penknife clear to the wood, thru't the bud therein, obferving to place it fmooth between the rind and wood of the flack, cutting off any part of the rind belongin5 to the bud that may be toolong for the ilit made in the flock; and fo having exactly fitted the bud to the Atock, tie them clofely runnd with bafj-mat, beginning at the under part of the flit, and lo procteding to the top. taking care not to bind round the eye of the bud, which fhould be left open.

When ycur buds have been inoculated three weeks or a month, thofe which are frcth and plump you may be fure are joined ; and at this time you thould loofen the bandage, which if it be not done in time, will in. jure if not deltroy the bud. The March following cat off the Aock noping, about three inches above th: bud, and to what is left fatten the thoot which proceeds from the bud: but this muft continue no longer than one year; after which the fuck mut be cut ofi clufe above the bud. The time for inoculating is from the middle of June to the middle of Augult: but the moft general rule is, when you obferve the buds formed at the extremity of the fam: year's focot, which is a fign of their having fiaithed their fpringgrowth. The firlt fort commonly inoculated is the apricot; and the laft the orange tree, which thould never be done till the latter end of Augult. And in doing chis work, you thould always make choice of cloudy weather; for if it be done in the middle of the day, when the weather is hot, the thoots will perfpire So faft, as to leave the buds deftitute of moiture.

Inoculation, in a phyfical fenfe, is ufed for thetraniplantation of diftempers from one fubject to another, particularly for the engrafement of the fmatl. pox; which, though of ancient ufe in the Eaftern countries, is but a modern practice among us, at leat under the direction of art.

It is well obferved by the Baron Dimflale, that accident hath furnifued the art of medicine with many valuable lints, and fome of its greatef improvements have been received from the hands of ignorance and barbarifm. This truth is remarkably exemplified in the practice of inoculation of the fmall-pox: but to the honour of the Britifh phyficians, they meafured net the value of this praciice by the meanaefs of its origin, but by its real importance and utility; they patronifed a barbarous difeovery vith no lefs zeal and
affection than if it had been their own. Indeed the whole nation might be faid to have adopted the practice; for the greatelt encouraged it by becoming examplee, and the wiffet were determined by the general event of the method.

As to the origin of the art of inoculating the frallpox, as well as the time and place in which it was performed, they are equally unknown to all by whom the practice is adopted. Accident probably gave rife to it. Pylatini fays, that among the Turks it was not attended to except amongit the meaner fort. Dr Ruffel informs us in the Philofophical Tranfactious, vol. 1viii. P. $14^{2}$ that no mention is made of it by any of the an. cient Arabian medical writers that are known in Europe; and the phyficians who are natives in and about Arabia, affert, that nothing is to be found regarding it in any of thofe of a more modern dasp. He farther fays, that he engaged fome of his learned Turkih friends to make enquiry ; but they did noi difcover any thing on this fubject of inoculation either in the writings of phy ficians, hiftorians, or poets. Until the beginning of the 18 th century, all the accounts we have of inoculating the fmall-pox are mercly traditional. The filence on this fubject, obfuved amongt writers in the countries where the practice obtained, Dr Ruffel fuppofes, with great probability, to be ow. ing to the phylicians there never countenancing or engaging in it. It is alfo remarkable, that before Py larini's letter to the Royal Society in 1701 , nor jet for feveral years after, this practice is not noticed by any of the moft inquiftive travellers. On this Dr Ruf. fit very juflly obferves, that cuftoms, the moit common in diftant countries, are often the lealt apt to attract the obfervation of travellers, who, engaged in other purfuits, mult be irdebted to accident for the knowIedge of fuch things as the natives feldom talk of, upon the belief that they are known to all the world.

The firft acconts we have in the learned world concerring inoculation, are from two Italian phyficians, viz. Py larini and Timoni, whofe letters on the fi:bject may be feen in the Philofoph. Tranf. abr. vol. v. P. $37 \mathrm{C}, 8 \mathrm{c}$. The firl is dated A. D. 1701 ; the next is dated A. D. 1713. Whether our inquiries are extended abroad or confined to our own country, inoculation hath been practifed under one mode or other time immemorial; in Great Britain and its adjacent ints we have well authenticated accounts, exiending farther backward than any from the continent. Dr Williams of Haverfordweit, who wrote upon inocuta. tion in 1725 , proves, that it had been practifed in Wales, though in a form fomewhat dificent, time out of mind. Mr Wighlt, a furgeon in the fame plact, fays, that buying the fmall pox is both a common practice, and of long tanding in that neighbourhood. He fays, that in Pembrokehire there are two large villages near the harbour of Milford, more famous for this cuftom than any other, viz. St Ifhnael's and Marlois. The old inhabitants of thefe villages fay, that it hath been a common practice; and that one William Allen of St Ihmatl's, who in 5723 was go years of age, declared to fome perfons of good fenfe and integrity, that this practice was uled ali his time; that he vell remembered his mother telling hin, that it was a common practice all her time, and that the got the
fmall pox that way ; fo that at lealt we go back 160 years or more.

Inocula.
In the Highlands of Scotland and fome of the adjacent ifles, Dr Alexander Monro fenior informs us, that the cuifom through ages paft hath been, to put their children to bed with thofe who laboured under a favourable fmall-pox, and to tie worlled threads abnut their childrens wrifts, after having drawn them through variolous puftules.

According to the refult of Di Ruffel's inquiries, the Arabians affert, that the inoculation of the fmallpox has been the common cultom of their ancellors, and that they have no durbt of its being as ancient as the difeafe itfelf. It is renarkable, that buying the frnall. pox is the name univesfally applied in all countries to the method of procuring the difeafe: it is true that there are other terms; but in Whales and Arabia, as well as many other countries, this is the ufual appellation. From the famenefs of the name, and the little diverfity obfervable in the manner of performing the operation, it is probable that the practice of inoculation in thefe countries was originally derived from the fame fource. From its cxtenfive fpread, it is probably of great antiquity too.
In the year 1717, Lady Mary Wortley Montague, wife of the Englin ambafiador at Conftantinople, had her fon inoculated there at the age of fix years; he had but few putules, and foon recovered. In April ${ }^{\mathrm{t}} 7^{21}$, iroculation was fuccefofully tried on feven condemned criminals in London, by permiffion of his majefty. In 1722, Lady Mary Wortley Montague had a daughter of fix yearz old inoculated in this ifland; foon after which, the children of the royal family that had not had the fmall-pox were inoculated with fuc. cels; then followed fome of the nobility, and the practice foon prevailed. And here we date the commencement of inoculation under the direction of art.

From the example of the royal family in England, the practice was adopted in Germany, particularly in. Hanover, and its adjacent countries.

After Mr Maitland had fucceeded with thofe he had inoculated in and about London, he introcuced the practice into Scotland in the year 7206 .

Swedu foon followed the example of the Britifh. Ruffia lately engaged one of our principal promaters and improvers of this art. And now there are not many countries that do not more or lefs practife it.

Different Mgalks of Inocvlatiov. The practice of inoculation having ittained in every part of the world. it may be grateful, at leaft to curiofity, to have a general acconat of the different modes that are and have been adopted in that practice.

Inocuiation witb the blood of variolons patients hath been tried without effeet: the variolous natter only produces the variokous difeafe.

The application of the variolous matter takes place in a fentible part only; the activity of the virus is fuch, that the fmaileft atom, though imperceptible to any of our fenfes, conveys the difeafe as well as the largelt quantity. Hence the moit ubvious method is the prick of a needle or the point of a lancet dipped in the matter of a variolous pultule.

Cotton or thread is ufed, that is previoufly rubhed with powiered variolons fabs; this thread is draws

## I N O [ 246 ] N O

Inoculd - with a needle through the cutis, but not left in. This tion. is the method in fome parts of the Eaf Indies. The

Indians pafs the thread on the outtide of the hand, between any of the fingers, or between the fore-finger and thumb. The Treffalian wenen inoculate in the forehead and chin.

Some abrade the fcarf.fkin, and rub in the powdered dry fcabs which fall from the pultules of patients with the fmall pox.

Many of the Greek women make an oblique puncture with a needle, on the middle of the top of the forthead, on each cheek, the chin, each metacarpus, and each metatarfus ; then drop in each a little of the pus jult taken warm from a patient, and brought in a fervant's bofom. Others in Greece make feveral little wounds with a necdle in one, two, or more places, in the Rkin, till fome drops of blood enfue; then the operator pours a drop of warm pus frefh from a puitule, and mixes it with the blood as it iffues out; then the wound is covered by fome with a bandage, by others with half a walnut fhell placed with its concave fide over each orifice.

The Chinefe convey a pellet of variolated cotton, with the addition of a little mufk, intn the nolirils of the patient ; they collect dry pufules, and keep them in a porcelain bottle well corked; and when they inoculate, they mix a grain of mulk with three or four grains of the dry fcales, and roll them in cotton. This metlood may be called inodoration.

About Bengal, in the Eatt Indies, the perfon who intends to be inoculated, having found a houfe where there is a good fort of the fmall-pox, goes to the bed of the fick perfon, if he is old enough; or if a child, to one of his relations, and fpeaks to him as follows: "I am come to buy the fmall-pox." The anfwer is, "Buy if you pleafe." A fum of money is accordingly given, and one, three, or five puifules, for the number mult always be odd, and not exceeding five, extracted whole, and full of matter. Thefe arc immediately rubbed on the fikin of the outfide of the land between the forefinger and the thumb; and this fuffices to produce the difeafe. The fame cuftom obtains in Algiers, Tunis, Tripuli, and other countries.

Very fimilar to the cuftom amongft the people about Bengal, \&c. is that in Arabia, where on fome flefhy part they make feveral punctures with a needle imbrued in variolous matter, taken from a pultule of a favourable kind. Here they buy the fmall-pox too, as follows: the child to be inoculated carries a few raifins, dates, fugar-plums, or fuch like; and flanwing them to the child from whom the matter is to be taken, afks how many poeks he will give in exchange? The bargain being made, they proceed to the cperation; but this buying, though alill continued, is not thought neceffary to the fuccefs of the operation. The Arabs fay that any flefly part is proper; but generally they infert the matter between the fure-finger and thumb on the outfice of the hand.

The Georgians infert the matter on the fore-arm.
The Armenians introduce the matter on the two thighs. In Wales the practice may be termed infriction of the fmall-pox. There fome of the dry puftules are procured by purchafe, and are rubbed hard upon the naked arm or leg.

The practice in fome places is to prick the fkin be-
tween fome of the fingers by means of two fmall needlea joined to one another; and after having rubbed a little of the matter on the fpot, a circle is made by means of feveral punctures of the bignefs of a cominon puftule, and matter is again rubbed over it. "Tlie operation is finithed by drefling the wound with lint.-Another cufton is to mix a little of the variolous matter with fugar, and give it to be drank in any agreeable liquor.

Incitions have been made in the arms and legs, and thread, cotton, or lint, previoully dipped in the variolous matter, was lodged in them. The practice of fome is to bathe the feet in warm water, and then fecure lint dipped in the variolous matter on the inttep, or other part of the foot, where the fkin is thin. Othcrs apply a fmall blitering plafker; and when the fcarf- fk in is clevated and flipped off, the variolous matter is applied to the furface of the true fkin, and confined there by a little lint or plafter. Scratching the fkin with a pin or needle, and then rubbing the part with lint, previouny dipped in variolous matter, is the cultom in fome places.

In the Highlands of Scotland they rub fome part of the fkin with freth matter, or dip worted in variolous matter, and tie it about the childrens wrifts. They obferve, that if frefh matter is appled a few days fucceffively, the infection is more certain than by one application.

Objections to Inoculation anfewered. I. "It is not lawful."

In anfwer to this, the Scriptures afk, Is it lawful to fave life, or to dellroy it? Luke vi. 9. And as it is a difficulty with many ferious people, whether to admit of this practice or not, this objection Mould be confidered in a religious view. We thould in this cafe reinember, that as the fall of man brought the danger of difeafes into the world, fo to evade, oppofe, or deftroy it, is not only his right, but duty, if in his power. And if events imply the caufe, a long rum of uninterrupted fuccefs implies an efficacious remedy. Though fome die under this management, it is fufficient to prove the lawfulnefs of a remedy, that it is proper for and has by experience been found in molt cafes effectual to the end for which it was ufed. When danger furrounds us, no conduct is more proper than to inquire into and purfuc the means of efcape. To neglect our fafety is to fiuk below the brutes, who by inltiner avoid the evils to which they are expofed. Inoculation is a means of faving life in many inflances, and of moderating the feverity of afliction in more. Wilfully then to neglect the means of faving life is to be guiliy of murder.
11. "It is bringing a diftemper on ourfelves, and fo ufurping the facred prerogative of God."

1. As to the firli part of this objection, if by diAtempers are meant ficknefs and pain, that is practifed daily in other inflances, in concurrence with the Scripture dictate, viz. of two evils choofe the leall. But the fuppofition of objectors in this inflance is not altogether true. Fut by inoculation, a difeafe is not properly faid to be communicated. It only excites and frees us from onc, which, though latent, is alleady in us: or (which in effect is the fame) inoculation, by an advantageous mode of infecting, \&c. frces the patierit in all inflances from the ufual difficulties of the difeafe;

## I $\mathrm{N} \quad \mathrm{O}$

faves the life of moft who fubmit to it; and with the naturai fmall-pox it defroys that difpofition in the body, without which the dileafe cannot take place. It is owned that fome hazard attends it: it is fometimes mortal, and indeed it is fit it fhould be fo: it is generally fuccefsful, that encourages us to proceed: it lometimes, though rarely fails; hence we are cautious and careful, and led to act with a dependence on Him to whom belong the iffues from death.
2. Refpecting the offence given to God ; a reliance en Providence does not imply that we are not to prevent or oppofe the evils which we forefee, and which we have in our power to guard againlt by prudent precautions. Would thefe objectors, in other inflances, rffule the means of leffening the malignancy and danger of difeafe, than which the practice of inoculation is no more? Let thefe ferupulous perfons fay, whether, when God permits the difcovery of preferving ourfelves from an impending cvil, he forbids our availing ourfelves of that difeovery? If our Maker offers us a remedy, it is offending him to reject it.
III. "The decrees of God have fised the commif. fion of every difeafe, and our precautions cannot prevent what he hath determined."

However tuse it is that our days are determined, Sce. yet it is God's revealed will, and not his fecret purpofes, which we are to regard as the rule of duty. God has required of us to have a tender regard to our lives; and thofe who difobey him herein are guilty of a degree of felf-murder, and will never be aequitted of that guilt by the fecret determination of Heaven concerning them. Befides, God who has ordained the end, has alfo determined the means leading to it. St Paul, in his dangerous royage, had a fpecial revelation to affure him, that all who were with him fhould efeape; and yet when the feamen were getting out of the hip, he declares that if they did not flay in it they conld not be faved, Acts xxvii. 31. God purpofed to preferve them in the way whereby they wercafterwards delivered.
IV. "We fhould not do evil that good may come."

If inceulation is in its own nature a moral evil, it certainly fhould be rejected, however great its advantages may feem to be. The profpect of relief froms any calamity in life thould not tempt us to offend God. Bet thofe who make this objection proceed on a miftake. Their principle is true with regard to moral evil, but is not fo when applied to phyfiol. It is certainly lawful to pull down a houfe to fave a great number from being burnt ; this is a phylical evil, which can hardly take place without fome degree of moral evil; and many other inflances may be pointed out, where, for a gieater good, a leffer ill is fubmitted to. And is the fnall ill induced by inoculation to be conpared with all thofe evils which are tolerated and authorifed by all laws ?
V. "The patient may die ; and then his laft moments are difteffed, and the future reflections of his friends are griewous."

This objection leads many to decline the practice of inoculation, even when they allow the theory of it to be reafonable. They hope to efcape the diftemper in the natural way, and they have fears of dying in this; and thus they are prevented from going into it. But they fhould confider what grounds they have for either the one or the other, and what is to be advanced to
balance the account, by examining the different degrees of probability that attend their hopes and fears in the ufe or neglect of inoculation. Dying is a ferious thing : but if inoculation be a probable and lawful means of preferving life in a sime of danger, it is a duty to comply with it ; and what more praceful reflection than to die in the way of duty?
VI. "Fear is a dangerous paffion in the fmall-pox; but inoculation increafes the caufes of fear, by leffen. ing our faith and trult in God."
When the fmall-pox is left to mature, fuch are its
ravages, that not to fear would be to fink beneath ravages, that not to fear would be to fink beneath humanity: its confequences are too grievous to be treated with neglect. But experience manifelts the fafety that attends receiving the difeafe by inoculation; it is therefore fo far a remedy to that jult fear which enhances the danger when the difeafe is left to itfelf. As to faith in Gud, none is defirable but that which is agreeable to the Scripture; and a difregard to calamities and dangers is never the effect of that.
Inceulation is a means of fafety; and it is as ra. Incculation is a means of fafety; and it is as rational 10 conclude, that our lives fhould be preferved without eating and drinking, as that we fhall be delivered from danger without a prudent care for our own
fafety. We are to depend on the cart of Providence vered from danger without a prudent care for our own
fafety. We are to depend on the cart of Providence only in the way of duty. To boalt of courage and trult in God, while we omit the means of efcaping danger which furrounds us, is not faith, but prefumption. Thes, when inoculation becomes a probable means by which to fave life, it is a prefumption, and not truit, to meglect it.
VII. "Inoculation does not exempt from future in. fection."
If by inoculation of the fmall-pox the fame difeafe is produced, the fame effeets may be expected from it when artificially produced as in the natural way. It is inconceivable, that a contagious fubtance, the very feminal matter of the fmall-pox, fhould propagate, inftad of its own, another difeafe. De Haen is an a. cute phyfician, and was a violent oppoler of inoculating the finall-pox; but he never fuppofed that the matter of the fmall-pox will produce any difeafe but itfelf. Obfervation alone determined the opinion, that the natural fnall-pox does not attack a fecond time: the natural mall-pox does not attack a fecond time:
the fame tlarids good in favour of the artifcial difeafe. And to this numberlefs trials have been made without
effect, to reinfect thofe in whom the frall-pox had A nd to this numberlefs trials have been made without
effect, to reinfect thofe in whom the fmall-pox had taken place by inoculation.
VIII. "Other difeafes are communicnted with the matter of the fmall-pox, by inoculating it."

That cartlefinefs or wilfulnefs in the operator may in fome inftances give caule for this objection is true ; but that by the matier, of a varioluus puttule, any other difeafe hath been conveyed, is yet to be proved. As the confuent and malignant fmall-pox have not yet been obferved to produce their own degree and mode
of this diftemper when infufed by inoculation, it is been obferved to produce their own degree and mode
of this diftemper when infufed by inoculation, it is foarcely conceiveable that they fhould tranfmit another difeafe effentially different. The vencreal difeafe is known to be as communicable as any; yet feveral have been inoculated from patients labouring under confiderable degrees of the venereal difeafe, and no ill confequences ever yet were known to follow, none to give
the leaft fufpicion of the kind. If the variolous matfequences ever yet were known to follow, none to give-
the leaft fufpicion of the kind. If the variolous mattet may convey another difeafe in the artificial, it may matter of the fmall-pox will produce any difeafe but
$\qquad$

[^9]$\qquad$
$\square$
$\qquad$

$\qquad$
do the fame in the natural way; and cven then, advantage is attendant on inoculation, for we can choofe a healthy perfon to take the infection from; but no inftance of the kind hath ever occurred.
IX. "Perlaps the difeafe may never attack in the natural way."
Such objectors thould be informed, that this dittemper cannot be given to one who never would have it ; for they only who are fufceptible of it can take it by inoculation, as is evident from numerous experiments made to verify this fac. Again, the fmall pox may be faid to be general; fo few there are who are exempted from it, that they can hardly be confidered as an ex. ceftion to the gencral law: it is thercfore worth while to inoculate, firft, to afcertain the fafety of the individual from the difeafe; and, fecondly, on account of the general advantages of this practice, in cale he thould be fufceptible of the infection. On this fubject Dr Jurin hath inferted an ingenious paper in the Philofophical Tranfactions; in which he obferves, that it is difficult to afcertain the exact number who die without laving the frall pox ; but that, of all the children that are born, there will fome time or other die of the finall pox one in fourteen; and that of perfons of all ages taken ill of the fmall-pox, there will die thereby tue in tleven. From a table of burials it appears, that in Edinburgh and St Cuthbert's parifh, during ten years, about one-tenth of the dead were killed by the fmall pox. Farther, as it cannot be known that any individual is exempted from the fmall-pox, his hazard of dying of that diftemper, being made up of the hagard of having it, and the hazard of dying of it if he has it, will be exactly the fame, viz. that of one in eight or nine (whether the proportion of mankind that
eficape having the fmall-pox be great or finall). In efcape laving the fmall-pox be great or finall). In inquiry from houfe to houfc for the number of people with the fnall pox, in feveral towns, during one year, it appeared that near one in five died who had them; and that of eighty two perfons who were inoculaied in thefe places in the fame year, not one died.
X. "It requires much thought to know what we mould do with regard to inoculation."

Not to dwell on the abfurdity of this objection, and of complaining that confideration is a burden when it is neceflary for the prefervation of life, it may fuffice to point out, that a facred writer tells us, that "a prudent man forefeetl the evil, and lideth himfelf; but fools pais on and are punifhed."
XI. "It endangers others."

Since very few of mankind now efcape the fmallpox, it mult fooner or later come to every place; therfore, if it he true in fact that a much greater num. ber lofe their lives by the natual than by the artificial infection, it is of more fervice to introduce the fmallpox in a favourable way and feafon, than paffively to allow it to deftroy multitudes. As to fpreading the difeafe by introducing inoculation, it is but of little confequence; for inoculating where the difeafe does not already exill, is difierently circumftanced from this practice, whert it already prevails in the natural way; the quantity of the circunambient contagion is leits, or the fame extent of atmofphere is lefs impregnated with the infectious principles from inoculated patients, than when it naturally prevails, or the fame number of people received it in the natural way.

NS 167.

## I N O

The noof plaufible objector on this account is Dr Raft, of Lyons, in France. From his revicw of the bills of mortality in and about London, he obferves, "that more have died by the fmall-pox in London, fince the introduction of inoculation, than in the fame time preceding that period, in confequence of the difeafe thereby being more univerfally extended and propagated." But to this, Dr Lettfom moft fatiffactorily replieध, "That the late increale of burials cannot depend upon the practice of inoculation, under which, though it is a rare thing to hear of a fatal cafe, but rather upon the innovation introduced in the treatment of the natural fmall-pox of expoling the patients to the open air, and a lefs referved intercourfe among the community. Add to this the improvements in medicine in various inftances, the police of the city, \&c. which by preferving many lives occafion more fubjects for the fmall-pox, and confequently a proportional increafe of deaths by this difeafe, many of thofe who are preferved by the above named improvements not being favoured with the advantage of inoculation. Befides the care taken in and about London to prevent inconvenience from inoculation, $\& \mathrm{cc}$. it fhould be remembered, that the increafing acceffion of young perfons to the capital from the country, eafily accounts for the increafe of 19 deaths in 1000 more than formerly happened." See a Defence of Inoculation, in Dr Lett fom's Medical Memoirs.
XII. "The practice of inoculation comes from the devil."

The beft anfwers to this feem to be, firt, that cavillers will never ceafe from objecting; and oppofitions will be made as long as there are men of wit to devife, or of fophillry to invent. Secondly, that Job was aflicted by the devil with the fmall-pox, is not a known fact. Thirdly, that if by what is faid the principal objections are removed, it is hoped that the reafonable and the religious will be enabled to approve themfelves to God in the practice of inoculation. See a difcuffion of moft of the preceding objections in an excellent pamphlet, entitled, " Inoculation impartially confidered, and proved to be confiftent with Reafon and Revelation," by the Rev. Mr David Some, purblifhed by Dr. Doddridge in 1750 .

Adrantages of Inoculation. Though no difeafe, after it is formed, baffles the powers of medicine more than the fmall-pox, yet more may be done before-hand to render this difeafe favouable than in any other we know. The artificial method of producing the fmallpox hath almoft ftripped it of its terrors ; in general, hath rendered its afpect mild, its progrefs uniform, and nearly without hazard to the patient.

Mr Mudge, in his Differtation on the inoculated Small-pox, enumerates the following fources of danger from this difeafe, viz. I. The patient's conflitution. 2. The propenfity of the patient to be infected. 3. The manner or mode of the infection being comnunicated. 4. The conltitution of the air at the time of infection. And it is the advantage of inoculation, if prudently conducted, alnoft totally to exempt its fubjects from the difadvantages attendant on thefe fouices.

1. "Refpecting the habit of body, or tate of the patient's cortlitution at the time of infection."

Conti-

Contitutional or habitual difeafes, in general, do not interfere with the courfe of the fmall-pox, whether in its natural or its artificial progrefs; fuch as fcorbutic eruptions on the fkin, Arumons complaints, itch, fcabby eruptions, excoriated ears, \&c. The variolous poifon is therefore a thing fui generis, and noways affected by thefe taints of the juices, or what is ufually called a bad habit of body ; or at leaft fo inconfiderably, as not to deprive fuch patients of any of the advantages of inoculation. But the cafe is much reverfed with refpect to fome accidntal difeafes. E. gr. If on the attack of the fmall-pox, the habit or its attending circumftances tend to inflammation, or, on the contrary, to a putrid acrimony, the eruptive fever in thefe aggravated ftates will load the body with variolous matter, or produce puftules of a very unfavourable kind ; in either of thefe cafes (not to enumerate more) the patient will moft probably be fevertly affected But inoculated fubjects may be infected when the couflitution is in the beft condition to combat with the difeale ; if either of thofe indifpofitions are attendant, or any other which ufually endangers, they may foon be reftrained or removed.
2. "The different degrees of propenfity in the pasient, at different times, to be infected."

That different quantities of matter are produced in different perfons in the procefs of the difeafe, we find true in fact ; and there is the ftrongelt reafon to bclieve, that, previous to infection, the quantity of the variolons matter, or rather that principle in the conftitution which eventually produces it, ehbs and flows, is more or lefs vigorous at different times in the fame fubject, under various combinations of circumftances. The inflances are not uncommon, where the patient who bath withfood at one time all the ordinary means of infection, nay, who hath indutlrioully, but ineffectually, fought it; yet at another hath had a fmall-pox fo malignant in appearace and effect, that the whole body hath betn converted into an offenfive variolous putrefence. If the degree of propenfity to receive infection was always the fame, it would be inconceivable that any one could pars unaffected when the fmall pox became epidemic. From whatever caufes, however, this propenfity may arife, it is moft reafonable to affert, that the increafe or decieafe of this principle takes place according as the fmall-pox is epidemic or not. During the continuance of any contagious epidemic difeafe, we always find that thofe conttitutions which are moft congenial with that character, are peculiarly obnoxious to the correfpondent diftemper. And we may reafonably conclude, that when the confitution of a perfon not patt the fmall-pox is mon faturated with the variolous principle, he is then more particularly fubject to infestion. Again, it is not only undoubted, that the variolous principle fubfitts in the confitutions of perfons not paft the fmall-pox, but it is more than probable that a part of this principle is produced by the eruptive fever, and the reft of the wariolous procefs. Agreeably to what hath been faid, we find, that during the epidemic tendency, thofe who have not paffed the difeafe, are more open to contagion than in other conftitutions of air, when the fnallpox is not epidemic, and is confequently a rare difeale. Many who have efcaped infection from inoculation and other means of contagion, on removal into a fituation

Vol. IX. Part I.
where the fmall-pox has been epidemic, have prefently after been feized with this diforder. Events of this kind are fo common, as to have given rife to the ill grounded opinion, that any change of air is hazardous to thofe who have not had the fmall pox. If at a time when the propenfity to be affected is the greateft, there floould be a concurrence of thofe flates of the conftitution above noticed, how aggravated will the condition of the patient be!

Refpecting the evalion of thefe inconveniences by inoculation, is is tu be oblerved, that as the propenfity to the difeafe differs at different times in the fame fubject, it is reafonable to fuppofe that the difurder is produced by downight violence, when there fubfifts in the patient but little of that peculiarity of conflitution fo effential to the production of the difeafe (and fo general, when the farall pox is epidemical), or, in cther words, when the body is indifpoied to be poifoned. This confideration, peculiar to the difeafe when artificially produced, appears to be the true caufe of the fmall quantity of pocky matter, and that general fcarcity of puftules, when compared to the natural fmall-pox, which has ever accompanied inocultution, and is one of the grand advantages of the difcovery. Farther, as it is very rafonable to fuppofe, that this picpenfity is the greatel when there is an epidemic conflitution of the air which favours the production of the difeafe; and if it be as probable that the feverity cir mildnefs of the difeafe depends in a good degree upora the greater or leffer propenfity of the fubject to be infreted; it will certainly be an eligible ftep not to bring. on the diforder by inoculation during the continuance. of an evidently prevailing tendency to the difeafe. Prudence in this cafe directs us to take advantage of the abfence of fuch a prevailing tendency, when all: the benefits of inoculution may be fecured; and not to delay the operation, till fuch a con!litution of air prevails, as at once makes the operation neceffary, and deprives it of fome of its advantages. To conclude, we may add to this confideration, that by the practice of expofure to cold, the violence of the cruptive fever is fo far moderated, as to prevent its forming an additional quantity of variolous matter, which, in a violent and unreftrained Atate, it would do, by afimilating the juices of the conititution into the nature of the variolous poifon.
3. "The manner or mode of the infection being". communicated."

In the natural fmall-pox, the difeafe may be produced by accidental contagion, or an epidemic influence. Dr Mad fays, that the air of this climate never produces the plague, fmall. pox, or meafies; and Dr Arbuthnot fays, that the plague itfelf may be generated by fome quality in the air, without any contagion. Be thele opinions as they may, it is evidentthat contagion is fometimes fo languid, that it requires. the agency of other caufes to give it activity, fo as to produce the tribe of difeafes to which it belongs, and. which without this agency would never be brought forth; and though the ftrongeft epidemic tendency. may not in Eúrope create the fmall pox, without the concurrence of contagious fomes, yet there is, by the agency of the former, fuch an alteration made, and. prupenfity brought on the animal juices, as is effen-. tially neceffary to continue the exiftence of the difeafe.

Varialoz3:
innculs.
sion.
"trocu's Variolous contagion prodnces its effects by the actual tion.
application of its poifon, cither externally, through the medium of the fkin; or internalls, to the gullet,
flomach, and guts, in the act of deglutition; or laftly, to the lungs, in the act of refpiration. Though there may be a poffible admiffion of the poifonous miafmata into the conftitution through the flin, from the principle of abforption; yet the poifon very feldom, if ever, exerts its influence upon the habit in this manner: poffibly by a local actual application of the grofs matter lodged in the cluaths, or otherwife conveyed, the diftemper may fometimes be produced by a kind of inoculation, and then the diforder will probably be favourable. But when the poifon, in a more dilute ttate, ooly floats in or impregnates the air, it feldom enters the pores of the fikin and poilons by way of abforption; for the degrees of activity in which this power is exerted, are molt probably in proportion to the aids the conftitution may ftand in nced of from it. However, it is more than probable that the ordinary mode of infection is by the lungs, which from their fructure shey are well calculated to receive, to entangle, and to retain. When either the lungs or the fomach are firft infested by the infectious eflluvia, it is mof reafonable to believe, that thefe nuble parts, together with the §auces, glottis, wind-pipe, and gullet, will frequently labcur under a greater load of puitules than the external furface of the body: for it is obferved, that when the patient is infected artificialty, the parts to which the poifon is applied fuffer in a greater degiee than the more dilant; and that the circumjacent finn, to fome extent, is filled with puitules. From this particular application of the morbid matter to the fauces, $\& \mathrm{cc}$. it is probable, that the large difcharge of Saliva, \&cc. ariles, which characterizes the conflsent fmall-pox in adults; and as children fwallow this faliva, it excites a diarrluea, which in them anfwers to the : Spitting in thofe more aged. When the internal parts are oppreffed with puftules, there is no interval between the enptive and the fulfoquent fymptomatic fever; and the fuffering which the patient labours under from a gencrally inflamed finin, lecightened by the difcafed condition of the nobler parts, perpetuates the firt fever. This informs us that all is not fo well within as otherwife the external appearances might lave induced us to believe; but that the nohler parts are rendered unfit for the purpofes of life, at leaft are labouring and lagging behind in the procefs, fo that they hate not kept pace with the apparent flate of the difeafe en the furface of the body: this fome have fuppofed to be the true general canfe of the fecondary fever, under which the patient, if he finks, dies peripneunoonic. Thefe confequences frequently atterd the infection received in the natural way; and if, fuperadded to the fe, the unlappy fituation of thofe defcribed under the firlt and fecond fources of danger attends the patient, the diforder will be proportionably aggravated, and the chance of life leffened.
But here again inoculation relieves: for by this mode the virus is applied to the external furface of the body, fo that the whole conflitution (exeepting the part immediate:y furrounding the wound) bcing afected uni :formly, the procefs of the difeafe is regulaly carried on; and the nobler parts not being particularly affect-
their furface, have no diftrefs to prochaina by a fecondaty fever, which therefore is fcarcely ever feen in ino. culated patients.
4. "The confitution of the air at the time of in. fection."

A powerful fource of difficulty and danger in the natural fmall pox is, the malignant influence of the air at fome feafons, and particularly if it happens at the time of receiving the inferion. If this concurs with one or more of the other fources, how dreadful the devaltation! Whether this conllitution of the air pro. duces its deleterious eflects by heightening the natural malignity of the infecting poifon, or acts on the confitution itfelf fo as to render the effects of contagion mere peculiarly fatal, the confequence of this flate of the air is the fanie. The general characters of a morbid flate of the air are the inlammatory and putid; and it is uniformly obferved, that whenever a perfon is attacked with a fever under either of thefe prevailing difputitions, it never fails to imprefs its character upon the diftefe.

But here alfo inoculation affords the mof benign influence. The judicious practitiuner does not expofe his patient to the pernicious cffects of an air that can llamp its bancful character on the fmall-pox, but choofes the feafon befl calculated for the fafety and welfare of his patient; and hence we rarely fee the influence of this evil fource attendant on the artificial difeafe.

Having feen, that from the influence of one or more of thefe four fources of difficulty and danger, and that from their union will refult a natural fmall-pox, complicated with horrors not lefs to be dreaded than the plague; how ineftimable mult appear that favour of Providence, by which we are freed from the formidable attendants of this difeafe, viz. inoculution, by which the diforder is rendered mild, and in general lefs hazardous than a common cold!

From attention to the above foarces of ill in the natural fmall-pox, we perceive with fufficient fatisfaction the many inftances of relief and fecurity which generally we avail ourfelves of by inoculation; a part of which we lave feen, and a few others follow.

1. As already obferved, it faves the lives of moft who are its fubjects. From a gencral calculation it appears, that in the hofpitals for fmall. pox and inocuhation, $7=$ dic out of 400 patients having the diftemper in the natural way, and only one out of this number when inoculated. 2. It leffens the afliction from both the degree and the number of ill fymptoms, even when it proves fatal. It leffens the number of puftules; and, by moderating the virulence of the difeafe, the marks on the face are not fo deep. 3. It is extremely rare that the fecondary fever aitends in; a fymptom productive of much fuflicring, if the patient is happy enough to efcape with hife. 4. It produces the difeafe under the feweft difadvantages, and favours with forefight to prevent many ills not to be guarded againt in the natural fmall-pos. 5. Intead of communicating other diforders with it, many diforiers fublequent to the natural are very rarely obferve.' after the artificial fmall pox. 6. It effctually removes all juft grounds of fear; a paffion very injurious in this difeafes

## I N C $[25 \mathrm{r}] \quad \mathrm{I} \mathrm{N}$ S

diteafe. 7. Soldiers, failors, alud all who would appear abıoad, or in public officee, are freed from every ansiety and hazard attendant on the natural fmall-pos. 8. Servants, women with cbildren at their brealfs, pregnant wo:zen, magiflates, phyiicians, \&c. are all freed from the moft dilitefing embarrafinent, by conformity to inoculation. See Medicine.

INOSCULATION, in antatomy; the fame with Anastomosis.
in:Promptud. or Impromptu. See Impromptu.
INOUEST, in Scots law, the fame with Jury.
INQUISITION, in the church of Rome, a tribunal in feveral Roman Catholic countries, erected Ey the popes for the examination and punifhment of heretics.

This court was founded in the 12 th century by fasher Dominic and his followers, who were fent by Pope Introcent III. with orders to excite the Catholic princes and people to extirpate heretics, to fearch into their number and quality, and to tranfmit a faithful account thereof to Rome. Hence they were called inquifitors ; and this gave birtl to the formidable tribunal of the ir:quifition, which was received in all Italy and the doniniuns of Spain, except the kingdom of Naples and the Low Countries.

This diabolical tribunal takes cognizance of herefy, Judaifm, Mahometanifm, Sodomy, and polygamy; and the people fland in fo much fear of it, that parents deliver up their children, hulbands their wives, and manters their fervants, to its officers, without daring in the leall to murmur. The prifoners are kept for a leng time, till they themfelves turn their own accufers, and declare the caufe of their imprifonment; for they are neither told their crime nor confronted with wirnefes. As foon as they are imprifoned, their friends go into mourning, and fpwak of them as dead, not daring to folicit their pardon, left they fhould be brought in as accomplices. When there is no flacow of proof againt the pretended criminal, he is difcharged, after fuftering the mott cruel tortures, a tedious and dreadful imprifonment, and the It fs of the greatett part of his effects. The fentence againt the prifoners is pronounced pullicly, and with extraordinary folemnity. In Portugal, they erect a theatre capable of holding 3000 perfons; in which they place a rich altar, and raife feats .1 each fide in the furm of an amphitheatre. There the prifoners are placed; and over-againt them is a high chair, whither they are called, one by one, to hear their doom, from one of the inquifiturs.

Thefe unhappy people know what they are to fuf. fer by the clothes they wear that day. Thore who appear in their own clothes are difchàrged upon payenent of a fine: thofe who have a fauto benito, or ftrait yellow coat without fleeves, charged with St Andrew's crofs, have their lives, but forfeit all their effects : thofe who have the refemblance of flames, made of red ferge, fewed upon their fanto benito, with. out any crofs, are pardoned, bet threatened to be burnt if ever they relaple: but thofe who, befides thefe flames, have on their fanto benito their own picture, farrounded with figures of devils, are condemned is expire in the flames. The inquifitors, who are ecclefiatics, do not pronounce the fentence of death; but form and read an ant, in which they fay, that
the criminal being convited of fuch a crime, by his fufcribes ovn confeffion, is with mucli reluctance delivered to the fecular power to be puiflhed according to his demerits: and this writing they give to the feven judges who attend at the right fide of the altar, who immediately pals fentence. For the conclufion of this horrid feene, fee Act of Faith.

INSCRIBED, in geometry. A figure is faid to be infcribed in another, when all its augics touch the fide or planes of the other figure.

INSCRIPTION, a title or writing affixed to any thing, to give fome farther knowledge of it , or to tranf. mit fome importari truth to pofterity.
Antiquaries are very curious in examining ancient infcriptions found on flones and other monuments of antiquity. Sanc.roniathon, contemporary, as it is faid, with Gideon, drew moll of the memoirs whereof his hiftory is compofed, from infcriptions which he found in temples and on column, both among the Heathens. and the Htbrews.
It appears, indeed, that the ancients engraved upon pillars the principles of fciences, as well as the hittory of the world. Thofe mentioned by Herodotus fhow, that this was the firf way of inftructing people, and of tranfmitting hifories and fciences to polterity. This is confirmed by Plato in his Hippias; wherein he fays, that Pififtratus engraved on thone-pillars precepts ufeful for hubandmen. Pliny affurcs us, that the firt public monuments were made of plates of lead; and that the treaties of confederacy concluded between the Romans and the Jews were written upon plates of brafs; that (fays he) the Jews might have fomething to put them in mind of the peace and confederacy concluded with the Romans. The Greeks and Romans were great dealers in infcriptions, and were extremely fond of being mentioncd in them: and hence it is, that we find fo many in thofe countries of ancient learning, that large volumes have been compofed as the collection of Gruter, \&\&. Since Gruter's collection, Th. Reinefius has compiled another huge volume of irferiptions. M. Fabretty puislihed another volume at Rome in 1609, wherein he has corrected abundance of errors which had efcaped Gruter, Reinefius, and other antiquaries, \&c. and added a great number of inferiptions omitted by them.-Since all thefe, Grevius has publifed a complete collection of inferiptions, in three volumes folio.

INSCRUTABLE, Unsearchable, in theology, is ufually underfood of the fecrets of Providence, and the judgments of God, which cannot be found out, or into which human reafon cannot penetrate.

## Academy of Inscriptions. See Aeademy.

INSECTS, insecta, in natural hiltory, a fmaller fort of animals, coinmonly fuppoied to be exfanguious; and ditinguifhed by certain incifures, cuttings, or indentings in their bodies. The word is originally Latin, formed of in, and feco "I cut;" the reafon of which is, that in fome of this tribe, as ants, the body feems to be cut or divided into two; or becaufe the bodies of many, as worms, caterpillars, \&e. are compofed of different circles, or rings, which are a fort of incifure. See Zoology and Entomosogy.

Of the Kinds of Insects, and where the Colletar for the Cabint may find then. Infects, in general, are. known to mott people, the fyltematic difinctions bue:

Snfects. to few ; nor have we any Englifh names for the greateft part of them. The general denominations of beetles, butterflies, moths, flies, bees, walps, and a few other common names, are all that our language fupplies. It would, therefore, be in wain to enumerate the immenfe variety of genera and fpecies to any perfon unflkilled in the fcience of entomology : we may, however, give directions under general names where to find each kind.

The clafs of infects is divided by Linnæus into feven orders. See Znology and Entomology.
I. The Coleopiera kind. Many of thefe (as the fearabias or chafier, dermgfes or leather-eater, bijler or mimick-beetle, Raplylinus or rove-betle, \&c.) are found in and under the dung of animals, efpecially Eetifome's of cows, horfes, and theep. Some (as lecanus or flagNaturralf's beetle, cerambyx or capricorn beetle, dermeftes, \&c.) and Travit are found in rotten and half-decayed wood, and under ler's Compar the decaycd bark of trees. Others (as bijher, filpha згі\%.
or carrion-beetle, flapbylinus, \&.c.) on the " earcafes of
animals chat lave been dead fuur or five days; on moilt bones that have been guawed by dogs or other animals; on flowers having a fetid fmell; and on feveral kinds of fungous fubftances, particularly the rotten and mof ftinking. Others (as byrrbus, curculio or weevil, bruclius or feed-beetle, \&c.) may be found in a morning about the bottoms of perpendicular racks and fand-banks, and alfo upon the flowers of trees and herbaccous plants. Many kinds (as gyrinus or whirl-bectle, isfificus or water beetle, \&ic.) may be caught in rivers, lakes, and flanding pools, by means of a thread-net, with fmall mefhes, on a round wirehnop, fixed at the end of a long pole. In the middle of the day, when the fur. Thines liot, fome (as the coccinella or lady-fly, bupreflis or burn-cow, cbryfomela or golden honey-bettle, cantharis or foft-wingedbeetle, elater or $\dot{\text { fpring}}$ beetle, necydalis or clipt-wing. ed beetle, \&cc.) are to be feen on plants and flowers, blighted trees and fhrubs. Others (as lampyris or glow. worm, \&.c.) frequent moilt meadows, and are beft difcovered at niglut, by the flining light which they emit. A grcat variety lit clofe on the leaves of plants, particularly of the burdock, elecampane, cults foot, dock, thifte, and the like, (as the caffula or tortoife heetle, \&c.); or feed on different kinds of tender herbs (as the sneloè or blifiter-bectle.) Numbers (as the tenelrio or ftinking-beetle, may be found in houfes, dark cellars, damp pits, caves, and fubterraneous paffages; or on umbelliferous flowers, (as the cerambyx, pinus, \&c.) ; or on the trunks as well as on the leaves of trees, in timber yards, and in the holes of decayed wood. Some (as the leptura or wood bectle, cicindela or glofly. heetle, $\mathcal{W}_{c}$ ) inhabit wild commons, the margins of pools, marthes, and rivulets; and are likewife feen creeping on flags, reeds, and all kinds of waterplants. Multitudes (as the carabus or ground-beetle) live under fones, mofs, rubbif, and wrecks near the fhores of lakes and rivers. Thefe are found alfo in bogs, marfhes, moift places, pits, holes of the earth, and on flems of trees; and in an evening they crawl plentufully along path-ways after a thower of rain. Some (as the forficula or earwig) may be difcovered in the hollow ftems of decayed umbeliferous plants and on many forts of flowers and fruits.

L1. Heniptera. Some of thefe (as the llatta or cock-
roach) are found about bake-houfes, \&ce.; others (as Infe the mantis or camel-cricket, sryllus or locuft, fulgora, cicald, or flea-locurt, cimex or bug, \&c.) on grafs, and all kinds of field-herbage. Some (as natonecia or boatfly, nepa or water fcorpion, \&:c.) frequent rivers, lakes, and flanding pools.
III. Lepidoptora. In the day, when the fun is warm, butterflies are feen on many forts of trees, Phrubs, plants, and flowers. Muths may be feen in the day-time, fitting on pales, walls, trunks of trees, in fhades, ont-houfes, dry holes, and crevices; on fine evenings, they fly about the places they inhabit in the day-time: fome (as the fobinx or hawk-moth) are feen lying in the day-time over the flowers of honeyfuckles and other plants with tubular flowers. Infects of this fpecies feldom fit to feed, but continue vibrating on the wing, while they thruft the tonguc or probofcis into the flowers.
IV. Neuroptera. Of thefe, fome (as the myrmeleon, bemerohius or pearl-fy, raflhidia or camel.fly, \&c.) are found in woods, hedges, meadows, fand-banks, walls, pales, fruits, and nmbelliferous flowers. Others (as lilictlila or dragon-fly, eptbemera or may.fly, phryggenea or (pring-fly, \&ic.) fly about lakes and rivers in the day.
V. Hymenoptera Thefe, including wafps, bees, \&c. frequent hedges, fhrubs, flowers, and fruits.
VI. Diptera. Flies of various kinds contlitute this clafs; of which fome (as afras or gad-fy, mufca or fly, tabanus or whame) fly about the tops of trees, little hills, horfes, cows, fheep, ditches. dunghills, and evcry offenfive object. Others (as tipula, conops, afilus or wafp.fly, \&cc.) are found on all forts of flowers, particularly thofe of a fetid fmell.
VII. Aptera, or thofe without wings, comprehend fcorpions, fpiders, crabs, lobiters, sc.

Of Catding and Preferving Insects for Collesions. In the following directions, we fhall relate the methods of killing them the moft readily, and with the leatt pain, as the purfuic of this part of natural hiftory hath been often branded with cruelty; and however reafonably the naturaliit may exculpate himfelf by pleading the propriety of fubmitting to an evil which leads to ufeful difcoveries, yet for wanton cruelty there never can be a jult pretest.

1. The firt clafs, confitling of beetles (coleoptera), are hard-winged. Many kinds fly about in the day, others in the evening, fome at night only. They may be caught with a gauze net, or a pair of forceps covered with ganze. When they are taken, Atick a pin through the miadle of one of the hard wings, and pafs it through the body. They may be killed inftantly, by immerfion in hot water, as well as in fpirit of wine ; then ftick them on a piece of cork, and afterwards carefully place their legs in a creeping pufition, and let them continue expofed to the air until all the moifture is evaporated from their bodies. Beetles may alfo be preferved in fpirit of wine, brandy, or rum, clofely corked up.
2. Infucts of the fecond clafs (keniitcra) may be killed in the fame manner as beetles, and likewife by means of a drop of the etherial oil of turpentias applied to the heat : or in the manner to be defcribed under the next ciaf? ir killun! moths.
3. The divilion of butterfics and moths, (lapidopte-

Eis. rat, as well as all flies with membranceons wings, pin-culhion with three or four different fizes of pins Infecto fhould be catched with a ganze net, or a pair of gauze forceps: whan taken in the furceps, run a pin through the thorax or floulders, between the furewings. After this is done, take the pin by the head, and remove the forceps, and with the other hand pinch the breatt of the infect, and it will immediately die: the wings of butterties fhould be expanded, and kept fo by the proflare of fmall nips of paper for a day or two. Moths expand their wings when at relt, and they will naturally take that pofition.

The larger kinds of thefe infects will not fo readily expire by uhis method, as by theking them apon the tottom of a cork exactly fitted to the mouth of a botile, into which a little fulphur had been put, and by gradually heating the buttle, till an exhalation of the fulplur take place, when the infect inflantly dies, without injuring its colours or plumage.

The bett method of having the molt perfect butterflies is to find out, if poffible, the lavva or caterpillar of each, by examining the plants, flurubs, or crees, they ufiually feed upon, or by beating the fhrubs and trees with long poles, and thereby thaking the caterpillars into a fheet fpread underneath to receive them; to put them into boxes covered with thin canvas, gauze, or cat-gut, and to feed them with the frefh leaves of the tree or herb on which they are found; when they are full grown, they will go into the pupa or chryfalis flate, and require then no other care till they come out perfect butterflies, at which time they may be killed, as before directed. Somttimes thefe infects may be found hanging to walls, pales, and branches of trecs, in the chryfalis flate.

Moths might likewife be procured more perfect, hy collecting the caterpillars, and breeding them in the fame manner as butterflies. As the larve or caterpillars cannot be preferved dry, nor very well kept in fpirit, it would be fatisfactory if exact drawings could bs made of them while they are alive and perfect. It may be neceffary to obferve, that in breedng thefe kinds of infects, fome earth fhould be put into the boxes, as likwife fome rotten wood in the corners; becaufe, when the caterpillars change into the pupa or chryfalis flate, fome go into the earth, and continue under ground for many months before they come out into the moth flate; and fome cover themfelves with a hard fhell, made up of fmall pieces of rotten wood.
4. The fourth clafs of infects (neuroptera) may be killed with fpirit of wine, oil of turpentine, or by the fumes of fulphur.
5. Thofe of the next clafs (bymenoptera) may be killed in the fame manner. A pin may be run through one of their wing flells and body.
6. Infects of the fixth clafs (diptera) may likewife be killed by fpirit, or by fumes of fulphur.
7. Thofe of the lif divifion (aptera) are in general fubjects which may be kept in fpirit.

When in fearch of infects, we thould have a hox Suitable to carry in the pocket, lined with cork at the bottom and top to thick them upon, until they are brought home. If this box be flrongly impregnated with camphor, the infects foon become flupified, and are thereby prevented from fluttering and injuring their plumage. Betides a fmall forceps, the collector thould have a large mufqueto gauze net, and alfo a
to fuit the different fizes of infects.
In hot climates infects of every kind, but particnlarly the larger, are liable to be eaten by ants and other fmall infects; efpecially before they are perfectly dry : to avoid chis, the piece of cork on which our infects are fluck in order to be dried, flowld be fufpended from the cicting of a room, by means of a fender Atring or thread; befmear this thread with bird-lime, or fome adhefive fubftance, to intercept the rapacious vermin of thofe climes in their paffage along the thread.

After our infects are propenly dried, they may be placed in the cabinet or boxes where thcy are to remain : thefe boxcs fhould be kept dry ; and alfo made to fhut very clofe, to prevent fmall infects from deItroying them; the bottoms of the boxes fhould be covered with pitch, or green wax, over which paper may be laid; or, which is better, lined with cork, well inpregnated with a folution of corrofive fublimate mercury in a faturated folution of crude fal-ammoniac in water, an ounce of which will diffolve 20 fcruples of the fublimate.
The finett collections have been ruined by finall infects, and it is impoffible to have our cabinets too fecure. Such infects as are thus attacked may be fumigated with fuphur, in the manner defcribed for killing moths; if this prove ineflectual, they may be inmerfed in fpirit of wine, without much injuring their fine plumage or colours, and afterwards let them be fprinkled about their bodies and infertions of the wings with the folution above mentioned. But baking the infects in an oven, in the manner defcribed for Birds (under that aricice), is the moft effectual method of extirpating thefe enemies; however, the atmot caution is requifite in this procefs in regulating the heat of the oven.
N. B. All kinds of infects having no wings, may be preferved in fpirits, brandy, or rum ; except crabs, lobiters, and the like, which may conveniently be preferved dry.
$I_{\text {NSECTS }}$ giving Root to Plants. Of this we have an account, by Mr Fourgeroux, in the Memoirs of the A. cademy of Sciences for 1769 . The plants, of which Mr Fourgeroux gives an account, are perfectly the reverfe of the worm-plant of China, defcribed by Mr Reaumur in the year 1726 . For, in that cafe, a worm fixes its fnout into the extremity of the plant, and derives nourifliment from it. But the plants, of which an account is here given, derive their nourifhment from the animals.

The greatel patt of the animal-plants which he has feen, grow, he tells us, on the chryfalis of a fpecies of cicada. The plant growing on thefe infects has got the generic name of clavaria, becaufe its ttalks and branches, when it has any, are terminated by tubercles, which give the appearance of little clubs. The root of this plant, in general, covers the body of the infect, and fometimes is even extended over its head. When thefe productions have for fome time been preferved in fpirits, the plant and animal may be fepara* ted from each other without hurting either. Small grooves, formed by the rings of the animal, may be obferved running crofs the roots of the plant : but no veftige can be found of the root's having any where

Inficti. penetrated the body of the infeet. Theic plants produce fibres differing in length and number. The fibres are termiluated by tubercles, which, before the plant arrives at inaturity, are folid; but, after that period, they are found punctured, probably by worms which have fufiered a metamorphotis upon efcaping frons them.

According to Mr Fourgeroux, plants grow, not only on the cliryfalis of the cicada, but upon the cicada itfelf. He faw one of this kind upon a cicada brought from Cayenue. The plant, in chis cafe, differed from the clavaria already mentioned. It was a fpecies of fucus, compofed of long, white, filky fibres, covering the body of the infect, and extending from feven to sight lines above and belo:: its belly.

The author has found the clavaria growing upon worms. He has found it chiefly upon worms, which, fuffering a metamurphofis, become afterwards a fmall fpecies of May-bur. This chryfalis, he obferves, is very different froms that of the cicada; and, even in its worm. fate, may eatily be dittingnifhed from it:

After defribing thefe different fpecies of animalplants, the author next proceeds to offer his opinion upon this fubject. He firft confiders what had been faid by Dr Wa:fon, in the Philofophical Tranfactions,
 Dr Watfon's account of thefe flies is, that they bury themfelves about the month of May, and begin to be metamorphofed in June; and that the little plant which grows upon them refembles a branch of coral, is about three inches in height, and carries fmall protuberances, where worms are generated, which are again conve:ted into flies. The author imagines, that, in this account, $\mathrm{Dr}_{\mathrm{r}}$ Watfon has been deceived by the worms, which he has already obferved will eat into the clavaria, and undergo a change in the holes which they have there made. Mr Fourgeroux is rather inclined to adopt the opinion of Dr Hill, founded upon obfervations made at Martinico. There the cicadie are very frequent; and, during their chry falis thate, bury themfelves among dead leaves, to wait their metamorphofis. Dr Hill imarines, that the feeds of the clavaria are then attached to them, and are afterwards developed, much in the fame manner as the fungus ex pede cquino grows upon the hoofs of dead horfes.

It may appear aftonifhing, that the clavaria fhould attach itfelf fo contantly to the nympho of the cicadx in America, as it is not obferved to do fo in other countries. For this Mr Fourgeroux attempts to account, from viewing the clavaria as a parafite peculiar to this Cpecies of infect; from the great number of the mymphe of cicadxe which abound in America; and from the circumfances of the climate and foil, which may render this phenomenon very common there, although it be not obferved in Europe.

Insects blown from the Nofe. Of this we are furnifked with many accounts in the works of medical atsthors. The fact is confirmed by Dr Monro $\ddagger$, who Fed. Med has received at different times fome of thefe infects Gam. ii. $3^{122}$ from dificent perfons. They were all of the fcolopendra kind, rhough not exactly anfwering to any deferip. tion of Linnzus. One of thefe he received from Mr Hill furgeon in Dumfries. It was an inch and a half long; and lived fome hours after it was difcharged, creeping about flowly on a table. It was then put in. to ardent [pirits, foon after which it died,

Noxious Inszcrs; Means of defroying them, or preventing their Ancreafe, The following remedies we find collected in the Gentleman's Magazine for October 1790.-Of thofe fubilances which have been generaliy obferved to be efficacious in drivin, 5 away or in deltroying infeess, mercury, and its variuus preparations, may be reckoned one of the molt genetally. ufeful. Sulphur is alfo ufeful. Oils of all kinds liave been ofien and defervedly recommended. Tobacco is not lefs remarkable for its utility. Of the application of thefe in order.

1. Mercury is known to kill or drive away lice from. the human body; and it may probably be of equal efficacy in ridding other animals of their infects. Forinllance, fleep having a fmail quantity of mercurial ointment robbed on their flins, on the fides, hetween the fore legs and the body, it may kill or drive away the infect peculiar to them. Sulphur is recommended to be added to the mercurial ointment. Thus not only the infect peculiar to them, but alfo the fcab, may be cured: See the Tranfactions of the Society for the Ensouragement of Arts, Londun. Vol. VII. VIIt. p. go. In the Tranfactions of the fame Society, Vol. V. V1. p. 59, Mr Ailway directed that, in the winter, the walls, frames, Sc. of his green and hot houfes fhould be well. wained with the following mixture: Take of corrofive fublimate mercury four ounces, and diffolve it in two gallons of water. 'I hefe houfes had been greatly infetled with red fpiders and ants. After laving been wafted with the above mixture, neither were to be feers. next fummer. This wafh may be ufed on old garden walls, and to the roots of fruit-trees infetted with infects, if made weaker. It may deflroy the tender leaves of plants, though not the roots. This wafh will effectually deftroy that difagreeable infect the bug, and all other infects of a tender euticle; and it will not in the lealt hurt the colour of bed furniture or hangings. Care mult be taken, that the wath be applied into every erevice or folding of the furniture winh a painter's brofh. It will fometimes be neceffary to repeat the wafh, as fome of the ova of bugs may temain concealed, notwithilanding the utmoft care.

Some of the Weft India iflands were much infelted with large ants, which greatly hurt the fugar-canes. The remedy was, to diffolve corrofive fublimate mercury in rum, in the proportion of two drams to a pint of fpirits. This folution was poured on dry powdered fugar; and when the fugar was dried, it was laid in, the paths of the ants. They eat it, and were dettroyed. Might not this practice be imitated, by laying fugar thus prepared on paper or pieces of thin bnards near the roots of fruit-trees infefted by infects, efpecially when the fruit is ripening? The papers or boards might be taken in duing the night, or whe it rained. The fugar thould be coloured with indigo, or other fubitance, thereby to mark it as a fubllance to be a. voided by curious idlers.
2. We are informed that a perfon in Philadelphia employed brimftone in the following manner, Having cleared all round the roots of trees infefted with cater: pillars or other infects, he ftrewed fome fiour of brimAtone round the roots, and covered it with a thin fprinkling of fine mould, that it might not be blown away by the wind, yet fo that the fun might operate through, and caufe the brimtlone to fumigate. Thus be deftroyed the caterpillars. One pound he fount

Es. fuficient for zoo trees. In that hot climate the fun may perliaps have that effect ; but it fcarecly will in this. He alfo employed fulphur in the following manner to dive infects from tall trees. He fplit the end of a pole, and put in the flit fome matches, fet them on fire, and held them under the parts of the trees cliefiy affeeted. A pole thus armed, he found, wonts anfwer for three or four trees. Brimftone thus mixed with damp tlraw, and fet on fire, for inflance, in hopground infefted with the Ay, might be of ufe to drive away the fly.

The itch is fuppofed to proceed from a very fmall infect which nefles under the fkin, and proceeds ro farther into the habit; and is therefore atterded with no dangerous confequences. Brimftone made into an ointment with hags.lard is a fure remedy.

Sheep are liable to an cruption on the Asin, known by the rame of the foal. The brimflone, when added to the mercurial ointment recommended for that diforder in the Tranfactions of the Suciety for the Encouragement of Arts, Vol. Vll. p. go, might perhaps render the application more efficacious and lefs dangerous.
3. The natives of bot countries are taught by experience, that an unctuous covering on their bodies prevents the bites of mufquitoes and all gnats. The white inhabitants in fuch countries are not fufficiently careful in preventing the leaft flagnant water near thcir dwellings, in which the mufquiteses are bred; even in the wafte water thrown out thcy are produced. Dr Franklit, by a careful attention to this circumftance, guarded his family in Philadelphia from fuch infe cts: one diny feeing a number of mufguitoes in his library, he found on inquiry, that one of his fervants had taken the cover off a tub placed near his window for receiving rain-water. On fuch an occafion the remedy is eaff, viz. flutting the room up for the day, fo that the mufquitoes cannot come at any water, in which time they die. Though this caution maj feem trilling to us who live in a mild climate, it is far otherwife in hot countries.

Oils being known to be moft efficacious in deflroying infects, may wot the ufe of it be extended to the dellruetion of worms in the bowels of horfes, where they may occafion- the viulent pain they feem fometimes to fuffer? If the horfe was for fome time kept fafling, and a large quantity of oil, fuppofe a pint, was given, if wooms are the caufe, the oil may in that cafe kill them

Flowers, leaves, and fruit, on plants, are known to be devoured by caternillars. Thefe are ceftroyed by nils, which clofe the lateral pores by which they breathe. For this purpofe it is advifed, that, on the approach of fpring. a cloth dipped in train oil be laid on fuch parts of the tree in which there is the leatt appearance of them.

We are informed, in the Memoirs of the Society of Agriculture at Paris, that nil of turpentine, when applied to animals which were covered with infects, dellroyed the infects withnut hurting the animal. The author tried it on feveral trees, mixed with fine earth fo as to incorporate them well, then a.dding water, fill firring 1l.cm carcfully till the whole was brought to dome degree of fividity. In this misture he dipped branches of fruit-trees on which there were infeis, and bereby defroyed n:ot only tbe eggs but alfo the infects,
without hurting the leaves. This compofition may be got of by uafhing, or the firlt heavy hower. From thefe experiments the author thinks, that oil of turpentinc may with cqual efficacy be employed for killing various kinds of lice on domeflic animals.
We are informed, in the Tranfactions of the Society for the Encouragement of Arts. Vol. V. p. 45, that Mr 1 Iinter, among other experiments on turnip. feed, Atecped the feed 24 hours in a fufficiene quantity of train oil. He then drained the oil from the feed, which he inixed with a quantity of finc fifted earth, and immediately fowed it in drills. When the plants began to afpear on the furface, the ground was fown with foot. He found that feed fteeped in lintfeed oil anfwered equally well. The turnips the leaft irjured by the fly were thofe that grew from feed freeped as above, which grew \{o luxuriantly as to produce rough leaves feveral days prior to the molt 月ounifing of any of his other experinzents, and were the better cnabied to widitand the fly's attack. The leaves of thefe turnips were of a darker green, and appeared twice as thick in bulk and luxuriancy than the other turnipa, and were a confiderable deal larger. The feed was drilled an inch and a half deep, and at a foct dillanze in the rows. Train oil is apt to kill the leaves of plants wlich have been injured by infects, but lintfeed oil has not that cffect, though 'qually deflructive to the infects. The train oil feems to act both as an oil, and by its difagrecable fmell it prevents infects approaching it. In this refpect it may be fuecelsfully ufed to prevent field-mice or other vermin preying on acorns, chcfnute, or other feeds flecped in it before they are fown.

When thus giving cirections for preventing the fly on turnips, a late experiment fhould be mentioned, by the difclofing of which a perfon gained a confiderable reward. His fecret was, running a roller over the ground early in the morning, while the dew remained on the ground, on the firft appearance of the fly. The dew cntangled the flies fo much, that they could not make their efcape, and were thcrefore crufhed to death. As the roller may leave the furface of the earth too hard, fome very properly advife to lix fome houghs of elder in a gate or hurdle, to be drawn over the field; and if the boughs had been before fumigated with the fmoke of tobaceo, or tincture of afafoctida, the fuccefs would be the furer. The mon certain method of preventing the lhurt done hy the fly is to raife the plants in a nurfery, and at a proper age to tranfplant them, being carried to the ground in a wheelbarrow filled with manure fufteried with water fo as to admit the plants. This method will fecure their more fpeedy growth. In the nurfery the attack of the fly mas; be prevented by fprinkling foot or quickline on the ground. The utility of tranfplanting turnips is evident by the practice of tranfplanting the turnip-rooted cabbage. They who are difcouraged from this pracice by the expence attending it, do not reflect that the looing is prevented, and the plants grow the better, being fet in frefly earth.
4. Before procceding to direct the ufe of the lat means mentioned, viz. tobacco, for deftroying infects in turnips, it may he proper to mention an experiment made by Mr Green, of her majefly's flower-garden at Kew. He contrived a pair of bellows, fimilat to that employ* ed in recoverisg people feemingly drowned. It has a

Infects. cavity in the nozzle, in which fome tobacco is put, with a live coal over it. The bellows being then worked, the tobacco is fet on fire, and the fmoke is directed to any particular foot. A lady was fond of having the moflarofe in her dreffing-room, but was prevented having it on account of the green infects which conflantly adhere to that plant. To remedy this inconvenience, Mr Green had a box made large enough to contain a pot in which a plant of the mofkrofe grew. In one end of the box was a hole, to admit the nozzle of the bellows; the bellows was worked, and the fmoke was received into the box. When the tobacco was confumed, the nozzle was withdrawn, and a cork being put into the hole, the box thus re. mained till morning, when the infects were all laid dead on the earth. Being fwept off, the plant was in a flate fit for a dreffing room. Many plants thus infefted with infects may be too large, or otherwife fo placed as not to be put into a box. In this cafe it occurred to the writer of thefe obfervations, that being fprinkled with an infufion of tobacco in water might in fome degree anfwer the fame purpofe. On trial he found it anfwer, and he thus freed other plants of their infects. He allo ufed it on trees of ealy accefs with advantage. Train oil is fo inimical to tender plants or leaves, that it deftroys them if infects have in the lealt hurt them; whereas the infufion, inltead of killing the leaves, promoted a frefh vegetation.

Fruit trees often beeome the prey of infects. Thofe againtt a wall, or in efpaliers, being eafily come at, much of the mifchief may be prevented by cutting off the leaves fo foon as they are obferved to be curled; for then frefh eggs are laid on them, probably by butterfies. If fprinkled with the infufion of tobacco, it will prevent their coming to life. After the fruit is formed, the infufion muft not be ufed, left the tafte and fmell may remain. The fciffars are then the proper remedies, which ladies may employ as amufement, and may thereby prefent fruit to their friends of their own preferving. A lye of the aft of plants fprinkled on the leaves may have a good effect, as alfo on other pot-herbs, which are often the prey of eaterpillars. As many infects, befides thofe bred on the leaves or in the walls, may deftroy the fruit, the fugar with the corrofive fublimate, as already defcribed, may be laid in the way of other infects, to all which it will prove a fpeedy death. Diligent infpection into their retreats is the mof certain means of preventing the lofs fuftained by fnails. Ants are prevented rifing up the trees, by laying round the roots powdered chalk, or any other fublance which by entangling their feet prevents their crofling it. Care fhould be taken to dedtroy their nefls every where near the garden.

Hops are now become an article of fo great confequence, that it deferves our particular attention. Early in ite growth, when the vines begin to afeend the poles, a black fly preys on its leaves, frequently in fuch number:, as, by deftroying the leaves, to interrupt the vegetation, much of the food of plants being abforbed by the leaves. The infufion of tobacco deltroys them, or at leaft drives them away fo effectually, that a plant almolt totally ftripped of its leaves has put out frefh leaves after the ufe of it. If care be not taken, they will again fall on the frefl leaves. As the flies lodge on the lower fide of the leaves, they are protected from $\mathrm{N}^{\circ} 167$.
ftorns of rain, and therefore the infution muft be driven upwards by a forcing pump. As it is faid that the expence of tobacco is too great, perhaps lime-water, or even water by itfelf, driven ftrongly againft the leaves, might drive them away. The labour attending fuch experiments in a large plantation difcourages others, without reflecting that, if fuch means are uled early, the flies may more eafily be got rid of. Free ventilation is undoubtedly beneficial to all plants; and lience perhaps the particular advantages of drilling corn in rows a little diftant. If alleys fomewhat larger than common were made in the plantations of hops, there might be fufficient faces left where the alleys crofs one another to admit of fetting damp Araw, or other materials mixed with brimftone, foot, \&c. on fire. Smoke itfelf is faid to prevent the fly; and if $\mathrm{fO}_{\mathrm{o}}$ it will ftill act more powerfully when mixed with fuch materials. It has been obferved in Sweden, that the hops grow naturally among heaps of llones or fragments of rocks. They therefore advife to cover the ground round their roots with flones, which will prevent the infects laying their eggs near the roots in the ground, where they lay them to be protected daring the winter. The fones will alfo preferve moiture at the roots during the fummer. A rope cannot be drawn acrofs a plantation of hops, as it can acrofs a field of corn, in cale of mildew. Here water to wafh off the clammy juice that entices and feeds infects feems to be the only remedy. The plantation being well ventilated, may at leaft prevent the frequeney of it. The forcing pump will molt effectually wafh off this exudation.

Cruelly to InSECTS. It does not appear upon what principle of realon and jultice it is, that mankind have founded their right over the lives of every creature that is placed in a fubordinate rank of being to themfelves. Whatever claim they may have in right of food and felf-defence (to which ought we to add the purpoles of the naturalit, explained above?) did they extend their privilege no farther than thofe articles would reafonably carry them, numberlefs beings might enjoy their lives in peace, who are now hurried out of them by the molt wanton and unneceflary cruelties. It is furely difficult to difcover why it fhould be thought lefs inhuman to crufi to death a harmlefs infect, whofe fingle offence is that he eats that food which nature has prepared for his fultenance, than it would be were we to kill any bulky creature for the fame reafon. There are few tempers fo hardened to the impreffions of humanity, as not to hudder at the thought of the latter: and yet the former is univerfally practifed without the leaft check of compaffion. This feems to arife from the grofs error of fuppoling, that every creature is really in itfelf contemptible, which happens to be clothed with a body infinitely difproportionate to our own,' not confidering that great and little are merely relative terms. But the inimitable Shakefpeare would teach us, that

> the poor beetle that we tread upon,
> In corp'ral fuff'rance, feels a pang as great
> As when a giant dies.

And indeed there is every reafon to believe that the fenfations of many infects are as exquifite as thofe of creatures of far more enlarged dimenfions, perhaps even more fo. The millepede, for inflance, rolls itfelf

At round upon the fighteft touch, and the fnail gathers in her horns upon the leaft approach of our hand. Are not thefe the ftronget indications of their fenfibility? and is it any evidence of ours, that we are not therefore induced to treat them with a more fympathifing tendernels?

Montaigne remarks, that there is a certain claim of kindnefs and benevolence which every fpecies of creatures has a right to from us. It is to be regretted that this general maxim is not more attended to in the affair of education, and preffed home upon tender minds in its foll extent and latitude. We are far, indeed, from thinking, that the early delight which children difcover in tormenting flies, \& c. is a mark of any innate cruclty of temper, becaufe this turn may be accounted for on other principles; and it is entertaining unworthy notions of the Deity, to fuppofe he forms mankind with a propenfity to the mont deteftable of all difpofitions: but molt certainly by being unreilrained in forts of this kind, they may acquire by habit, what they never wonld have learned from nature, and grow up into a confirmed inattention to every kind of fuffering but their own. Accordingly the fupreme court of judicature at Athens thought an inflance of this fort not below its cognizance, and punifhed a boy for putting out the eyes of a poor bird that had unhappily fallen into his hands.

It might be of fervice, therefore, it fhonld feem, in order to awaken as early as poffible in children an extenfive fenfe of humanity, to give them a view of feveral forts of infects as they may be magnified by the affiftance of glaffes, and to thow them that the fame cvident marks of wifdom and goodnefs prevail in the formation of the minutelt infect, as in that of the moft enormous leviathan: that they are equally furnifhed with whatever is neceffary, not only to the prefervation, but the happinefs of their beings in that clafs of exitence to which Providence has affigned them: in a word, that the whole conftrnction of their refpective organs diftinctly proclaims them the objects of the divine bencvolence, and therefore that they jultly ought to be fo of ours.

INSERTION, in anatomy, the elofe conjunction of the vefels, tendons, fibres, and membranes of the body with fome other parts.

INSINUATION denotcs a cunning and covert way of creeping into any perfon's favour.

Insincation of a l'ill, among Civilians, is the firt production of it, or the lcaving it with the regifter, in order to its probate. See Will.

INSIPID, rasteless, that which has nothing ir it pungent enough to affect the palatc, tongue, \&c. and to occafion that fenfation we call tafling.

INSITION, Insitio, in botany, denotes the fame with engrafting; viz. the a $\varepsilon_{2}$ of inferting and uniting a cyon, bud, or the like, in the fubfance of the tlock.

INSOLATION, in pharmacy, a method of preparing certain fruits, diugs, \&c. by expofing them to the heat of the fun's rays; either to dry, to maturate, or to Charpen them; as is done in vinegar, figs, \&c.-The word comes from the Latin verb infolare, which is ufed by Pliny and Columella, and fignifies to expofe to the fun.

INSOLVENT, a term applied to fuch perfons as have not wherewithal to pay their juft debte. A perVoz. IX. Part I.
fon dying, and not leaving eftate fufficient to difcharge thefe, is faid to die infolvent.
nection
Trial by INSPECTION, or Examivation, is when, for the greater expedition of a caule, in fome point or iffuc, being either the principal queflion, or arifing collaterally out of it, but being evidently the ohject of fenfe, the judges of the court, upon the teAlimony of their own fenfes, fhall decide the point in difpute. For, where the affirmative or negative of a queftion is matter of fuch obvious determination, it is not thought neceffary to fummon a jury to decide it ; who are properly called in to inform the confcience of the court of dubious facts: and therefore, when the fact, from its nature, muft be evident to the court either from ocular demonitration or other irrefragable pronf, there the law departs from its ufual refort, the verdict of 12 men , and relies on the judgment of the court alone. As in eafe of a fuit to reverfe a fine for non age of the cognizor, or to fet afide a fatute or recognizance entered into by an infant; here, and in other eafes of the like fort, a writ ©hall iffue to the Sheriff, commanding him that he conllrain the faid party to appear, that it may be afcertained by the view of his body by the king's juttices, whether he be of full age or not : Ut per afpectun corporis jui conflare potrit juliciariis nofris, fi prallitus an fit plow atatis necne. If, however, the court has, upon infpection, any doubt of the age of the party (as may frequently be the cale), it may proceed to take proofs of the part ; and particularly may examine the infant himfelf upon an oath of voir dive, veritatom dicere; that is, to make true anfwers to fuch queilions as the court fiall demand of him : or the court may examine lis mother, his godfather, or the like.

INSPECTOR, a perfon to whom the care and conduct of any work is committed.

Inspectors, in the Roman law, were fuch perfons as examined the quality and value of lands and effects, in order to the adjuting or proportioning taxes and impofitions to every man's eltate.

The Jews alfo have an officer, in their fynagogue, whom they call inffector, in bhazen. His bufinefs confifts principally in infpecting or overlooking the prayers and leffons, in preparing and fhowing them to the reader, and in ftanding by him to fee he reads right ; and, if he makes mittakes, he is to correct him.

INSPIRATION. among divines, \&c. implies the conveying of certain extraordinary and fupernatural notices or motions into the foul, or it denotes any fupernatural influence of God upon the mind of a rational creature, whereby he is formed to any degree of intellectual improvements, to which he could not, or would not, in fact have attained in his prefent circumflances in a natural way. Thus the prophets are fand to have fpoken by divine infpiration.

Some authors reduce the infpiration of the facred writers to a parcicular care of Providence, which pre: vented any thing they had faid from failing or coming to nought ; maintaining, that they never were really infpired either with knowledge or expreflion.

According to M. Simon, infpiration is no more than a direction of the Holy Spirit, which never permitted the faered writers to be mittaken.
lt is a common opinion, that the infpiration of the Holy Spinit regards only the matter, not the fiyle or
k k
words;

14spiration words; and this feems to fall in with M. Simon's - doctrine of direction.

Theological writers have enumerated feveral kinds of infpiration: fuch as an infpiration of fuperintendency, in which God does fo influence and direct the mind of any perfon, as to keep him more fecure from error in fome various and complex difcourfe, than he would have been merely by the ufe of his natural faculties; plenary fuperintendent infpiration, which excludes any mixture of error at all from the performance fo fuperintended; infpiration of elevation, where the faculties act in a regular, and, as it feems, in a common manner, yet are raifed to an extraordinary degree, fo that the compofure fhall, upon the whole, have more of the true fublime or pathetic, than natural genius could have given; and infpiration of fuggeftion, when the ufe of the faculties is fuperfeded, and God does, as it were, fpeak directly to the mind, making fuch difcoveries to it as it could not otherwife have obtained, and dictating the very words in which fuch difcoveries are to be communicated, if they are defigned as a meffage to others. It is generally allowed that the New Teftament was written by a fuperintendent infpiration; for without this the difcourfes and doctrines of Chritt could not have been faithfully recorded by the evangelifts and apofles; nor could they have affumed the authority of fpeaking the words of Chrift, and evinced this authority by the actual exercife of miraculous powers: and befides, the facred writings bear many obvious internal marks of their divine original, in the excellence of their doctrines, the firituality and elevation of their defign, the majefly and fimplicity of their ityle, the agreement of their various parte, and their efficacy on mankind; to which may be added, that there has been in the Chriftian church, from its earlieft ages, a conftant tradition, that the facred books were written by the extraordinary affiftance of the fpirit, which mult at leaft amount to fuperintendent infpiration. But it has been controverted whether this infpiration extended to every minute circumflance in their writings, fo as to be in the moft abfolute fenfe plenary. Jerom, Grotius, Erafmus, Epifcopius, and many others, maintain that it was not; whilit others contend, that the emphatical manner in which our Lord fpeaks of the agency of the fpirit upon them, and in which they themfelves \{peak of their own writings, will juftify our believing that their infpiration was plenary, unlefs there be very convincing evidence brought on the other fide to prove that it was not: and if we allow, it is faid, that there were fome errors in the New Teflament, as it came from the hands of the apoftles, there may be great danger of fubverting the main purpofe and defign of it ; fince there will be endlefs room to debate the im: portance both of facts and doctrines.

Among the Heathens, the priefts and priefteffes were faid to be divinely infpired, when they gave oracles. -The poets alfo laid claim to it; and to this end they always invoked Apollo and the Mufes ait the beginning of any great work.
Inspiration, in phyfic, is underfond of that action of the breaft, by which the air is admitted within the lungs; in which fenfe, infpiration is a branch of refpiration, and flands oppofed to Exspiatiton.

This admiffion of the air depends immediately on infififati its fpring or elafticity, at the time when the cavity of the breaft is enlarged by the elevation of the thorax and abdomen, and particularly by the motion of the diaphragm downwards: fo that the air does not enter the lungs, becaufe they are dilated; but thofe dilate, becaufe the air enters within them. Nor is it the dilatation of the breatt which draws in the air, as is commonly thought, though this is a condition abfolutely neceffary to infpiration; but an actual intrufion of the air into the lungs. See Respiration.

INSPISSATING, in pharmacy, an operation whereby a liquar is brought to a-thicker confiflence, by evaporating the thicker parts.

INSPRUCK, a city of Germany, in the circle of Auftria, and capital of the county of Tyrol, received its name from the river Inn, which runs by it. It has a noble caftle or palace, formerly the refidence of the archdukes of the houfe of Auttria, with a cathedral where they are buried. The houfes, though built in the German tafte, are rather handfomer; and the ftreets, though narrow, are remarkably well paved. For the defence of this city the inhabitants can place but little confidence in their fortifications, which are very trifling. They feem rather to depend on the natural fattneffes of their country; which appear indeed to form a barrier, fo perfectly inacceffible to any ene= my, that even the great Guttavus Adolphus, after having over-run with his victorious arms the other parts of Germany, could never make any impreffion upoa this. It is feated in a plealant valley, in E. Long. 11. 27. N. Lat. 47. 3.

INSTALLATION, the act of giving vifible poffeffion of an order, rank, or office, by placing in the proper feat. See Instalment.

INSTALMENT, a fettling or inflating any perfon in a dignity. The word is derived from the Latin in, and fallum, a term ufed for a feat in church, is the choir, or a feat or bench in a court of jultice, Bec. Though Voffius is of opinion the word is of German origin.

Instalment is chiefly ufed for the induction of a dean, prebendary, or other ecclelidftical dignitary, in. to the poffeflion of his ftall, or proper feat, in the cathedral church to which he belongs. This is fometimes alfo called infallation.

Instalment is likewife ufed for the ceremony, whereby the knights of the garter ate placed in their rank, in the chapel of St George at Windfor.

INSTANT, a part of duration in whick we perceive no fucceffion; or it is that which takes up the time only of one idea in our minds.

INSTAURATION, the re-eftablifment, or reflauration of a religion, a church, or the like, to its former flate. The word is by fome derived from the old Latin infaurum, which fignified the "ftock" of things neceflary for the tilling and managing of grounds; as cattle, tools, harnefs, \&c. But the word infaurum is only of the middle age : infauratio is of much greater antiquity, and by fome derived from inflar, "like;" as importing a thing's being brought to its former likenefs or appearance. See Restau-
ration.
INSTEP, in the manege, is that part of a horfe's

## I N S

inct. hind leg, which reaches from the ham to the pafternjoint.

INSTINCT, a certain power or difpofition of mind, by which, independent of all inftruction or experience, without delibetation, and without having any end in view, animals are unerringly directed to do \{pontaneouly (A) whatever is neceflary for the prefervation of the individual or the continuation of the bind. Such in the human fpecies is the inftinct of fucking exerted immediately after birth; and fuch in the inferior creation is the infinet by which infects invariably depolit their eggs in fiuations moft favourable for hatching and affording nourifhment to their future progeny. Thele operations are neceflary for the prefervation of the individual and the continuation of the kind; but weither the infant nor the inlect knows that they are neceffary: they both aft without having any end in view, and act uniformly without inftruction and without experience.

The actions of the inferior animals are generally directed by inftinct; thofe of man by reafon. This at lealt is the cale with refpect to men in a flate of civilization: in the favage fate they are probably little lefs the flaves of inftinct than the brutes themfelves. Concerning buman inftincts, indeed, philofophers differ widely in opinion; fome maintaining that man is endowed with a greater number of inftinets than any fpecics of brutes; whilf others deny that in human nature there is any power or propenfity at all which can properly be called inttinctive.

This diverfity of opinion may eaflly be traced to its fource. There are not many original thinkers in the world. The greater part even of thofe who are call. ed philofophers, implicitly adopt the opinions of certain mallers whofe authority they deem fufficient to fupply the place of argument ; and having chofen their refpective guides, each maintains with zeal what his mafter taught, or is fuppofed to have tanght. When Locke fo fuccefsfully attacked the doctrine of innate ideas and innate principles of fpeculative truth, he was thought by many to have overturned at the fame time all innate principles whatever; to have divelted the luman mind of every paffion, affection, and initinet; and to have left in it nothing but the powers of fenfa. tion, memory, and intellsct. Such, we are perfuaded, was not his intention; nor is there any thing in his immortal work which, when interpreted with candour, appears to have fuch a tendency.

In our opinion, great part of the Effay on Human Underfanding has been very generally mifunderttood. Much of its merit, however, was foon difcovered; and mankind, finding philofophy difencumbered of the bar-
barous jargon of the tchools, and buile upon a few felfevident principles, implicitly embraced every opinion advanced, or which they fuppofel to he advanced, by the illutrious author ; elpecially if that opinion was contrary to any part of the fcholaftic fyftem which had fo long been employed to perplex the underfanding and to veil abfurdity. Hence arofe many philoCophers of eminence both at home and abroad; who maintained, as they imagined, upon the principles of Locke, that in the human mind there are no inftinets, but that every thing which had been ufually called by that name is refolvable into affociation and habit. This doetrine was attacked by Lord Shaftefbury, who introduced into the theory of mind, as faculties derived from nature, a fenfe of beauty, a fenfe of honour, and a fenfe of ridicule; and thefe he confidered as the telts of fpeculative truth and moral rectitude. His lordhip's principles were in part adopted by Mr Hutchifon of Glafgow, who publifhed a fyftem of moral philofopty, founded upon a fenfe or inflinet, to which he gave the name of the moral fenfe; and the undoubsed merit of his work procured him many followers.

Men generally run from one extreme to another. It being now difcovered, or at leaft fuppofed, that the human mind is endowed with inftinctive principles of action, a fect of philofopliers foon afterwards arofe, who maintained with much vehemence that it is like. wife endowed with inftinctive principles of belief; and who built a fyltem of metaphyfics, if fuch it may be called, upon a number of innate, diftinct, and independent fenfes The rife of this fect is well known. Berkeley and Hume had adopted Locke's doctrine refpecting the origin of our ideas; and had thence deduced confequences fuppofed to be dangerous in thensfelves, but which, it was thought, could not be denied without refuling the principles from which they were inferred. The foundation of the inftinctive fytem being thus laid, the fyltem itfelf was rapidly carried to a height far beyond what feems to have been the intention of its excellent author; and reafon was well nigh banifhed from the regions of philofophy. For fuch a proceeding it is not difficult to affign the caufe. The inftinctive fcheme requires much lefs labour of inveftigation than the fyttems of Locke and the ancients; for upon the principles of it, when carricd to its utmoft extent, every phenomenon in human nature is thought to be fufficiently accounted for, by fuppoling it the effect of a particular inftinct implanted in the mind for that very purpofe. Hence in fome popular works of philofophy we trave a detail of fo many diftinct internal fenfes, that it requires no fmall Atrength of memory to retain their vcry names: befides the mo-

$\mathrm{Kk}_{2}$ improper to obferve, that through the whole of this article the word fontaneous is to be taken in the fenle in Which it is ufed in the following extracts from Hales's Origin of Mankind: "Many analogical motions in animals, though I cannot call them rolentary, yet I fee them fpontaneous: I have reafon to conclude, that thefe are not fimply mechanical." "The fagacities and inttincts of brutes, the $\sqrt{p}$ ortaneoufnefs of many of their motions, are not explicable, without fuppofing fome active determinate power connected to and inherent in their fpirits, of a higher extraction than the bare natural modification of matter." If this be attended to, our definition of intinct will be found perfectly confonant to that which has been given by the author of Ancient Metapkyfics. "Infinct (he fays) is a determination given by Almighty Wifdom to the mind of the brute, to act in fuch or fuch a way, upon fuch or fuch an occafion, without intelligence, without knowledge of good or ill. and without knowing for what end or purpore he acts.".

## $\begin{array}{lllllll}\text { I N S } & 260 & ] & \text { I N S }\end{array}$

Intinet. ral fenfc, we have the fenfe of leauty, the lenfe of deformity, the fenfe of bonour, the boarding fenfe, and a thuufand others which it is needlefs here to mention.

This new fyltem, which converts the philofophy of mind into mere hiftory, or rather into a collection of facts and anecdotes, though it has made a rapid progrefs, is not yet univerfally received. It has been oppofed by many fpeculative wen, and by none with greater Akill than Dr Priefley; who maintains, with the carliell admirers of Loc"te, that we have from nature no innate fenfe of truth, nor any inllinctive principle of action; that even the action of fucking in new born infants is to be accounted for upon principles of mechanifm; and that the defire of the fexes is merely afluciation.

Whitt men, eminent for candour as well as for with reaforence, have thus been difputing the limits between with reafon inftinct and reafon in the human mind, and endeavourmechanufu ing to afcertain the actions which refult from each, two writers of name, treating of that fubject, have lately advanced opinions, which, if admitted as juft, mult render the difpute hencefurth ridiculous, and put an end for ever to all moral inquiries. Mr Smellie, in a work which he calls The I'bilofoply of Nitural Hijlory, affirms, that between inflinctive and ralional motives no ditinction exits, but that the reafoning faculty itfelf is the neceffary refult of inftinct; and Dr Reid, in his Eflays on the Alive Powers of Man, by attributing to infing the action of breathing, feens to confound that 5 principle with mere mechanifm.
Thefe three principles accurdtely diflingurthed from each other.

That reaion, inftinct, and mechanifm, are all effen. tially different from one another, has hitherto been uni: verfally allowed; and it appears not to be a talk of much difficulty to point out in what relpect cach of them differs from the other two. AEtions performed with a vicw to accomplifh a certain end are called ra. tional actions, and the end in view is the motive to their performance. Infingive actions have a caufe, viz. the interual impulfe by which they are fpontaneonnly performed ; but they canpot be faid to have a motive, becaufe they are not done with any viecu to confequences. Actions automatic have likewife a caufe; but that caule is not internal impulfe, but mere mechanifm, by which they are performed without any fontaneity of the agent. Thus, a man gives charity in order to relieve a perfon from want; he performs a grateful action as
a duty incumbent on him; and he fights for his coun- Intina try in order to repel its enemies. Each of thefe actions is performed from a motive, and therefore they are all rutional actions. An infant is impelled to fuck the breaf, but he knows nut that it is neceffary for his prefervation; a couple of young favages gn together, for the firlt time, without any view to offspring or any determinate idea of enjoyment. Thefe actions have $n o$ motive, and therefore are not rational: but as they are performed by a fpontancous exertion of the agents, they are not to be attributed to mere mechanifm; they are therefore inflintive actions. A man breathes without any motive, without any fpontaneous exertion of his own, and that as well when he is alleep as when he is awake. The action of breathing therefore is nether rational nor inllinctive, but merely automatic or mecbanical. All this feems to be very plain. To talk of the motives of actions performed by inflinct. in an atgument intended to prove that between reafon and inthinct these is no difference, is either to beg the quettion or to pervent language. If the author of the Philofoply of Natural Hittory choofes to call the imspulle which promps the infant to fuck by the name of motive, he unly ufes an Englifh word improperly ; if it be his intention to afhrm that fuch a motive is not totally and effentially different from that which prompts a man to give charity or to fight for his country, he affirms what all mankind know to be falle ( $B$ ).

Haviag thus afcertained what we mean by inftinct, we thall now proceed to inquire, Whether or nut there be any inftinctive principles in man ? But in order to proceed upon fure grounds, it will be pioper to collfider, in the firlt place, fuch actions of the inferior animals as are gencrally allowed to be inttinctive: for an attempt has lately been made to prove, that even thefe actions are the offspring of reafon influenced by mocives; and that injlinit, as we have defined $t$, is a mere imaginary principle, which has no exillence cither in man or brute.

It has been faid that caterpillars, when haken off a Inftances ${ }^{6}$ tree in evory direct:on, inllantly turn sound towards of i: fias the crunk and climb up, thongh they had never for- in animal merly been on the furtace of the ground. This is a flriking inftance of inttinct. On the tree, and not upon the ground, the caterpillar finds its food. If therefore it did not turn and climbup the trunk, it would
(B) The author of Ancient Metapbyfics, whofe learned work contains more good fenfe on this fubject than any other book which we have feen, thus diftinguifhes between reafon and initinct: "With refpect to the mere animal, it is evident, that he purfues nothing but what is conducive eilher to the prefervation of the animal life or to the continuation of the kind. On the other hand, the object which the intellectual mind purfues, is the fair and the bandfome; and its happinefs conlifts in the contemplation of thefe. And though it purfue allo what is ufeful and profitable for the heing and well-being of the animal life, yet it is fnr the fake, nut of the animal life iticlf, but of the to xaxov or beautijul; which therefore is the ultimate object of its purfuit in all things.
"A nother material difference in practice betwixt the animal and intellectual mind is, that every action of jatellect proceeds from an opinion formed concerning what is good or ill, beantiful or the contrary, in the action. When we do fo, we are faid to act from will, which is always determined by fome opinion formed of the kind I have mentioned: whereas, when we att from mere appetite or inclination, without deliberation or opinion formed, we act as the brute does always; for he has no will, but is prompted to action by natural impulfe, or ${ }^{\circ}{ }_{f} \mu n$, as the Greeks call it.
" A third very material difference is, that intellect, in all its operations, propofes ends, and devifes means to accomplifh thefe ends; whereas the inflinet of the brute proceeds without confideration either of eads or means."
a. would inevitably perifh : but furely the caterpillar knows not that fuch an exertion is neceflary to its prefervation; and therefore it acts not from motives, but from hlind impu'fe. The bee and the beaver are endowed with an inftinct which has the appearance of forefight. They build magazines, and fill them with provifions; but the forefight is not theirs. Neither bees nor beavers know any thing of futurity. The folitary waip digs holes in the fand, in each of which the depolts an egg. Though the certainly knows not that an animal is to proceed from that egg, and Atill lefs if poffible that this animal muft be nourifhed with other animals, fhe collects a few fnall green worms, which the rolls up in a circular form, and fixes in the hole in fuch a mainner that they cannot move. When the walp-worm is hatehed, it is amply ftored with the food which nature has deftined for its fupport. The green worms are devoured in fuecefion; and the number depolited is exactly proportioned to the time neceflary for the growth and transformation of the wafpworm into a $\mathrm{fl}_{\mathrm{y}}$; when it iflues fro:n the hole, and is capable of procuring its own nourifhment. This infinct of the parent-wafp is the more remarkable, that She feeds mot upon fleth herfelf. Birds of the fame fpecies, unlefs when reflrained by peculiar circumftances, uniformly build their nefts of the fame materials, and in the fame form and lituation, though they inhabit very different climates; and the form and fituation are always exactly fuited to their nature, and calculated to afford them fhelter and protection. When danger, or any other cirenmftance peculiar to certain countries, rebders a deviation from the common form or fituation of nefls neceffary, that deviation is made in an equal degree, and in the very fame manner, by all the birds of one fpecies; and it is never found to extend beyont the limits of the country where alone it can ferve any good purpofe. When removed by neceffity from their eggs, birds return to them with latle aud anxiety, and hife then fo as to heat them equally; and it is worthy of obfervation, that their hatle to return is always in proportion to the cold of the chunate. But do birds reafon, and all of the fame fpecies reafon equally well, upon the nature and extent of danger, and upon the means by which it can but be avoided? Have birds any notion of equality, or do they know that heat is neceffary for incubation? DVo: in all thefe operations men recognife the intentions of nature; but they are hid from the animals themfelves, and therefore cannot operate upon them as motives.

Of the infinct of animals we fhall give one inftance more in the elegant and perfpicuous language of Dr Reid. "Every manufacturing art among men (fays that able writer) was invented by fome man, improved by others, and brought to perfection by time and experience. Men learn to work in it by long practice, which produces a habit. The arts of men vary in every age and in every mation, and are found only in thofe men who have been taught them. The manufactures of animals differ from thofe of men in many Atriking particulars. No animal of the fpecies can claim the invention; no animal ever introduced any new insprovement, or any variation from the former practice; every one of the fpecies has equal nzill from the beginning, without teaching, without experience, and
without habit; every one has its art by a kind of in. Ianine. fpiration. I do mot mean that it is infpired with the principles or rules of the art, but with the ability of rworking in it to perfection, without any knowledge of its principles, rules, or end. The work of every animal is indeed like the works of nature, perfect in its kind, and can bear the molt critical examination of the mechanic or the mathematician, of which a boncycomb is a flriking in lance.
"Bees, it is well known, conftrnct their combs with Remark. fmall cells on both fides, fit both for holding their tore able inof honey and for rearing their young. There are fance in cnly three poffible figures of the cells, which can make the bee, them all equal and fimilar, without any ufelefs interftices. Thefe are the equilateral triangle, the quare, and the regular hexagon. Of the three, the hexagon is the molt proper, both fur convenience and itrength. Bees, as if they knew this, make their cells regular hexagons. As the combs have eells on both fides, the cells may either be exactly oppofite, having partition again! partition, or the buttom of a cell may reft upon the partitions between the cells on the other fide, which will ferve as a buttrefs to ftrengthen it. The latt way is the bett for ftrength; accordingly the bottom of each cell relts againtt the point where three partitions meet on the other fide, which gives it all the ftrength poffible. The bottom of a cell may either be one plane, perpendicular to the fide partitions; or it may be compofed of feveral planes, meeting in a folid angle in the middle point. It is only in one of thefe two ways that all the cells can be fimilar without lohing room. And for the fame intention, the planes, of which the bottom is compofed, if there be more than one, mult be three in number, and neither more nor fewer. It has been demonftrated, that by making the bottoms of the cells to confilt of three planes metting in a point, there is a faving of material and labour no way inconfiderable. The bees, as if acquainted with thefe principles of folid geometry, follow them moft accurately; the bottom of each celi being compnfed of three planes, which make obtufe angles with the fide partitions and with one another, and neet in a point in the middle of the bottom; the three angles of this bottom being fupported by three partitions on the other fide of the comb, and the point of. it by the common interfection of thefe three partitions. One intlance more of the mathematical fkill difplayed in the Aructure of a honey-comb deferves to be mensioned. It is a curinus mathematical problem, at what precife angle the three planes which compofe the buttom of a cell ought to meet, in order to make the greateft polfible faving of material and labour. This is one of thofe problcms belonging to the higher parts of mathematies, which are called problems of maxima and minma. The celebrated $M \cdot$ Laurin refolved it by a fluxionary calculation, which is to be found in the Tranfactions of the Royal Society of London, and determined precifely the angle required. Upon the mof exact menfuration which the fubject could admit, he afterwards found, that it is the very angle in which the three planes in the botton of the cell of a honeycomb do actually meet.
"Shall we afk here, Who taught the bees the properties of folids, and to refolve problems of maxima and miniza? If a honey-comb were a work of human art,

Inftinet. every man of common fenfe would conclude, without hefitation, that he who invented the conftruction muft have underftood the principles on which it was conftructed. We need not fay that bees know none of thefe things. They work moft geometrieally without any knowledge of geometry; fomewhat like a child, who by turning the handle of an organ makes good mufic without any knowledge of mufic. The art is not in the child, but in him who made the organ. In like manner, when a bee makes its combs fo geometrically, the geometry is not in the bee, but in that Great Geometrician who made the bee, and made all things in number, weight, and meafure."
8
Which can. We have given a full detail of the flructure of a wot be con- honey comb, becaufe it is an effect of inftinct which founded cannot be confounded with the operations of reafon. with the operations of reafon.

The author of The Natural Hiflory of Animals, juftly offended with that theory which treats of infinctive motives, which reprefents the human mind as a buidle of inftincts, and of which the object feems to be to degrade mankind to the level of brutes, has very laudably exerted lis endeavours to detect its weaknefs, and to expofe it to contempt. But in avoiding one extreme, he feems to have run into the other; and whilit he maintains the rights of his own fpecies, he almolt raifes the brutes to the rank of men. "It is better (he fays) to fhare our rights with others than to be entirely deprived of them." This is certainly true; and no good man will hefitate to prefer his theory to that of his antagonift: but we fee no neceflity for adopting either; the phenomena may be aecounted for without degrading realon to the level of inftinct, or elevating inltinct to the dignity of reafon.

We fhall readily allow to Locke (c), that fome of in the inferior animals feem to have pereeptions of particular truths, and within very narrow limits the faculty ont of reafon: but we fee no ground to fuppofe that their cafil natural operations are performed with a view to con. infe fequenees; and therefore cannot perfuade ourfelves, mul with this hittorian of theirs, that thefe operations are pert the refult of a train of reafoning in the mind of the thei animal.
ral,
He acknowledges indeed, that their reafoning and tion thinking powers are remarkably defieient when compared with thofe of men; that they eannot take fo full a review of the paft, nor look forward with fo penetrating an eye to the future; that they do not accumslate obfervation upon obfervation, or add the experience of one generation to that of another; that their manners do not vary nor their cuftoms fluctuate like ours; and that their arts always remain the fame, without degeneracy and without improvement. "The crow (he obferves) always builds its neft in the fame way ; every hen treats her young with the fame meafure of affection; even the dog, the horfe, and the fagacious clephant, feem to act rather mechanically than with defiga. From fuch hafty obfervations as thefe, it has been inferred (he fays), that the brutes are directed in their actions by fome mytterious influence, which impels them to employ their powers unintentionally in performing actions beneficial to themfelves, and fuitable to their nature and circumAtances."

And are thefe obfervations indeed hafty? and is this inference ill founded? To us the matter appears quite otherwife. If the arts of brutes and other animals 6
have
(c) "For if they have any ideas at all, and are not mere machines, as fome would have them, we cannot deny them to have fome reafon. It feems as evident to me, that fome of them do, in certain inftances, reafon, as that they have fenfe; but it is only in particular ideas, juft as they received then from the fenfes. They are tbe beft of them ticd up within thofe narrow bounds, and have not, as 1 think, the faculty to enlarge them by any kind of abftraction." Effay on Human Under/landing, Book II. chap. 11.

This is in part a juft obfervation, and ferves to account for many phenomena which later writers have derived from inflinct. The author of The Philofophy of Natural Hiftory had "a eat that frequented a clofet, the door of which was fattened by a common iron latch. A window was fituated near the door. When the door was fhut, the eat gave herfelf no uneafinefs. As foon as the tired of her confinement, fhe mounted on the fole of the window, and with her paw dexteroully lifted the lateh and came out." This practice, which we are told continued for years, muft have been the confequence of what Locke calls reafoning in particular ideas. It could not be the effect of inftinct; for inftinct is adapted only to a flate of nature, in which cate have neither latches to lift nor doors to open; and as it is not faid that the animal attempted to lift the latches of other doors, we are not anthorifed to infer that this particular action was the confequence of reafoning in ideas enlarged by abftraction : the cat had repeatedly fcen one door opened by an exertion which the was capable of imitating. Yet that animals have no power of enlarging their ideas, is a pofition, of the truth of which, though it is advanced by Locke, we are by no means confident. It is well known that crows feed upon feveral kinds of ghell-filh when within their reaeh; and that they contrive to break the fhell by raifing the fifh to a great height, and letting it drop upon a flone or a rock. This may perhaps be confidered as pure inftinet directing the animal to the proper means of acquiring its food. But what is to be thought of the following fact, which was communicated to us by a gentleman whofe veracity is unqueftioned, and who, being totally unaequainted with the theories of philofophers, has of courle no favourite hypothefis to fupport ? In the fpring of the year 1791, a pair of crows made their neft in a tree, of which there are feveral planted round his garden; and in his morning-walks he had often been amufed by witneffing furious combats between them and a cat. One morning the battle raged more fiercely than ufual, till at laft the eat gave way and took fhelter under a hedge, as if to wait a more favourable opportunity of retreating to the houfe. The crows continucd for a fhort time to make a threatening noife; but perceiving that on the ground they could do nothing more than threaten, one of them lifted a fone from the middle of the garden and perched with it on a tree planted in the hedge, where fhe fat watching the motions of the enemy of her young. As the cat crept

## 1 N S

have always remained the fame without degeneracy, and without improvement; and if they be at the fame time the refult of reafoning; they mult either be fo perfect that they cannot be improved, or fo imperfect that they cannot degenerate. That the ftructure of a honey-comb is imperfect, no man has ever imagined. We liave feen, that, as far as we are capable of difcerning the end which it is intended to ferve, it is the meft perfect ftructure poffible : and thereforc, if it be the refult of the reafoning of the bee, the author mult retract his affertion refpecting the extent of the reafoning and thinking powers of inferior animals; and inftead of faying that they are remarkably deficient when compared with thofe of men, affirm that they are infinitely more perfect. No human art has yet arrived at fuch perfcetion as that it might not be improved ; no architect has ever built a town, or conftructed a magazine, which he could mathematically demonftrate to be of the very beft poffible form for the end intended, and fo abfolutely perfect as to be incapable of improvement.
But the fame author proceeds to affirm, that "the laws of analogical reafoning do not juftify the idea that the brutes aet, on any occafion, abfolutely without defign." Nay, he fays, it feems more probable, "that the inferior animals, even in thofe intlances in which we cannot difinguif the motives which aEtuate them, or the views with which they proceed, yet act with defign, and extend their views, if not a great way, yet at leaft a certain length forward; than that they can be upon any occafion, fuch as in rearing of their young, building nefts, \&c. actuated merely by feeling, or over-ruled by fome mylterious influence, under which they are nothing but infenfible inftruments." This laft phrafe is ambiguous. If by infenfible inftruments it be meant that the brutes are confidered by the advocates for inflinct as mere machines without the faculties of fenfation and fpontaneity, the author is combating a phantom of his own creation; for we believe an opinion fo abfurd is not now maintained by any man, (fee Brute). But if by infenfible inftruments be meant fuch inftruments as aft fpontaneoully without being confcious of the end to which their aetions lead, he appears not only to be egregioully miltaken in his conjeeture refpecting the defign of brutes, but alfo to have advanced an hypothefis contradietory and inconfiftent.
If it be true, that the inferior animals aet with defign, even in thofe inflances in which we cannot di-
flinguifh their motives, their views may indeed ex. Intinct. tend but a little way when compared with infinity: but certainly they extend farther than ours; for there Maintainis no ufeful work of man conftucted with fuch fkill, ed, and but that, after it is finifhed, another man of equal education will be able to diftinguifh the general defign of the artift. But if the inferior animals, on all occafions, act with defign, we fhould be glad to know the defign of the bees in forming the cells of their combs in the manner which we have fo largely defribed. Do thefe little animals indeed know that a comb, confifting on both fides of hexagonal cells, with the bottom of each compofed of feveral planes meeting in a certain folid angle, and fo formed as that the bottom of a cell on the one fide fhall reft upon the partitions between the cells on the other fide, is in all refpects the moft proper both for holding their ftores of honey and for rearing their young? And do they likewife know, that its excellence arifes from the precife figure and pofition of the cells, by which there is a very confiderable faving of labour and materials, whill the comb at the fame time has the greateft poffible ftrength, and the greateft poffible capacioufnefs? If they know all this, and act with a view to thefe ends, it mut indeed be confeffed that becs are rational creatures, and that their thinking and reafoning powers far furpafs thofe of men; for they have from the earlielt ages made difcoveries in the higher mathematics, which there is reafon to believe were altogether unknown to the human race till the bcginning of the prefent century, and which at this moment are beyond the comprehenfion of nine-tenths of mankind in the moft enlightened nation on earth. If this be a conclufion too abfurd to be admitted, there is no other alternative, but either to fuppofe that by this artificial Atructure of their cells the bees have fome other end in view, which we cannot diftinguifh; or to acknowledge, that they are over-ruled by fome mylterious influence, under which they are nothing but fpontaneous agents, unconfcious of the end to which their operations tend. Which of thefe conclufions is the moft rational, we will not offer fuch an infult to the undertanding of our readers, as to fuppofe the mcanelt of them capable of entertaining a doubt. That a honey-comb is conftructed with defign, we moft readily admit ; but the defign is not in the bees, but in the Creator of the bees, who directs their operations to, their own good, by what the author with great propriety terms a mylterious influence ( D ).

But he thinks it an unanfwerable argument in fup* An objee-
port tion to it:
along under the hedge, the crow accompanied her by flying from branch to branch and from tree to tree ; and when at laft pufs ventured to quit her hiding-place, the crow, leaving the trees and hovering over her in the air, let the flone drop from on high on her back. That the crow on this occafion reafoned, is felf evident; and it feems to be little lefs evident, that the ideas employed in her reafoning were enlarged beyond thofe which the bad reccived from her fenfes. By her fenfes fhe may have perceived, that the fhell of a fifh is broken by a fall; but could her fenfes inform her, that a cat would be wounded or driven off the field by the fall of a fone? No; from the effect of the one fall preferved in her memory, fhe muft have inferred the other. by her power of reafoning.
(D) Though this way of acting is undoubtedly myfterious, " yet it thould not appear extraordinary even so a man who is not a philofopher, as we fee examples of it daily in our own fecies: For a man under the direction of another of fuperior underfanding, will ufe means to accomplifh an end, without having any idea ofr cither; and indeed in my opinion, by far the greater part of mankind are deflined by God and nature to be governed in that way." Ancisnt Metaphysiss, Vol. III. p. 352.
port of his theory, that in the performance of thofe actions, in which animals are faid to be guided by unerring intinet, different individuals difplay different modes of conduct; and in his opinion, to talk of inftinctive principles which admit of improvement, and accommodate themfelves to circumflances, is merely to introduce new terms into the language of philofopliy ; for he affirms, that no fueh improvement or accommodation to circumftances can ever take place writhout a companifon of ideas, and a deduction of inferences. It is probable, that the author here alludes to thofe animals which, in their moft important operations, are known to act differently in different countries. Thus the oftrich in Senegal, where the heat is exceffive, neglects her eggs doring the day, but fits upon them in the night. At the Cape of Good Hope, however, where the degree of heat is lefs, the oltrich, like other birds, fits upon her eggs both day and night. In countries infetted with monkeys, many birds, which in other climates build in buthes and elefts of trees, fufpend their neils upon flender twigs, and thus elude the

But though we cannot agree with this author when Ind he affirms that no accommodation to circumftances can ever take place without a comparifon of ideas, we readily admit that no faculty which is capable of improve- capah ment by obfervation and experience can in propriety imprr of fpeech be termed initinct. Inftinet being a pofitive ment determination given to the minds of animals by the Author of nature for certain purpoles, mut necellarily be perfet when viewed in connection with thole purpofes: and therefore to talk, as Mr Smellic does, of the improvement of inftinct, is to perplex the underftanding by a perverfion of language. There is not, bowever, a doubt, but that reafon may copy the works of inftinct, and fo far alter or improve them as to render them fub. fervient to other purpofes than thofe for which they were originally and initinctively performed. It was thus in all probability that man at firit learned many of the moit ufeful arts of life.

> "Thy att, of bulding from the bee receive;
> " Learn of the nole to plough, the worm to weave;
> "Learn of the tate naueduato fail,
> " Spread the thin oar, and catch the driving gale.

But the arts thus adopted by men are no longer the works of inftinct, but the operations of realon influenced by motives. This is fo obvioully and undeniably true, that it has compelied the author laft mentioned to confefs, in that very lection which treats of inllinets improveable by experience, that "what men or brutes learn by experience, though this experience be founded on inftinet, cannot with propricty be called inftinctive knowledge, but knowledge derived from experience and obfervation. Initinct (he fays) fhould be limited to fuch actions as every individual of a fpecies exerts without the aid either of experience or imitation." This is a very jult dillinction between intlinet and experience; but how to reconeile it with the fundamental principle of the author's sheory we know not. It would certainly be a very arduous tafk; but it is a tafk from which we are happily relieved, as his theory and ours have little refemblance.

Having thus proved, 'we hope to the fatisfaction of our readers, that there is fuch a prineiple as inftinct in the inferior animals, and that it is effentially different from human reafon; let us return to our own โpecies, The and inquire whether there be any oceafions upen which ther man acts inftinctively, and what thofe occations are. be a This is a queftion of fome difficulty, to which a com- cafio plete and fatisfactory anfwer will perhaps never be gi- man ven, and to which we have not the vanity to think infir that fuch an anfwer will be given by us. The prid-ly? ciple of afociation (to be explained afterwards under ned. the article Metaphysics) operates fo powerfully in man, and at fo carly a period of life, that in many cales it feems to be impoffible to dittinguifh the effeets of habit from the operations of nature. Yet there are a few cafes immediately connected with the prefervation of the individual and the propagation of the kind, in which by a little attention thife things may be dittinguifhed. We have already given an inftance in the fueking of a child, which we believe to be an oo peration performed by inftinct. Dr Prieftley, how: ever, thinks differently: "The action of fucking (fays he), I am confident, from my own obfervations, is not natural, but acquired." What obfervations they were which led him to this conclution he has vot told
a. us, and we cannot imagine; but every obfervation which we ourfelves have made, compels us to belicve that an attemp! to fuck is natural to children. It has been obferved by the author of the Philofophy of Natural Hiltory, that the inttinct of fucking is not excited by any fmell peculiar to the mother, to milk, or to any other fubdance; for that infants fuck indifcriminately every thing brought into contact with their mouths. He therefore infers, that the defire of fucking is innate, and coeval with the appetite for air. The oblervation is certainly juft: but a difciple of Dr Priefley's may object to the inference; for "in fucking and fwallowing our food, and in many fuch inflances, it is exceedingly probable (Fays the Doctor), that the actions of the mufcles are originally automatic, having been fo placed by our Maker, that at firt they are ftimulated and contraet mechanically whenever their action is requifite." This is certainly the cafe with tefpect to the motion of the muicles in the action of breathing; and if that action be of the fame kind and proceed from the very fame caufe with the action of fucking, and if a child never fhow a defire to fuck but when fomething is brought into contact with its mouth, Dr Priefley's account of this operation appears to us much more fatisfactory than that of the authors who attribute it to inflinct.

But the actions of breathing and fucking feem to differ effentially in feveral particulars. They are indeed both performed by means of air ; but in the former, a child for many months exerts no fponianeous efiort, whilf a fpontaneous effort feems to be abfolutely neceffary for the performance of the latter. Of this indeed we could nor be certain, were it true that infants never exhibit fymptoms of a wijb to fuck but when fomething is actually in contact with their mouths; for the mere at of fucking then might well be fuppofed to be automatic and the effect of irritation: But this is not the cafe. A healthy and vigorous infant, within ten minutes of its birth, gives the plainelt and moft unequivocal. evidence of a defire to fuck, before any thing be brought into actual contact with its month. It ftretches out its neck, and turns its head from fide to fide apparently in quet of fomething ; and that the object of its purluit is fomething which it may fuck, every man may fatisfy limfelf by a very convincing experiment. When an infant is thus flretching out its neck and moving its head, if any thing be made to :ouch any part of its face, the little creature will inftantly turn to the object, and endeavour by quick alternate motions from fide to fide to feize it with its mouth, in the very fame manner in which it always feizes the breaf of its nurfe, till taught by experience to dittinguith objects by the fenfe of light, when thefe alternate motions, being no longer ufeful, are no longer employed. If this be not an inftance of pure inftinct, we know not what it is. It cannot be the refult of affociation or mechanifm; for when the ftetching of the neck takes place, nothing is in contact with the child's mouth, and no affuciation which includes the act of fucking can have been formed. Affociations of ideas are the confeqnences of fimultaneous impreffions frequently repeated; but when the child firit declares, as plainly as it could do were it poffefled of language, its wifh to fuck, it has not received a fingle impreffion with which that wilh can poffibly be affociated.

Vol. IX. Part I.

Were Dr Priefley to weigh thefe facts, of the truth of which we are certain, we doubt not that his wellknown candor would make him retract the affertion, that all the actions which Dr Reid and others refer to intling, are cither automatic or acquired. The greater part of thofe actions, as well as of the apparently initinctive principles of belief, we have no doubt are acquired: but we are perfuaded that a child fucks its nurfe as a bee builds it cell, by inftinet ; for upon no other hypothefis can we account for the fpontancous efforts exerted in both thefe operations: and we think it no difgrace to our fpecies, that in fome few cafes we fhould act from the fame principle with the inferior creation, as nothing feems more true than that,

Reafon raife oocr inftinet as we can;
In this 'tis God that works, in that 'tis man.
We have faid, that, in the favage flate, the fexes so together for the firf time by inftinct, without any view to offspring, and perhaps with no determinate idea of enjoyment. This opinion, we believe, has been generally maintained ; but it is controverted by Dr Hartley. "Here (fays he) we are to obferve, firt, that when a general pleafurable flate is introduced, either by direct impreffions or by affociated influences, the organs of generation muft fympathize with this general thate, for the fame reafons as the other parts do. They mut therefore be affected with vibrations in their nerves, which rife above indifference, into the limits of pleafure, from youth, health, grateful aliment, the plafures of innagination, ambition, and fympathy, or any other caufe which difules grateful vibrations over the whole fyftem.-Secondly, as thefe organs are endued with a gieater degree of fenfibility than the other parts, from their make, and the peculiar fructure and difpofition of their nerves, whatever the fe be, we may expect that they fhould be more affected by thofe general pleafurable ftates of the nervous fyftem than the other parts.-Thitdly, the dittenfion of the cells of the reficula feminales, and of the finufes of the uterus, which take place about the time of pubertys mutt make thefe organs more particularly irritable then." His fourth oblervation refpects a tlate widely different from that of nature, and therefore is nothing to the puipofe: but his fifth is, that " the particular Thame which regards the organs of generation, may, when confidered as an aflociated circumftance, like other pains, be fo far diminifhed as to fall within the limits of pleafure, and add confiderably to the fom total."

To this excellent and able writer we may allow the truth of thefe obfervations (though fome of thens might certainly be controverted) ; and yet deny his conclufion, that "they are fufficient to account for the general defires which are obfervable in young perions, and that thofe defires are of a factitions nature." For fuppoing every thing which he meations to take place by mere mechanifm and affociation; that the organs of generation are irritated, and certain cells and finufes dittended ; the only inference which can be fairly drawn from fuch premifes is, that at the age of puberty young men and wo nen muit from thefe caufes experience certain feelings and wants which they knew not before; but furely mechanifm and affociation cannot teach them the ufe of the organs of generation, or point out the only means by which their new feelings can be grati-
l. 1
fied:

Inatinct. fied: and therefore, as we fee thefe means invariably purfued by all animals rational and irrational, withunt experience and without infrustion, we muft refer the mutual defire of the fexes to a higher principle than mere mechanifm and afficiation; and that principle cau be nothing but inflinct.

Jeffides thefe, we think the action of eating may be attributed to inftinet. It is certainly performad by a fponcaneous exertion of the proper organs; and that exertion is firit made at a time of life when we have no conception of the end which it ferves to accomplith, and therefore cannot be influenced by motives. It mult ir leed be confeffed, that the firt act of chewing is pertormed by a child, not for the purpule of mathieating food, but to quicken the operation of nature in the cutting of teeth: and perlaps it may be faid, that the pleating fenlation of $1 . y / f$, which is then fith experienied, and afterwards remembered, prompts the child to comtinue at intervals the exertion of clewing after all its tecth are cut; fo that though the act of eathing is not performed with a view to the matlication of fools or the nomrifhment of the body, it may yet be performed, not from any inftinctive impulce, but mercly froma an early and deep -rooted afuciation. But in anfwer to this it is fufficicut to ank, Who tangle the infant that the aitof chewing would ginicken the operation of mature in the cutting of teeth? Not reafon, furely, nor expenience; for an infant knows nothing of teth or the manner in which they grow: and if it be granted. that for this purpofe it was ariginally impelled by forme internal and mytherious influence to perform the action of chewing, we are not inelued to deny that the operation may be continued for other purpofes by means of affuciation.

$$

in God's, ine fingle can fe end pathere,
let ferve : 0 foen id tos finme nimet ule

This is found philofophy confirmed by obfervation and daily experience: but though in the works of 1 ; 1 , one priaciple produces many coufequences, and though perlaps there is not a principle which falls under our cogaizance mare fruitul than that of afficiation, jet if it be not fufficient to account for the firflad of
chewing, we cannot refer to it alune as to the fource is of that operation. Shoold it be faid, that the gums of an infant are at the period of cutting teeth foirritable, that the moment any thing is applied to then the jaws perform a motion metely altomatic, which we millake for the Spontaneous effict of intlinet; fill we would alk, What prompts the child to apply every thing to its mouth: Dues the irritation of the gums contrict the mufcles of the arns? By a higot for meclianifm this might be faid, were it true that the arm of an infant, like a piece of clock-work, is always for regulaty move. 1 as to bring its hand direetly into contact with its gums: but this is far from being the cafe; an infant inakes many unfuceefful efforts io reach its mouth, and docs not accomplifl its purpofe till after repeated trials, Perhaps it may be alleged / for when men adopt a fasourice hypothefis they will alinge any thing in its fup. port), that infants are taught to carry things to their mouths by the pleafing fenfation received from the application of their nurfes breatts, and continue the prac. tice from habit and affociation. But it is certain that they do not begin this practice till tecth are forming in their gums ; and then they ufe fuch things as they themfilves carry to their mouths very differently from the breafts of their nurfe : they conltantly chew and bite their ratiles, though they very foldom bite their murfes. As this practice cannot be begun from a principle of aff ciation, fo it appears to us that it cannot be continued upon fuch a principle. Were the feafation experienced by an infant when chewing a hard fublance a pleating fenfation, the remembrance of the pleafure might as a motive prompt it to rcpeat the operation: but it is obvious, that hy prefling a gum, through which a tooth is making its way, againt any thing hard, the infant mul experience a painful fenfation; and therefore the influence which impels it to continue this operation, mut be fomething more powerful than plafure or pain (A).

Thefe three actions, then, by which iufants fuck, by Tbe which they chew their food, and by which mankind be o are proparated, have undeniably their origin in in- acoi ftinct. There may be many other human aitions whu which derive their origin from the fame fource (D) ;imil"
butso
guif
the
(A) A learned phyfician, to whon this article was fhown in manufeript, and to whofe animadverfions it is indebted for grear part of what merit it may poffefs, thinks that the pain arifing from the cutting of teeth is all vinted by the chowing of hard fubfances, and that this is the caufe of that inclination which infants have perp tunily to che $x^{\prime}$. Congive probability to an opinion which admits not of direct proof, he obierves, that the violent prin in the ghans penis occafoned by aftone in the blodder, is certainly alleviated by rubbing the glans and pulling the prepuce, which is therefore a very frequent employment of all who are aftheted with that dreadfox diforder. Notwithfandiag the deference which we willingly pay to the juldgment of our fiiend, we call perceive no analory between thefe two cafes, which, to be of any ufe to his argument, ought to be not only analogons but fimilar. It is well known that rubbing the glans penis will almoll at any time give a pleating fenfation ; and it is eafy to conceive how two oppofite ferfations, excited at once in the fame place, may counterbalance each other, fo as to leave the patient equally free from pleafure and pain. But is it conceivable, that to prefs again'l a hard fubflance a gum in which a tooth is forming, fhould excite a pleafing fenfation? If it be, nur friend's opimion accounts better than ours for the continnance of the practice of chewing; but fill it mull be infinct, which, on either fuppofition, fingl directs the infant to that operation, for it cannot be begun either from reafon or experience.
(D) The refleffnefs which perpetually accompaniss the paffage of a fane from the kidneys through the ureters, has by many been confidered as the effect of inftinct ; and their npinion is not without a plaufible foundation. In a nephritic pasoxyfm, a man rifes from his chair, throws himfelf dowa with viulence, and rifes

## I N S

t. but in a flate of civil fociety it is very difficult, if not impoflible, to difinguifh them from the effects of early haliit ( E ).
Such, however, is the prefent impaticnce of that 13 . bour without which effects cannot be traced to their caufes, that every plenomenon in human nature, whicl (s) former philofophers would have occationed difficul. ty, is now thought to be fufficiently accounted for by refering it to fome inflinct as its particular caufe; and he who can provide himfelf with a fufficient number of the le instincts, for the reality of which he offers no proof, feats hirr.felf in the philofopher's clair, and dreams that he is dictating a fyftem of fcience, whilt he is cully retailing a collection of anecdotes. A phikofopher of this fechool has lately carried the doctrine of intlinctive principles fo far, as to attribute the fuperiority of nan over the other animals, chiefly to the creat number of inflincts with which his mind is endowed; and among thefe he reckons (not, we believe, as chalacter ittic of our feecies in contradiftinction to other animals, but as part of the iullinetive bundle in the largenefs of which nur fuperiority confifts) "the veiding of urine and eactroment, fieczing, retralion of the nufets upon the application of any pantul limulus, the moving of the eye-lids ant other parts of the body:" Thefe, he fays) are offects of original inftincts, and effential to the cxiftence of young animals. With this writer inthet is fomerimes reprefented as looking into futurity, and acting upon motives which has hitherto betn confidercd as the province of reafon and the characterillic of man: here the fame inftinct is confounded with iritation and meechanifm; and if this mode of philofophifing continue in fafhion, we fhall not be furprifed in find men, beaht, hirds, and vegetables, confidered by fomeother writcrasnothing more than differeut fpecits of the fanie genus of beings, that are all actuated by the great and univer Fal principle of inft inct. If fneezing and the rutraction ot the mufcles upon the application of any painful Rimulus be actions of inftinct, there cannot be a

## 267 ] <br> I N S

doubt, upon the received principles of philofophy, but that Intinct. the contraction of the leaves of the fenfitive plant upon the application of any titimulus proceeds likewife from inftinct : nay, a piece ofleather mult be endowed with inflinct ; for it too retracts upon the application of the painful ftimulus of lire. All thefe are evidently fimilar effects produced by the fame or fimitar caufes; for in the operations of fneezing and retracting the mufcles upon any painful application, there is not the leaft fpontaneous exertion on our part, no co-operation of nind more than in the contraction of the leather and the plant. With refpect to the voiding of arine and excrement, it is obvious, that at lirtt thefe operations are performed without any effort of fpontaneity; and that a voluntary power over the mufeles which are fubfervient to them is very gradually acquired. Urine and excrement irriate the bladder and guts, which are fupplied with branches of the fame nerves that fupply the abdominal mufcles. But it is woll known that the irritation of one branch of a nerve brings on a contraction of the mufles which are fupplied by the other branches. Urine and excrement therefore are evidently expelled by the mechanical contraction of the orgaus of excretion : and to attribute thefe eracuations to infling, is equally abfurd as to fay, that water or any other foft fubttance pent up in a veffu, and preffed equally on all lides, makes it efcape by infling through the caliefl palfage. It is difficult to guefs what the author neeans by the inllinstive motion of the eye-lids and other parts of the body. There is a motim of the eye lids which is voluntary, and another which is involuntary. 'l'he furmer proceeds from fome motive, to exclude tos great a Hhare of light, or to guard the eye againll a forefeen mifchief, and is therefore the refult of reafon as diftinguifhed from inilinet : the latter is obvioufy the effect of aflociation, which took place in early infancy and produced a habit. Infants for feveral days after birth du not wink with their cyes upon the approach of one's

Ll2
hand
again he knows not why. Thefe motions are certainly performed by fpontantous exertions; and as they tend ta quicken the defeent of the fone, they ferve the bell of purpofes. Yet thongh they are not performed with this view, and though nine-tenths of mankind know nothing of their falutary tendency, we would nut te too pufitive that they proceed from inllisct. A man fufiering vioknt pain tries every cxperiment to pracire relief; and if thefe incelfont changes of pofure be begun with any view of this kind, however indiltinet, they commence from reafon, and may be continued by habit. If they be begun with no view whatever, they are undoubtediy intlinctive.
( $\mathrm{t)}$ " As intellect is latent for a confiderable time in the individuals among us, and muft have been latent for a very long time, perhaps fur ages, among favages, it is not to be fuppofed that Nature, in that natural and primitive flate, would leave us unprovided with what fhe has fo hountifully beftowed upon onther animals. What particular intinct man then had, it is difficult to fay; but this we may be affured of, that he had all that was neeefliary for his being and well-being: but not fo much would be neceffary to him as to other animals, whole ceconomy is more arificial than that of man, his being very fimple, and much refembling that of cattle and hurfes. After he had acquired intellect, reafon would, in fome meafure, fupply the place of intliuct: and there remains nothing now of intince among us, execpt what appears in our infants before they have got the ofe of reaton; fuch as their applying to the breaft of the mether for nourifhment. By the ufe of intelleat, and the arts and feiences invented by us, we have formed a fy flem of life altogether different from the uatural." Anci,nt Mítuphyfics, wol. ii page 3 co.

Wirether intellect was for ages latent amorg favages, this is not the proper place to inquire. It is a queftion which may be confidered afterwards, when the anthor's opinion refpecting the four minds in man paffo under our review : but whatever may be thought of thefe peculiar fentiments, the reafon here affigued for the dificulty of afcertaining the genuine inflincts of man, will be admitted by all who have thought fufficiently on the fubject.

Intinct. hand or any other fubflance; but after having experiinced pain from too much light or any other thing which hurts the eye, and that pain having at firft produced an automatic motion of the eye-lids, the motion comes in time to be fo clofely affociated with its cause, tint the very appearance of the latter proeduces the former. In all this there is no inflict, nor any thing which refembles intine: in the one cafe, the motion of the eyelids is in the fricteft fenfe voluntary and rational; and in the ether, it is, either automatic or the effect of habit.
" The love of light (fays the fame writer) is exhibited by infants at a very early period. I have remarked evident fymptoms of this attachment on the third day after birth. When children are farther advanced, marks of the various pinions generally appear. The paton of fear is difcoverable at the age of two months. It is called fourth by approaching the hand to the child's eye, and by any fudden motion or mnufual noife." lt ha, likewife been paid, that " an infant may be put into a friche by an angry countenance, and frothed arran by files and bandifhnents :" and "that all the ie are cafes of pure intinct." In reply to which, we feruple not to affort with Dr Priefley, that an infant (untefs by an infant be meant a child who his a good deal of experience, and of courfe has made many obs rations on the connections of thing n) "is abfelutcly incap able of terror. I ain pofitive ( (days he), that no child ever Showed the lat fymptom of fear or apprehension till he had actually received hurts and had felt pain; and that children have no fear of any particular perfor or thing, but in eonfequence of fore connection between that perfon or thing and the pain they have felt. If any instinct of this kind were more neceflary than another, it would be the dread of fire. But every body molt have observed, that infants how no fign of any fuch thing; for they will as readily put their finger to the flame of a candle as to any thing elf, till they have been burned. But after rome painful experience of this kind, their dread of fire, though undeniably the effect of afrocation, becoines as quick and as effectual ins its operations as if it were an original. infinitive primsiple." We moreover do not hefitate to fay, with the fame great philosopher, that if it were pol. file always to beat and terrify a child with a placid countenance, fo as never to alum that appearance but in thole circumftanees, and always to fonthe him with what we call an angry countenance, this connection of ideas would be reverfed, and we Gould fee the child frighted with a file and delighted with a frown. In fact, there is no more reafon to believe that a child is naturally afraid of a frown, than that he is afraid of being in the dark; and of this children certainly difcover no ligan, till
they have either found fomething difafrecable to them in the dark, or have been told that there is Something dreadful in it.
The truth of the fe observations is fo obvious, that we doubt not but they will carry conviction to the mind of every reader. For though it thould be granted, that fo early as on the third day after birth children exhibit fymptoms of uneafinefs upon the fulden exclufion of light, it would by no means follow that the love of light is in them int in five ( A ). Light operates upon the eye by contact, and communicates to the infant a fenfation of touch. If that fenfation be pleafont, the child mut neceffarily feel forme degree of uneatinefs upon its removal, jut as a full grown man mutt feel uneafy upon being deprived of any pofitive pleafure. But is ferfation, or pleaflure, or the removal of pleafure, pure instinct? No, furcly.

Thus difficult is it to fay in many cafes what actions have their origin in inftinct, and what are merely the effects of early affociation. But we think it may be fafely affirmed, that no action, whether of man or brute, which is deliberately performed with a viezo to confequences, can with any propriety be fain to proceed frominftinct: for fuch actions are the effect of reafon influenced by motives. Deliberation and inflinct are obviously incompatible. To fay with the author of the Philosophy of Natural Hittory, "that, when we are flimulated by a particular inftinct, inftead of instantly obeying the impulfe, another ialtinct arifes in oppofiton, creates hefitation, and often totally extinguishes the original motive to action," is either to affirm what is apparently not true, or it is a grofs perverfion of hasgurge. Motives oppofed to each other may create hefitation, and a powerful motive may counterbalance a feeble inftinet; but of two or more inftincts operating at the fame time, and oppofing each other, we have no conception. Infinct, if we chonfe to freak a language that is intelligible, means a certain impulle under the direction of Supreme Wifdom; and it is very little probable that fuel 2 wifdom fhould give oppofite impulfes at the fame instant. In the natural works of animals, which arc confeffedly under the influence of inftinct, we perceive no symptoms of deliberation; but every one, when not interrupted by external violence, proceeds without hefication in the direct road, to an end of which the animal if elf knows nothing. The fame would be the cafe with man were he under the guidance of inflict: and it is vain to fay that the inAline of fear is daily counteracted by ambition and refentment, till it be proved that fear, ambition, and refoutmont, are really inftincts. Of this, however, the author rems to have no doubt. Indeed his work is fo likerally footed with there principles, fo ufful to every man who withes to acquire the name of a philofopher without the labour of inveltigation, that not only far, anibizion, and refintmicnt, but even fupcyfition, devotion,
respect
(A) It may with equal propriety be faid, and upon apparently better evidence, that children have an infinctive love of darkens. A child who has been for forme time in a dark room, will exhibit fronger fymptoms of uneafinefs upon the fudden introduction of candles, than he would upon candles being fuddenly carried out of a room which had been for forme time illuminated. This fact, and the reafon of it, are well known to every man who has but barely diet into the faience of Optics: but no philofopher, till author arofe, ever thought. of accounting for it by the hort and leafy method of infin.
tinot. respea for eminent characters, avarice, bope, envy, benevolence, and fympathy, are all, in his opinion, infinas fimple or moditied. The origin of fear we have already feen when examining the inftinets faid to exhibit themfelves in early infancy: let us try if we cannut trace fome other individuals of this numerous family to the fame fource of early afociations.

The cafe then feems to be as follows. We firft perceive or fuppofe fome real good, i. e. fome fituefs to promote our happincfe, in thofe things which we love or defire. Hence we annex to thofe things the idea of pleafure ; with which they come, in time, to be fo clofely affociated in our minds, that they camot ever after prelent thomflues without bringing that idea along with them. 'I his afiociation likewife often remains even after that which firf gave rife to it is quite forgotitn, or perhaps does not txilt. An inlance or two will make this very clear. No man can be born a lover of money; for in a flate of nature money exifts not : no man therefore can be born with our author's inftinct of avarice, directed in the manner which the moft common acceptation of that word denotes. Yet how many men are there in the world, who have as ftrong a defire for money as if that delire were innate and intlinctive; who account fo much money fo much happinefs; and who nake the mere poffeffion of gold and filver, without any thought or defign of ufing them, the ultimate end of all their actions? This is not becaufe the love of money is lorn with them, for that is imprffitle; but becaufe they firlt perceive a great many advintages from the peffeffion of money, whence they concrive a pleafure in having it. Hence they defire it, endeavour to obtain it, and feel an actual pleafure in obtaining and poffefling it. Then, by dropping the intermediate Reps between money and happinds, they join money and happinefs immediately together, and content themfelves with the phantafic pleafure of having it; making that which was at firlt purfued only as means, be to them an ulimate end, in which confifts their happinefs or mifery. The fame might be obferved concerning the thirlt after know. ledge, fame, ambition, and moit of the various purfuits of life. Thefe are at firit entered upon with a vitw to fome farther end, but at length become habitual exercifes; with which the ided of pleafure is fo clofely affociated, that we continue the purfuit after the reefon from which it was at firit begun has tutirely vanifhed from our minds. Hence alfo we may account for another of our althon's modifed irfiness, the almoft diabolical feeling of envy. Mr Locke nhferves, that there are fome men entisely unacquainted with this paffion. His obfervation we believe to be a jut one: for moft men that are ufed to reflection, remember the time when they were firf under its influence; and though they did not, it is a thing very little likely that the beneficent Author of nature fhould have implanted in the human mind teen the feeds of an inflinet, which, in thic emphatic language of the Rambler, " is mere unmixed and genuine evil." Envy is that pain which alifes in the mind upon obferving the fuccefs or profperity of others: not houever of all others indetinitely, but only of thofe with whom, upon forne account or ather, the envious perfon has once had a rivalmip. But of fuch a feeling the origin is obvions; for when two or more perfons are competions for the lame
thing, the fuccefs of the one neceffarily tends to the lufinet detriment of the other: hance the fuccefs of the one rival is in the mind of the other clofely affociated with pain or mifery ; and this affociation remaining after the rivalthip which occalioned it has ceafed, the perfon in whofe mind envy is thus generate l, alsays feels pain at the fuccefs of his rival eren in affuire which have no relation to the original competition. Thus it is, that we are apt to eney thofe pelfons who refule to be guided by our judgments, or perfuaded hy our arguments : For this is nothing elfe than a rivalfhip about the fuperiority of judgment; and we take a fecret pride, both to let the world fec, and in imgining ourfelves, that in perfpicacity and Itrength of j Idgronent we have no fuperior.

Though the principle of affuciation will be more fully explained in another place, there is one obfervation which mult not be omitted here; it is, that we do not aluays, nor perlaps for the molt part, make thefe affociations ourfelves, but learn them from others in very early life. We annex happinefs or mifery to certain things or actions, becaufe we fee it done by our parents or companions ; and acquire principles of action by imitating thofe whon we efleem, or by being told, by thofe in whom we have been taught to place confidence, that fach conduct will promote our happinefs, and that the reverfe will involve us in mifery. Hence the fon too often inherits both the vices and the party of his father as well as his eftate; hence national vintues and vices, difpofitions and opinions; and hence too it is, that habits formed before the periud of diftinet remembrance are fo generally miftaken for natural inftincts.

From the whole then of this inveftigation, we think Men perourfelves wat ranted to concluce, that there is an effen- form ratiotial difference between mechanifm and inthet, and between both and reafon; that mankind penform ac-atuma:ic tions by cach of thefe principles, and that thofe ac-athonso tions ought to be carefully diftinguifhed; and, though the human mind is unqueftionably endowed with a few inftenets neceflary to the prefervation of the individual and the proparation of the race, that by far the greater part of thofe altions which are commonly faid to proceed from inflinct are morely the effects of early ha. bits. We are likevife of opinion, that the prefent fafhionabie mode of referring almot every phenomenon The danger in human na:ure to a particular inting as its ultimate of refercaufe, is huriful to feience, as tending to check all;henomefurther inquiry : and dangernus in morals, as making $n$ in in hupeople implicitly follow, as the dicates of natare and mon nature nature's God, the abfurd, foperfitious, or inpious cuftoms to a partiof their refpective countries.
finct as its.
INSTITUTES, in litcrary hitory, a book con. u'timaze taining the elements of the Roman law.
caufe.
The inflitutes are divided into four books ; and contain an abridgment of the whole body of the civil law, bring defigned for the ufe of fudents. See Law, no $0,-11$. and 43,44 .

Institute, in Scots law. When oy difpolition or deed of entail a number of perfons are called to the fucceflion of an eftate one after another, the perfon lint named is called the inflitute, the others fubfitutes.

INSIITUTION, in general, fignifies the eftablifhing or founding fomething. - In the canon and

1: ffrumert comnon law, it lignilies the inveling a clerk with the fpiritualitics of a reetory, \&c. which is done by the bilhop, who ufes the following formula: "I inflitute you rector of fuch a church with the cure of fouls, and reccive your care and mine."

Institutions, in literary matters, denote a fyftem of the clements or rules of any art or fcience.

Thus phyfical, or medicinal indtitutions, are fuch as teach the neceffary praconnita to the practice of medicine, or the cure of difeafes.

INSTRUMENT, in general, whatever is fubfervient to a caufe in producing any effect.

ATathematical, Philojopbicul, \&e Instrunesnqs. See Astronamy, Electricity, Geometey, Levelling, Mechanics, Optics, Fneumaties, \&ic. ※c.

Instrument is alfo mied in lan, to lignify fome public act, or anthentic deed, by means whereof any truth is made apparent, or any right or title eltablithed, in a court of jultice.

Noturial Lastriment, in Scots law, any fact certified in witing, under the hand of a notary-publis.

INSUBRIUM AGER, (anc -gerg.), a diftrict of the Tranfpadans; fituated between the Ticinus to the well, the Addua to the eall, the Padus to the fouth, and Orobii to the north. The people called Infibres by Livy, Injultri by Ptolemy, and Ijmilres by strabo. Now the Dichy of Milan.

INSULAR, any thing belonging to an ifland.Infular lituations are productive of many happy confequences to the inhabitants, both with refpect to the climate, fecurity, and convcnience for commerce; for a particular account of which, fee Island and Coast.

INSULATLD, in architecture, an appellation giveng to fucli columns as ftand alone, or free from any contiguous wall, like an illand in the fea; whence the name

Insulated, in electrical experiments. When any body is prevented from communica-ing with the earth by the interpolition of an electric budy, it is faid to be infuluted. Siee Electricity, p. 418.

INSURANCE, in law and commerie, a contract, whereby one party engages to pay the lofles which the other may furtain. For a itipulated premium or confideration. The moot common forts are, Infurance againt the dangers of the feas, infurance againft fire, infurance of debrs, and iufurance of lives.
I. Insurance againgt Lofs at Sca, is a moft teneficial inflitution, for promoting the fecurity of trade, and preventing the ruin of individuals; and is now conducted by a repular fyftem of rules, etlablifhed by the interpolition of the legiflature, the decifion of the courts of jultice, and the prasice of merchants.

It is carried on to the beft advantage by public companies, or by a confiderable number of private perfons, each of whom only engages for a fmall lum, on the fame veffel. There are two public companies eitablifhed by authority of parliament, viz. the London and Royal Exchange Infurance-Companies. For procuring fubfcription by private perfons, brokers are generally employed, who extend the policy or contract of infurance, procure fubfcriptions, and affit at fetting lofles. They are intitled to an allowance for their trouble, generally 5 por cent. on premiums, and 2 per cent. on lofles.

The parties who engage to pay the damage are call-
a' the infurers or under-writers: the parties for whofe Inf fecurity they engage are called the infured; and the premium is underltood to be paid when the infurance is made.

Oa this fubject, we fhall confider, What is neceffary to render an infurance valid:- When the rifk com. mences, and when it terminates:- What conftitutes a total or a parcial lofs:- What proof of lofs is neceffary: —and, How the lofs is adjufted.
Firf, In order to render an infurance valid, the infured muat have property really at take; the royage mult take place under the circunafances agreed on; the dangers infured againll mutt not be contrary to law ; and a candid account mult be given of circumftances which enhance the danger.

1. The condition of poffieffing property was required by 19 Geo. 11. c. 37 . to prevent fhips froin being fraudulentlv deltroyed when infure! above their value; and todifcourage a practice which had become cominon, of converting policies to the parp, fe of mere wagers. In tranfanions of this kind, as the infured had no property, and could claim no indemnification for partial damage; fo the infurers, having lott their wager by the frip"s beng loft, could claim no abatement, though part was faved: accorlingly, the policies contained claufes of interetl or no intere!!, free front average, and without benefit of falvage. All fuch policies are declared invalid.
This rellricion does not extend to privatecrs, nor to Thips trading to the Spanith or Portaguefe planta tions.
Infurances are commonly nade as intereff flatl appear; and it is incumbent on the iafured to prove the value of his property. The value of the gonds may be proved by the invoices; and the coquet mull be produced, if required, to intruct that the goods were actually thipped. It is admitted to value the Chip at prime coll and charges, dedusting the freights that have been drawn lince purchafed, if the proprietors choofe to ftand to that sule; but they are not retricted $t$ it. Sometimes the value of the hip or goods is expreffed in the policy; and his value malt be admitted, although it be bigher than the true one: but it is incumbent on the iufured to prove that he had property at itake ; and, it the property be trifing in comparifon of the furn infured, the infurance will be fet atide, as an evalisu of the ttatute.

Expected protits, and bounty on the whale-fifhery, if freciiied in the policy, may be infured.

When the value is lefo than the fum infured, the owners may clain a retura of premium for the ex. cefs.

If there be feveral policies on the fame fubject, of different dates, the carlier one is valid, and the others mult be vacated. If they be of the fame date, they mull be vacated in equal proportions.

When a pollicy is vacated, in whole or in part, the under-writers have a right to retain $\frac{1}{2}$ per cent. for their trouble.
In the cafe of a cargo intended for A, but afterwards fent to B, both expected it, and infured, and B claimed for the value on its being loft. The underwriters anfwered, that it was a double infurance, and they ought only to pay their proportion. Judgment was given, finding them liable for the whole, and referving
ance. to them any demand competent againf the underwiters «ho infured for A.

Fraudulently to calt away or deflroy a thip infured above its value, is felons-.
2. If the fhip does not proceed on the woyage, or if, being warranted to depart with convoy, it departs withe ut convoy, the infurance mult be wacated.

If the extent of a trading voyage be uncestain, the langett one in contemplaiton is deferibad in the policy, and it is agreed that part of the prominn fall be returned if the voyage he thortened. In like manner, in time of war, when infurance is made withont condition of convor, it is agreed that part of the premium be returned in cafe it fail with convoy.

When a hip is warmated to depart with convoy, it is undettood from the ufual nlace of consoy (e.g. the Downs). and it is infured till it arrive there.

The common proof of Cuilins with convoy is the production of failin or lers ; but, if a Thip be preveuted by the weather from receiving the failing orders, other proof may be admitud.

A fhip was infurce from the Thames to Halifax, warranted to fail from Purtmouth with convoy. The convoy had failed before the thip arrived there, and the underwriters declined to infure it, without cunvoy, for the reft of the woyage. They were found liable to return part of the preminm, retaining only in proportion to the arcuftoned rate from London to lortimouth. This decition feems to ellablifh the following principk, that, when the voyage perfermer is muly part of that deferibed in the policy, and then the rilk can be proportioned, the underwriters are bound to return part of the promium, though there be no agreement for that purpule.

But, if a fhip, infured only againtt the hazards of the fea, be taken by the enemy, the infured have no right to clains a return of promium, though the cap ture happen foon, under pretence that little fea-hazard was incurred.

If a thip deviates from the voyage deforibed in the policy without neceflity, it fets afide the infurance. An intention to deviate is not fufficient to fet it aflde ; there mult be an actual deviation; and, even in that cafe, the infurers are liable for damages fullained before deviation.

It is mus deviation to go out of the way to the accuftomed place of convoy, nor to the nearef place where neceffary repains may be had. Deviation, for the purpole of fmuggling, if without the knowledge of the owners, does not fet alide the infurance, nor when the malter is forced by the crew to return.

In infurances to the Ealt-Indies, and home, the infurers are muderflood to take the rifk of detention in the country, and of country voyages.

3 Infurance of prohibited goods, againt the riks of fcizure by the govermment, is unlawful, and invalid. The infurers, infured, brokers, and all acceffories, are liable to the fine of 5001 .
4. If the infured have any information of more than common danger, they muft reveal every fuch circumblance to the infurers, otberwife the policy is fet alile.

This rule is eftablifhed for the prefervation of good faith ; and there are feveral ftrong decifions in fupport of it. If a 隹ip be fpoke to leaky at fea, or if there be a report of its being loft, thefe circumftances
muft be communicated to the infurers. Even the lifurarce. concealment of a falle report of lofs vitiates the infurance; and, if the thip be afterwards lof, though in a different manner, the infured will recover nothing. In a voyage from Carolina to I,ondon, another Mip had faited io days after that which was infured, and arrived feven days before the infurance was made ; and the concealment of this circum lance, though the fact was not proved to the fatisfaction of the jury, was confidered as fufficient to [et it alide. Alfo, during the continuance of the American war, a fhip being infured from Portugal, by the month, without conde. fcending on the voyage, failed for North America, and was taken by a provincial privatcer. The infurers refufed to pay, becaufe the hazardous deflination was concealed; and it was only upon proof of the infured being equally ignorant of it that they were found liable.

But the infured are not obliged to take notice of general perils, which the infurers are underlood to have in contemplation ; dangerous navization, WeltIndian hurricanes, enterprizes of the enemy, and the like.

Infurance is not fet afide by a miftake in the name of the hip or malter, or the like.
Infurance may be made on an uncertain fhip; on any hip that the goods may be loaded on; on any Ohip that A thall Cail in form Virginia. In this lalt cafe, the policy is not transferred to a hip which A goes on board during the vyage.

Secondiy, If a thip be infured at and from a port, the infurance comnences immediately if the frip be there, or at its arrival there. If it be damaged when prepaling for a voyage, the infurers are liable; but nor if the voyage be laid afide fur feveral years, with confent of the owners. Infurance from a port commences when the fhip breaks ground; and, if it fet fail, and be driven back and loft in the port, the in. furers are lithle.

Infurance on goods generally continues till they be landed; but, if they be fuld after the Thip's anrival, and freizht contracted to ano.loter port, the infurance is concluded. Gonds fent on board another fhip or lighter are not at the rifk of the infurer; but goods fent aflore in the long-boat are.

Infurance on freight commences when the goods are put on board.

Goods from the Eaft Indies, infured to Gibraltar, and to be reftipped from thence to Britain, were put on board a ftore fhip at Gibraltar, to wait an opportunity of re-hipping, and were lolt: The cullom of putting goods aboard a ftore-fhip being proved, the infurers were found liable.

Lofs of fails afthore, when the fhip is repairing, is comprehended within the infurance. What is neceffarily undertood, is infured, as well as what is exprefled ; the effential means, and inturmediate fleps, as well as the end. Ships performing guarantine are at the rifk of the infurer.

Thirdly, The infarers are liable for a total lofs when the fubject perihes through any of the perils infured againft. Baratry, thoust it properly fignifies running away with the Mip, extends to any kird of frand in the mafter or mariners. Infurance againf detexion of princes does not extend to thips that are feized for tranfgrefling the laws of foreign countries.

The infurers are alfo liable for a tetal lofs, when damage is futtained, and the remaining property abandoned or velled in the infurers.

If a flip be flranded, or taken, and kept by the enemy, or detained by any foreign power, or feized for the fervice of the government, the proprietors have a right to abandon.
But, if a fhip be taken by the enemy, and be retaken, or makes its efcape, before action againit the infurers; have the infured a right to abandon, or mult they only claim for the damages fubftained as an average lofs? There are oppofite decifions, according as the circumftances of the cafe were flrong. When the thip was long detained, the goods periihable, the voyage entircly lof, or fo difturbed, that the purfuit of it was nut worth the fieight, or when the danage exceeds half the value of the thing, they have been found intitled to abandon; (Gofs againit Withers, 2 Burrow, $68_{3}$.). But, if the voyage be completed with little trouble or delay, they are not intitled; (Hamilthn againtt Mendez, 2 Burrow, 1199.).

The infured cannot claim, as for a total lofs, on an offer to abandon, when the lofs is, in its nature, only partial; for, if this were permitted, they might devolve the lofs occationed by bad markets on the infurers.

And, in all cafes, the infured have their option to abandon, or not. They may retzin their property if they pleafe, and clain for an average lofs; and they mnult make their option before they claim.

If the goods be fo much damaged, that their value is lefs than the freight, the infurers are accountable as for a total lofs

The infurers are liable for general average, when the property is charged with contribution; and for particular average, when the property is danaged, or part of it deltroyeed.

If the damage be fultained through the fault of the Ship, the owners of the goods may lave recourfe, either againf the mafter or infurers; and, if the infurers be charged, they fland in the place of the owners, and have recourfe againt the mafter.

In order to prevent the infurers from being troubled with frivolous denaands for average, it is generally flipulated, that none fhall be charged under 5 per cent. or fome other determined rate ; and corn, flax, fruit, filh, and like perifhable goods, are warranted free from average, unlefs general, or the fhip be Atranded.

In order to encourage e very effort to fave the fhip, the infurers are liable for charges laid out with that defign, although the. fubject perifh. Thus, they may be clarged with more than the fum infured.

In cafe of goods bring damaged, the proportion of the fum infured, for which the under writers are liable, is regulated by the proportion of the priees which the found and damaged goods fetch at the port of deftination. The prime colt of the goods is not confidered, nor the neceffity of iminediate fale, in confequence of damage. Although the damaged goods fell above prime coft, the infurers are liable.

Fourthly, If a fhip be loft, and the crew faved, the lofs is proved by the evidence of the crew.

If damage be fuftained, the extent is proved by an ex ination of the fubject damaged, at the fhip's arrival; and the caufe by the evidence of the crew.
$\mathrm{N}^{\circ}{ }_{167}$.

If the fhip be franded, evidence mult be taiken at lufur the place where ftranded.
Documents of lofs mult be laid before the underwriters, with all convenient fpeed; and, if thefe be fufficiently clear, the lofs fhould be inmediately fettled. The underwriters generally grant their notes at a month or fix weeks date for their proportions.
If a fhip be not heard of for a certain time, it is prefumed loft ; and the underwriters are liable to pay the fums infured, the property being abandoned to them in the event of the thip's return. Six months are allowed for a voyage to any part of Europe, a year to America, and two years to the Ealt Indies.
By the ordinance of Hamburgh, if a thip be three months beyond the ufual time of performing a voyage, the underwriters may be defired to pay 92 per cent. on an abandon. If they decline it, they are allowed 14 months more, and then they mult pay the full value.
A fhip infured againt the hazards of the fea, but not againft the enemy, if never heard of, is prefumed loft at fea.
Fiffthy, In order that the manner of fettling loffes may be undertood, we mult explain what is meant by covering property. We mentioned already, that infurances for greater fums than the infured had really at flake, were contrary to law : but fome latitude is allowed in that refpect; for if the owner were to infure no more than the exact value of his property, he would lofe the premium of infurance, and the abatement, if any was agreed on.

For example, if he has goods on board to the value of tool. and infures the faine at 5 per cent. to abate 2 per certt. in cafe of lofs; then, it a total lofs hap. pen, he reeovers 981 . From the infurers, of which 51. being applied to re-place the premium, the nett fum faved is only 93 l.: but, if the value on hoard be only 931 . and the fum infured 100 l . he would be fully indemnified for the lofs; and his property, in that cafe, is faid to be covered.
To find how much fhould be infured to cover any fum, fubtract the amount of the premiun and abatement (if any), from rool. As the remainder is to 1001 . fo is the value, to the fum which covers it.

In eafe of a total lofs, if the fum infured be not greater than that which covers the property, the infurers mult pay it all. If greater, they pay what covers the property, and return the premium on the overplus.
Partial loffes are regulated by this principle, that whereas the owner is not fully indemnified, in cafe of a total lofs, unlefs he covers his property, therefore he fhould only be indemnified for a partial lofs in the fame proportion; and, if it he not fully infured, he is confidered as infurer himfelf, for the part not covered, and mult bear a fuitable proportion of the lofs. Therefore the value of the property is proved, and the fum required to cover it computed. If that fum bc all infured, the underwriters pay the whole damage ; if only part be infured, they pay their flare, which is computed by the following rule: As the fum which covers the property is to the fum infured, $f_{0}$ is the whole damage to the part for which the infurers are liable. - For example, if the value of the property be 360 l . the fum infured 300 l . the premium 8 per can.
nec. cert. and abatement 2 per cent.; thea the fum which flould be infured to cover the propetty is 400 l . ; and, if damage be fuftained to the extent of 2001 . the owners will recover 150 .
If a voyage is infured out and home. the premium nutward mult be confidered as part of the value on the homeward property, and the fum neceftary to cover it computed accordingly. For example, to infure 1001. out and home, at 5 fer cent. each voyage, abaiement 2 fer cent. we compute thus:
93-100:: L. 100: L. 107:10:6, to be infured outward, premium on L. 107:10:6 outwards, at 5 fer ceitt. L. $5: 7: 6: 93: 100:$ : L. 109: $7: 6$ : L. $113: 6 \mathrm{~s}$. to be infured home; the premiam on which is $1.5: 13: 6$; and, if the fnip, be lut on the homeward voyage,

$$

or lefs than 12; nor is there any differente of contri- Infurance. bution allowed on acconnt of difference of age. - This fociety has fubfited ever fince i 706, and its credit and ufefuluefs are well eftablifhed. Its plan, however, is liable to feveral objections. Firt, it is evident, that regulating the dividends among the nominces: by the number of members who die cvery rear, is rot equitable; becaufe it makes the benefit which a menifer is to receive to depend, not on the value of his contribution, but on a contingency; that is, the number of members that fhall happen to die the fame year with him. Secondly, its requiring the fame payments from all perfons under 45, is alfo not equitable; for the payment of a perfon admitted at 12 , ought not to be more than lialf the payment nf a perfon admitted at 45. Thirdly, its plan is fo marrow, as to confine its ulefulnefs too much. It can be of no fervice to any perfon whofe age exceeds 45 . It is, likewife, by no means pioperly adapted to the circumftances of perfons who want to make affurances on their lives for only one year, or a fhort term of years. For example: the true value of the affurance of $150 \%$ for five rears, on the life of a perfon whofe age is 39 , may be found, by the firft rule, to be nearly three guineas fer amn. fuppofing intereft at 3 per cent. and the probability of the durtion of human life, as they are given in Dr Halley's Table of Obfervations. But fuch an affurance could not be made in this fociety without an annual payment of 51 . Neither is the plan of this fecitty at all adapted to the circumflances of perfons who want to make affurances on particular furvivorhips. For ezample : a perfon poffeffed of an eftate or falary, which mutt be lof with his life, has a perfon dependent upon him, for whom he defites to fecure a fum of money payable at his death. Dut he defires this onfy as a fecuity againt the danger of his dying firt, and leaving a vife, or a parent, without fupport. - In thefe circumflances he enters himfelf into this fociety; and, by an annual payment of 5 1. incitles his nominee at his death to 1501. In a few years, perhaps, his nominee happens to die; and having then loft the advantages he had in view, he deternines to furfeit his former payments, and to withdraw from the fuciety. The right method, in this cafe, would have been to have taken from fuch a perfon the true value of the fum affured, "on the fuppofition of non-payment, provided he fhould furvive." In this way he would have chofen to contract with the fociety: and had he done this, he would have paid for the aflurance (fuppoing intereft at 3 per cent. his age 30 , the age of his nomince 30 , and the values of lives as given by M. De Moivre) 31.8 s . in annual jayments, to begin immediately, and to be continued during the joint duration of his own life, and the life of his nominee.
None of thefe objections are applicable to the plan of the focicty which meets at Black Friars bridge, and which has jufly Atyled itfelf the Equitatle Society for Afurances on Lives and Survivorfhips. The bulinefs tranfacted by this fociety is fo extenfive, and it is governed fo entirely by calculations, founded on the beft rules and obfervations, that it canno: but prove one of the greatell public benefits.

It was ellablifhed in the year 1762 , in confequence of propofals which had been made, and lectures recomMm
mending

Irfurance. mending fuch a defign, which had been read by Mr Dodfon, the author of the Matliematical Kepofitory. It affures any fums or reverfionary annuities, on any life or lives for any number of years, as well as for the whole continuance of the lives; and in any manner that may be belt adapted to the vicus of the perfons affured: that io, either by making the affured fums payable certainly at the failure of any given lives; or on condition of furvivorhip; and alfo, either by taking the price of the affurance in one prefent payment, or in annual payment, during any fingle or joint lives, of any terms, lefs than the whole poffible duration of the lives. Any perfons, for inflance, who depend on incomes which mult be loft when they die, or who are only tenants for life in eftates, may, if they want to borrow money, be enabled to give fufficient fecurity, by affuring fuch fums as they want to borrow in this fociety, and affigning the policy; in confequence of which, the lender will, during the term of the affurance, be guarded againft all danger of lofing his principal by the death of the borrower. In the fame way, clergymen, counfetlors, perfons holding any places of profit, traders, and others, who have families, whofe fubfiffence depends on the conrinuance of their lives, may here be enabled to make fome provifion for their families after their deceafe. All perfons who enjoy annuities for the lives of others, may here fecure themfelves againtt the lofs they would futtain, hould they furvive the perfons on whofe lives the annuities depend, by making affurances which fhould intitle them to any fums, payable on condition their furvivorfhip fhould take place. Any perfon intitled to an eflate, annuity, legacy, or effice, after another perfon, provided he furvives, may here fecure fome equivalent for his family at his deceafe, provided he does not furvive.Hufbands may, in this fociety, fecure annuitics for their wives, provided they fhould leave them widows. Parents, by affuing the lives of their children when infants, till they attain a given age, may fccure for them, fhould they live to that age, fuch fums as may be neceffary to put them out to apprenticefhips, or to make capitals or fortunes for thein, with which to fet out in bufinefs, or to marry. Any perfons, apprehenfive of being left without lupport in old age, when incapable of labour, may, in this fociety, purchafe an annuity, to commence at any future year of his life, and to continue during the remainder of his life; and he may do this at a very fmall expence, if he is young, and willing to wait for the commencement of his annuity till he is 55 or 60 years of age.

In fhort, there are no kinds of affurances on lives and furvirorfhips, which this fociety does not make. In doing this, it follows the zules which have been given by the bef mathematical writers on the doctrine of life annuitics and reverfions, particularly Mr Simpfon: and, iu order to gain fuch a profit as may render it a permament benefit to the public, and enable it to bear the expences of management, it takes the advantage of making its calculations at fo low an interelt as 3 per cent. and from tables of the probabilities and values of lives in London, where (as in all great towns) the rate of human mortality is much greater than it is in common among mankind.

This fociety has lately made a particular inquiry Infur into its own ftate, as to profit and lofs, by all the bufinefs it lias tranfacted from its firf inflitution. This inquiry was made in three different methods, propofed to the directors by Dr Price, the authnr of the Treatife on Reverfonary Payments; and the refult las been, that it appears, that a much fmaller proportion of the perlons aflured have died than Joould have died, according to the tables for London, from which the calculations have been made, or even according to Dr Halley's table for Brelaw; that, for this reafon, the claims have been much lefs than they foould have been; and that the fociety has for many ycars been enjoying an income fome thoufands per annum greater than it wants, and a furplus fock of near L. 40,000, over and above what is neceffary to enable it to make gond all its engagements.

In thefe circumfances, the fociety finding itfelf well fecured againft future hazards, and being unwilling to take from the public an extravagant profit, have determined to reluce all the future payments for affurances one-tenth; and alfo to return to the perfons now affured one-tenth of all the payments which they have made. And there is, it feems, reafon to expect, that this will be ouly a preparation for farther reductions. Nor need the public, we are informed, be apprehenfive of their going too far in making reductions; for in confequence of the inquiry they have lately made, and of the order into which this inquiry has thrown their accounts, they will have it in their power to determine exactly from year to year what they are able to do, and always to keep under their view a clear flate of their own circumftances.

From the preceding account of chis fociety it is manifet, that its bufinefs is fuch, that none but Rkilfut mathematicians are qualified to conduct it. The intereft of the fociety therefore abfolutely requires, that it thould make the places of thofe who manage its bufinefs fo advantageous, as to induce the ablelt mathematicians to accept them ; and this will render it the more neceffary for the fociety to take care, on any future vacancies, to pay no regard in filling them up, to any other confiderations than the ability and integrity of the candidates. The confequence of granting good pay will be a multitude of folicitations on cvery vacancy, from perfons who, however unqualified, will hope for fuccefs from their connections, and the interef they are able to make; and fhould the fociety, in any future time, be led by fuch caufes to trult its bufinels in the hands of perfons not poffeffed of fufficient ability, as calculators and mathematicians, fuch miltakes may be committed as may prove in the highelt degice detrimental. We have reafon to know, that at prefent the fociety is in no danger of this kind; and one of the great public advantages attending it is, that it has eltablifhed an office, where not only the bnfinefs we have defcribed is tranfacted with faithfulnefs and fkill; but where alfo all who want folutions of any queftions relating to life annuities and reverfions may apply, and be fure of receiving juft anfwers.

Thefe rates are so per cent lower than the true raJues, according to the decrements of life in London, reckoning intereft at 3 per cent.; but at the fame time, fur all ages under 50, they are near a third higher than all the true values, according to Dr Hallcy's Table of the decrements of life at lireflaw, and Dr Price's Tables of the decrements of life at Northarp. ton and Norwich. - As therefore this fociety has lately found, that the decrements of life among its members have hitherto been lower than even thofe given in the fe laf Tables, it may be reafonably expected, that they will in time refuce their rates of affurance to the true values by thefe tables.

Re. Insurancr is a fecond contract, made by an infurer, to transfer the rifk he has engaged for to another. It is in general forbidden by in Gco. II. c. 37. but is permitted to the reprefentatives of an infurer in cafe of his death, or to his affignees in cafe of his bankruptcy; and it mult be mentioned in the policy that it is a re-infurance.

INTAGLIOS, precious ftones on which are engraved the heads of great men, infcriptions, and the like; fuch as we frequently fee fet in rings. feals, \&c.

INTEGER, in arithmetic, a whole number, in contraditinction to a fraction.
INTEGRAL, or integrant, in philofoply, appellations given to parts of bodies which are of a fimilar nature with the whole: thus filings of iron have the fame nature and properties as bars of iron.

Bodies may be reduced into their integrant parts by triture or grinding, limation or filing, folution, amalgation, \&cc. See Grinding, \&cc.

INTEGUMENTs, in anatomy, denote the conmon coverings which inveft the body; as the cuticula, cutis, \&c. See Avatomy.

Integument is alfo extended to the particular membranes which inveft certain parts of the body; as the coats or tunics of the eyt.

INTELLECT, a term ufed ameng. philofophers, to figuify that faculty of the foul ufually called the underflanding. See Logic and Metaphsisics,
tion, and manajement, of any thing. See Superintendait.

Intercatia.
This is a title frcquent among the Freneh : they have interdatits of the marine, who are officers in the feaports, whofe bufinefs. it is to take care the ordinances and regulations relating to fea-affairs be obferved : intenclents of the funnces, who have the direction of the revenues: intendants of provinces, who are appointed by the king to take care of the adminiftration of jultice, policy, and finances in the provinces : alfo intendants of buildinys, of boifes, scc.
INTENLMMENT, in law, is the intention, defign, or true meaning, of a perfon or thing, which frequently fupplies what is not fully expreffed; but though the intent of parties in deeds and contracts is much regarded by the law, yet it cannot take place againit the rules of law.
Intendment of Cigmes; this, in cafe of tre:fons where the intention is proved by circumfances, is pro nifhable in the fame manner as if it was put in execution. So, if a perfon enter a houfe in the night-time, with an intent to commit burglary, it is felony; alfo, an affault, with an intent to commit a robbery on the highway is made felony, and punifhed with tranfportation, 7 Geo. II. c. 21.

INTENT, in the civil law, fignifies to begin, or commence, an action or procefs.

INTENTION, in madicine, that judyment or method of cure which a phyfician forms to himflif from a duc examination of fymptoms.
Intention, in phyfics, the increafe of the power or energy of any quality; as heat, cold, \&c. by which it flands oppofed to remifion, which fignifies its decreafe or diminution.
Intention, in metaphyfics, denotes an exertion of the intellectual faculties with more than ordinary vigour; when the mind with earnelnefs fixes its view on any idea, confiders it on all fides, and will not be called off by any folicitation.

INTERAMNA (anc. geog.), fo called from its fituation between rivers, or in an illand in the river Nar; a town of the Cifalpennine Umbria. Interamnates the people ; furnamed Nartes by Pliny, to diftinguilh them from the people of other Interamax. Now Terni; a town in the Pope's territory in Umbria. E. Long. 13. 38. N. Lat. $4^{2 \cdot} 40$.

Interamna, a town and colony of the Volfci in Latime, on the confines of Samnium, at the confuence of the rivers Liris and Melpis; and for difinction fake called I-irinas. The town is now in ruins.
Interamna, or Interamnia Pretutianorum (Ptolemy); a town in the territory of the Prætutiani, a part of the Picenum. Now Teramo, in the Abrinzzo of Naples. E. Lung, 15. N. Lat. 42. 40.

INTERCALARY, an appellation given to the odd day inferted in leap-year; which was fo called from calo, calare, "to proclaim," it being proclaimed by the prietts with a loud voice.

INTERCATIA (anc. geog.), a town of the Vaccrei in the Hither Spain. Here Scipio Emilianus flew a champion of the barbarians in fingle combat ; and was the firf who mounted the wall in taking the town. It was fituated to the fouth-eaft of Alturica; now faid to be in ruins.

## I N T [ 276 ] I N T

Irtercef: fion

INTERCESSION (intercefio), was ufed in aucient Rome, for the act of a tribune of the people, or other magidrate, by which he inhibited the acts of other magitrates; or even, in cafe of the tribunes, the decrees of the ienate. Veto was the folemn word ufad by the tribunes when they inhibited any decree of the fenate or law propofed to the peoplc. The general law of thefe intercefions was, that any magiftrate might intibit the acts of his equal or inferier; but the tribunes had the fole prerogative of controlling the acts of every other magitrate, yet could not be controlled themfelves by any.

INTERCESSOR (from inter and cedo "I go between's), a perfon who prays, expottulates, or intercedes, in behalf of another. In the Roman law, interceffor was the name of an officer, whom the governors of provinces appointed principally to raife taxes and other duties.

1-tercessor is alfo a term heretofore applied to fuch bifhops as, during the vacancy of a fee, adininiflered the bihoprick, till a fucceffor to the deceafed bihop had been elected. The third council of Carthage calls thefe interventors.

INTERCOLUMNIATION, in architeCture, denutes the fpace betwcen two columns, which is always to be proportioned to the height and bulk of the cohımas.

INTERCOSTAL, in anatomy, an appellation given to fuch inufles, nerves, arteries, and veins, as lie between the ribs.

INTERDICT, an ecclefiaftical cenfure, by which the church of Rome forbids the performance of divine fervice in a kingdom, province, town, \&c. This cenfure has been frequently executed in France, Itely, and Germany ; and in the year 1:70, pope Alexandeq III. put all England under an interdict, forbidding the clergy to perform any part of divine fervice, except baptifing of infants, taking confeffons, and giving abfolution to obing penitents. But this cenfure being lable to the ill confequences of promoting libertinifm and a neglect of religion, the fucceedirg popes have very feldom made ofe of it.

There was alio an interdict of perfons, who were deprived of the benefit of attending on divine fervice. Particular perfons were alfo anciently interdicted of fire and water, which fignitied a banilhment for fome particular offence: by their cenfure no perfon was allow ed to receive them, or allow them fire or water; and being thus wholly deprived of the two neceflary elemente of life, they were doubtlefz under a kind of civil death.

INTEREST, is the premium or money paid for the loan or ufe of other inoney. See Arithmetic, $n^{\circ} 20$.

Many good and learned men have in former times very much perplexed themfelves and other people by raifing doubts about the legality of intereft in foro confcientiz. It may not be amifs here to inquire upon what grounds this inatter does really fland.

The enemies to intereft in general make no diftinction between that and ufury, holding any increafe of money to be indefenfibly ufurious. And this they ground as well on the prohibition of it by the law of Mofes among the Jews, as alfo upon what is laid down by Arifotle, That money is naturally barren; and to
make it breed money is prepofterons, and a perverfion Inte of the end of its inftitution, which was only to ferve the purpofes of exchange, aod not of increase. Hence the fchool-divines have bracded the practice of taking interelt, as being contrary to the divine law botb nitural and revealed; and the canon liw has preferibed the taking any the lealt increafe for the loan of money as a mortal in.

But, in anfiver to this, it may be obferved, that the Mofacal precept was elearly a $:$ litical, and not a moral, precepr. It only prohibited the Jews from taking ufury from their brethren the Jews; but in ex. prefs words permitted them to take it of a Atranger: which proves that the taking of moderate ufury, or a reward for the ufe, for fo the word figuines, is not ma. lun in fe, fince it was allowed where auy but an $1 f$. raclite was concerned. Aud as to Ariltutle's reafon, decuced from the natural barrennefs of money, the fame may with equal force be alleged of houles, which never breed houfes; and twenty other things, which: nobody doubts it is lawfu to make profit of, by letting them to hire. And though money was originally ufed only for the purpofes of exchange, yet the laws of any fate may be well juftified in permitting it to be turn. ed to the purpofes of profit, if the convenience of fo.. ciety (the great end for which money was invented): fhall require it. And that the allowance of moderate intere!t tends greatly to the benefit of the public, efpecially in a trading country, will appear from that ge nerally acknowledged principle, that commerce cannot fublif without mutual and extenfive credit. Unlefs. money therefore can be burrowed, trade cannot be carried on: and if no premium were allowed for the hire of money, few perfons would care to lend it ; or at leait the eafe of borrowing at a hort warning (which: is the life of commerce) would be entirely at an end. Thus, in the dark ages of monkin fuperitition and civil tyranny, when intereft was laid under a total in. terdict, commerce was alfo at its loweft ebb, and fell entirely into the hands of the Jeiss and Lombards: but when mens minds began to be more enlarged, when true religion and real liberty revived, commerce grevz again into credit ; and again introduced with itíelf its infeparable companion, the doctrine of luans upon in. tereft.

And, really, confidered abitractedly from this ite ufe, fince all other conveniences of life may be either bought or hired, but money can only be hired, there feems oo greater, impropriety in taking a recompence. or price for the hire of this, than of any other, convenience. If one borrow 100 l . to employ in a benefi cial trade, it is but equitable that the lender hould. have a proportion of the gains. To demand an exorbitant price is equally contrary to confcience, for the loan of a horfe, or the loan of a fum of money: but a reafonable equivalent for the temporary inconvenience which the owner may feel by the want of it, and for the hazard of his lofing it entirely, is not more immoral in one cafe than it is in the other. And indeed the ab. folute prohibition of lending unon any, even moderate intereft, introduces the very inconvenience which it feems meant to remedy. The neceffty of individuals will make borrowing unavoidable. Without fome profit by law, there will be but few lenders: and thofe piincipally bad nen, who will break through the law.

## $\left.\begin{array}{lllll}\mathrm{I} & \mathrm{N} & \mathrm{T} & 277 & 1\end{array}\right] \quad \mathrm{N}$ T

A. and take a profit; and then will endeavour to indem nify themlelves from the danger of the penalty, by making that profit exorbitant. Thus, while all degrees of profit were difcountenanced, we find more complaints of ufury, and more flagrant inflances of opprefion, than in modern times when money may be ealily had at a low interel. A capital diftinction mult therefore be made between a moderate and exorbitant profic; to the former of which we ufually give the name of intreff, to the latter the truly odious appella. tion of ufury: the furmer is neceflary in every civil llate; if it were but to exclude the latier, which ought never :o be colerated in any well-regulated fociety. For, as the whole of this matter is weli fummed up by Grotins, 's if the compenfation allowed by law does not exceed the proporsion of the hazard run, or the want felt, by the luan, its allowance is neither repug. want to the revealed nor to the natural law: but if it exceeds thofe bounds, it is then epprefive ufury; and though the municipal laws may give it impunity, they never can make it juft."

We fee, that the exorbitance or moderation of intertll, for the money lent, depends upon two circumAences; the inconvenience of parting with it for the prefent, and the hazard of lofing it entirely. The inconvenience to individual lenders can never be eltimated by laws; the rate therefore of general interell muft depend upon the ufual or general ineonvenience. This refults entirely from the quantity of [pecie or current money in the kingdom: for, the more fpecie there is circulating in any nation, the greater fuperfuity there will be, beyond what is neceflary to carry on the butinefs of exchange and the common concerns of life. In every nation, or public community, there is a certain quantiry of monsy thus neceffary; which a perfon well failled in policical aritbmetic might perhaps calculate as exactly, as a private baniser can the demand for running calh in his own flop: all above this neceffary quansity may be fparen, or lent, without much incontenience to the refpective lenders; and the greater this national fuperlluity is, the more numerous will be the lenders, and the lower ought the rate of the national intereft to be : hut where there is not enough, or barely enough, circulating cafh, to anfwer the urdinary wes of the public, interelt will be proportionably tigh; for lenders will be but few, as few can fubmit to the incunvenience of lending.

So alfo the hazard of an entire lofs has its weight in the regulation of interelt: hence, the better the fecu. sity, the lower will the interell be; the rate of intereft being generalls in a compound ratio, formed out of she inconvenience aad the hazard. And as, if there were no inconvenience, there thould be no interelt but what is equivalent to the bazard; $\int 0$, if there were no tazard, there ought to be no interelt, fave only what arifes from the mere inconvenience of leuding. Thus, If the quantity of fpecic in a nation be fuch, that the general inconvenience of lending for a year is computed to amount to three per cent. a man that has money by him will perhaps lend it upon good perfonal feenrity at five per cent. allowing two for the hazard run; he will lend it upon landed fecurity, or mortgage, at four fer cent, the hazard being proportionably lefs ; but he will lead it to the ftate, on the maintenance of
which all his property depends, at threc fer cent. the hazard being none at all.

But fonctines the hazard may be greater than the rate of intereft allowed by law will compenfate: And this gives rife to the practice, t. Of buttomry, or reSpondentia. 2. Of policies of infurance. See Bortomry, and Insurance.

Upon the two principles of inconvenience and hazard, compared together, different nations have at different times eltablifhed different rates of intereft. The Romans at one time allowed centifima, oue per cent. monthly, or twelve per cent. per annum, to be taken for common louns; but Juftinian reduced it to trientes, of one third of the as or centifinma, that is, four fer cent. 3 . but allowed higher interefl to be taken of merchants, becaule there the hazard was greater. So too Grotius informs us, that in Holland the rate of interelt was then eight fer cent. in common loans, but twelve to merchants. Our law eitablifhes one thandard for all alize, where the pledge or fecurity itfelf is not put in jeopirdy; left, under the general pretence of vaguce and indeterminate hazaros, a door fhould be opened to. fraud and ufury: leaving fpecific hazards to be provided againit by fpecific infurances, or by loans upon refpondentia or bottomry. But as to the rate of legal intereft, it has varied and decrealed for 200 years pait, according as the quantity of fpecie in the kingdom has increafed by acceffions of trade, the introduction of paper-credit, and other circumitances. The Aatute 37 EIen. VIII. c. 9. confined intereit to ten per cent. and to did the flatute $!3$ Eliz. c. 8. But as, through the encouragements given in her reign to commerce, the nation grew more wealtiy ; fo, under ber fucceffor; the flatute 21 Jac. 1. c. 17. reduced it to eight per cent. ; as did the flatute 12 Car. II, c. 13. to fix: and lattly, by the ftatute 12 Ann. A. 2. c. 16 . it was brought down to live per cent. yearly, which is now the extremity of legal interelt that can be taken. But yet, if a contract which carries intereat be made in a forcign country, our courts will diret the payment of intereft according to the law of that country in which the contract was made. Thus Irifh, Anerican, Turkiih, and Indian interet, have been allowed in our courts to the amount of even 12 per cent. For the modera. tion or exorbitance of intereit depends upon local circuintances; and the refufal to enforoe fuch contracts would put a ftop to all foreign trade. And, by fata 14 Geo. 1II. e. 79. all mortages and other fecurities upon eftates or other property in Jreland or the plantations, bearing intereft not exceeding lix per cent. hall be legal ; though executed in the kingdon of Great Britain: unlefs the money lent thall be known at the time to exceed the value of the thing in pledge; in which cale alfo, to prevent ufurious contracts at home under colour of fuch foreign fecurities, the borrower thall forfeit treble the fum fo borrowed.

INTERJECTION, in grammar, an indeclinable part of fpeceh, fignifying fome paftion or emotion of the mind. See Grammar.

INI'ERIJI, a name given to a formulary, or kind of confeffion of the articles of faith, ubtruded upon the Protellants after Luther's death by the emperor Charles V. when he had defeated their forces; fo called becaule it was only to take place in the intrim (mean.

## I. N T [ 279 I N T

Snteriocu time) till a general council foould have decided all tor II
Fnterment points in difpute between the Proteftants aud Romanilts. It retained moft of the doctrines and ceremonies of the Romanifts, excepting that of marriage, which was allowed to the clergy, and communion to the laity under both kinds. Moft of the Proteftants rejected it. There were two other interims; one of Leipfic, the other of Franconia.

INTERLOCUTOR, in'Scots law. The fentence - or judgment of a court of law, is commonly called an interlocutar before decree is extracted.

INTERLOCUTORY decree, in Englifh law. In a fuit in equity, if any matter of facł be flrongly con--troverted, the fact is ufually directed to be tried at the bar of the court of king's bench, or at the affizes, upon a feigned iffue. If a quedion of mere law arifes in the courfe of a caufe, it is the practice of the court - of chandery to refer it to the opinion of the judges of the court of king's bench, upon a cafe flated for that purpofe. In fuch cafes, interlocutory decrees or or-- ders are made.

Interlociutory Judgments are fuch as are given in the middle of a caufe, opon fome plea, proceeding on default, which is only intermediate, and does not finally determine or complete the fuit. But the interlocutory judgments moit ufually fooken of, are thofe incomplete judgments, whereby the right of the plaintiff is ellablithed, but the quantum of damares fuftained by him is not afcertained, which is the province of a jury. In foch a cafe a writ of inquiry iffues to the Sheriff, who fummons a jury, enquires of the damages, and returns to the court the inquifition fo taken, whereupon the plaintiff's attorney taxes colts, and figns final judgment.

Interlocutory Order, that which decides not the caufe, but only fettles fome intervening matter relating to the caufe. As, where an order is made in chancery, for the plaintiff to have an injundion, to quit pofferfion till the hearing of the cavfe; this order, not being final, is called interlocutory.

INTERLOPERS, are properly thofe who, without due authority, hinder the trade of a company or - corporation lawfully eflablifhed, by dealing in the fame way.

INTERLUDE, an entertainment exhibited on the theatre between the acts of a play, to amuie the fpectators while the actors take breath and fhift their drefs, or to give time for clanging the feenes and decorations.

In the ancient tragedy, the chorus fung the interludes, to fhow the intervals between the acts.

Interludes, among us, ufually coufitt of fongs, dances, feats of activity, concerts of mulic, \&c.

Aritotle and Horace give it for a rule, that the interludes thould confift of fongs built on the principal parts of the drama; but fince the chorus has been Jaid down, dancers, buffoons, \&cc. ordinarily furnifh the interludes.

INTERMENT, the act of interring, i. c. burying or laying a deceafed perfon in the ground.

Arittotle afferted, that it was more jult to affift the dead than the living. Plato, in his Republic, does not forget, amonglt other parts of jullice, that which concerns the dead. Cicero eftablifhes three kinds of juftice; the firt refpects the gods, the fecond the
manes or dead, and the third men. Thefe princi- Inter ples feem to be drawn from nature; and they appear at leaft to be neceffary for the fupport of fociety, fince at all times civilized nations have taken care to buy their dead, and to pay their laft refpects to them. See Burial.

We find in hiftory feveral traces of the refpect which the Indians, the Egyptians, and the Syrians entertained for the dead. The Syrians embalmed their bodies with myrrh, aloes, honey, falt, wax, bitumen, and refinous gums; they dried them alfo with the finoke of the fir and the pine tree. The Egyptians preferved theirs with the relin of the cedar, with aromatic fpices, and with falt. Thefe people often keep fuch mummies, or at leall their effigies, in their houfes, and at grand entertainments they were inttoduced, that by reciting the great actions of their ancettors they might be better excited to virtue. Sce Funeral Rites.
'The Greeks, at lirlt, lind probably not the fame vene: ration for the dead as the Egyptians. Einpedacles, therefore, in the eighty-fourth Olympiad, reftored to life Pouthia, a woman of Agrigentum, who was about to be interred *. But this people, in proportion as they grew civilized, becoming more enlightened, perceived Lacrt the neceflity of eftablifhing laws for the protection of rition the dead.

At Athens the law required that no perfon flould inb. 8 be interred before the third day ; and in the greater part of the cities of Greece a funeral did not take place till the fixth or feventl. When a man appeared to have breathed his laft, his body was generally wafted by his neareft relations, with warm water mixed with wine. They afterwards anointed it wich oil ; and coyered it with a drefs, commonly made of fine linen, according to the cuftom of the Egyptians. This drefs was white at Meffina, Athens, and in the greater part of the cities of Greece, where the dead body was crowned with fowers. At Sparta it was of a purple colour, and the body was furrounded with olive leaves. The body was afterwards laid upon a couch in the entry of the hoofe, where it remaned cill the time of the funeral. At the magnificent obfequies with which Alexander honoured Hepheltion, the body was not burned until the tenth day.

The Romans, in the infancy of their empire, paid as little attention to their dead as the Greeks had done. Acilins Aviola having fallen into a lethargic fit, was fuppofed to be dead; he was therefore carried to the funeral pile; the fire was lighted up; and though he cried out he was Atll alive, he perifhed for want of fpeedy affiftance. The Pretor Lamia met witl the fame fate. Tubero, who had been Pretor, was faved from the foneral pile. Afclepiades a phyfician, who lived in the time of Pompey the Great, about one hundred and twenty years before the Chriftian ara, returning from his country-houle, obferved near the walls of Rome a grand convoy and a crowd of people, who were in mourning affiting at a funeral, and flowing every exterior fign of the decpeft grief. Having anked what was the occafion of this intercourfe, no one made any reply. He therefore approached the pretended dead body; and imagining that he perceived figns of life in it, he ordered the bytlanders to take away the flambeans, to extinquifh the fire, and to pull down the funcral pile. A kind of murmur on this a-

## I N T

ent rofe throughout the whole company. Some faid that - they ought to believe the pliyfician, while others turned both him and his profeffion into ridicule. The relations, however, yielded at length to the remonftrances of Afclepiades ; they confented to defer the obfequies for a little; and the confequence was, the reforation of the pretended dead perfon to life. It appears that thefe exaniples, and feveral others of the like nature, induced the Romans to delay funerals longer, and to enact laws to prevent precipitate intermerits.

At Rume, afterallowing a fufficient time for mourning, the neareft relation generally clofed the eyes of the deceafed; and the body was bathed with warm water, either to render it fitter for being anointed with oil, or to reanimate the principle of life, which might remain fufpended without manifelting itfelf. Proofs were afterwards made, to difcover whether the perion was really dead, which were often repeated during the time that the body remained expofed; for there were perfons appointed to vifit the dead, and to prove their fituation. On the fecond day, after the body had been wafhed a fecond time, it was anoiuted with oil and balm. Luxury encreafed to fuch a pitcls in the choice of foreign perfumes for this purpofe, that under the confulfhip of Licinius Craflus and Julius Cafar, the fenate forbade any perfumes to be ufed except fuch as were the production of Italy. On the third day the body was clothed according to its dignity and condition. The robe called the pretexta was put upon magittrates, and a purple robe upon confuls; for conquerors, who had merited trimphal honours, this robe was of gold tiflue. For other Romans it was white, and black for the lower claffes of the people. Thefe drefles were often prepared at a diftance, by the mothers and wives of perfons Atill in life. On the fourth cay the body was placed on a couch, and expofed in the veltibule of the houle, with the vifa je turned towards the entrance, and the feet near the door; in this fituation it remained till the end of the" week. Near the couch were lighted wax-tapers, a finall box in which perfumes were burnt, and a veffel full of water for puitication, with whieh thofe who approached the body befprinkled themfelves. An old man, belonging to thofe who furnifhed every thing neceflary for funerals, fat near the deceafed, with fome domellics clothed in black. On the eighth day the funeral rites were performed; but to prevent tbe body from corrupting before that time, falt, wax, the refinous gum of the cedar, myrrh, honey, balm, gypfum, lime, afphaltes, or bitumen of Judea, and feve. ral other fubltances, were employed. The body was earried to the pile with the face uncovered, unlef3 wounds or the nature of the difcafe had rendered it loạtbome and difguting. In fuch a cafe a mafk was ufed, made of a kind of flatter; which has given rife to the expreffion of funera larvata, wfed in fome of the ancient authors. This was the lalt method of concealment which Nero made ufe of, after having caufed Germanicus to be poifoned : for the effect, of the poifon had become very fenfible by livid fpots and the blacknels of the body; but a fhower of rain bappening to fall, it wafhed the plafter entirely away, and thus the horrid crime of fratricide was difcovered.

The Turks have, at all times, been accuftomed to
walh the bodies of their dead before interrpest; and interment: as their ablutions are complete, and no part of the body efcapes the attention of thofe who aflitt at fuch melancholy ceremonies, they can eafily perceive whicther oue be really dead or alive, by examining, amones other net hods of proof, whether the /pbintice ani has b, ift its fower of contraction. If this mufcle remains htill contracted, they warm the body, and endeavour to recal it to life ; otherwife, after having wafhed it with water and foap, they wipe it with linen eloths, walio it again with rofe-water and aromatic fubllances, cover it with a rich drefs, put upon its head a cap ornamented with flowers, and extend it upon a carpet placed in the vellibule or hall at the entrance of the houfe.

In the primitive church the dead were wafhed an 1 then anointed; the body was wrapped up in liner, or clothed in a drefs of more or lefs value according to circumftances, and it was not interred until after being expofed and kept fome days in the houle. The enitom of clothing the dead is preferved in France only for princes and ecclefiaftice.

In other countries, more or lefs care is taken to prevent fudden interments At Geneva, there are people appointed to infpect all dead bodies. Their duty conlifts in examining whether the perfon bs really dead, and whether one died naturally or by violence. In the north, as well as at Genoa, it is ufual not to bury the dead till three days have expired. In Holland, people earry their precautions much farther, and delay the funerals longer. And in England bodies generally remain unburied three or four days.
Premature Interament. Notwithtanding the cufoms above recited: till, in many places, ard on many ocs eafions in all places, too much precipitation attend 3 this laft effice; or if not precipitation, a neglect of due precautions in regard to the body. In general, indced, the moft improper treatment that can be imagined is adopted, and many a perfon made to defeend into the grave before he has fighed his latt breath. The hitories related by Hildanus, by Camerarius, by Hortius, by Macrobins in his Somnium Scipionis, by Plato in his Republic, by Valerius Maximus, and by a great many modern authors, leave us no doubt refpecting the dangers or mifconduct of fuch precipitation. It muft appear allonifhing that the attention of mankind has been after all fo little roufed by an idea the moll terrible that can be conceived on this fide of eternity. If rature recoils from the idea of death, with what horror mult fhe flart at the thought of death anticipated; preeipitated by inattention-a return of life in darknefs, diftraction, and defpair-then death repeated under a oonies unfpeakable! To revive nailed up in a coffin! The brain can fearce fultain the reflection in our cooleft cafeft moments.

Aceording to prefent ufage, as foon as the fem. blance of death appears, the chamber of the fick is deferted by friends, relatives, and phyficians; and the apparently dead, though frequently living, body, is committed to the management of an ignorant and unfeeling nurfe, whofe care extends no farther than laying the limbs ftraight, and fecuring her accultomed. perquifites. The bed-cloaths are immediately removed, and the body is expofed to the air. This, when cold',
nu?

4nterment. muf extinguih any fpark of life that may remain, and which, by a different treatment, might have been kindled into flame; or it may only continue to reprefs it, and the unhappy perfon afterwards revive amidft the horrors of the tounb.

The difference between the end of a weak life and the commercement of death, is fo finall, and the uncertainty of the figns of the latter is fo well eftablifhed both by ancient and modern authors who have turned their attention to that important object, that we can fcarcely fuppofe undertakers capable of diftinguifh. ing an apparent from a real death. Animals which fleep during winter flow no figns of life; in this cafe, citculation is only fufpended: but were it annihilated, the vital fpirit does not fo eafily lofe its action as the other fluids of the body; and the prinociple of life, which long furvives the appearance of death, may re-animate a body in which the action of all the organs feems to be at an end. But how diff. cult is it to determine whether this principle may not be revived? It has been found impoffible to recal to life fome animals fuffiocated by mephitic vapours, tho' they appeared lefs affected than others who have revived. Coldnefs, heavinefs of the body, a leaden livid colour, with a yellownefs in the vifage, are all very uncertain figns: Mr Zinmerman obferved them all upon the body of a criminal, wha fainted through the dread of that punifhment which he had merited. He was thaken, dragged about, and turned in the fame manner as dead bodies are, without the leaft figns of refittance; and yet at the end of 24 hours he was recalled to life by means of volatile alkali.

A Dircter of the eoarh.office at Dijon, named Colinet, was fuppofed to be dead, and the news of this event was fpread thronghout the whole city. One of his friends, xilho-was defirous of feeing him at the moment when he was about to be buried, having looked at him for a confiderable time, thought he perceived fome remains of fenfibility in the mufcles of the face. He therefore made an attempt to bring him to life by fpiri:uous liquors, in which he fucceeded; and this di-- yecter enjoyed afterwards for a long time that life which he owed to his friend. This remarkable circumftance was much like thofe of Empedocles and Afclepiades. Thefe in Hances would perhaps be more frequent, were men of flsill and abilities called in cafes of fudden death, in which penple of ordinary knowledge are often deceived by falte appearances.

A man may fall into a fyncope, and may remain in that condition three or even eight days. People in this fituation have heen known to come to life when depofited among the dead. A boy belonging to the hofpital at Caflel appeared to have breathed his laft : he was carried inio the hall where the dead were expoled, and was wrapped up in a piece of canvas. Some time after, recovering from his lethargy, he recollected the place in which he had been depofited, and crawling towards the door knocked againft it with his foot. This noile was luckily heard by the centinel, who foon perceiving the motion of the canvas called for affiftance. The youth was immediately conveyed to a warm bed, and foon perfectly recovered. Had his body been confined by clore bandages or ligatures, he would not have been able, in all probability, to make himfelf be heard: his unavailing cflozts would have made him

No ${ }_{1} 67$.
again fall into a fyncope, and he would have been thus Ince buried alive.

We muft not be aftonifhed that the fervants of an hofpital fhould take a fyncope for a real death, fince even the moft enlightene t people have fallen into errors of the fame kind. Dr John Schmid relates, that a young girl, feven years of age, after being aflictell for fome weeks with a violent cough, was all of a furden freed from this troublefome malady, and appeared to be in perfect health. . But fome days after, while playing with her companions, this child fell down in an inflant as if ftruck by lightning. A death-like palenefs was diffufed over her face and arms; fhe had no apparent pulfe. her temples were funk, and the thowed no figns of fenfation when fhaken or pinched. A plyfician, who was called, and who believed her to be dead, in compliance with the repeated and prefling requeft of her parents, attempted, though without any .hopes, to recal her to life; and at length, after feveral vain efforts, he made the foals of her feet be fmartly rubbed with a brufh dipped in ftrong pickle. At the end of three quarters of an hour the was obferved to figh; fhe was then made to fwallow fome fpirituous liquor; and the was foon after reltored to life, much to the joy of her difconfolate parents - A certain man having undertaken a journey, in order to fee his brother, on his arrival at his houfe found him dead. This news affected him fo much, that it brought on a molt dreadful fyncope, and he himfelf was fuppofed to be in the like fituation. After the ufual means had been employed to recal him to life, it was agreed that his body fhould be diffected, to difcover the caufe of fo fudden a death; but the fuppofed dead perfon overhearing this propofal, opened his eycs, flarted up, and immediately betook himfelf to his heels.-Cardinal Efpinola, prime minifler to Philip II. was not fo fortunate; for we read in the Memoirs of Amelot de la Houffai, that he put his hand to the knife with which. he was opencd in order to be embaimed. In fhort, almoft every one knows that Vefalius, the father of anatomy, having been fert for to open a woinan fubject to hyfterics, who was fuppofed to be dead, he perceived, on making the firt incifion, by her motion and cries, that the was ftill alive; that this circumftance rendered him fo odious, that he was obliged to fly; and that he was fo much affected by it, that he died foon after.-On this occafion, we cannot forbear to add an event more recent, but no lefs melancholy. The Abbé Prevof, fo well known by his writings and the fingularities of his life, was feized with a fit of the apoplexy, in the foreft of Chantilly, on the 23 d of Oetober 1763 . His body was carried to the nearelt village, and the officers of jutlice were proceeding to open it, when a cry which he fent forth affrightened all the affiftants, and convinced the furgeon that the Abbé was not dead: but it was too late to fave hiin, as he had already received the mortal wound.

Even in old age, when life feems to have been gradually drawing to a clofe, the appearances of death are often fallacious. A lady in Comwall, more than 80 Zb years of agc, who had been a confiderable time decli- $V_{0}$ ning, took to her bed, and in a few days feemingly ex-p. pired in the morning. As fhe had often detired nut to be buried till the had been twa days dead, her requeft was to have been regularly coruplied with by her rela-

## 1 N '

nent. tions. All that faw her looked upon her as dead, and, the report was current through the whole place; nay, a gentleman of the town actually wrote to his friend in the ifland of Scilly that the was deceafed. But one of thofe who were paying the laft kind office of humanity to her remains, perceived fome warmth about the middle of the back; and acquainting het friends with it, they applied a nirror to her mouth; but, after repeated trials, could not obferve it in the leaft flained ; her under jaw was likewife fallen, as the common phrafe is; and, in fhort, the lad every appearance of a dead perfon. All this time the had not been ftripped or dreffed; but the windows were opened, as is ufual in the chambers of the deceafed. In the evening the heat feemed to increafe, and at length fhe was perceived to breathe.

In flort, not only the ordinary figns are very uncertain, hut we may fay the fame of the fliffnefs of the limbs, which may be convulfive; of the dilation of the pupil of the eye, which may proceed from the fame caufe; of putrcfaction, which may equally attack fome parts of a living body; and of feveral others. Haller, convinced of the uncertainty of all thefe figns, propofes a new one, which he confiders as infallible. "If the perfon (fays he) be ftill in life, the mouth will immediately fhut of itfelf, becaufe the contraction of the mufcles of the jaw will awaken their irritabiiity." The jaw, however, may be deprived of its irritability though a man may not be dead. Life is preferved a long time in the paffage of the inteflines. The fign pointed out by Dr Fothergill appears to deferve more attention. "If the air blown into the mouth (fays this plyyician) paffes freely through all the alimentary channel, it affords a ftrong prefumption that the irritability of the internal fphincters is deftroyed, and confequently that life is at an end." Thefe figns, which deferve to be confirmed by new experiments, are doubtlefs not known to undertakers.
The difficulty of diftinguifhing a perfon apparently dead from one who is really fo, has, in all countries where bodies have been interred too precipitately, rendered it neceflary for the law to affit humanity. Of feveral regulations made on this fubject, we thall quote only a few of the moft recent; fuch as thofe of Arras in 1772 ; of Mantua in 1774 ; of the Grand Duke of Tufcany in 1775; of the Senechauffice of Sivrai, in Poitou', in $1: 77$; and of the Parlament of Metz in the fame year. To give an idea of the reft. it will be fufficient to relate only that of Tufcany: By this edict, the Grand Duke forbids the precinitate interment of perfons who die fuddenly. He orders the Magiffrates of Health to be in formed, that phyficians and furgeons may examine the body; that they may ufe every endeavour to recal it to life, if peffible, or to difcover the caufe of its death; and that they flall make a report of their procedure to a certain tribunal. On this occafion, the Magiltrate of Health orders the dead not to be covercd until the moment they are abut to be buried, except fo far as decency requires; oblerving always that the oody be not clofely confined, and that nothing may comprefs the jugular veins and the carotid artcries. He forbids people to be interred according to the ancient method; and requires that the arms and the hands hould be left extended, and that they
fhould not be folded or placed crofs-wifc upon the Interment, brealt. He forbids, above all, to prefs the jaws one againt the other; or to fill the mouth and noftrils with cotton, or other ftuffing. Laftly, he recommends not to cover the vifage with any kind of cloth until the body is depofited in its coffin.

We fhall conclude this article by fubjoining, from Dr Hawes's Addrefs to the Public on his diubject, a few of the cafes in which this fallacious appearance of death is moll likely to happen, together with the refpective modes of treatment which he recommends.
In apoplectic and fainting fits, and in thofe arifing from any violent agitation of mind, and alfo when opium or fpirituous liquors have been taken in too great a quantity, there is reafon to bclieve that the appearance of death has been frequently miftaken for the reality. In thefe cafes, the means recommended by the Ilumane Society for the Recovery of Drowned Perfons fhould be perfevered in for feveal hours, and bleeding, which in fimilar circumftances has fonetimes proved pernicious, thould be ufed with great caution. (See the article Drowning.) In the two latter inftances it will be highly expedient, with a view of counteracting the foporific effects of opium and fpirits, to convey into the flomach, by a proper tube, a folution of tartar emetic, and by various other means to excite vomiting.
From the number of children caried off by convulfions, and the certainty arifing from undoubted facts. that fome who bave in appearance died from that caufe have been recovered; theré is the greateit reafon for concluding, that many, in confequence of this difeafe, have been prenaturely numbered among the dead; and that the fond parent, by neglecting the means of recalling life, has often been the guiltefs executioner of her own offspring. To prevent the commifion of fuch dreaful mittakes, no child, whofe life has been apparently extinguifhed by convulions, flould be configned to the grave till the means of recovery above recommended in apoplexies, \&c. have been tried; and, if poffible, under the direction of fome fiilful practitioner of medicine, who may vary them as circumftances fhall require.
When fevers arife in weak habits, or when the cure of them has been principally attempted by means of depletion, the confequent debility is often very great, and the patient fometimes finks into a flate which bears fo clofe an affinity to that of death, that there is reafon to fufpect it has too often deccived the byflanders, and induced them to fend for the undertaker when they fhould have had recourfe to the fuccours of medicine. In fuch cafes, volatiles, eau de luce for example, hould be applied to the nofe, rubbed on the temples, and fprinkled often about the bed; hot flannels, moiftened with a ftrong folution of camphorated fpirit, may likewife be applied over the breaft, and renewed every quarter of an hour ; and as foon as the patient is able to fwallow, a tea-fpoonful of the flronget cordial fhould be given every five minures.

The fame methods may alfo be ufed with propriety in the fmall-pox when the puftules fink, and death appa:ently enfues; and likewife in any other acute difeafes, when the vital functions are fufpended fron a fimilar caufe.

Intermittent, or Intermitting, Fever.

tion.
INTERPOLATION, among critics, denotes a
fpurious paffage inferted into the writings of fome ancient author.

INTERPOSITION, the fituation of a body between two others, fo as to hide them, or prevent their ation.

The eclipfe of the fun is occafioned by an interpofition of the moon between the fun and us; and that of the moon by the interpofition of the earth between the fun and moon. See Eclipse.

INTERPRETER, a perfon who explains the thoughts, words, or writings, of fome other, which before were unintelligible.-The word interpres, according to lfidore, is compofed of the prepofition inter, and partes, as fignifying a perfon in the middle betwixt two parties, to make them mutually underftand each others thoughts: others derive it from inters and pras, i. e. fidejuflor; q. d. a perfon who ferves as fecurity between two others who do not underttand one another.

There have been great debates about interpreting Scripture. The Romanilts contend, that it belongs abfolutely to the church: adding, that where the is filent, reafon may be confulted; but where fie fpeaks, reafon is to be difregarded. The Proteftants generally allow reafon the fovereign judge, or enterpreter ; tho' fome among them liave a lirong regard to fynods, and others to the authority of the primitive fathers. Laftly, others have recourfe to the Spirit within every perfon to interpret for them; which is what Bochart

INT'ERREGNUAI, the time during which the throne is vacant in elective kingdoms; for in fuch as are hereditary, like ours, there is no fuch thing as an interregnum.

INTERREX, the magiftrate who governs during an interregnum.

This magiftrate was eftablimed in old Rome, and was almoft as ancient as the city itfelf: after the death of Romulus there was an interregnum of a year, duxing which the fenators were each interrex in their turn, five days a piece.

After the eftablifmment of confuls and a commonwealth, though there were no kings, yet the name and function of interrex was ftilif preferved: for, when the magiltrates were absent, or there was any irregularity in their election, or they had abdicated, fo that the comitia could not be held; provided they were unwilling to create a dietator, they made an interrex, whofe office and authority was to laft five days; after which they made another. To the interrex was delegated all the regal and confular authority, and he performed all their functions. He affembled the fenate, held comitia or courts, and took care that the election of magiftrates was according to'rules. Indeed at firft it was not the cuftom of the interrex to hold comitia, at leaft we have no inftance of it in the Roman hiltory. The patricians alone had the right of electing an interrex; but this office fell with the republic, when the emperors made themfelves mafters of cvery thing.

INTERRQGATION, ERotesis, a figure of rhe-
toric, in which the paffion of the fpeaker introduces a Intert thing by way of queftion, to make its truth more confpicuous.

The interrogation is a kind of apoftrophe which the fpeaker makes to himfelf; and it mull be owned, that this figure is fuited to exprefs moft paffions and emotions of the mind; it ferves allo to prefs and bear down an adverfary, and generally adds an uncommon brifknefs, action, force, and variety, to difcourfe.

Interrogation, in grammar, is a point which ferves to diftinguifh fuch parts of a difcourfe, where the author fpeaks as if he were akking queftions. Its form is this (?).

INTERROGATORIES, in law, are particular queftions demanded of witneffes brought in to be examined in a caufe, efpecially in the court of chancery. And thefe interrogatories muft be exhibited by the parties in fuit on each fide; which are either direct for the party that produces them, or counter, on behalf of the adverfe party; and generally both plaintiff and defendant may exhibit, direct, and counter, or crofs interrogatories. They are to be pertinent, and only to the points neceffary; and cither drawn or perufed by counfel, and to be figned by them.

INTERSECTION, in mathematics, the cutting of one line, or plane, by another; or the point or line wherein two lines, or two planes, cut each other.

The mutual interfection of two planes is a right line. The centre of a circle is in the interfection of two diameters. The central point of a regular or irregular figare of four fides, is the point of interfection of the two diagonals.

The equinoxes happen when the fun is in the inter fections of the equater and ecliptic.

INTERSPINALES. Sce Anatomy, Table of the Mufles.

INTERVAL, the diflance or face between two extremes, either in time or place. The word comes from the Latin intervallum, which, according to Iftdore, figniges the face inter foffam E" murum, "between the ditch and the swall:" othera note, that the fakes or piles, driven into the ground in the ancien: Roman bulwarks, were called vallu; and the interlices or vacancy between them, intervalla.

Interval, in -mufic. The ditance between any given found and another, frictly fpeaking, is neither meafured by any common ftandard of extenfion nor duration ; but either by immediate fenfation, or by computing the difference between the numbers of vibrations produced by two or more fonorons bodies, in the act of founding, during the fame given time. As the vibrations are flower and fewer during the fame inftant, for example, the found is proportionally lower or graver ; on the contrary, as during the fame period the vibrations increafe in number and velocity, the founds are proportionably higher or more acute. An interval in mufic, therefore, is properly the difference between the number of vibrations produced by one fonorous body of a certain magnitude and texture, and of thofe produced by anothet of a different magnitude and texture in the fame time.

Intervals are divided into confonant and diffonant. A confonant interval is that whofe extremes, or whofe higheft and loweft founds, when fimultaneouny heard, coalefce in the ear, and produce an agreeable fenfation

## I N T

rval. called by Lord Kames a tertium quid. A diffonant interval, on the contraty, is that whofe extremes, fimultaneoully heard, far from coalefcing in the ear, and producing one agreeable fenfation, are each of them plainly diftinguifled from the other, produce a grating effect upon the fenfe, and repel each other with an irreconcileable holtility. In proportion as the vibrations of different fonorous bodies, or of the fame fonorous body in different modes, more or lefs frequently coincide during the fame given time, the chords are more or lefe perfect, and confequently the intervals more or lefs confunant. When thefe vibrations never coincide at all in the fame given time, the difcord is confummate, and confequently the interval abfolutely diffonant.
Intervals are not only divided according to their naturcs, but alfo with refpect to their degrees. In this view, they are either enharmonic, chromatic, or diatonic. Of thefe therefure in their order, from the lealt to the greatefl.

An cnharmonic interval is what they call the eighth part of a tone, or the difference between a major and minor femitone generally diftinguifhed by the uame of a comma. Commas, however, are of three different kinds, as their quantities are more or lefs; but fiuce thefe differences cannot be afeertained without long and intricate computations, it is not neeffiry for us to att cmpt an inveftigation, whofe purfuit is fo unpleafant, and whofe refult attended with for little utility. It has by muficians been generally called the eigbtb part of a tone; but they ought to have confidered, that a comma is by no means the object of auricular perception, and that its ellimate can only be furmed by calculation. For a morc minute difquifition of this matter, our readers may coufult the article Соmma in the Mufical Dictionary, or the article Music in this Work, Notes, $n$ and s. A chromatic interval confits proper1y of a minor femitore, but may alfo admit the major. A diatonic interval confifts of a femitone-major at leatt, hut may confilt of any number of tones within the octave. When an octave higher or lower is affumed, it is obvious that we enter into another fcale which is either higher or lower, but fill a repetition of the former degrees of found.

Intervals again are either fimple or compound. All the intervals within any one octave are fimple; fuch as the fecond major or minor, the third, the fourth, the fifth, the fixth, the feventh, \&c. of thefe afterwards. All intervals whofe extremes are contained in different odaves, fuch as the ninth, the tenth, the eleventh, the iwelth, the thirteenth, the fousteenth, the fifteenth, \&c. may be termed compound intervals.

The femitone either exactly or nearly divides the tone into two equal parts. In the theory of harmonical computation three kinds of femitones are recognifed, viz. the greatef, the intermediate, and the fmall. cit femitone. But in practice, to which thefe expli. cations are chicfly adapted, the femitone is only diתinguifhed into major and minor. The femitone ma. jor is the difference between the third major and the fourth, as EF. Its ratio is as 15 to 16 , and it forms the leaft of all diatonic intervals.

The femitone minor confilts of the difference between the third major and minor: it may be marked

## 83 ] $\quad \mathrm{I} \quad \mathrm{N}$ T

in the fame degree hy a flarp or a flat, and it only Interva? forms a cliromatic interval; its ratio is as 24 to 25 .
Though fome diftinction is made hetween thefe femitones by the manner of marking them, yet on the organ and harpfichord no diftinction can be made; nor is there any thing more common for us than to fay, that D Tharp in rifing is $E$ flat in defcending, and fo through the whole diapafon above or below; befides, the femitone is fometimes major and fometimes minor, fometimes diatonic and fometimes chromatic, ascording to the different modes in which we compofe or practife ; yet in practice thefe are called femitones minor, whict are marked by fharp3 or flats, without changing the degree; and femitones major are thofe which form the interval of a fecond.

With refpect to the three femitones recognifed in theory, the greateft femitone is the differerce between a tone major and a Cemitone minor; and its ratio is as 25 to 27 . The intermediate femitnne is the difference between a femitone major and a tone major; and ita raite is as 128 to 135 . In a word, the frall femitone confifts of the difference bet ween the greatelt and the intermediate femitone; andits ratio is as 12 ; to 128 .

Of all thefe. intervals, there is only the femitone major, which is fonetimes admitted as a fecond in harmony.

The interval of a tone which characterifes the diatonic fpecies of compofition, is either major or minor The former confitls of the difference bet ween the fourth and fifth; and its ratio is as 8 to 9 : and the latter, whofe ratio is as 9 to 10 , refults from the difference between the third minor and the fourth.

Seconds are diflinguiflaed into four kinds: two of which are nor in practife fufficiently monentous tu be mentioned. The fecond major is fynonymous with the intervals of a tone; but as that tone may be either major or minor, its ratio may be either as 8 to 2 , or as 9 to 10.
The fecond minor confifts of the difance from B to C, or from EF; and its ratio is as 15 to 16.

The third is fo called, becaufe it conffils of two gradations, or three diatonic founds, as from G to B afcending, or from A to C , inclufive of the extremes; of which the firt is a third najor, compored of two full tones, and its ratio as 4 to 5 ; the fecond, a third minor confilting of a tone and a femitone major, and its ratio as 5 to 6 .

The fourth has by fome been reckoned an imperfect, but more jully by others a perfect, chord. It confilts of three diatonic degrees, but take its name from the four different founds of which it is formed; or, in other words, the number by which it is denominated includes the extremes. It is compofid of a tone major, a tone minor, and a femitone major, as from C to Fafcending; its ratio as 3 to 4 .

The fifth next to the octave, is,' perhaps, the mot perfect interval, as leatt furceptible of alteration. The number from whence it affunes its name likewife includs it extremes. It confifts of two tones major, one minor, and a femitone major, as from A to E afeending; its ratio is as 2 to 3 .

The fixth is uot found among the natural order of confonances, but only admitted by combination. It is not here neceffary to mention its various ditinctions $\mathrm{Nn}_{2}$ and

Interval. and ufes, as we only give an account of intervals in ge-neral.

The fixth major confifts of four tones and a femitone inajor, as from $G$ to $E$ alcending; its ratio is as 3 to 5. The fixth minor contains three tones and two lemitones major, as from E to C alcending ; its ratio is as 5 to 8 .

The feventh, as a reciuplieation of the fecond, is a diffonance. When major, is confills diatonically of five tones, three major, and two minor; and a major femione, as from $C$ to $B$ afcending ; its ratio is as 3 to 15.

When minor, it confifts of four tones, three major and ore minor, and two major femitones, as from E to D afcending ; its ratio is as $5 \mathbf{t 0} 9$.

The oftave is the mott perfect of all chords, and in many cafes hardly to be dittinguithed by the car from an unifon; that is to fay, from that coincidence of found produced by two mufalal trings, whole matrer, lenglis, diameters, and tenfions, are the fame. As the vibrations of two flrings in unifon during any given time, are precifely coincident; fo whilit the loweft exteme of the octave vibrates once, the high. eft vibrates twice; and confequently its ratio is as 1 to 2 , as from $c$ to $C$ afcending. It confifts of fix full truts and two femitoneb major. Its name is derived frem the Latin oilo, "eight;" becaufe that number likewife includes its extremes. It may likewile be divided into twelve femitones. It contains the whole diatonic feale; and every feries above or below confills only of the fame returning founds. From whence the natures, diffances, and powers, of every interval greater than the octave, as the ninth, the tenth, the cleventh, the twelfh, the thirteenti, the fourteenth, the fifteenth, the triple cetare, \&c, may eaflly be computed.

During our paft obfervations upon the term interval, we have either whoily neglected our faithful affociate M. Roufieau, or only maintained a dillant and momentary intercourfe with him. We now propofe to pay him a more permanent and familiar vifit ; but as he is engaceed in the difpute between the Pythagoreans and Ariltoxenians, we think it more advantageous to decline the controverfy, and to follow him, after having efcaped the fray, like a gentleman and a fcholar. Having put the partizans of Ariftuxenus to filence, let us, with him, forfake the lifts of combat, nor ftain his triumph by infulting the falling champions.
"We divide (fays he) as did the ancients, intervals into confonant and diffonant. The confonances are perfect or imperfect * diffonances are either fuch by nature, or become fuch by accident. 'There are only two interval naturally diffonant, viz, the fecond and feventh, including their octaves or replications; nay, till thefe two may be reduced to one alone, as the feventh is properly no more than a replication of the fecond; for $B$, the feventh above the loweft C , where we have generally begun the fcale, is really an octave ahove B , the note immediately below that $C$; and confequently the interval between thefe lower founds is no more than that of a fecond major, to which all diffonances may therefore be ultimately seduced, whether confidered as major or miner; but
sven all the confunances may become diffonant by ac- Int cident. See Discoro.
" Befides, every interval is either fimple or reduplicated. Simple intervals are fuch as the limits of a fingle octave comprehend. Every interval which furpaffes this extent is reduplicated; that is to fay, compounded of one or more ottaves, and of the fiaple interval whofe replication it is.
"Simple intervals are li"owife divided into direct and inverted. Take ariy fimple interval whatever for a direct one ; the quantity which, added to itfelf, is required to complete the octave, will be found an invertcd interval; and the fame obfervation lolds reciprocally true of fuch as are inverted.
"There are only fix kinds of fimple intervals; of which three contain fuch quantities, as, added to : he oiler three, ate required to complete the oftave; and of confequence likewife the one mut be inverfrans of the other. If you take at lirlt the fnalle l intervals, you will have, in the order of direct intervals, the fecond, the third, and fourth; for inverted, the feverth, the lixth, and fifth. Suppofe thefe to be di$1 e e^{2}$, the others will be inverted; every thing here is rsciprocal.
"To find the name of any interval whatever, it is only neceflary to add the denomination of unity to the degree which it contains. Thus the interval of one degree flall give a fecend ; of two, a third; of three, a fourth; of feven, an octave; of nine, a tenth, \&e. But this is not fufficient to determine an interval with accuracy; for under the fame name it may be either major or minor, true or falle, diminithed or redundant
"The confonances which are imperfeet, and the two natural diffonances, may be major or minor; which, without changing tixeir degree, occalions in the interval the difference of a femitone; fo that if, from a minor interval, we flill deduce a femitone, it becomes an interval diminifhed; if, by a Cemitone, we increafe a major interval, it becomes an interval redundant.
" The perfect confonances are by their nature invariable. When their intervals are fuch âs they ought to be, we call them julb, tras: and if we dilate or contract this interval by a Cemitone, the eonfonance is termed fulfe, and becomas a dillonance; redunilant, if the femitone be added ; diminijbed, if it be ahitracted. We improperly give the name of a fulfe fifib to the fifth diminifhed; this is taking the genus for the fpecies: the fifth redundant is every jot as falle as the diminifhed, it is even more fo in every refpect."

In the Mutical Dictionary, plate C, fig. 2. may be feen a table of all the fimple intervals practicable in mulie, with their names, their degres, their values and theit ratios.

Having afeertained the diftinction between major and minor intervals, it is only neceffary to add, that thefe may be natural or artificial. Of the natural we have already given fome account, by afcertaining the diltances and ratios of fuch as have been mentioned. Of the artificial, we may obferve, that they are fuch as change their pofition from what it uaturally is in the diatonic fale, to what the conveniency of coinpofition or tranfpolition requires it to be. A noté

## I N T

flate thus antificially heightened by a femitone, together with the character which exprcfles that elevation. is called a barp; on the contrary, a note artilicially deprefled hy a femitone, together with the character by which that deprefion is fignified, is called a fat. The chatacter which rellores a note thus depreffed or raifed to its primary tlate, is called a natural M.jor or minor iutervals, as they prevail, characterife the inajor or minur mode. Sce Mone.

INTESTATE, in law, a perfon that dies without making a will.

INTESTINA, in the Linmean Syfem, an order of woms see Zoology.

INTESTINES, Intestina, in anatomy, the guts or bowels ; thofe hollow, membranous, cylindrical parts, extended from the right orifice of the llomach to the anus; by which the chyle is conveyed to the lacerals, and the excrements are voided. See $\Lambda_{\text {na }}$ тоиY, 10 y3

INTONATION, in mulic, the action of founding the nutes in the fate with the voice, or any other given irder of mufical tones. Intonation may be cither true or falle, cither too high or too lnw, cither too Tharp or too flat; and then this word intonution, attesded with an epithet, mull be underllood concerning the manner of performing the notes.

In executing an air, to form the founds, and pre. ferve the intervals as they are marked with jultnefs and accuracy, is no inconfiderable diffulty, and farcely practicable, but by the affiftance of one common idea, to which, as to their ultimate telt, thefe founds and intervals mutt be ieferred : thefe common ideas are thofe of the key, and the mode in which the performer is ergaged; and from the word tone, which is fumetimes ufed in a fenfe almoft identical wath that of the key, the word intonation may perhaps he deri red. It may alfo be deduced from the word druenic, as in that fcale it is molt frequently converfant; a leale which afpears moft comenient and moft natural to the voicc. We feel more diffutilty in our intonation of fuch intervals as are greater or leffer than thefe of the diatonic order; becaufe, in the firl cale, the glottis and vocal organs are modified by gradations too large; or ton complex, in the fecond.

INTRENCHMENT, in the military art, anywork that fortifies a polt againft an enemy who attacks. It is generally taken for a ditch or trench with a parapet. Intrenchments are fometimes made of falcines with earth thrown ovet them, of gabions, hogfoads, or bags filled with erth, to cover the men frum the enemy's fire.

INI'RIGUE, an aftemblage of events or circumAances, occuring in an affar, an 11 perplexing the per--fons concerned in it. In this fenfe, it is ufed to figgnity the nojus or plot of a play or rumance; or that point wherein the principal characters are mof embarraffed through the artilice and o!pofition of eertain perfons, or the unfortumate failing out of certain accidents and circumflances.

In tragedy, comedy, or an epic poem, there are always two deligns. The finft and p:incipal is that of the lero of the piece: die feeund contains the defigus of all thof whu oppric hine Thefe oppofite caulis produce oppolite eflicte, to wit, the efforto of
the hero for the execution of his delign, and the efforts of th. fe who thwart it. As thofe caufes and defigns are the beginning of the action, fo thefe efforts are the middle, and there form a knot or difficulty "hich we call the intrigue, that makes the greatelt part of the poein. It lalls as long as the mind of the reader or hearer is fufpended abou the event of thofe oppolite efforts: the folution or cataltrophe commences when the knot begins to unravel and the difficulties and doubts hegin to elear up.

The intrigute of the lliad is twofold. The firt com. prehends three day's lighting in Achilles's abfence, and confils on the one fide in the refltance of Agamemnon and the Grecks, and on the other in the in. exorahle temper of Achilles. The death of Patroclus unavels this intrigue, and makes the beginning of a recund Achilles refolves to be revenged, but Hector oppofes his defign; and this forms the fecond intrigue, which is the laft day's butle.

In the Pitiend there are alio two intrigues. The firt is taken up in the voyage and landing of Reneas in Ltaly; the fecond is his eftablifhment there: the oppontion he met with from Juno in both thefe undertakings, furms the intrigue.

As to the choice of the intrigne, and the manner of uaravtlling it, it is ccrtain they ought both to fpring naturaliy from the ground and fubject of the poem. Ioffu gives us three manners of forming the intrigue of a poem: the firft is that already mentioned; the lecond is taken from the fable and defign of the poct; in the third the intrigue is fo laid, as that the folution follows from it of courle.

INTRINSIC, a term applied to the real and ge. nuine values and properties, \&c. of any thing, in oppofition to their sutrinfic or apparent values.

IN TRODUCTION, in general, fignifes any thing which tends to make another in fome meafure known hefore we have leifure to examine it thoroughly ; and hence it is ufed on a great variety of occations. Thus we fpeak of the introdiction of one perion to another; the introduction to a book, \&c.-It is alfo ufed to fignify the actual motion of any body out of one place into another, when that motion has been oecalioned by fome other body.

Intronuction, in oratory. See Oratory, $n^{\circ} 2 G$.
INCUIT'ION, among logicians, the act whereby the nind perceives the agreement or difagrement of two ideas, immediately by themfelves, without the intervention of any other; in which eafe the mind perceives the truth as the eye does the light, only by being directed towards it. See Logic, $n^{\circ}{ }^{\circ} 25.27$.

INTUIT VE evidence, is that which refults from Intuition Di Campbell diflinguithes different forts of infuitive evidence: one refulting purely from intellection, or that faculty which others have called intuition: another kind arifing from conccioufnels ; and a third fort from that new named faculty Common SEwse, which this ingenious writer as well as feveral others contend to be a diltinét uriginal fource of knowledge, wrilt uthers refer its fuppofed office to the intuitive power of the undertanding.

INVALID, a porfor wounded, maimed, or difabled for action by agc.

At Cholfea and Greenwich are magnificent Hospr.

## I N V [ 286 ] N V

If vected tals or 1ather colleges, built for the reception and il Inventory. accommodation of invalids, or foldiers and feamen worn out in the fervice.

We have alfo twenty independent companies of in. valids, difperfed in the feveral forts and garrifons.

At Paris is a college of the fame kind, called les Invalides, which is accounted one of the finelt buildings in that city.

INVECTED, in heraldry, denotes a thing fluted or furrowed. See Heraldry.

INV E.CTIVE, in rhetoric, differs from reproof, as the latter proceeds from a friend, and is intended for the good of the perfon reproved; whereas the invective is the work of an enemy, and entirely defigned to vex and give uneafinefs to the perfon againt whom it is direkted

INVEGES (Auguftin), a learned Sicilian Jefuit, wrote in ltalian an Hiltory of the city of Palermo, and other works, which are efleemed. He died in : 677, aged 82.

INV ENTION, denotes the act of firding any thing new, or even the thing thus found. Tlus we fay, the invention of gunpowder, of printing, \&c. The alcove is a modern invention owing to the Moors.

The Doric, Ionic, and Corinthian orders, are of Greek invention; the Tufcan and Compofite of Latin invention. Janfon ab Almeloveen has written an $O$. nomaticon of inventions; wherein are flown, in an alphabetical order, the names of the inventors, and the time, place, \&c. where they are made. Pancirollus has a treatife of old inventions that are loft, and new ones that have been made; Polydore Virgil has alfo publifhed eight books of the inventors of things. De Inventoribus Rerum.

Invention is alfo ufed for the finding of a thing hidden. The Romith church celebrates a feaft on the $4^{\text {th }}$ of May, under the title of, Invention of the Moly Crofs.

Invention is alfo ufed for fubtilty of mind, or fomewhat peculiar to a man's genius, which leads him to a difcovery of things new; in which fenfe we fay, a man of invention.

Invention, in painting, is the choice which the painter makes of the objects that are to enter the compofition of his picce. Sce Painting.
invention, in poetry, is applied to whatever the poet adds to the hiftory of the fubject he has chofen; as well as to the new turn he gives it. See Poetry.

Invention, in rhetoric, fignifies the finding out and choofing of certain arguments which the orator is to ufe for the proving or illuftrating his point, moving their paffions, or conciliating the minds of his hearers. Invention, according to Cicero, is the principal part of oratory: he wrote four books De Inventione, whereof we have but two remaining. See Oratory.

INVENTORY, in law, a cataloguc or fehedule orderly made, of all a deceafed perfon's goods and chattels, at the time of his death, with their value appraifed by indifferent perfons, which every executor or adminiltrator is obliged to exhibit to the ordinary at fuch time as he thall appoint.

By 21 Hen. VIII. c. v. executors and adminiftrators are to deliver in upon oath to the ordinary, indeuted inventories, one part of which is to remain with the ordinary, and the other patt with the executor or ad-
miniftrator; this is required for the benefit of the cre. ditors and legatees, that the exccutor or adminittrator may not conceal any part of the perfonal eftate from them. The ftatute ordains, that the inventory fhall be exhibited within three months after the perfon's deceafe; yet it may be done afterwards, for the ordinary mey difpenfe with the time, and even with its being ever exlibited, as in cales where the creditors are paid, and the will is executed.

INVER $\& R Y$, a parliament-town of Scotland, in Argylefhires, pleafantly fituated on a fmall bay formed by the junction of the river Ary with Loch-fin, where the latter is a mile in width and 60 fathoms in depth. Here is a caftle, the principal feat of the dutes of Argyle, chief of the Campbells. It is a modern building of a quadrangular form, with a round tower at cach corner; and in the middle rifes a fquare one glazed on every fide to give light to the ftaircafe and galleries, which has from without rather a heavy appearance. This caftle is built of a coarfe lapis ollaris brought from the other ficle of Loch-fin; and is of the fame kind with that fornd in Norway, of which the king of Denmark's palace is built. The founder of the caftle, the late Duke Archibald, alfo formed the defign of an entire new town, upon a commodious elegant plan, becoming the dignity of the capital of Argylthire, a country moft admirably fituated for fifheries and navigation. The town hath been rebuilt agreeable to the original defign; and the inhabitants are well lodged in houfes of ftonc, lime, and nlate. They are fully employed in arts and mannfaciures, ind plentifully fupplied in the produce of fea and land. - The planting around Inverary is extenlive beyond conception, and admirably variegrated ; cvery crevice, glen, and mountain, difplaying tafte and good fenfe.

The value of the immenfe wood at this place, for the various purpofes of bark, charcoal, forges, paling, furniture, houfe and thip building, is thus eftimated by Mr Knox: "Some of the betch are from 9 to 12 fcet in circumference, and the pines from 6 to 9 ; but thefe being comparatively few, we flall ftate the rnedium gith of $2,000,000$ trces planted within thicfe latt hundred years, at 3 feet, and the medium value at 4 s . which produces L. 400,000 ; and this, for the molt part, upon grounds unfit for the plough, being chiefly compofed of hills and rock." One of thefe hills rifes immediately from the houfe a great height, in the form of a pyramid, and is cloathed to the fummit with a thick wond of vigorous ornamental treea. On this fummit or point Archibald duke of Argyle built a Gothic tour or obfervatory, where lie fometimes amufed himfelf. The afcent by the road feems to be half a mile, and the pcrpendicular height about 800 feet.

INVERBERVIE, or Bervie, a town of Kincardinefhire or the Mearns, 3 miles N. E. from Montrofe. It lies between two fmall hills, which terminate in high cliffs towards the fea; and though a royal borough, and the only one in the country, it is but a fmall place, the inhabitants of which are chiefly employed in making thread.

INVERKEITHING, a parliament-town of Scotland, in the county of Fife, fituated on the nerthern thore of the Frith of Forth, in W. Long. 3. 15. N. Lat. 56. 5. It was much favoured by William, who
granted

## I N V

$[28$
ochy, granted its firf charter. He extended its liberties nef. confiderably, and in the time of David I. it became a royal refidence. The Moubrays had large poffeffions here, which were forfeited in the reign of Rubert II. The Francifans had a convent in this town; and, according to Sir Robert Sibbald, the Dominicans had another. This town bas a confiderable trade in coal and other articles.

INVERLOCFYY, an ancient caftle in the neigh. bourhood of Fort-WILlam in Invernefsthire. It is adorned with large round towers; and, by the mode of building, feens to have been the work of the Englifn in the time of Edward I. who laid large fines on the Scotch barons for the purpofe of erecting new caftes. The largett of thefe towers is called Cumin's: But long prior to thefe ruins Inverlochy, aecording to Boece, had been a place of great note, a molt opulent city, temarkable for the vaft refort of French and Spaniards, probably on account of trade. It was alfo a feat of the kings of Scotland, for here Achaius in the year too figned (as is reported) the league offenfive and defenfive between himfelf and Charlemagne. In after-times it was utterly defroyed by the Danes, and never again reftored.

In the neighbourhood of this place were fought two fierce battles, one between Donald Balloch brother to Alexander lord of the ifles, who with a great power invaded Lochaber in the year $142 \%$ : he was met by the carls of Mar and Caithnefs; the laft was flain, and their forces totally defeated. Balloch retumed to the ifles with vaft booty, the object of thofe plundering chieftains. Here alfo the Campbells under the marquis of Argyle, in Fehruary 1645, received fiom Montoofe an overthrow fatal to numbers of that gallant name. Fifteen hundred fell in the action and in the purfuit, with the lofs only of three to the royalifts. Sir Thomas Orilvie, the friend of Montrofe, died of his wounds. His death fuppreffed all joy for the vítory.

INVERNESS, capital of a county of the fame rame in Scotland, is a parliament-town, finely feated on the river Nefs, over which there is a fone-bridge of feven arches, in W. Long. $4^{\circ}$. N. Lat. 57.36. It is large, well built, and very populous, being the laft town of any nnte in Britain. As there are always regular troops in its neighbourhood, there is a great air of politenefs, a plentiful market, and more money and bufinefs ftirring than could have been expected in fuch a remote part of the ifland. The country in the neighbourhood is remarkably well cultivated; and its produce clearly hows that the foil and climate are not defpicable. The falmon-fifhery in the Nefs is very confiderable, and is let to London fifhmongers. Some branches both of the woollen, linen, and hemp manufacture, are alfo carried on here; and, in conlequence of the excellent military roads, there is,a great proportion of inland trade. But befides all this, Invernefs is a port with 20 creeks dependent upon it, part on the Murray Frith to the eaft, and part on the north of the town, reaching even the fouth border of the county of Caithnefs. Invernefe las feveral good fchools; and it is now intended to erect an academy there on an extenfive fcale. The inhabitants fecik the Erfe and Englif language promifcuoully. On an eminence near the town are the remains of a cafle, where, according
o fome 1 . Duncan his royal guelt.

Inverness. Shire, a county of Scotland, bounded on the north by Rofshire; on the eaft by the Mires of Nairne, Murray, and Aberdeen; on the fouth, by thofe of Perth and Argyle; and on the weft, by the Atlantic Ocean. Its extent from north to fouth is above 50 miles; from ealt to weft about 80.--The northern part of this county is very mountainous and barren. In the ditriet of Glenelg are feen the ruins of feveral ancient circular buildinge, limilar to thofe in the Weftern Illes, Sutherland, and Rofs hires; concerning the ufes of which antiquaries are not agreed. In their outward appearance, they are round and tapering like glafs-houfes. In the heart of the wall, which is perpendicular within, there are horizontal galleries going quite round and connęted by flairs. Thefe afcend toward the top, which is open. They are all built of tone, without linc or mortar of any kind. They have no opening outward, except the doors and the top; but there are feveral in the infide, as windows to the galleries. From Bernera barracks, in this diltrict, proceeds the military road to Invernefs.

This courty is nearly divided by water; and it appears from a late furvey, that by means of a canal uniting Loch Nefs, Loch Oich, Loch Lochy, and. Lochiel or Loch Eil, a communication might be readily opened here between the two feas. In this tract, Fort George, Fort Augulus, and Fort William, form what is called the Chain of Forts acrofs the ifland. By means of Fort George on the eall, all entrance up the Frith towards Invernefs is prevented; Fort Augullus curbs the inhabitants midway; and Fort Wil. liara is a check to any attempts in the weft. Detachments are made from all thefe garrifons to Invernefs, Bernera barracks oppofite to the ifle of Skie, and cafle Duart in the ifle of Mull. Other fmall parties. are alfo fcatsered in huts tbroughout the country, to prevent the tealing of cattle.

The river Nefs, upon which the capital of the Thire is fituated, is the outlet of the great lake called Lorb Nefs. This beautiful lake is 22 miles in length, and for the mott part one in breadth. It is ikreened on the north. wett by the lofty mountains of Urquhart and Meal. fourvony, and botdered with coppices of birch and. oak. The adjacent hills are adorned with many estenfive forefts of pine; which afford fhelter to the catcle, and are the retreat of flags and deer. There is much cultivation and improvement on the banks of Locb Neís; and the pafture grounds in the neighbowring valleys are excellent.- From the fouth, the siver Fyers defcends towards this lake.' Over this river there is built a ftupendous bridge, on two oppofite rocks; the top of the arch is above 100 feer from the. level of the water. A little below the bridge is the celcbrated Fall of Fyers, where a great body of water darts through a narrow gap between two rocks, then falls over a valt precipice into the bottom of the chafn!, where the foam rifes and fills the air like a great cloud of fmoke.

Loch Oich is a narrow lake, flretching about foue miles from eaft to weft. It is adorned with fome fmall wooded inands, and is furrounded with ancient trees. Near this is the family-feat of Clengary, furroundect by natural woods of full grown fir, which extend nine or ten miles along the banks of the river Gary. The waters of Loch Oieh flow through Loch Nefs into the caftern fea.-Loeh Lochy tranfmits its waters in an oppofite direction, this being the higheft part of the raft flat tract that here ftretches from fea to fea. This extenfive lake is above ten miles in length, and from one to two in breadth. From the welt, the waters of Loch Arkek defcend into this lake. Out of it runs the river Lochy, which about a mile below its iffue from the lake, receives the Spean, a cunfiderable river, over which there is a magnificent bridge, built by General Wade, about two miles above the place where it falls into the Lachy. Thefe united ftreams traverfing the plains of Lochaber, after a courfe of five or fix miles fall into Loch Eil.

A few miles to the fouth eaft of Loch Locly is Glenroy or King's Vale. The north-eaft end of this valley opens on Loch Spey. A fmall river paffes along the bottom of the vale, accompanied by a modern road. On the declivity of the mountains, about a mile from the river, on either hand are feen feveral parallel roads of great antiquity. On the north-weft fide, five of thefe roads run parallel and clofe by each other. On the oppofite fide are three other rodds exactly fimilar. Thefe roads are 30 feet broad, all perfectly horizontal, and extend eight or nine miles in length. Their deftination or ufe has bafled the conjectures of antiquaries.- Not far from, Fort All. guftus foars the pointed fummit of liennevifh, which is efteemed the highelt mountain in Britain, rifing mere than 4300 feet above the level of the fea - In the diftricts of Moydart, Arafaick, Morer, and Kinoydart, there are numerous bays and creeks, along the coalt, many of which might be excellent fifhing ftations.

The fonthern part of this county is very mountainous, and is fuppofed to be the mott elevated ground in Scotland. From its numerous lakes inany fireams deicend toward both feas. 'In the extenfive diftrict called Badenoch lies Locls Spey, the fource of the great river Spey, which. proceeding eaftward with an increafing flream, enters the flire of Murray at Rothicmurchus. aiter having expanded into a fine lake. Not far from this is feen the lofty top of Cairugorm; a mountain celcbrated for its beautiful rock-cryitals of various tints. Thefe are much efteemed by lapidarics; and fome of them, having the luitre of fine gems, bring a very high price. Jimellone, iron-ore, and fome traces of different minerals, are found in the county; but no mines have yet been worked with much fuccefs. Its rivers and lakes afford abundance of falmon and trout. The extenfive plains which furround the lakes are in general fertile; and the high grounds feed many theep and blaek cattle, the rearing and felling of which is the chief trade of the inhabitants. - By the prefent spirited exertions of the gentlemen in this populous county, the commerce and the induttry of the inlabitants have of late been greatly inereafed; and to facilitate the enmmunication with other parts, application has been made to parliament for leave to levy a tax on the proprietors of land for improving the roads and erecting bridges in this extenfive fhire. The commonalty in the high parts of the county and on the weltern thore fpuak Gaelic ; but the people of fahion in $\mathrm{N}^{\mathrm{o}} 168$.

Invernefs and its vicinity ufe the Englifh language, and pronounce it with remakable propricty.

INVERSE, is applied to a manner of working the rule of thres. Sce Arithmetic, $\mathrm{n}^{\circ} 13$.

INVERSION, the act whereby any thing is inverted or turned backwards. Problems in geometry and arithmetic are often proved by inverfion ; that is, by a contrary rule or operation.

Inverston, in grammar, is where the words of a phrafe are ranged in a manner not fo natural as they might be. For an inftance: "Of all vices, the moft abominable, and that which leaft becomes a man, is impurity." Here is an inverfion; the natural order being this: Impurity is the mott abominable of all vices, and that whict lealt becomes a man.-An inverfion is not always difagrecable, but fometimes has a good effect.

INVERTED, in mulic, is derived from the Latin prepofition in, and vertere, "to turn any thing a contrary way." The analogy of this term, and its ufe in mufic, will appear more obvious from the fequel

It fignifies a change in the order of the notes which form a chord, or in the parts which compofe harmony: which happens by fubftituting in the bafs, thofe found which ought to have been in the upper part: an operation not only rendered practicable, but greatly facilitated, by the refemblance which one note has to another in different octaves; whence we derive the power of exchanging one octave for another with fo much propriety and fuccefs, or by fubltituting in the extremes thofe which ought to have occupied the middle flation; and vice verfa.

It is certain, that in every chord there mult be a fundamental and natural order, which is the fame with that of its generation: but the circumflances of fucceffion, tafte, exprefion, the beauty of melody, and variety, the approximation of harmony, frequeritly oblige the compofer to change that order by inverting the chords, and of confequence the difpofition of the parts.

As three thing may be arranged in fix different orders, and four things in twenty-four; it would feem at firlt, that a perfect chord fhould be fufceptible of fix inverfions, and a diffonant chord of twenty four ; fince one is compofed of four and the other of three founds, and fince inverfion confifts only in a tranfpofition of octaves. But it muft be ohferved, that in harmony all the different difpofitions of acuter founds are not reekoned as inverfions, whilf the fame founds remain in the lower parts. Thus, thefe two orders of the perfect chord ut mi fol, or CEG, and $u t$ fol mi, or CGE, are only taken for the fame inverfion, and only bear the fame name: this reduces the whole of inverfions of which a perfect chord is fufceptible to three that is to fay, to as many inverfions as the chord contains different founds: for the replications of the fame found are lere reekoned as nothing.

Every time, therefore, when the fundamental bals is heard in the lowelt parts, or if the fundamental bafs be retrenched, every time when the natural order is preferved in the ehords, the harmony is direct. As foon as that order is changed, or as foon as the fundamental founds, without being in the lower parts, are heard in fome of the others, the harmony is inverted. It is an inverfion of the chord, when the fundamental
found

INVESTITURE, in law, a giving livery of feifin inveftiture or poffeffion. There was ancier.tly a great variety of " 1 invertion,
ceremonies ufed upon inveftitures; as at firlt they were made by a certain form of words, and afterwards by fuch things as had the greateft refemblance to the thing to be transferred: thus, where lands were intended to pafs, a turf, \&c. was delivered by the granter to the grantee. In the church, it was cuftomary for princes to make invertiture of ecclefiattical benefices, by delivering to the perfon they had chofen a patoral flaft and a ring.
inula, elecampane: A genus of the polygamia fuperflua order, belonging to the fyngenefia clafs of plants; and in the natural method ranking under the 49 th order, Compofitc. The receptacle is naked; the pappus fimple; the anthere, at the bafe, ending in two brifles. There are 22 fpecies, of which the helenium, or common elecampane, is the moft remarkable. It is a native of Britain ; but is cultivated in gardens for the fake of the root, which is ufed in medicine. The root is perennial, thick, branching, and of a flrong odour. The lower leaves are eight or nine inches long, and four broad in the middle, rough on their upper fide, but downy on the under fide. The falks rife about four feet high, and divide toward the top into feveral fmaller branches, garnifhed with oblong oval leaves indented on their edges, ending in acute points. Each branch is crowned with ooe large yellow radiated flow. er, fucceeded by narrow four-cornered feeds, covered with down. It may be propagated in autumn by feeds or offsets.

Medicinal Ufes, \&c. The root of elecampane, eefpecially when dry, has an agreeable aromatic fmell ; its talte, on chewisg, is gluminous, and as it were fomewhat rancid; in a little time it difcovers an aromatic bitternefs, which by degrees becomes confiderably acrid and pungent. It polfefes the general virtues of alexipharmacs; and is principally recommended for promoting expectoration in bumoral afthmas and coughs. Liberally taken, it is faid to excite urine, and to loofen the belly. In flome parts of Germany, large quantities of this root are candied, and ufed as a Itomachic for ftrengthening the tone of the vifcera in general, and for attenuating tenacious juices. Spirituous liquors extract its virtues in greater perfection than watery ones. The former fcarce elevate any thing in diftillation : with the latter an effential oil arifes, which concretes into white flakes; this poffeffes at firt the flavour of the elecampane, but is very apt to loofe it in keeping. Outwardly applied, a decoction of it is faid to cure the itch. The root bruifed and macerated in urine with balls of a fhes and whorle-berries, dyes a blue colour.

INUNDATE, the name of the $15^{\text {th }}$ order in Linneus's fragments of a natural method; confining of plants which grow in the water. See Borany, p. 460 .

INLNDATICN, a fudden overflowing of the dry land by the waters of the ocean, rivers, lakes, fprings, or rains.

INVOCATION, in thenlogy, the ast of adoring God, and efpecially of addrefling him in prayer for this affitance add protection. See the articles Adozation and Prayer.
The difference between the invocation of God and O。

## I N V [290 ] J O A

Invocation of the faints, as practifed by the Papifs, is thus explained in the catechiim of the council of Trent. "We beg of God, (fays the catechifm, to give us good things, and to deliver us from evil ; but we pray to the faints, to intercede with God and obtain thofe things which we fland in need of. Hence we ufe different forms in praying to God and to the faints: to the former we Cay, bear us, bave mercy on us; to the latter we only fay, pray for us." The council of Trent exprefsly teaches, that the faints who reign with Jefus Clirill offer up their prayers to God for men: and condemn thofe who maintain the conerary doctrine. The Proteflants reject and cenfure this practice as contrary to fcripture, deny the truth of the fact, and think it highly unceafonable to fuppofe that a limited finite being fisuld be in a manner omni. prefent, and at one and the fame time hear and attend to the prayers that are offerd to him in England, China, and Peru; and from thence infer, that if the faints cannot hear their requelts, it is inconfiftent with common fenfe to addrefs any kind of prayer to them.

Invocation, in poetry, an addrefs at the beginning of a poem, wherein the poet calls for the affifance of fome divinity, particularly of his mufe, or the deity of poetry.

INVOICE, an account in writing of the particulars of merchandife, with their value, cuffom, charges, \&c. tranfmitted by one merchant to another in a diflant country.

INVOLUCRUM, among botanifts, exprefles that fort of cup which furrounds a number of dowers together, every one of which has befide this general cup its own particular perianthium. The involucrum confills of a multitude of little leaves difpofed in a radiated manner. See Calyx.

INVOLUTION, in algebra, the raifing any quantity from its root to any height or power affigned. See Algebra.

IO, (fab. hift.) daughter of Inachus, or according to others of Jafus or Pirenc, was prieftefs of Juno at Argos. Jupiter became enamoured of her; but Juno, jealous of his intrigues, difcovered the object of his affection, and furprifed him in the company of Io. Jupiter changed his millrefs into a beautiful heifer; and the goddefs, who well knew the fraud, ohtained from her hufband the animal whofe beauty the had condefcended to commend. Juno commanded the hundred eyed Argus to watch the heifer; but Jupiter, anxious for the fituation of Io, fent Mercury to deftroy Argns, and to reftore her toliberty. Io, freed from the vigilance of Argus, was now perfecuted by Juno, who fent one of the Furies to torment her. She wandered over the greateft part of the earth and croffed over the fea, till at laft the fopped on the banks of the Nile, ftill expofed to the unceafing torments of the Fury. Here the entreated Jupiter to reflore her to her natural form; and when the god lad changed her from a heifer into a woman, the brought forth Epaphus. Afterwards fhe married Telegonus king of Egypt, or Ofris according to otbers; and the treated her fubjects with fuch mildnefs and humanity, that after death the received divine honours, and was worthipped under the name of Ifis. According to Herodotus, Io was carried away
by Phœnician merchants, who wifhed to make reprifals for Europa who had been flolen from them by the Greeks.

JOAB, general of the army of king David, defeated the Syrians and the other enemies of David, and took the fort of Zion from the Jebufites, who, thinking it impregnable, committed it to the care of the larme and blind, whom they placed on the walls. He fignalized himfelf in all Davil's wars, but was guiity of bafely murdering Abner and Amala. He procured a reconciliation between Abfalom and David; and afterwards flew Abfalom, contrary ta the exprefs orders of the king. He at length joined Adonijah's party; and was put to death by the order of Solomon, 1014 B. C.

JOACHIMITES, in church hiftory, the difciples of Joachim a Ciftertian monk, who was an abbot of Flura in Calabria, and a great pretender to infpiration.

The Joachimites were particularly fond of certair ternaries: The Father, they faid, operated from the beginning till the coming of the Son; the Son, from that time to theirs, which was the year 1260 ; and from that time the Holy Spirit was to operate in his turn. They alfo divided every thing relating to men, to doctrine, and the manner of living, into three claffes, according to the three perfons in the Trinity: The fift ternary was that of men; of whom the firft clafs was tbat of married men, which had lafted during the whole period of the Father: the fccond was that of clerks, which had latled during the time of the S in; and the laft was that of the monks, in which there was to be an uncommon effufion of grace by the Holy Spirit: The fecond ternary was that of doetrine, viz. the Old Teitament, the New, and the everlalting Gofpel ; the firft they afcribed to the Father, the fecond to the Son, and the third to the Holy Spirit: A third ternary confifted in the manner of living, viz. un. der the Father, men lived according to the flefh; un der the Son, they lived according to the flefl and the fpirit; and under the Holy Ghoft, they were to live according to the fpirit only.

JOAN (Pope), called by Platina Fobn VIII. is faid to have held the holy fee between Leo IV. who died in 855, and Benedict III. who died in 858 . Marianus Scotus fays, fhe fat two years five months and four days. Numberlefs have been the controverfics, fables, and conjectures, relating to this pope. It is faid that a German gifl, pretending to be a mang. went to Athens, where the made great progrefs in the fciences ; and afterward came to Rome in the fame habit. As fhe had a quick genius, and fpoke with a good grace in the public difputations and lectures, her great learning was admired, and every one loved her extremely; fo that after the death of Leo, the was chofen pope, and performed all offices as fuch. Whilit the was in poffeffion of this high dignity, he was got with child; and as the was going in a folemn procerfion to the Lateran church, the was delivered of thatchild, between the Colifeum and St Clement's church, in a moft public flteet, before a crowd of people, and dicd on the fpot, in 857. By way of embellifing this flory, may be added the precaution reported to have been afterward taken to aroid fuch another acci-
dent.
dent. After the election of a pope, he was placed on a chair with an open feat, called the groping chair, when a deacon came mof devoutly behind and fatiffied himfelf of the pontiff's fex by feeling. This precantion, however, has been long deemed unneceffary, becaufe the cardiuals now always get baftards enough to eltablifh their vitility before they arrive at the pontificate.

Foan d'Arc, or the Maid of Orleans, whole heroic belraviour in reanimating the expiring valour of the French nation, though by the moft fupertitious means, (pretending to be infpired), deferved a better fate. She was burnt by the Englifh as a forcerefs in 1421, aged 24. See France, no 101.

JOANNA (St), one of the Comora inlands in the Indian ocean, E. Long. 44-15. S Lat. 12. 30. The north fide fhoots out into two points, 26 miles afunder, between whieh there is a great bay. This ifland is a proper place of refrefhment for the Eaft India Thips, whofe ertws, when ill of the feurvy, foon recover by the ufe of limes, lemons, and oranges, and from the air of the land. The town where the king refides is at the eaft fide of the ifland ; and though it is three quarters of a mile in length, it does not contain above 200 houfes. Their principal houfes are buile with ftone, with a quadrangle in the middle, and are only one fory ligh. All the other houfes, or rather huts, are nightly compofed of plaftered reeds; and yet the mofques are tolerable ftructures, very neat and clean in the infide. The horned eattle are a kind of buffaloes, lhaving a large hump on their fhoulders, whieh is very delicious eating; but there is not one horfe, mule, nor afs, in all the ifland.-The original natives, in number about $70^{\circ} \mathrm{o}$, occupy the hills, and are generally at war with the Arabian interlopers, who ettablifhed themfelves on the fea coaft by conqueft, and are about $30 c 0$ in number. Thefe latter are defcribed by an anonymous letter-writer * as poor miferable beings, who not being able to carry on any extenfive degree of cultivation, on aecount of their being expofed to the depredations of the mountaineer natives, fulfilt chiefly by fupplying the India hhips who touch there for refrefhment with a few cattle and tropical fruits. According to the fame writer, the deferiptic $s$ of this inland and its inhabitants by the Abbé Raynal and Major Rooke, are not only exagyerated but errontous; neither the country being fo picturefque in beautiful landfeapes as the former defceibes it, nor the inhabitants meriting the refpectable character given of them by the latter. As we are not, however, competent to decide in this matter, we fhall fubjoin the entertaining account given by the Major.
" Though Joanna is not the largeft, yet it may be reckoned the prineipal of the Comora Inands; it claims fovereignty over, and exacts tribute from, all the others: thefe pretenfions it is however fometimes ohliged to affert by the fword, and at prefent meditates an expedition againft Mayotta, which is in a flate of rebellion: The natives on being afked the caufe of their war with that people, reply, "Mayotta like America." They get their fupplies of arms and ammunition from fhips that tonch here; and the arrival of fo large a flet as the prefent will prove very feafonable to them, as it is cuftomary for all to make prefeats of arms and powder to the prince when he
pays a vifit on board, which he does to every one. A falute is the compliment due on that occafion; but as our guns are flotted, an apology is made for the omiffion of that ceremony, and the prince readily admits of it, provided he receives a number of cartridges equal to the guns that would have been fired.
" The king lives at a town about I 2 miles off on the eaft fide of the ifland : two princes of the blood refide here ; who on going their round of vifits fail not to alk for every thing they fee which Itrikes their fancy; and of courfe the honour of making a prefent to a prince, induces one at firlt readily to grant what they requeft : but no fooner is that done than they make frefh applications, till we are reduced to the rude neceffity of putting the negative on molt of them. Thele great ${ }^{*}$ perfonages are very richly dreffed and attended by a numerous fuite of flaves, who, like their princely ma. fters, are much ftruck with the objects they fee, but ufe lefs ceremony in their manner of obtaining them. Thefe black princes (for that is the complexion of them and all the inhabitants) have by fome means or other obtained the titles of Prince of Wales and Prince Will : the former has probably been called fo by fome jocole Englifhmen as being the heir apparent, and the natives have adopted the term, not the only one they borrow from us. They have an officer flyled Purfer Jack, who feems to be at the head of the financedepartment. Of dukes they have a prodigious number, who entertain us at their hotels for a dollar per day, and give us for dinner very good rice and curry. Thefe noblemen, together with a numerous tribe of others of all ranks, make the earlielt application to every one to folicit the honour of his company and cuftom ; even before the hip has let go its anchor, they comt along fide in their canoes, and produce written certificates of their honefty and abilities from thofe who liae been here before: the purport of which is to inform you that the bearer has given them good eheer, wafh. ed thrir linen well, and fupplied their fhip punctually with all forts of refrethments.
"The effect is Atriking and fingular on entering the road to fee a valt number of eanoes, which are made of trunks of trees hollowed out, with three or four black fellows in each, their faces turned towards the front of the canoe, with paddles formed like a fpade, digging away in the water, and moving with no fmall velocity". To keep thefe cockle fhells fteady, and prevent them from overfetting, they have what is termed an outrigger: it is compofed of two poles laid aerofs the upper part of the eanoe, and extending feveral feet beyond the edges thereof on each lide, joined at the extremitits by two flat pieces of woud, fo that it appears like a fquare fiame laid acrofs the eanoe: they are very long, but fo narrow that one perfon can only fit breadthways.
" The price of every artiele here is regulated; and each thip has its contractor who engages to fupply it with neceffaries at the eftablifhed rate.
" We find no other animals fur our fea provifions but bullocks, guats. and fuwls: the feafon fur oranges is palt, but we get mof other tropical fruits; and whatever ue want, have only to give in a lat to a duke, and he provides us therewith. This, it will be thought, is a new character for a duke to appear in, and fuch it ferms to be; but it is in fact only owing to the mode : they

Joanna, are their own ftewards, and difoofe of the produce of their eftates themfelves, which noblemen of other countries do by the intermediate aid of an agent: they at lealt act confifently with their characters by an urbanity of manners, which one is furprifed to mect with in a people in.habiting a fmall fpot feeluded from the relt of the civilized world. They have a regular form of government, and exercife the Mahometan religion: buth were introduced by Arabians who paffed over from the continent and fubdued the country. The orizinal Juanna natives are by no means thoroughly reconciled to shis ufurpation, and fill look upon their conquerors with an evil tye. Like their fentiments, fo are the culours of thefe two races of men very different: the Arabs have not fo deep a tinge as the others, being of a copper complexion with better features and a more animated countenance. They confider a black freak under the eyes as ornamental; and this they make every day at their toilettes with a painting brufh dipt in a kind of ointment. The cuftom of ehewing the betel nut prevails greatly here, as in molt of the Eallern countries; and anfsers to the fahtion of fmoking cobacco or taking fnulf with us, except that with them it is nore general. No one is without a purfe or bag of betel; and it is louked on as a piece of civility to offer it to your friend when you meet hin or take leave. See the articles Areca and Betel.
"Their religun licenfes a plurality of wives and likewife enncubines. They are extremely jealous of them, and never dllow any man to fee the women: but female flrangers are adinitted into the haram; and fome Englifh ladies, whofe curiofity has led them there, make favou:rable reports of their beauty, and richnefs of apparel difplayed in a profution of ornaments of gold, filver, and beads, in form of neeklaces, bracelets, and ear-rings; they wear half a dozen or more in eacla through holes bored all along the outer rim of the ear.
"The men feem not to look with an eyc of indif. ference on our fair countrywomen notwithftanding they are of fo different a complesion. One of the firft rank among them being much fmitten with an Englifi young lady, wifhed to make a parchafe of 1. $r$ at the price of 5000 dollars; but on being in. formed that the lady would feteh at leaft 20 times that fum in India, he lamented that her value was fo , far fuperior to what he could afford to give.
" Thefe people are very temperate and abftemious, wine being forbidden them by the law of Mahom. med. They are frequent in prayer, attending their mofques three or four times a-day. We are allowed to enter them on condition of taking off our fhoes. Thefe buildings are regular, but quite plain. In prayer the people proffrate themfelves on the ground, frequently kiffing it and expreffing very fervent devotion.
" Joanna town is clofe to the fra, fituated at the foot of a very high lill, and about a mile and a half in circuit. The hovifes are inclofed either with high tone walls or palings made with a kind of reed; and the itreets are litte narrow alleys, extremely intricate and forming a perfect labyrinth. The better kind of houfes are built of fone wi:hin a court-yard, have a portico to quicld them from the fun, and one long lofty room where they receive guelts, the other apartinents being facred to the wonen. The lides of their rooms are covered
with a number of finall mirrors, bits of china ivare, and other little ornaments that they procure from fhips which come here to refreth: the mot fuperb of them are furnifhed with cane foplas covered with chintz and fattin mattreffes. Mort of the people fpeak a little Englifh : they profet's a particular reyard for our nation, and are very fond of repeating to you, that "Joanna-man and Englilh-man all brothers;" and never fail to afk " how King George do?" In general they appear to be a courteous and well difpofed people, and very fair and honslt in their dealings, though there are amongtt them, as in all other nations, fome vicioufly inclined; and theft is much practifed by the lower elafs, notwithftanding the punithment of it is very exemplary, being amputation of both hands of the delinquent.
" The inhahitants of this ifland, like thofe of mont lot and tropical countries, are indolent, and do not improve by their labour the richnefs of that foil with which uature has bleffed then. Climate here favours vegetation to fuch a degree as requires little toil in the hußbandman; but that litte is denied: fo that beyond oranges, bananas, pine-apples, coeoa nuts, yams, and purflain (all growing fpontaneouly), few regerables are met with. Nor are the natural beantirs of the ifland inferior to its other advantages of plenty and fertility; the face of the country is very pictureique and pleating, its fcenes being drawn by the bold Itrokes of Nature's malterly pencil: lofty mountains clothed to their very fumnits, deep and rugged valleys adorned by frequent cataracis, cafcades, woods, rocks, and rivulets, intermixed in "gay theatric pride," form the landfcape. Groves are feen extending over the plains to the very edge of the fea, formed principally by the cocoa-nut trees, whofe long and naked fiens leave a clear uninterrupted paffage beneath; while their tufted and overfpreadinц tops form a hlick fhade above, and keep off the feorching rays of the fun. In thefe we pitch our tents and enjoy a flort relief from the ennui of a tedious voyage.
"In the interior part of the ifand, furrounded by mountains of a prodigious height, and about 15 niles from this town, is fituated a faercd lake balf a mile in circumference. The adjacent hills covered with lofty trees, and the unfrequented folitude of the place, feem more calculated to infpire religious awe in thofe who vifit this fequeflered fpot, than any fanctity that is to be difeovered in a parcel of wild ducks inhabiting it, which are deified and wormipped by the orizinal natives, who confult them as their oracles on all importamt affairs, and facrifice to them. Being extremely averfe to conduct Atrangers there, they ttipulate that all guns flall be left at a place five milts from the lake. The worfhip paid to thefe birds enfures their fafety and tranquillity; and rendering them of courfe perfectly tame, they fearlefsly approach any one who goes there. The Arabian part of the iflanders hold this barbarous fuperlition in the utmof deteflation; but dare not forbil the practice of it, fo bigotted to it are the others."

JOB, or Book of 70 , a canonical book of the Old Tetlament, containing a narrative of a feries of miffortunes which happened to a man whofe name was Yob, as a trial of his virtue and patience; together with the conferences he had with his cruel friends on

$\qquad$

$\qquad$

the
the fubject of nis misfortunes, and the manner in which he was reftored to eafe and happinefs. This book is filled with thofe noble, bold, and figurative exprefions, which conflitute the very foul of peciry.

Many of the Jewifh rabbine ; retend that this relation is altogether a fiction: others think it a fimple narrative of a matter of fact juft as it happened: while a third fort of critics acknowladge, that the groundwork of the thory is trut, but that it is wrote in a potical itrain. and decorated with peculiar circumftances, to render the ndrration more profitable and entertaining.

The time is not fet down in which Joblived. Some have thought that he was much ancienter than Mofes, becaufe the law is never cited hy Job or his friends, and becaufe it is related that $J$ ob himielf offered facrifices. Sume imagine that this book was wrote by himfelf; others fay, that Job wrote it originally in Syriac or Arabic, and that Mofes tranflated it into Hisbew: but the rabbins generally pronounce Mofes to be the author of it; and many Chrilian writers are of the fame opiaion.

JOBBER, a purfon who undertakes $j$ bs, or fmall pieces of work.

In fome flatutes, johber is ufed for a perfon who buys and fells for others. See Broker.

JOBBING, the hufinefs of a jobher.
Stock- Fobbing, denotes the practice of trafficking in the public funds, or of buying and felling llock with a siew to its rife or fell. The term is commonly applied to the illegal practice of buying and felling fock for tine, or of accounting for the differences in the rife or fall of any partrcular flock for a flipulated time, whether the buyer or feller be poffeffed of any fuch rea! fock or not. Sce Stuck Broker.

JOBERT (Lewis), a pious and learned Jefuit, born at Paris in $16+7$. He difinguinted himfelf as a preacher; and befides feveral other tracts wrote a treatife entitled La Science des Medailles, which is in good efterm. He died in 1719 ; and the beft edi. tion of this work is that of Paris in 1739, 2 vols 12 mo.

JOCASTA, (fab. hilt.) a daughter uf Menœceus, who married Laius king of Thebes, by whom the had Cdipus. She afterwards married her fon CEdipus, without knowing who he was, and had by him $E$. tencles, Polynices, \&c. When fle difcovered that the had married her own fon and been guilty of inceft, the hanged herfelf in defpair. She is called Esicegaty fome mythologits.

JOCKEI, in the management of horfes; the perfon who trims up, and rides abont horfes for fale.

JODE (Petet de), an engraver of fome note, was a native of Antwerp. He received his firf inftruc. tions in the art of cngraving from Henry Goltzius; and afterwards went to Italy, in order to complete his fudies from the works of the great mafters. He engraved feveral plates in that country from different painters; and returned to Antwerp about the year 1601, where he refided till the time of his death, which happened A. D. 1634 . His works are very numerous, and puffefs a confiderable fiare of merit.

JIODE (Peter de, the younger), was fon to the former, and born in 1606 . From his father be learned
the art of engraving, and furpafed him in tafte and the facility of handling the graver; though he can fearcely be faid to have equalled him in correctnefs of drawing, efpecially when confined to the naked parts of the human figure. It does not appear cisut he wert to ltaly; but he accompanied his father to I'aris, where they engraved conjointly a conliderable number of plates for M. Bonefant, and Le Sieur I'lmago. His molt capital performances are froni Rubens and Vandyck. Bafall fays of him, that in Feveral of his engravings he has " equalled the beft engravirs, and in others lie has funk below himfelf." The time of his death is not known. He left a fon, Arunld, who was alfo an engraver, but of very inferior merit.
JODELLE (Stephen), lord of Linodin, was boru at Paris in 1532; and ditinguifed himelf fo greaty by his poetical talents, that he was reckoned une of the Pleiades celebrated by Ronfard. He is faid to be the firft Frenchman who wrote plays in his own language according to the ancient form. He was remark. ably ready at compofition, writing without fudy or labour; and was well fkilled in polite arts and genteel exercifes. In his younger years he embraced the reformed religion, and wrote a fatire on the mafo in 100 Latin verles; yet all of a fudden retorned to that mals again. He died in 1579, very poor.

JOEL, or the Praphecy of foex, a canonical book of the O.d Tiltament. Joel was the fon of Pethut. cl , and the fecond of the twellve leffer prophets. The Hyle of this prophet is figurative, ftrong, and ex. preflive. He upbraids the 1 frathites fur their idolatry, and foretels the calamities they fhonld fuffer as the panithment of that fin: but he endeavours to fuppurt them with the comfort that their miferies fhould have an end upon their reformation and repentance. Some writers, inferring the order of time in which the mi: nor prophets lived from the order in which they are placed in the Hebrew copies, conclude-that Joel prophelied before Amos, who was contemporary with Uz. ziah, king of Judah. Aichbifnop UPher makes this inference fiom Joel's foretelling that drought, chap. $i$. which Amos mentions as having happened, chap. iv. 7. 8,9. If we collides the main delign of Jocl's "prophecy, we fhall be apt to conclude, that it was uttered afier the captivity of the ten tribes; for he directs. his difcourfe on'y to Judah, and fpeaks ditinctly of the factifices and oblations that were daily made in the trmple.

JOGHIS, a fes of heathen religious in the Eaft In. dies, who never marry, nor hold any thing in private property; but live on alens, and practife Atrange feverities on themfolves.

They are fubject to a general, who fends them from one country to anuther to preach. They are, properly, a kind of penitent pilgrims ; and are fuppofed to be a branch of the ancient Gymuofophilts.

They frequent, principally, fuch places as are con. fecrated by the devotion of the people, and pietend to live feveral days together without eating or driuk. ing. After having goae through a courfe of difcipline for a certain time, they look on themfelves as impec. cable, and privileged to do any thing; upon which they give a loofe to their prafions, and run into all manner of dehauchery.

JOGUES, or Yoocs, certain ages, æras, or periods, of extraordinary length, in the clironology of the Hindoos. They are four in number; of which the following is an account, cxtracted from Halhed's Preface to the Code of Genton Laws, p. xxxvi.

1. The Suttee Yogue (or age of purity) is faid to have lafted three million two hundred thoufand years; and they hold that the life of man was extended in that age to one hmidred thoufand years, and that his thature was $t$ wenty-one cubits.
2. The Tirtab Fogue (in which one third of mankind was corrupted) they fuppofe to have confifted of two million four huudred thoufand years, and that men lived to the age of ten thoufand years.
3. The Dwapaar Yogue (in which half of the human race became depraved) endured onc million fix hundred thoufand years, and the life of man was then reduced to a thoufand years.
4. The Collee Yogue (in which all mankind are corsupted, or rather lefifened, for that is the true meaning of Collce) is the prefent æra, which they fuppofe ordained to fubfift four hundred thoufand years, of which near five thoufand are already palt; and the life of man in that period is limited to one hundred years.

Concerning the Iudian chronology, we have already had occafion to be pretty copious; fee Hindoos, $\mathrm{n}^{\circ} 19,22$. We fhall here, however, fubjoin Dr Robertfon's obfervations on the above periods, from the Notes to his Hillorical Difquiftion concerning India.
" If (fays he $\dagger$ ) we fuppofe the computation of time in the Indian chronology to be made by folar or even by lunar years, nothing can be more extrava. gant in itfelf, or more repugnant to our mode of calculating the duration of the world, founded on facred and infallible authority. From one circumflance, however, which merits attention, we may conclude, that the information which we have hitherto received concerning the chronology of the Hindoos is very incorrect. We have, as far as I know, only five original accounts of the different Jogues or xras of the Hindoos. The firft is given by M. Roger, who received it from the Brahmins on the Coromandel coaft. According to it, the Suttee Jogue is a period of one million feven hundred and twenty-eight thoufand years; the Tirtah Jogue is one million two hundred and ninety-fix thoufand years; the Dwapaar Jogue is eight hundred and fixty-four thoufand. The duration of the Collee Jogue he does not fpecify; (Porte Ouverte, p. 179.) The next is that of M Bernier, who received it from the Brahmins of Benares. According to him, the duration of the Suttee Jogue was two million five hundred thoufand years ; that of the Tirtah Jogue one million two hundred thoufand years; that of the Dwapaar Jogue is eight hundred and fix-ty-four thouland years. Concerning the period of the Collee Jogue, he likewife is filent; (Voyages, tom. ii. p. 160.) The third is that of Colonel Dow; according to which the Suttee Jogue is a period of fourteen million of years, the Tirtah Jogue one millinn cighty thoufand, the Dwapaar Jogue feventy-two thoufand, and the Collee Jogue thirty-fix thoufand years ; (Hije of Hindof. vol. i. p. 2.) The fourth account is that of M. Le Gentil, who received it from the Brahmins of the Coromandel coaft; and as his information was acquired in the fame part of India, and
derived from the fame fource with that of M. Roger, it agrees with his in every particular. (Mcin. de $b$ ' Aca. dem. des Scientes pour 1772, tom. ii. part i. p. 176.) The fifth is the account of Mr Hallhed, which has beerı already given. From this difcrepancy, not only of the total numbers, but of many of the articles in the different accounts, it is manifeft that our information concerning Indian chronology is hitherto as uncertain as the whole fyltem of it is wild and fabulous. To me it appears highly probable, that when we underftand more thoroughly the principles upon which the factitions reras or jogues of the Hindoos have been formed, that we may be more able to teconcile their chronology to the true mode of computing time, founded on the authority of the Old Teftament; and may likewife find reafon to conclude, that the account given by their aftronomers of the fituation of the heavenly bodies at the beginning of the Collee Jogue, is not eftablifhed by aciual obfervation, but the refult of a retrofpetive calculation."

JOHN (St), the Baptist, the fore-runner of Jefus Chrit, was the fon of Zacharias and Elizabeth. He retired into a defart, where he lived on locults and wild honey; and about the year 29 began to preach repentance, and to declare the coming of the Mefliah. He baptized his difciples, and the following year Chrift himfelf was baptized by him in the river Jordan. Some tine after, having reproved Herod Antipas, who had a criminal correfpondence with Herodias his brother Philip's wife, he was calt into prifon, where he was beheaded. His head was brought to Herodias; who, according to St Jerome, pierced his tongue with the bodkin fhe ufed to faften up her hair, to revenge herfelf after his death for the freedom of his reproofs.

John (St), the apofte, or the evangelift, was the brother of St James the Great, and the fon of Zebedee. He quited the bulinefs of fifhing to follow Jefus, and was his beloved difciple. He was witnefs to the actions and miracles of his Malker ; was prefent at his transfiguration on mount Tabor; and was with him in the garden of Olives He was the only apotte who followed him to the crofs; and to him Jefus left the care of his mother. He was alf, the firft apoftle who knew him again after his refurrection. He preached the faith in Afia; and principally refided at Ephefus, where he maintained the mother of our Lord. He is faid to have founded the churches of Smyrna, Pergamus, Thyatira, Sardis, Philadelphia, and Laodices. He is allo faid to have preached the gofpel amonrft the Parthians, and to have addrefled his firft epifte to that people. It is related, that, when at Rome, the emperor Domitian caufed him to be thrown into a caldron of boiling oil, when he came out unhurt; on which he was banifhed to the ifle of Patmos, where he wrote his Apocalypfe. After the death of Domitian, he returned to Ephefus, where he compofed his Gofpel, about the year 96; and died there, in the reign of Trajan, about the year 100, aged 94 .

Gofpel of St Joнn, a canonical book of the New Teftament, cuntaining a recital of the life, actions, ductrine, and death, of our Saviour Jefus Chrilt, written by St John the apofte and evangelit.

St John wrote his Gofpel at Ephefus, after his re-
ohn. turn from the ifle of Patmos, at the defire of the Chriftians of AGa. St Jerome fays, he would not undertake it, but on condition that they fhould appoint a public faft 10 implore the affiflance of God; and that, the fat being ended, St John, tilled with the Holy Ghoft, broke out into thefe words, "In the beginning was the Word," \&c. The ancients affign two reafons for this undertaking : the firlt is, becaule, in the other three Gofpels, there was wanting the hiltory of the heginning of Jefus Chrilt's preaching, till the impifonment of John the Baptif, which therefore he applied himfelf particularly to relate. The fecond reafon was, in order to remove the errors of the Corinthians, Ebionites, and other fects. But Mr Lampe and Dr Lardner have urged feveral reafons to thow that St Joha did not write againll Cerinthus or any other heretics in his Gofpel.
Revelation of St Fohn. See Apocalypse.
Forn of Salifbury, bifhop of Chartres in France, was born at Salifurry in Wilthire, in the beginning of the 12 th century. Where he imbibed the rudiments of his education, is unknown ; but we learn, that in the year 1136 , being then a youth, he was fent to Paris, where he fludied under feveral eminent profeffors, and acquired corifiderable fame for his application and proficiency in rhetoric, poctry, divinity, and particularly in the learned languages. Thence he travelled to Italy: and, during his refidence at Rome, was in high favour with pope Eugenio III. and his fucceffor Adrian IV. After his return to England, he became the intimate friend and companion of the fanous Thomas Becket, archbihhop of Canterbury, whom he attended in his exile, and is faid to have been prefent when that haughty prelate was murdered in his cathedral. What preferment he had in the church during this time, does not appear ; but in 1176 he was promoted by king Henry 11. to the bifhopric of Chartres in France, where he died in 1182. This John of Salitibury was really a phenomenon. He was one of the firft reftorers of the Greek and Latin languakes in Europe; a claffical fcholar, a philofopher, a learned divine, and an elegant Latin priet. Hc wrote feveral books; the principal of which are, his Life of St Thomas of Canterbury, a collection of letters, and Polycraticon.
Pоре Yoнn XXII. a native of Cahors, beforc called Yames di'Eufe, was well fkilled in the civil and canon law ; and was elected pope after the death of Clement V . on the 7 th of Auguit 1316. He publifhed the con. fitutions called Clementines, which were made by his predeceffor; and drew up the other conftitutions called Extravaragantes. Lewis of Bavaria being elected em . peror, John XXII. oppofed him in favour of his competitor; which made much noife, and was attended with fatal confequences. That prince, in 1329 , cauled the antipope Peter de Corbicro, a cordelicr, to be elected, who took the name of Nicholas V . and was fupported by Michael de Cefenne, general of his order; but that antipope was the following year taken and carried to Avignon, where he begged pardon of the pope with a rope about his neck, and died in prifon two or three years afier. Under this pope arofe the famous queltion among the cordeliers, called the bread of the cordeliers; which was, Whether thofe
monks had the property of the things given them, at the time they were making ufe of them? for example, Whether the bread belonged to them when they were eating it. or to the pope, or to the Roman church ? This frivolous queftion gave geat employment to the pope; as well as thole which turned upon the colour, form, and AuIT, of their habits, whether they ought to be white, grey, or black; whether the conl ought to be pointed or round, large or fmall; whether their robes ought to he fill, fhort, or long; of cluth, or of ferge, \&c. The difputes on all thele minute trifles were carried fo far between the minor brothers, that fome of them were burned upon the occafion. He died at Avignon in 1334, aged 90.

John, king of England. See Engiand, no 135, 1470 7ohn of Forcloun. See Fordoun.
Foun of Gaunt, duke of Lancalter, a renowaed - general, father of Henry IV. king of England, died in $143^{8}$.

Forn of Leyden, otherwife called Buccold. See Avabaptists.

Foun Sobiefi of Poland, one of the greateft warrious in the 17 th century, was, in 1665 , made grandmarfhal of the crown; and, in 1667, grand-general of the kingdom. His victories obtained over the Tartars and the Turks procured him the crown, to which he was elected in 1674 . He was an encourager of arts and fciences, and the protector of learned men. He died in $1 \% 96$, aged 72 .

St Tonn's Day, the name of two Chriftian fettivals; one obferved on June 24 th, kept in commemoration of the wonderful circumftances attending the birth of John the Butift ; and the other on December 27thp: in honour of $S t$ John the evangelit.

St John's Wort. See Hypericum.
Joнs's (St), an ifland of the Eaft-Indies, and one of the Philippines, ealt of Mindanayo, from which it is feparated by a narrow itrait. E. Long. 125.25 N. Lat. 7. o.

John's (St), an ifland of North-America, in the bay of St Lawrence, having New-Scotland on the fouth and weit, and Cape Breton on the eaft. The Britifh got poffeflion of it when Louifbourg was furrendered to them, on July 26, 1758.

JOHNSON (BEN), one of the moft confiderable dramatic poets of the latt age, whether we confider the number or the merit of his productions. He was. burn at Wettmintter in 1574, and was educated at the public fchool there under the great Camden. He was defcerded from a Scottifh family; and his father, who loft his eftate ander Queen Mary, dying before our poet was born, and his mother marrying a bricklayer for her fecond hufband, Ben was taken from. fchool to work at his father-in law's trade. Not being captivated with this employment, he went into the Low Countries, and dittinguithed himfelf in a milio. tary capacity. On his return to England, he entered himfelf at St John's college, Cambridge; and having, killed a perfon in a duel, was condemned, and narrowly efcaped execution. After this he turned actor; and Suakefpeare is laid to have firt introduced him to the worid, by recommending a play of his to the ftage, after it had been rejected. His Alchymitt gained him: fuch reputation, that in 1619 he was, at the death of:

# $\mathrm{J} \mathrm{O} \mathrm{H} \quad\left[\begin{array}{lll}296\end{array}\right] \quad \mathrm{J} O \mathrm{H}$ 

Johifor. Mr Danicl, made poet-laureat to King James I.and mafter of arts at Oxford. As we do not find Johnfon's œconomical virtues any where recorded, it is the lefs to be wondered at, that after this we find him petitioning king Charles, on his acceffion, to enlarge his father's allowance of 100 merks into pounds; and quickly after we learn, that he was very poor and fiek, lodging in an obfcure alley : on which occafion it was, that Charles, being prevailed on in his favour, fent him ten guineas; which Bea receiving, faid, "His majelty has fent me ten guineas, becaufe I am poor and live in an alley ; go and tell him, that his fonl lives in an alley." He died in Auguit $1 \sigma_{37}$, aged $\sigma_{3}$ years, and was buried in Weftminitter-Abbey.- The moft complete edition of his works was printed in 1756, in 7 vels 8vo.
Johnson (Samuel), an Englifh divine, remarkable for his karning, and Iteadinefs in fuffering for the principles of the revolution in 1688. He was born in 1649 ; and, entering into orders, obtained in 1670 the rectory of Corringham in the hundreds of Effex, worth no more than L. 80 a.gear; which was the only churcli-preferment he ever had. The air of this place not agreeing with him, he was obliged to place a cur rate on the fpot, at the expence of half his income, while he fettled at Londen; a fituation much more to his liking, as he had a trong propenfity to politics. The times were turbulent: the duke of York declaring himfelf a Papift, his fucceflion to the crown began to be warnily oppofed; and Mr Johnfon, who was naturally of no fubmiffive temper, being made chaplain to lord William Ruffel, engaged the ecelefiaftical champion for paffive obedience Dr Hicks, in a treatife intitled Fulian the apofate, Bra. publinhed in 1682. He was anfwered by Dr Hicks in a piece intitled Govian, Ecc. To which he drew up, and printed, a reply, under the title of fulian's arts to undermine and extirpate Chriftianity, छ̌c.; but by the advice of his fricuds fupprefled the publication. For this unpublifhed worl he was committed to prifon; but not being able to pracure a copy, the court profecuted him for writing the firf tract, condemned bim to a fine of 500 merks, and to lie in prifon until it was paid. By the affittance of Mr Hambden, who was his fellow- prifuncr, he was enabled to run into farther troubles; for on the encampment of the army on Hounflow-heath, in 1686, he printed and difperfed, An bumble and bearty addrefs to all the Proteflunts in the prefent army; for this he was fentenced to a fecond fine of 500 merks, to be degraded from the priefthood, to fland twice in the pillory, and to be whipped from Newgate to Tyburu. It happened luckily, that, in the degradation, they omitted to ftrip him of his caffock; which circumftance, llight as it may appear, rendered his degradation imperfect, and afterwards preferved his living to him. Interceffion was made to get the whipping omitted; but James replied, "That fince Mr Johofon had the fipirit of martyrdom, it was fit he fhould fuffer:" and he bore it with firmnees, and even with alacrity. On the Revolution, the pasliament refolved the proceedings againit him to be null and illegal; and recommended him to the king, who offered him the rich deanery of Durham: but this he refufed, as inadeg̣iate to his fervices
$\mathrm{N}^{\mathrm{o}} 168$.
and fufferings, which he thought to merit a bifhopric. Johr The truth was, he was paffionate, felf. opiniated, and turbulent; and though, through Dr Tillotfon's means, be obtained a penfion of 3001 . a-year, with other gratifications, he remained difcontented; pouring forth all his uneafinefs againlt a flanding army. and the great favours thown to the Dutch. He died in 1703. and his wotks were afterwards collected in one volume folio.
Johnson (Dr Samuel), who has been Ayled the brighteft ornament of the 18 th century, was born in the city of Litchfield in Staffordfhire on the 18 th of September N. S. 1709. His father Michael was a bookfeller ; and muft have had fome reputation in the city, as he more than once bore the office of chief magitrate. By what cafuiftical reafoning he reconciled his confcience to the oaths required to be taken by all who occupy fuch fations, cannot now be known; but it is certain that he was zealoully attached to, the exiled family, and intilled the fame principles into the youthful mind of his fon. So much was he in earnefl in this work, and at fo early a period did he commence it, that when Dr Sachaverel, in his memorable tour through England, came to Litchfeld, Mr Johnfoa carried his fon, not then quite three years old, to the cathedral, and placed him on his floulders, that he might fee as well as hear the far-famed preacher.

But political prejudices were not the only bad things which young Sam inherited from his father: he denived from the fame fource a morbid melancholy, which, though it neither depreffed his imagination, nor clouded his perppicacity, filled him with dreadful apprehenfions of infanity, and rendered him wretched through life. From his nurfe he concracted the ferophula or kiog's evil, which made its appearance at a very emply period, disfigured a face naturally well-formed, and deprived him of the fight of one of his eyes.

When arrived at a proper age for grammatical inAruction, he was placed in the free fchool of Litchfield, of which one Mr Hunter was chen mafter; a man whom his illuftrious pupil thought "very fevere, and wrong-beadedly fevere," becaufe be would beat a boy for not anfwering queftions which he could net expect to be afied. He was, however, a thilful teacher; and Johnfon, when he flood in the very front of learaing, was fenfible how much be owed to him; for upon being afked how he had acquired fo accurate a knowledge of the Latin tongue, he rephied, "My malter beat me very well; without that, Sir, I hould have done nothing."

At the age of 15 Johnfon was removed from Lichfield to the fehool of Stourbridge in Worcefterfire, at which he remained little more than a year, and then returned home, where he faid two years without any fettled plan of life or any regular courfe of ftudy. He read, however, a great deal in a defultory manner, as chance threw books in his way, and as inclination directed him through them; fo that when in his 19th year he was entered a commoner of Pembroke college Oxford, his mind was flored with a variety of fuch knowledge as is not often acquired in univerfities, where boys feldom read any books but what are put intotheir hands by their tutors. He had given very early proofs of his poetical genius both in this fchool exercifes and

## j OH

in other occafional compofitions: but what is pethaps more remarkable, as it fhows that he mult have thought much on a fubject on which other boys of that age feldom think at all, he had before he was it entertained doubts of the truth of revelation. From the melancholy of his temper thefe would naturally prey upon his fpirits. and give him great uneafinefs: but they were liappily removed by a proper courfe of rcading (A) ; for " his Audies being honef, ended in conviction. He found that religuon is true; and what .he had learned, he ever afterward endeavoured to teach."

Concerning his refidence in the univerfity, and the -means by which he was there fupported, his two principal hiographers contradiet each other; fo that thefe are points of which we cantot write with certainty According to Sir Joln Hawkins, the time of his continuance at Oxford is divifible into two periods: Mr 330 well reprefents it as only one period, with the ufual interval of a long vacation. Sir John fays, that he was fupported at college by Mr A ndrew Corbet in quality of affitant in the ftudies of his fon: Mr Bofwell affures us, that though he was promifed pecuniary aid by Mr Corbet, that promife was not in any de gree fulfilled. We flould be inclined to adopt the knight's account of this tranfaction, were it not pal.pably inconfiftent with itfelf. He fays, that the two young men were entered in tembroke on the fame day; that Corbet continued in the college two years; and yet that Johnion was driven home in little more than one year, becaufe by the rencval of Corbet he was deprived of his pention A flory, of which one part contradicts the other, cannot wholly be true. Sir John adds, that "meeting with another fource, the bounty, as it is fuppofed, of fe me one or more of the members of the cathedral of Lichfield, he returned to college, and made up the whole of his refidence in the eniverlity about thice years." Mr Bofwell has told us nothing but that Johnfon, though his father was unable to fupport him. continued three years in college, and was then driven from it by extreme poverty.

Thefe gentlemen differ likewife in their accounts of Johufon's tutors Sir Jnhn Hawkins fays that he had two, Mr Jordan and Dr Adams. Mr Bofwell affirms that Dr Adams could not be his tutor, becaufe Jordan did not quit the college till 1731; the year in the auVol. IX. Part I.

## $2971 \quad \mathrm{~J}$ O H

tumn of which Johnfon himfelf was compelled to leave johnfort:
Oxford. Yet the fame author Oxford. Yet the fame author reprefents Dr Adams as faying, "I was Johnfon's nominal tutor, but he was above my mark :" a fpeech of which it is not eafy to difcover the meaning, if it was not Johnfon's duty to attend Adams's lectures In mof colleges we believe there are two tutors in different departments of ecucation ; and therefore it is not improbable that Jordan and Adams may lave been tutors to Johnfon at the fame time, the one in languages, the other in fcience. Jordan was a man of fuch mean abilities, that though his pupil loved hin for the oodnefs of his heart, he would often rifk the payment of a fmall fine rather than attend his lectures; nor was he fludious to conceal the reafon of his abfence. Upon occafion of one fuch impofition, he faid, "Sir, you have fconced me two-pence for non-attendance at a lecture not worth a penny." For fome tranfgreffion or ahfence his tutor impofed upon him as a Chritmas exercife the tafic of tranflating into Latin verfe Pope's Meffiah; which being fhown to the author of the original, was read and returned with this encomium, ". The writer of this poem will leave it a queftion for pofterity, whether his or mine be the original" The particular courfe of his reading while in college and during the vacation which he paffed at home, cannot be traced. That at this period he read much. we have his own evidence in what he afterwards told the king; but his mode of Audy was never regular, and at all times he thought more than he read. He informed Mr Bofwell that what he read folidly at Oxford was Greek, and that the fludy of which he was moft fond was metaphy ficc.

It $w$ as in the year 1,31 that Jolnfon left the univerfity without a degree; and as his father, who died in the month of December of that vear, had fuffered preat misfortunes in trade, he was driven out a commontr of nature, and excluded from the regular modes of profit and profperity. Having therefure not only a profeffion but the means of fubfitlance to feek, he accepted. in the munth of March 1/32, an invitation to the office of under-mafter of a free fchool at Market Bofworth in Leicelterfire: but not knowing, as he faid, whether it was more difagreeahle for tim to teach or for the bays to learn the grammar-rules, and being likewite difgufted at the tratment wlich be received from the patron of the ichool, he relinquined
$P_{p}$
in
(A) Mrs Piozzi fays, that at the age of to Johnfon's mind was diffurbed by fcruples of inficdity, which preyed upon his firits and made him very uneafy, and that they were afteruards removed by the fludy of -Grelius de veritate, \&c. This account of the early flate of Johnfon's mind with refpect to religion, Mr BofFell affects to turn into ridicule, as if it were a thang abfolutely impoffible that a boy of to ytars fiould have any religious tcluples. He fays, that Johnfon became inattentive to religion at nine; talked, but did not think much, againft it at 14 ; and was tirft made to think about it in earneft by a cafual perufal of Law's ferious call to the unconverted, which he had taken up with a view to laugh ar it. That it is not common for boys of to to have fctuples of infidelity, mult be granted; but that fome have had them to early, the writer of this article knows by the moft complete evidence: and if that be admitted of Johnfon which has been true of others, Mrs Piozzi's narrative is natural, and honourable to him of whom it is written. But that a melancholy perfon fhould talk without thinking againft religion, or that he fhould think againtl it with a difpofition to laugbter, and not be at the time a contumed atheff, is in ittelf of extrenely incredible, that we camnet help falpeçing Mr Bofwell to have on this occafion $n$ ittaken the wews of his great friend. "Law's ferinus call" is a very good bock; but furely it is not fo well actapted to caly cunvicic: tor leafonirg mind $\because$ Grotius $d$ : "seritate; and there is in Mr Bofwell's two volumes fufficient evidence that Johnfon was of our oginion.
in a few months a fituation which he ever afterwards recollected with horror. Being thus again without any fixed employment, and with very little money in his pocket, he tranflated Lobo's voyage to Abyfinia, for the trifling fum, it is faid, of five guineas, which he received from a bookfeller in Birmingham. This was the firl attempt which it is certain he made to procure pecuniary affittance by means of his pen ; and it mult have held forth very little encouragement to his commencing author by profeffion.

In 1735, being then in his 26 th year, he married Mrs P'orter, the widow of a mercer in Birmingham; whofe age was almolt double bis; whofe external form, according to Garrick and others, had never been cap. tivating; and whofe fortune amounted to hardly 800 l. That the had a fuperiority of underfanding and talents is extremely probable, both becaufe fhe certainly infpired him with a more than ordinary paffion, and becaufe the was herfelf fo delighted with the charms of his converfation as to overlook his external difadvantages, which were many and great. He now fet up a private academy; for which purpofe he hired a large houfe well fituated near his native city: but his name having then nothing of that celebrity which afterwards commanded the attention and refpect of mankind, this un: dertaking did not fucceed. The only pupils who are known to have been placed under his care, were the celebrated David Garrick, lis brother George Garrick, and a young gentleman of fortune whofe name was Ofely. He kept his academy only a year and a half; and it was during that time that he conflructed the plan and wrote a great part of his tragedy of Ircne.

The refpectable character of his parents and his own merit had fecured him a kind reception in the beft families at Lichfield; and he was particularly dittinguifhed by Mr Walm?ley regitter of the ecclefiallical court, a man of great worth and of very extenfive and various erudition. That gentleman, upon hearing part of Irene read, thought fo highly of Johnfon's abilities â a dramatic writer, that he advifed him by all means to finith the targedy and produce it on the tlage. To men of genius the flage holds forth temptations almoft reffiftefs. The profits arifing from a tragedy, including the reprefentation and printing of it, and the connections which it fometimes enables the author to form, were in Johnfon's imagination ineftimable. Flattered, it may be fuppofed, with thefe hopes, he fet out fome time in the year 1737 with his pupil David Garrick for London, leaving Mrs Jolinfon to take care of the houle and the wreck of her fortune. The two adventurers carried with them from Mr Walmfley an earneft recommendation to the reverend Mr Colfon, then mafter of an academy, and afterwards Lucafian profeffor of mathematics in the univerfity of Cambridge; but from that gentleman it does not appear that Johnfon found either protection or encouragement.

How he fpent his time upon his firt going to London is rot particularly known. His tragedy was refufed by the managers of that day; and for fome years the Genteman's Magazine feems to have been his principal relource for employment and fupport. To enumerate his various communications to that far-famed mifcellany, would estend this article beyond the limits which we can afford. Suffice it to fay, that his connection with Cave the proprietor became very clofe; that he wrote
prefaces, effays, reviews of books, and poems; and that he was oceafionally employed in correcting the papers written by other correfpondents. When the complaints of the nation againft the adminiftration of Sir Robert Walpole became loud, and a motion was made, February ${ }^{13 \text { th }} 1740-1$, to remove him from his majefty's counfels for-ever, Johnfon was pitched upon by Cave to write what was in the Magazine entitled Debates in the Senate of Lilliput, but was underflood to be the fpeeches of the molt eminent members in both houfes of parliament. Thefe orations, which induced Voltaire to compare Britifh with ancient eloquence, were battily fketched by Johnfon while he was not yet $3^{2}$ years old, while he was little acquainted with life, white he was ftruggling not for dilitinction but for exiftence. Perhaps in none of his writings has he given a more conficuous proof of a mind prompt and vigorous almoft beyond conception: for they were compofed from fcanty notes taken by illiterate perfons employed to attend in both houfes; and fometimes he had nothing communicated to him but the names of the feveral fpeakers, and the part which they took in the debate.
His feparate publications which at this time attracted the greatell notice were, "London, a Poem in imitation of Juvenal's third Satire ;" "Marmor Norfolcienfe, or an Eflay on an ancient prophetical Infeription. in Monkifh Rhyme, lately difcovered near Lynne in Norfolk;" and "A complete Vindication of the Licenfers of the Stage from the malicious and fcandalous afperfions of Mr Brook author of Guftavus Vafa." The poem, which was publifhed 1738 by Dofley, is univerfally known and admired as the molt fpirited inftance in the Englifh language of ancient fentiments adapted to modern topics. Pope, who then filled the poetical throne without a rival, being informed that the author's name was folnfon, and that he was an obfeure perfon, replitd, "he will foon be deterre?." The other two pamphlets, which were publifhed in 1739, are filled with keen fatire on the governinent: and though Sir John Hawkins has thought fit to declare that they difplay neither learning nor wit, Pope was of a different opinion; for in a note of his preferved by Mr Bofwell, he fays, that "the whole of tise Norfolk prophecy is very humorous."
Mrs Johnfon, who went to London foon after her hufband, now lived fometimes in one place and fometimes in another, fometimes in the city and fometimes at Greenwich : but, Johnfon himfelf was oftener to be found at St John's 'Gate, where the Gentleman's Magazine was publifhed, than in his own lodgings. It was' there that he became acquainted with Savage, with whom he was induecd, probably by the fimilarity of their circumblances, to contract a very clofe friendfhip; and fuch was their extreme neceflities, that they have often wandered whole nights in the freet for want of money to procure them a lodging. In one of thefe nocturnal rambles, when their diftrefs was almoft incredible, fo far were they from being depreffed by their fituation, that in high firits and brimful of patriotifm, they traverfed St James's Square for feveral hours, inveighed againft the miniter; and, as Johnfon faid in ridicule of himfelf, his companion, and all fuch patiots, "refolved that they would fand by their country !" In 1744, he publifhed the life of his
nfon. unfortunate companion; a work which, had he never
written any thing elfe, would have placed him very
nfon, unfortunate companion; a work which, had he never
written any thing elfe, would have placed him very high in the rank of authors (B). His narrative is 14 markably fmooth and well difpofed, his obfervations
are juft, and his reflections difclofe the inmolt receftes markably fmooth and well difpofed, his oblervations
are juft, and his reflections difclofe the inmoft recefles of the human heart.

In 1749, when Drury-lane theatre was opened under the management of Garrick, Johnfon wrote a prologue for the ocealion; which for jn 4 dramatic criticifm on the whole range of the Enghth fage, as wroll as for postical excellence, is confeffedly urivalled. But this year is, in his life, diftinguihed as the epoch when his arduous and important work, the Dictionary of the Englith Language, was announced to the world by the publication of its plan or profpectus, addeeffed to the carl of Cheflerfield. From that nobleman Jolmfon was certainly led to expect patronage and encourayement: and it feems to be equally certain that his lordihip, expected, when the book fhould be publifhed, to be honourd with the dedication. The expectations of both were difappointed. Lord Cheftertield, after feeing the lexicographer once or twice, fuffered him to be repulfed from his door: but afterwards thinking to conciliate him when the work was upon the eve of publication, he wrote two papers in "The Would," warmly recommending it to the public. This artifice was feen through; and Johnfon, in very polite language, rejected his Lordhip's advances, letting him know, that he was unwilling the public fhould confider him as owing to a patron that which Providence had enabled him to do for himfelf. This great and laborious work its author expected to com plete in three years: but he was certainly employed
upon it feven; for we know that it was begun in 7747 , Joinfor. and the laft fheet was fent to the prefs in the end of the year ${ }^{1754 .}$. When we confidet the nature of the undertaking, it is indecd attonifhing that it was finifh. ed fo foon, lince it was written, as he fays, "6 with little affiltance of the learued, and without any patronage of the great; not in the foft oblearities of returcinent, or under the finelter of academic bowers, but amidil inconvenience and diflraction, in ficknefs and in forrow." The forrow, to which he here alludes, is probably that which he folt for the lofs of his wife, who dicd on the 17 hb of March O.S. 1752 , and whom the continued to lament as long as he lived.
The Dictionary did not occupy his whole time: for while he was pulting it forward, he fitted his Tragedy for the Rage ; wrote the lives of feveral eminent men for the Gentleman's Magazine ; publifhed an Imitation of the roth Satire of Juvenal, intitled "The Vanity of human "Wifhes;" and began and finiherd "The Rambler." This lat work is fo well known, that it is hatdy neceffary to fay that it was a periodical paper, publifhed twice a-wcek, from the 2oth of March 1750 to the 14 th of March 1752 inclufive: but to give our readers fome notion of the vigour and promptitude of the author's mind, it may not be improper to obferve, that notwithltanding the feverity of his other lahours, all the affifance which he received does not amount to five papers; and that many of the mont mafterly of thofe unequalled effays sere written on the fpur of the occalion, and never feen entire by the author till they returned to him from the prefs (c).

Swon after the Rambler was concluded, Dr Hawkef$P_{p} 2$
worth
(в) From the merit of this work Mr Bofivell has endeavnured to detract, by infinuating, that the perfon called Richard Savage was an impotlor, and not the fon of the earl of Rivers and the countefs of Macclesfield. Sce our account of Satage.
(c) The Atyle of the Rambler has been much praifed and much cenfured, fometimes perhaps by men who paid little attention to the author's views. It has been compared with the ftyle of Addifon; to which it is thought fuperior by fome, and inferior by uthers. Its defects have been petulantly caricatured, and its merits unduly exalted. To attempt a defence of all the words in it which are derived from the Latin, would be in vain; for though many of them are elegant and expreflive, others are harfh, and do not eafily affimilate with the Englifh idiom. But it would be as cafy to defend the ufe of Johnfon's words as the ftructure of all Addifou's fentences; for though many of thefe are exquifitely beautiful. it muft be confeffed that others are feeble, and offend at once the ear and the mind. An ingenious eflayift fays, that in the Rambler "the conflant recurrence of fentences in the form of what have been called triplets, is difgufting to all readers " The recurrence is indeed very frequent ; but it certainly is not conllant, nor we hope always difgufting : and as what he calls the triplet is unqueftionably the mult energetic form of which an Englinh fentence is fufceptible, we cannot help thinking, that it /hould frequently recur its detached fflays, of which the object is to inculcate moral truths. He who reads balf a volume of the Rambler at a fitting, will feel his car fatigued by the clofe ef fimilar periods fo frequently recurring: but he who reads only one paper in the day, will experience nothing of this wearincfs. For purpofes merely didactic, when fomething is to he told that was not known before, Addifon's Ayle is certainly preferable to Johufon's, and Swift's is prefcrable to both : hut the queftion is, Which of them makes the beft provifion againt that inattention by which known truth are fuffered to lie neglected? There are very few moral truths in the Sptetator or in the Rambler of which the reader can be tutaly ignorant; but there are many which may have hitle influence on his conduct, becaufe they are feldom the objects of his thought. If this be fo, that Hyle fhould be coufidered as heft which moof roufes the attention, and impreffes deepeft in the mind the fentiments of the author: and therefore, to deride between the ftyle of Addifon and that of Johnfon, the reader flould compare the effeets of each upon his own memory and imagination, and give the preference t. that which leaves the moft la ting impreffion. But it is faid that Johnfon liumfelf muft have recognized the fault of perpetual triplets in his ftyle, fince they are by no means frequent in his laft productions. Is this a fair thate of the cafe?" his lall production was "the Lives of the Britifh Pocts," of which a great part confifts of the narration of facts; and fuch a narration in the Iyle of the Rambler would be ridiculous,

## J O H [ 300 ] J O H

Johnon. worth projected "The Adventurer" upon a fimilar plan: and by the affiftance of friends he was enabled to carry it on with almon equal merit. For a fhort time, indeed, it was the rolt popular work of the two; and the papers with the fignature $T$, which are confeffedly the moat fplendid in the whole collection, are now known to have been communicated by Johnion, who rceeived for each the fum of two: guineas. This was double the price for which he fold fermons to fuch clergymen as either would rot or could not compofe their own difcourfes; and of fermonwriting he feems to have made a kind of trade.

Though he had exhaufted, during the time that he was employed on the Dictionary, more than the fum for which the hookfellers had batgained for the copy; yet by means of the Rambler, Adventurer, fermons, and other productions of his pen, he now found himfelf in greater affluence than he had ever been before; and as the powers of his mind, diftended by long and fevere exercife, required rela*ation to reftore them to their proper tone, he appears to have done little or rothing from the clofing of the Adventurer till the year 1756 , when he fubmitted to the office of reviewer in the Literary Magazine. Of his reviews by far the moll valuable is thatof Soame Jennyns's "Free Inquiry into the Nature and Origin of Evil." Never were wit and metaphyfical acutenefs more clofely united than in that criticifm, which expofes the weaknefs and holds up to contempt the reafonings of thofe vain mortals, who prefumptuoully attempt to grafp the fcale of exiftence, and to form plans of conduct for the Creator of the univerfe. But the furnifhing of magazines, reviews, and even newspapers with literary intelligence, and authors of books with dedications and prefaces, was confidered as an employment unworthy of Johnfon. It was therefore propofed by the bookfellers that he fhould give a new edition of the dramas of Shakefpeare; a work which he had projected many years before, and of which he had publifhed a fpecimen which was commended by Warburton. When one of his friends expreffed a hope that this employment would furnih him with amufement and add to his fame, he replied, "I look upon it as I did upon the Dictionary; it is all wnork; and my inducement to it is not love ur defire of fame, but the want of money, which is the only motive to writing that I know of." He iffued propofals, however, of contidcrable length; in which he fhowed that he knew perfectly what a variety of refearch fuch an undertaking requirrd: but his indulence prevented him from purfuing it with diligence, and it was not publiohed till many years afterwards.

On the $15^{\text {th }}$ of April $175^{8}$ he hegan a new.period:cal paper intitled "The Idler," which came out every Saturday in a weekly newipaper, called "the Univerfal Chronicle, or Weekly Gazette," publifhed by Nezuberry. Of thefe effays, which were continued till the 5 th of April 1760 , many were written as haftily as an.
ordinary letter; and one in particular compoled at Johni Oxford was begun only half an hour before the departure of the polt. which carried it to London. About this time he had the offer of a living, of which: he might have rendered himfelf capable by entering into orders. It was a rectory in a pleafant country, of, fuch yearly value as would have been an object to one in much better circumfances; but fenfible, as it is. fuppofed of the afperity of his temucr, he declined it, faying, "I have not the requifites for the office, and I. cannot in my confcience fhear the tlock which I am unable to feed."

In the month of January 1759 his mother died at. the great age of 90 ; an event which deeplyafiected him. and gave birth io the 4 it Idler, in which he laments. that "the life which made his own life pleafam was at an end, and that the gate of death was thut upor his profpects." Soon afterwards he wrote his "Raifelis. Prince of Abyfinia ;" that with the profits he might defray the expence of his mother's funeral, and pay fome debts which fhe had $\mathrm{l}_{\mathrm{f} f}$. He told is friend, that he received for the copy 1001. and 251. more when it came to a fecond edition; that he wrote it in the: evenings of one week, fent it to the prefs in portions as it was writien, and had never fince read it. over.

Hitherto, notwithftarding his various publications, he was poor, and obliged to provide by his labour for. the wants of the day that was paffing over him: but. having been early in 1762 reprefented to the king as a very learned and good man without any certain provifion, his majelty was pleafed to grant him a penfion, which Lord Bute, then firlt minifter, affured him "was not given for any thing which he was to do, but for what he bad already done." A fixed annuity of three hundred pounds a-year, if it diminifhed his diftrefs increafed his indolence; for as he conflantly avowed that he had no other motive for writing tban to gain money, as he had now what was abundancly fufficient for ali his purpofes, as he delighted in converfation, and was vifited and adnired by the witty, the elegant. and the leanned, very little of his time was palt in folitary fudy. Solitude was indeed his averfion; and that he might avoid it as much as poffble, Sir Jofhuz Reynolds and he, in 1764 , inflituted a club, which exifted long without a name, but was afterwards known by the title of the Literary Club. It confifted of fome of the moft erlightened men of the age, who met at the Turk's Head in Gerard-freet Soho one evening in every, week at feven, and till a late hour enjoyed " the feaft of reafon and the flow. of foul."

In 1765 , when Johnfoo was more than ufually op? preffed with conftitutional melancholy, he was fortunately introduced into the family of Mr . Thrale, one of the moll eminent brewers in England, and menber. of parliament for the borough of Southwark : and it is but juftice to acknowledge, that to the affiftance which
culous. Cicero's orations.are univerfally admired; but if Cæfar's commentaries had been written in that ftyle, who would have read them? When Johnfon in his biugraphy has any important truth to enforce, he generally employs the rounded and vigorous periods of the Rambler ; but in the bare narration he ufes a fimpler ityle, and that as well in the life of Savage, which was witten at an early period, as in the lives of thofe which were written latelf. It is not, however, very prudent in an ordinary writer to attempt a clofe imiration of the fyle of the Rambler.; for Johnfon's vigorous periods are fitted only to the weight of Johnfon's thoughtso

## $\mathrm{J} 0 \mathrm{H} \quad[30 \mathrm{H}] \quad \mathrm{OH}$

Infon. which Mr and Mrs Thrale gave him, to the fhelter performance his admiter Mr Bofwell cannot; he fays, Jnhnfon: which their houle afforded him for 16 or 17 years, ard to the pains which they took to foothe or reprefs his uneafy fancies, the public is probably indebred for fome of the molt mallerly as well as molt popular works which he ever produced. At length, in the October of this year, he gave to the world lis edition of Shakefpeare, which is chielly valuable for the preface, where the excellencies and defects of that immortal bard arc difplayed with fuch judgment, as mult pleafe every man whofe tafte is not regulated by the Itandard of fafhion or national prejudice. In 1767 be was honoured by a private converfation with the king in the lihrary at the queen's houfe: and two years afterwards, ppon the ettablinment of the royal acedemy of painting, feulpture, \&c he was nominated profeflor of ancient literature; an office merely honorary, and confersed on him, as is fuppofed, at the recommendation of his friend the prefident.

In the varicty of fubjects on which he had hitherto exercifed his pen, he had forborne, fmee the adminiAration of Sir Robert Wilpole, to meddle with the difputes of contending factions; but having feen with indignation the methods which, in the bufinefs of Mr Wilkes, were taken to woik upon the populace, he publithed in 1770 a pamphlet, intitled "The Falle Alarm ;" in which he afterts, and labours to prove by a variety of arguments founded on precedents, that the expulfion of a member of the houfe of commons is equivalent to exclufion, and that no fuch calamity as the fubvesfion of the conftitution was to be feared from an act warranted by. ufage, which is the law of parliament. Whatever may be thought of the principles maintained in this publication, it unqueftionably contains much wit and much argument, expreffed in the author's bell Ityle of compofition ; ard yet it is known to have been written between eight o'clock on Wed. nefday night and twelve o'clock on the Thurfday night, when it was read to Mr Thrale upon his coming from the houfe of commons. In 1771 he pub. lified another political pamphlet, intitled, "Thoughts on the late tranfactions refpecting Falkland's Inands;" in which he atiacked Funius: and he ever afterwards delighted himfelf withathe thought of having deftroyed that able writer, whom he certainly furpaffed in nervous language and pointed ridicule.

In 1773 he vifited with Mr Bofwell fome of the moft confiderable of the Hebrides or Weftern Inands of Scotland, and publifhed an account of his journey in a volume which abounds in extenfive philofophical views of focicty, ingenious fentiments, and lively defeription, but which offended many perfons by the violent attack which it made on the authenticity of the poems attributed to Offan. For the degree of offence that was taken, the book can hardly be thought to contain a fufficient reafon: if the antiquity of thefe poems be yet doubted, it is owing more to the conduct of their editor than to the violence of Johnfon. In 1774, the parliament being diffolved, he addreffed to the electors of Great Britain a pamphlet, intitled "The Patriot;" of which the defign was to guard them from impofition, and teach them to diftinguifh true from falle patriotifin. In 1775 he publifhed os Taxation no tyranny; in anfwer to the relolutions and addrefs of the American Congrels." In this
perceive that ability of argument or that felicity of ex. preffion for which on other occafions Johnfon was fo cminent. This is a fingular criticifm. To the affumed principle upon which the reafoning of the pamphlet relts many have objected, and perhaps their objections are well founded; but if it be admitted that "the Supreme Yower of every community has the right of requiring from all its funjects fuch contributions as are neceffary to the public fafety or public profperity," it will be found a very difficult tafk to break the chain of arghments by which it is proved that the Brition parliament had a right to tax the Americans. As to the expreffor of the pamphlet, the reader, who adopts the maxim recorded in the "Journal of a tour to the Hebrides," that a controvertit " ought not to frike foft in battle," mult acknowledge that it is uncommonly happy, and that the whole performance is one of the molt brilliant as woll as molt correct pieces of compofition that ever fell from the pen of its anthor. Thele effays drew upon him nu. merous attacks, all of which he heartily defpifed; for though it has been fuppofed that "A letter addreffed to Dr Samuel Johnion occafioned by his political publications," gave him great uneafinefs, the contrary is manifert, from his having, after the appearance of that letter, collected them into a volume with the title of "Political Tracts by the author of the Rambler." In 176 ; Trinity College Dublin had created him LL.D. by diploma, and he now received the fame honour from the Univerfity of Oxford; an honour with which, though he did not boalt of it, be was highly gratified. In 1777 he was induced, by a cafe of a very extrardinary nature, to exercife that humanity which in him was obedient co every call. Dr Willians Dodd, a clergyman, under fentence of death for the crime of forgery, found means to interelk Johnfon is his behalf, and procured frem him two of the molt energetic compofitions of the kind ever feen; the one a petition from himfelf to the king, the other a like addrefs fiom his wife to the queen. Thefe petitions failed of fuccefs.

The principal bookfellers in London having determined to publifh a body of Englifh poetry, Johnfon was prevailed upon to write the lives of the peets, and give a character of the works of each. This tafk he undertook with alacrity, and executed it in fuch a manner as mult convince every competent reader, that as a biographer and a critic, no nation can produce his equal. The work was publifled in ten finall volumes, of which the firt four came abroad 1778 , and the others in 1781 . While the world in general was filled with admiration of the ftupendous powers of that man, who at the age of feventy two, and labouring under a complication of difeafes, could produce a work which difplays fo much genius and fo much learning.; there were narrow circles in which prejudice and refentment were foftered, and whence attacks of different forts iffued againlt him. Thefe gave him not the fmalleft dillurbance.. When told of the feeble; though fhrill, outery that had been raifed, he faid"Sir, I confidered myfelf as entrufed with a certain portion of truth. I have given my opinion fincerely; let them fhow where they think me wrong."

He had hardly begun to reap the laurels gained by,

Juhifun. this performance, when death deprived him of Mr Thrale, in whofe houfe he had enjoyed the moft comfortable hours of his life; but it abated not in Johnfon that care for the interefts of thofe whom his friend had left behind him, which he thought himfelf bound to cherifh, both in duty as one of the executors of his will, and from the nobler principle of gratitude. On this account, his vifits to Streatham, Mr Thrale's villa, were for fome time after his death regularly made on Monday and protracted till Saturday, as they had been during his life; but they foon became lefs and lefs frequent, and he lludioully avoided the mention of the place or the family. Mrs Thrale, now Piozzi, fays indeed, that " it giew extremely perplexing and diff. cult to live in the houfe with him when the mater of it was no more; becaufe his diflikes grew capricious, and he could fcarce hear to have any body come to the houfe whom it was abfolutely neceffary for her to fee." The perfon whom fhe thought it molt neceffary for her to fee may perhaps be gutfed at without any fuperior fhare of fagacity; and if thele were the vifits which Johufon could not bear, we are to far from thinking his dillikes capricious, though they may have been perplexing, that if he had acted otherwife, we flould have blamed him for want of gratitude to the friend whofe " face for fifteen years had never been turned upon him but with refpect or benignity."

About the middle of June 1783 his confitution fultained a feverer thock than it had ever before felt, hy a ftroke of the palfy; fof fudden and fo violent, that it awakened hin out of a found fleep, and rendered him for a fhort time Speechlefs. As ufual, his recourfe ander this afliction was to piety, which in him was conflant, fincere, and fervent. He tried to repeat the Lord's prayer firf in Englifh, then in Latin, and afterwards in Greek ; but fucceeded only in the laft attempt; immediately after which he was again deprived of the power of articulation: From this alarming attack he recovered with wonderful quicknefs, but it left behind it fome prefages of an hydropic aftection; and he was foon afterwards feized with a fpafmodic afthma of fuch violence that he was confined to the houfe in great pain, while his droply increafed notwithflanding all the efforts of the molt eminent phyficians in London and Edinburgh. He had, however, fuch an interval of eafe as enabled him in the fummer 1784 to vifit his friends at Oxford, Lichfield, and Ahbourne in Derbyfhire. The Romifh religion being introduced one day as the topic of converfation when he was in the houfe of Dr Adams, Johnfon faid, "If you join the papifts externally, they will not interrogate you ltrictly as to your belief in their tenets. No reafoning papilt believes every article of their faith. There is one fide on which a good man might be perfuaded to embrace it. A good man of a timorous difpolition, in great doubt of lus acceptance with God, and pretty ciedulous, might be glad of a church where there are fo many helps to go in heaven. I would be a papit if I could. I have fear enough; but an obftinate rationality prevents me. I fhall never be a papitt unlefs on the near approach of death, of which I have very great ierror."

His conltant dread of death was indeed fo great, that it aftonifhed all who had accefs to know the piety of his mind and the virtues of his life. Attempts have been
made to account for it in various ways; but doubtlefs that is the true account which is given in the Olla Po. drida, by an elegant and pious writer, who now adorns a high flation in the church of England. "That he thould not be confcious of the abilities with which Providence had bleffed him, was impolfible. He felt his own powers; he felt what he was capable of having performed; and he faw how little, comparatively fpeaking, he had performed. Hence his apprehenfion on the near profpect of the account to be made, viewed through the medium of conftitutional and morbid melancholy, which often exeluded from his fight the bright beams of divine mercy." This, however, was the cafe only while death was approaching from fome diftance. From the time that he was certain it was near, all his fears were calned; and he died on the 13 th of December 1,84 , full of retignation, ftrengthened by faith, and joyful in hope.

For a juft character of this great man our limits afford not room: we mult therefore content ourfelves with laying before our readers a very fhort fketch. His ftature was tall, his limbs were large, his Atrength was more than common, and his activity in early life had been greater than fuch a form gave realon to"expect: but he was fubject to an infirmity of the convulfive kind, refembling the diftemper called St Vitus's dance ; and he had the feeds of fo many difeafes fown in his conllitution, that a fhort time before his death he declared that he hardly remembered to have paffed one day whelly free from pain. He poffeffed very extraordinary powers of underilanding; which were much cultivated by reading, and ftill more by meditation and reflection. Iis memury was remarkably retentive, his imagination unconmouly vigorous, and his judgment keen and penetrating. He read with great rapidity, retained with wonderful exactnefo what he fo eafily collected, and paffefled the power of reducing to oriler and fyftem the leatterer hints on any fubject which he had gathered from different bouks. It would not perhaps be fafe to claim for him the higheft place, among his contemporaries, in any fingle department of literature ; but, to ufe one of his own expreffions, he brought more mind to every fubject, and had a greater variety of knowledge ready for all ncealions, than any other man that could be eafily named. Though prone to fuperitition, he was in all other refpects fo remarkably incredulous, that Hogarth faid, while Johnfon firmly believed the bible, he feemed derermined to believe nothing but the bible. Of the importance of religion he had a ftrong fenfe, and his zeal for its interefts were always awake, fo that profanenefs of every kind was abathed in his prefence. The fame enesgy which was difplayed in his literary productions, was exhibited alfo in his converfation, which was various, Itriking, and inftructive: like the fage in Raffelas, he fpoke. and attention watched his lips; he reafoned, and conviction clofed his periuds: when he pleafed, he could be the greatelt fophif that ever contended in the lilts of declamation ; and perhaps no man ever equalled him in nervous and pointed repartees. His veracity from the moft trivial to the molt folemn occafions, was frict even to feverity: he fcorned to embellifh a flory with fictitious circumftauces; for what is not a reprefentation of reality, he uled to fay, is not worthy of our attention. As his

## J O H [ 303 ]

purfe and his houfe were ever open to the indigent, fo
was his heart tender to thofe who wanted relief, and his foul was fufceptible of gratitude and every kind impreffion. He had a rouglinefs in his manner which fubdued the faucy and terrified the meek: but it was only in his manner ; for no man was more loved than Johnfon was by thofe who knew him; and his works will be read with vencration for their author as long as the language in which they are written thall be underttood.

JOHNSTON, or Johnson (John), a learned divine, born in 1662 He was zealous for the Revolution, and preached a noted fermon at Feverfham on the occafion, from the words, " Remember Lot's wife ;" wherein he fet forth the great danger of looking back, and vindicatell the liturgy againh Mr Baxter and others. IIe publifted The Clergyman's Vade ATccum, and A Colleaion of Ecclefigfical Laws as a continuation of it; but catching the infection fpread by Di Sachaverel, he, on the acceffion of Geo. I. to the amazement of all his old friends, entertained unfavourable thoughts of the Proteftant fucceffion, and refufed to read the ufual prayers for the king. Being profecuted, however, he thought proper to fubmit; and died vicar of Cranbrook in Kent, in 1725.

Johnston (Dr Arthur), was born at Cankieben, near Aberdeen, the feat of his anceftors, and prohably was educated at Aherdeen, as he was afterwards advanced to the highelt dignity in that univerfity. The ftudy he chiefly applied himfelf to was that of phylic ; and to improve himfelf in that fcience, he travelled into foreign parts. He was twice at Rome ; but the chief place of his refidence vas Padua, in which univerfity the degree of M.D. was conferred on him in 1610 , as appears by a MS. copy of verfes in the advocate's library in Edinburgh. After leaving Padua, he travelled through the reft of Italy, and over Germany, Denmark, England, Holland, and other countries; and at length fettled in Prance; where he met with great applaufe as a Latin poet. He lived there 20 years, and by two wives had 13 children. After 24 years abfence, he returned into Scotland in 1632. It appears by the Council Books at Edinburgh, that the Doctor had a fuit at law before that court about that time. In the year following, it is very well known that Charles I. went into Scotland, and made bifhop Laud, then with him, a member of that council : and by this accident, it is probable, that acquaintance began between the dodor and that prelate, which produced his "Pfalmorum Davidis Paraphrafum Poëtica;" for we find that, in the fame year, the doctor printed a fecimen of his Pfalms at London, and dedicated them to his lordmhip.

He proceeded to perfect the whole, which took lim up four years; and the firf edition complete was publifhed at Abcrdeen in 1637, and at London the the fame year. In $16+1$, Dr. Johnfton being at Ox. ford, on a vifit to one of his daughters who was married to a divine of the church of England in that place, was feized with a violent diarrhœa, of which he died in a few days, in the 54th year of his age, not without having feen the beginning of thofe troubles that proved fo fatal to his patron. He was buried in the place where he died; which gave occafion to the fol.

Suppiria on the Doctor's death :
Scotia mafta, dole, tanti vi luata fepulchro
Vatio; is Angligenis centigit alcus honos.
In what year Dr. Johniton was made phyfician to the kind does not appear; it is mott likely that the archbithop procured him that honour at his coming into England in 1633, at which time he tranflated So. lomon's Song into Latin elegiac verfe, and dedicated it to his majefty. His Pialns were reprinted at Middleburgh, 1642 ; London, 1657 ; Cambridge, .... Amllerdam, 1706; Edinburgh, by William Lauder, r 739 ; and laft on the plan of the Delphin claflics, at London, $: 741$, 8vo, at the expence of auditor Benfon, who dedicated them to his late majcity, and prefixed to this edition memoirs of Dr Johnllon, with the teflimonies of various learned perfons. A laboured compaiifon between the two tranflations of Bucha. nan and Johufton was printed the fame year in Englifh, in 8vo, intituled, "A Prefatory Difcourfe to Dr "Johnfon's Pfalms, \&c." and "A Conclufion to it." His tranflations of the Te Deum, Creed, Dccalogue, \&c. were fubjoined to the Pfalms. His other poctical works are his Epigrams; his Parerga; and his MIufe Anglica, or commendatory Verfes upon perfons of rank in church and fate at that time.

JOIGNY, a town of France, in Champagne, and in the diocefe of Sens, with a very handfome cafle. It confifts of three parifhes, and is pleafantly fituzted on the river Yonne, in E. Long. 3. 25. N. Lat. 47. 56.

JOINERY, the art of working in wood. or of fitting various pieces of timber together. It is called by the French menuiferie, "rmall work," to diltinguilh it from carpentery, which is employed about large and lefs curious works.

JOINT, in general, denotes the juncture of two or more things. The joints of the human body are called by anatomits articulations. See Anatomy, $n^{0} 2$.

The fupplenefs to which the joints may be broughe by long practice from the time of infancy, is very furprifing. Every common pofture-mafter fhows us a great deal of this; but one of the molt wonderful intances we ever had of it, was in a pcrion of the rame of Clark, and famous for it in London, where he was commonly known by the name of Cleok the pofuremafler. This man had found the way, by long practice, to diftort many of the bones, of which nobody before had ever thought it poffible to alter the pofition. He had fuch an abfolute command of his mufcles and joints, that he could almolt disjoint his whole body; fo that he once impoled on the famous Mullens by his diftortions, in fuch a manner, that he refufed to undertake his cure: but, to the amazement of the phyincian, no fooner had he given over his patient, than he faw him reftore himfelf to the figure and condition of a proper man, with no diftortion about him.

JOINTURE, in law, generally fignifies a fettle.ment of lands and tenements, made on a woman in confideration of marriage.

JOINVILLE (John Sire de), an eminent French Atatefman of the $13^{\text {th }}$ century, who was fenefchel o
lagh

## 1 O I

Joinvilie high fteward of Champagne, and one of the principal
lords in the court of Lavis IX. He attended that monarch in all his expeditions ; and had fo much con-
fidence placed in him, that all matters of junfice in the palace were referted to his decifion, and the king undertook nothing of confequence withour confulting him He wrote the hiftory of St Lewis in French, which is a very curious and interefling piece; and died about the year 1318 . The beft edition of this work is that of Du Cange, in folio, with learned re--marks.

Joinville, an ancient and confiderable town of France, in Champagne, with the title of a principality, and a lage magnificent caftle. It is fituated on the river Marne, in E. Long. 5. 10. N. Lat. 48. 20.

JOISTS, or Joysts, in architeeture, thofe pieces of timber framed into the girders and fummers, on which the boards of the floor are laid.
jokes. See Jesting.
Iolaia, a feftival at Thebes, the fame as that called Heracleia. It was inflituted in honour of Herculss and his friend Iolas, who affitted him in conquering the hydra. It continucd during.feveral days, on the firtt of which were offered folemn facrifices. The next day horfe-races and athletic cyercifes were exhibited. The following day was fet apart for wreftling, the victors were crowned with garlands of myrtle generally ufed at funeral folemnities. They were fometimes rewarded with tripods of brafs. The place where the exercifes were exhibited was called Iolaion ; where there were to be feen the monument of Amphi. sryon and the cenotaph of Iolas, who was buried in Sardinia. Thefe monuments were flrewed with gar. lands and flowers on the day of the feflival.

Iŏlas or Iolaus, (fab. hif.) a fon of Iphiclus king of Theffily, who affifted 1 ercules in conquering the Hydra, and burnt with a hot iron the place where the heads had been cut off, to prevent the growth of others. He was reftored to his youth and vigour by Hebe, at the requelt of his friend Hercules, Some time afterwards lolas affifted the Heracuide againt Euryftheus, and killed the tyrant with his own hand. According to Plutarch, Iulas had a monument in Beootia and Plincis, where lovers ufed to go and bind them felves by the molt folemn oaths of fidelity, confidering the place as facred to love and triendfhip According to Diodorus and Paufanias, Iolas died and was buried in Sardinia, where he had gone to make a fettlement at the head of the fons of Hercules by the 50 daughters of Thefpius.

JOLI, or Joly. (Claudius), a worthy parifh-prief, and an excellent fcholar, defcended from a family eminent for learning and piety; was born at Paris in 1607. He applied himfelf firl to the law, and pleaded for fome time at the bar: but inclining afterwards to the church, he entered into orders, and in 1631 obtained a canonry in the cathedral church of Notre Damt at Paris; the duties of which office he difeharged with an exacinefs beyond all example as long as he lived. Difc vering at the fame time occafionally a capacity for flate-affairs, the duke de Longueville, the French plenipotentiary for negociating a general peace, took Joly with him to Munfter, where he proved a good affifant. On his return, he refumed his former employments with his ufual zeal. In 1671 he was $\mathrm{N}^{\circ} 168$.
made precentor in his church; and feveral times official of Paris, without his feeking; alway3 behaving, as an ecclefiaftical magiftrate, with perfect integrity, and teftifying a fincere love for juftice. He died in 1700 , and left many works; in which, as in as many mirrors, his true character fully appears.
Jou (Guy), king's counfellor to the Chatelet, and fyadic of the revenues of the Hotel de Ville at Paris, attached himfelf for a long time to cardinal de Retz in the capacity of fecretary. Befide other tracts, he wrote ALemoirs from 1648 to 1665 , including thofe of Cardinal de Retz; a tranfation of which into Englifh was publithed in 1755 .
jolloxochitl, or Flower of the Heart, in botany; a large beautiful flower growing in Mexico; where it is not lefs efteemed for its beauty than for its odour, which is fo powerful, that a fingle flower is uffficient to fill a whole houfe with the moft plealing fragrance. It has many petals, which are glutinous, externally white, intemally reddifl or ycllowifh, and difpofed in fuch a manner, that when the flower is open and its petals are expanded, it has the appearance of a ftar, but when hut it refembles in fome meafure a heart, from whence its name arofe. The tree which bears it is tolerably large, and its leaves are long and rough.

ION, (fab. hift.), a fon of Xuthus and Creufa daughter of Ereeltheus, who married Helice, the daughter of Selinus king of Ægizle. He fucceeded to the throne of his father-in-law ; and built a city, which he called Helice on account of his wife. His fubjects from him received the name of Ionians, and the country that of Ionia. See Ionia.
lon, a tragic poet of Chios, who flourifhed about the 8 ad Olympiad, His tragedies were reprefented at Athens, where they met with univerfal applaufe. He is mentioned and greatly recommended by Ariftophanes and Athenzus, Sic.

IONA, Jona, or Icolmkill, one of the Hebrides; a fmall, but celebrated inand, "oace the luniinary of the Caledonian regions (as Dr Johnfon expreffes it), whence favage clans and roving barbarians derived the benefits of knowledge and the bleflines of religion" The name Yona is derived from a Hebrew word lignifying a dove, in allufion to its patron Columba, who landed here in 565. See Columba. - It is faid to have been a feat of the druids hefore his arrival, when its name in Irifh was Inis Drunifb, or the "Druid Ifland." The druids being expelled or converted, he founded here a cell of canons regular, who till 716 differed from the church of Rome in the obfervance of Ealler and in the tonfure. After his death, the ifland retained his name, and was called $\mathrm{r}_{\text {columb }}$ cill or "Columb's cell," now Icolmkill. The Danes diflodged the monks in the gth century, and Cluniacs were the next order that fetted here.

This inland, which belongs to the parif of Rofs in Mull, is three miles long, and one broad: the caff fide is moftly flat ; the middle rifes into fmall hills; and the weft fide is very rude and rocky : the whole forming a fingular mixture of rock and fertility There is in the inand only one town, or rather village. confifting of about 60 mean houfes. Near the town is the bay of Martyrs fain by the Danes. An oblong inclofure, bounded by a ftone dyke and called Clacbiana

Druinach,
nn. Druinach, in which bones have been found, is fuppofed to have been a burial-place of the Druids, or rather the common cemetery of the towns-pcople. Beyond the town are the tuins of the nunnery of Autin canoneffes, dedicated to St Oran, and faid to be fonnded by Columba: the church was 58 feet hy 20 , and the ealt roof is entire. On the floor, covered deep with cow-dung, is the tomb of the latt priorcfs with her figure praying to the Virgin Mary, and this infeription on the ledge: Hic jacet domina Anna Donaldi Terleti filia, quondam prioriffa de Yona, que oviit an'o $m^{\circ} d^{\circ}$ Nimo ejus animam Aluifimo commendamus: and another infcribed, Hic jacet Mariota flia Fokan: Lauchlain domini de..... A broad paved way leads hence to the cathedral ; and $\approx \mathrm{n}$ this way is a large handfome crofs called Macleaue's, the only one that remains of 360 , which were demolifhed here at the Reformation. Reilig Ouran, or the burying-place of Oran, is the large inclofure where the kings of Scotland, Ireland, and of the iffes, and their defcendants, were buried in three feveral chapels. The dean of the ifes, who travelled over them 1549, and whofe account has been copied by Buchanan, and publifhed at Edinburgh 1784, fays, that in his time on one of thefe chapels (or "tombes of Itain formit like little chapels with ane braid gray marble or quhin flain on the gavil of ilk ane of the tombes," containing, as the chronicle fays, the remains of 48 Scotch monarches, from Fergus II. to Macbeth, 16 of whom were pretended to be of the race of Alpin), was infcribed, Tumulus regum Scotia. The next was infcribed, Tumulus regum Hibernia, and contained four Irih monarchs: and the 3 d inferibed, Tumulus regum Norzeegie, contained tight Norwegian princes or viccroys of the Hebrides, while they were fubject to the crown of Norway. Boetius fays, that Fergus founded this abbey for the burial. place of his fucceflors, and caufed an office to be compofed for the funeral ceremeny. All that Mr Pennant could difcover here were ouly certain light remains, built in a ridged form and arched within, but the infcriptions lof. Thefe were called Gornaire nan righ or "the ridge of the kings.". Among thefe fones are to be feen only thefe two infcriptions in the Gaelic or Erfe language and ancient lrifh characters: Cros Dombail fat'afich, i. c. "tbe crofs of Donald LongShanks" and that of Uirbvine o Guin ; and another infrribed Hic jacret quatuor priores de Hy, Fobannes, Hugenius, Patricius, in decretis olims lacularius, qui obiit an. Dom. milles n:o quingertyfimo. Above 300 infcriptions were collecled here by Mr Sacheverel in 1688, and given to the earl of Argyle, but afterwards loft in the troubles of the family. The place is in a manner filled with grave flones, but fo over-grown with weeds, that few or none are at piefent to be feen, far lefs any iufciptions read. Here alfo flands the chapel of St Oran, the firft bulding begun by Coluriba, which the evil fpirits would not fuffer to fland till fome human vition was buried alive; for which fervice Oran offered himfelf, and his red grave-ftone is near the door. In this chapel are tombs of feveral chiefs, \&c. A little north-weft of the door is the pedettal of a crofs: on it are certain flones that feens to have been the fuports of a tomb. Numbers who vifit this ifland think it incumbent on them to turn each of thefe tbrice round, according to the courfe of the fun. Voz. IX. Part I.

They are called Clacba-brath; for it is thought that the lyath, or end of the world, will not arrive till the pedeflal on which they fland is worn through. Originally (fays Mr Sacheverel) here were three noble globes of white marble, placed on three ftone bafons, and thefe were turned round; but the fywod ordered them and 60 croffes to be thrown into the fea. The prefent flones are probably fubtituted in place of thefe globes. The precinct of thefe tombs was held facred, and enjoyed the privileges of a girth or fanctuary. Thefe places of retreat were by the ancient Scotch law, not to fheher indifcriminately every offender, as was the cafe in more bigotted times in Catholic countries; for here all atrocious criminals were excluded; and only the unfortunate delinquent, or the penitent finner, was fhielded from the inflant troke of rigorous juAice. A little to the north of this inclofure ftands the cathedral, built in form of a crofs, 115 feet long by ${ }^{23}$, the tranfept 70 feet: the pillars of the choir have their capitals charged with fcripture and other hiftories; and near the altar are the tombs of two abbots and a knight. A fragment remains of the altar. Atone of whitc marble veined with grey. This church is afcribed to Maldwin in the 7 th century but the prefent ftructure is far too magnificent for that age. Moll of the walls are built of red granite from the Nun's inland in the Sound. Two parallel valls of a covered way about 12 feet high and to wide, reach from the fouth-ealt corner to thic fea. In the churchyard is a fine crofs of a fingle piece of red granite, 14 feet high, 22 broad, and 10 inches thick. Near the foutheaft end is Mary's chapel. The monaftery is behind the clapel; of which only a piece of the cloiters remains, and fome facred black flones in a corner, on which contracts and alliances were made, and oaths fworn. Eaft of it was the abbot's gardens and offices. North of this was the palace of the bifhop of the ifles after the feparation of Man from them. This fee was endowed with 13 iflands; feveral of which were frequently taken away by the chicftains. The title of Soder, which fome explained Soter, Ewipp " the name of Chrift, or Soder, an imaginary town," is really derived from the dillinction of the diocefe into the northern iflands or Nordereys (i. e. all to the north of Adnamurchan point), and the Southern or Sudereys; which lat being the moft inportant, the inle of Man retained both titles.

Other ruins of monaftic buildings and offices may be traced, as well as fome druidical fepulchral remains. Several abbeys were derived from this, which with the illand was governed by an abbot-preflyter, who had rule even over bifhops. The place where Columba landed is a pebbly beach, where a heap of earth reprefents the form of his hhip. Near it is a hill with a circle of ftones called Cnoc- nar-aimgeal, or "the hill of angels," with whom the faint held conference ; and on Michaelmas day the inliabitants courfed their horfes round it, a remain of the cuftom of bringing them there to be bleffed. In former times, this illand was the place where the archives of Scotland and many valuable old manufcripts were kept. Of thefe moft are fuppofed to have been deflroyed at the Reformation ; but many, it is faid, were carried to the Scoteh college at Douay in France, and it is hoped fome of them may ftill be recovered. This once illuftrious feat of learning and

Qq
piety

Jonah piety has now no fehool for education, no ftemple for worfhip, no inflructor in seligion, unlefs vifited by the parith minitler from another ifland.

JONAH, or Proplecy of ToNat, a canonical book of the Old Teftament ; in which it is related, that Jonah (about 77 B. C.) was ordered to go and prophecy the dettruction of the Ninevites, on account of their wickednefs. But the prophet, inftead of obeying the divine command, embarked for Tarfhifh; when, a tempeft arifug, the mariners threw him into the fea: he was fwallowed by a great fifh; and after being three days and nights in his belly, was caft upon the land. Hereupon being fenfible of his palt danger and furprifug deliverance, he betook hinffelf to the journey and embafly to which he was appointed; and arriving at Ninevelh the metropolis of Alfyria, he, according to his commiffion, boldly laid open their fins and mifcarriages, and proclaimed their fudden overthow: upon which the whole city, by prayer and fafting, and a fpeedy repentance, happily averted the divine vengeance, and efcaped the threatened ruin. Jonah upon this, fearing to pafs for a falfe prophet, retired to a hill at fome diflance from the city; where God, by a miracle, condefcerided to thow him the unreafunablenefs of his difcontent.

JONAS (Jultus), a Proteftant divine, born at North Faufen, in Thuriugia, in 1493. He was one of Luther's moft zealous difciples. He contra\&ted a "rist friendfhip with Melancthon; became principal of the college of Wittemburg, and afterwards dean of the univerfity of that city. He wrote a treatife in favour of the marriage of priefts, and other works; and died in 1555.

Jonas (Arnagrimus), a learned Icclander, acquired great reputation by his fkill in the fciences, and particularly in aftronomy. He was coadjutor to Gundebran de Thorlac, bifhop of Hola, in Iceland He refufed that bithopric, after the death of Gundebran; an: died in $16+9$. He wrote feveral warks; the principal of which are, Idea verse Magifrotû's, and his hiltory and defcription of Iceland.

JONATHAN, the fon of Saul, celebrated in fa. ered liftory for his valonr, and his friendfhip for Da vid againft the intereft of his own houfe. Slain in battle $1055 \mathrm{~B} . \mathrm{C}$.

Gonathan Maccabias, hrother of Judas, a renowned general of the Jews. He forced Bacchides the Syrian general, who made war with the Jews, to aecept a peace; conquered Demetrius Soter, and afterwards Apollonius, that prince's general ; but, heing enfnared by Tryphon, was put to death 144 B. C.

JONES (Inigo), a celebrated Englifh architect, was the fon of a cloth-worker of London, and was born in 1572 . He was at firft put apprentice to a joiner; but early diftinguifhed himfelf by his inelinaion to drawing or defigning, and was particularly taken notice of for his fkill in landfcape painting. This afterwards recommended him to the favour of Wil. Biam earl of Pembreke, who fent him abroad with a hardfome allowance in order to perfect himfelf in that branch. He was no fooner at Rome, than he fonnd himfelf in his proper fpherc: he felt that nature had not formed hum to decorate cabinets, but to defign pabaces. He dropt the pencil and conceived Whitehall. In the ftate of Venice he faw the works of Palladio,
and learned how beautiful tafte may be exerted on a lefs thearre than the capital of an empire. How his abilities diffinguifed themfelves in a fout where they certainly had no opportunity to att, we are not told, though it would not be the leaft curious part of his hiftory ; certain it is, that, on the ftrength of his reputation at Venice, Chriltian IV. invited him to Denmark, and appointed him his architect; bur on what buildings he was employed in that country, we are yet to learn. James I. found him at Copenhagen, and queen Ann took him in the quality of her architect to Scotland. He ferved prince Henry in the fame capacit $y$, and the place of furveyor general of the works was granted to him in reverfion. On the death of that prince, with whom at leall all his lamented qualities did not die, Jones travelled once nore into Italy, and, affited by ripenefs of judg:nent, perfected his zatte. To the interval between thefe voyages Mr Walpole is inclined to allign thofe buildings of Inigo, which are lefs pure, and boider too mucli npon the baItard fyle, which one may call king Games's gethic. Inigo's defigus of that period are nut gothic, but have a littlenefs of parts, and a weisht of ornaments, with which the revival of the Grecian talte was encumbered, and which he fhook off in his grander defigns. The furveyor's place fell, and he returned to England; and, as if architecture was not all he had learned at Rome, with an air of Roman difinteretednefs he gave up the profits of his office, which he found extremely in debt; and prevailed upon the comptroller and paymatter to imitate his example, till the whole arrears were cleared.

In 1620, he was employed in a manner very unworthy of his genius: king James fet him upun dit:overing, that is, gueffing. who were the founders of S henge. His ideas were all Romanized; conf quenty, his partiality to his favourite people, which ought rather to have prevented him from charging thein with that mafs of barbarous clumfinels, made him conclude it a Roman temple.

In the tame year Jones was appointed one of the commiffuners for the repair of St Paul's; but which was not commenced till the year 1633 , when Lutud, then bifhop of London, laid the firtitione, and Inigo the fourth. In the rettoration of that cathedral, he made two capital fauls. He firtt renered the fides with very had Gothre ; and then added a Roman portho, magniticent and beautiful inciced, but which had no afflitity with the ancient parts that remained, and made his own Gothic appear ten times heavier. He committed the fame error at Winchefter, thrulling a fcreen in the Ruman or Grecian talle into the middle of that eathedral. Jones indeed was by no means fuccefsful when he attempted Gothic. The chapel of Lincoln's Inn has none of the characteriltics of that architecture. Tte cloyller beneath feems oppreffed by the weight of the building above.

Th. authors of the life of Jones place the erecting of the Banqueting-houfe in the reign of king Charles; but it appears, from the accounts of Nicholas Stone, that it was begun in 1619, and finifhed in two years-a fmall part of the pile defigned for the place of our kings; but fo complete in iifelf, that it llands a model of the moft pure and beautiful tafte. Several plates of the intended palace at Whitehali have been given;

## J O N [ 307 ] J O N

but Mr Walpole thinks, from no finifhed defign. The four great theets are evidently made up from general hints; nor could fuch a fource of invention and talle as the mind of Inigo ever produce fo much famenefs. The whole fabric, however, was fo glorious an idea, that one forgtts for a moment (hays Mr Walpole), in the regret for its not being executed, the confirmation of our liberties, obtained by a melancholy fcene that pafled befure the windows of that very Banqueting houfe.

In 1623 he was employed at Somerfet-houfe, where a chapel was to be fitted up for the Infanta, the intended bride of the prince. The chapel is ftill in being. The front to the river, part only of what was defigned, and the water-gate, were erected afterwards on the defigns of Inigo, as was the gate at Yorkfairs.

On the acceffion of Charles, Jones was continued in his pults under both kiug and queen. His fee as furveyor was 8 s .4 d . a day, with an alluwance of 461. a-year for houfe-rent, befides a clerk, and incidental expences. What greater rewards he had, are not upon record.

During the profperous ftate of the king's affairs. the pleafures of the court were carried on with much talle and magnticence. Poetry, painting, mufic, and architedure, were all called in to make them rational amufeanents. Mr Walpole is of opinion, that the celebrated fettivals of Louis XIV were copied from the thows exhibited at Whitehall, in lis time the noll polite court in Europe. Ben Johnfon was the laureat; Inigo Jones the inventor of the decorations; Laniere and Ferabofco compofed the fymphonies; the king, the queen, and the young nobility, danced in the interludes. We have accounts of many of thofe entertainments, called mafques; they had been introduced by lone of Denmark. Lord Burlington had a folio of the deligns for thele folemmetes, by Inigo's own thand, confifting of habits, malks, feenes, \&e. The harmony of thefe malks was a little interrupted by a war that broke out between the compofers, Inigo and Ben ; in which, whoever was the aggreffor, the turbulent temper of Johnfon took care to be moft in the wrong.

The works of Inigo Jones are not fcarce; Surgeon's hall is one of his beit works. One of the melt admired is the Arcdde of Covent-garden, and the Church: "T'wo ftructures (fays Mr Walpole), of which I want tafte to fee the beauties. In the arcade there is nothing remarkable; the pilatters are as arrant and homely ftripes as any plafterer would make. The barn roof over the portico of the church Atrikes my eyes with as little idea of dignity and beauty, as it could do if it covered nothing but a barn. It mult be owned, that the defect is not in the architect, but in the order. - Who ever faw a beautiful Tufcan building ? Would the Romans have chofen tbat order for a temple?" The expence of building that church was 45001.

Ambrefbury in Wilthire was defigned by Jones, but executed by his fcholar Webb. Jones was one of the firl that obferved the fame diminution of pilatters as in pillars. Lindfay-houfe in Lincoln's-Inn Fields, which he built, owes its chief grace to this lingularity. In 1618 a fpecial commifion was iffued to the lurd chancellor, the earls of Worcelter, Penibroke,

Arundel, and others, to plant and reduce to uniformity, Lincoln's-Inn Fields, as it thall be drawn by way of map, or ground-plot, by Inigo Jones, furveyorgeneral of the works. That fquare is laid out with a regard to fo trifling a fingularity, as to be of the exact dimentions of one of the pyramids: this would have been admired in thofe ages when the Fierp at Ken. nelworth Calle was erected in the form of an horle. fetter, and the Efcurial in the fhape of St Laurence's gridiron.

Colefhill in Berkhire, the feat of Sir Matthew Pleydell, built in 1650 , and Cobham-hall in Kent, were Jones's. He was employed to rebuild Caltle Amby, and finithed one front: but the civil war interrupted his progrcfs there and at Stoke-park in Northamptonfhire. Shaftbury-houfe, now the London Lyingin hofpital, on the ealt fide of Alderfgate-1treet, is a beantiful front. The Grange, the feat of the lord chancellor Henley in Hamplhire, is entirely of this mafter. It is not a large houfe, but by far one of the bett proofs of his tatte The hall, which opens to a fmall vellibule with a cupola, and the ltair-cafe adjoining, are beautiful models of the pureft and molt claffic antiquity. The gate of Beaufort-garden as Chelfea, defigned by Jones, was purchafed by lord Burlington, and tranfpurted to Chifwick. He drew a plan for a palace at Newmarket ; but not that wretched hovel that ftands there at prefent. One of the molt beaulifut of his works is the Queen's houfe at Greenwich. The firl idea of the holpital is faid to have been taken by his fcholar Webb, from his papers.

Inigo tatted early the misfortunes of his mafter. He was not only a favourite, but a Roman Catholic: in $16+6$, he paid 545 l. fur his delinquency and fequeHation. Whetlier it was hefore or after this fine, it is uncertain, that he and Stone the mafon buried their joint tlock in Scotland-yard; but an order being publifhed to encourage the informers of fucla concealments, and four perfons being privy to the fpot where the money was hid, it was taken up, and reburied in iambeth marth. Grief, misfortunes, and age, put an end to his life at Somerfet-houfe, July 21. 651. Siveral of his deligns have been publithed by Mr Kent, Mr Colin Campbell, and Mr Ifaac Ware. He lett in MS. fome curious notes on Paladio's architecture, which are inferted in an edition of Palladio publifhed in 1714.

IONIA, a country of Afia minor, bounded on the north by Eolia, on the welt by the Eyean and Icarian feas, on the fouth by Caria, and on the eall by Lydia and part of Caria. It was founded by colonies from Greece and particularly Attica, by the Ionians or luhjects of Ion. Ionia was divided into 12 fmall ftates which formed a celebrated confederacy often mentioned by the ancients. 'Thefe 12 tlates were lriene, Miletus, Colophon, Clazomenr, Ephefus, Lebedos, Teos, Hhocra, Erythra, Smyrua, and the capitals of Samos and Chios. The inhabitants of Ionia built a temple which they called Pan Ionium from the concourfe of people that nocked there from every part of Ionia. After they had enjoyed for fome time their freedom and independence, they were made tributary to the power of Lydia by Crofus. The Athenians affilted them to fhake off the flavery of the Aliatic monarchs; but they foon forgot their duty and rela-
ton to their mother -country, and joined Xerxes when he invaded Greece. They were delivered from the Perlian yoke by Alexander, and reftored to their orginal independence. They were reduced by the Roomans under the dictator Sola. Ionia has been always celebrated for the falubrity of the climate, the fruitfulnefs of the foil, and the genius of its inhabitans.

## IONiC order. See Architecture, no 45.

Ionic Dialect, in grammar, a manner of f peaking peculiar to the people of Ionia.

Ionic Ser g was the fir of the ancient facts of philofophers; the others were the Melic and Eleatic. The founder of this feet was Thales, who, being a native of Miletus in Ionia, occalioned his followers to aflume the appellation of Ionic: Thales was fucceeded by Anaximander, and he by Anaximenes, both of Miletus; Anaxagoras Clazomenius fucceeded them, and removed his fehool from Afia to Athens, where Soraes was his fcholar. It was the diflinguifhing tenet of this feet, that water was the principle of all natural things.

IUNIUM nark, a part of the Mediterranean Sea, at the bottom of the Adriatic. It lies between Sicily and Greece. That part of the Agean lea which lies on the coats of Ionia in A ia, is called the Sea of $I o-$ mia, and not the Ionian Sea. According to forme authors, the Ionian fear receives its name from Io, who foam acrofs there after the had been metamorphofed into a heifer.

JONK, or Jonene, in naval affairs, is a kind of fall hip, very common in the Eat Indies. There veffels are about the bigness of our fly-boats; and differ in the form of their building, according to the different methods of naval architecture unfed by the natons to which they belong. Their fails are frequently made of mats, and their anchors are made of wood.

JONSTON (Joh ni), a learned Polish naturalif and phyfician, born in 1603 . He travelled all over Europe, and procured elteem every where by his knowledge; afterward he bought the elate of Ziebendorf in the duchy of Liegnitz in Silefia, where he pent the remainder of his days. He wrote a natural hiftory of birds, fifth, quadrupeds, infects, ferments, and dragons, in folio: a piece upon the Hebrew and Greek feltvals, a thaumatography, and forme poems. He died in $\times 675$.

HOP $\lambda$, a fea-port town in Paleftine, lying fouth of Cefarea; and anciently the only port to Jerufalem, whence all the materials font from Tyre towards the building of Solomon's temple were brought bither and landed, (2 Chr. ii. 16.) It is faid to have been built by Japhet, and from him to have taken its name Fapho, afterwards moulded into $70 p p a$; and the very heathen geographers freak of it as built before the flood. It is now called $\mathcal{F}$ faa, fomewhat nearer to its frt appellation, and is but in a poor and mean condition.

JOR, the Hebrew for a river, which, joined with Dan, concurs to form the term Jordan. See Dan.

JORDANO (Luca), an eminent Italian painter, was born at Naples in 1632 . He became very early a difeiple of Jofeph Ribera; but going afterwards to Rome, he attached himself to the manner of Pietro da Cortona, whom he affined in his great works. Some of his pictures being feen by Charles II, king of

Spain, he engaged him in painting the Eleurial ; in which talk he acquitted himielf as a great painter. The king towed him a picture of Baffini, exprefing his concern that he had not a companion: Luca painted one fo exactly in Baflani's manner, that it was taken for a performance of that mailer; and for this feivice he was knighted, and gratified with feveral honourable and valuable employments. The great works he executed in Spain, gave him dill greater reputaton when he returned to Naples; fo that though he was a very quick workman, he could not fupply the eager demands of the citizens. No one, not even Tintoret, ever painted fo much as Jordano; and his generofity carried him fo far as to prefent altar-pieces to churches that were not able to purchafe them. His labours were rewarded with great riches; which he left to his family, when he died, in 1705 .

JORDANS (James), one of the mot eminent painters of the Flemish fehool, was born at Antwerp in 1593 . He learned the principles of his art from Adam Van Ort, whole daughter he married; which connection hindered him from gratifying his inclination of vifiting Italy. He improved mon under Rubens; for whom he worked, and from whom he drew his bet principles : his tatted directed him to large pieces; and his manner was ftrong, true; and fiveet. A great number of altar-pieces painted by him are preferved in the churches in the Netherlands, which maintain the reputation of this artily. He died in 1678 .

JORTIN (John), a very Icarned and ingenious Englifh clergyman, was born in Huntingdonhire, about the year 1701. Having forme private fortune of his own, and being of a peculiar difpoficion that could not folicit promotion, hie remained long without presferment. In $173^{8,}$, lord Winchefter gave him the living of Eaftwell in Kent ; but the place not agreeing with his health, he foo refigned it. Archbihop Herring, who had a great value for him, about the year 175 1 prefented him to the living of St Dunftan's in the Eat; and bifhop Ofbaldiflon in ${ }^{1} 762$ gave him that of Kenfington, with a prebend in St Paul's cathedral, and made him archdeacon of London. His temper, as well as his affect, was rather morofe and faturnine; but in company that he liked, he was at all times facetious, yet fill with a mixture of fol cerfurg fufeciorum. His fermons were fenfible and argumentative ; and would have made more impreffion on his hearers, had he been more attentive to the advantages flowing from a good delivery: but he appeared to greater advantage as a writer. His remarks on ecelefiaftical hifory, his fix differtations, his life of Erafmus, and his Sermons, were extremely well received by the public, and have undergone federal editions. He died in the year 1770 .

JOSEPH, the for of Jacob; memorable for his challity, and the honours conferred on him at the court of Egypt, \&c. He died in $16_{35}$ B. C. aged 110.

JOSEPHUS, the celebrated hitlerian of the Jews, was of noble birth, by his father Mattathias defended from the high-prielts, and by his mother of the bloodroyal of the Maccabees; he was born A. D. 37, under Caligula, and lived under Domitian. Ac 16 years of ape he betook himfelf to the feet of the Effenes, and then to the Pharifees; and having been fuccefsful in a

## J O U 309 ] J O U

mua journey to Rome, upon his return to Judxa he was made captain genctal of the Galilxans. Being taken prifcner by Vefpafian, he foretold his coming to the empire, and his own deliverance lyy his means. He accomponied Titus at the fiege of Jerufalem, and wrote his "Wars of the Jcws," which Titus ordered to be put in the public library. He afterwards lived at Rome, where he enjoyed the privileges of a Roman citizen, and where the emperors loaded him with favours, and granted him large penfions. Befides the above work, he wrote, I. Twenty books of Jewih antiquities, which he finifhed under Donitian. 2. 'Two books againt Appian. 3. An elegrant difcourfe on the martyrdom of the Maccabees. 4. His own life. Thefe works are excellently written in Greek.

JOSHUA, the renowned general of the Jews, who conducted them through the wildernefs, \&ec. died in $14^{2}+$ D. C. aged 110.
Joshen, a canonical book of the Old Teflament, containing a hillory of the wars and tranfactions of the perfon vihofe name it bears. This buok may be divided into threée parts: the firft of which is a hiftory of the conquef of the land of Canaan; the fecond, which begins at the 12 th chapter, is a defcription of that country, and the divifion of it among the tribes; and the third, comprifed in the two lalt chapters, contains the renewal of the covenant he caufed the Ifraelites to make, and the death of their victorious leader and governor. The whole comprehends a term of ${ }_{17}$, or, according to others, of 27 years.

JOSIAH, king of Judah; the deftroyer of idula. try, and the reftorer of the true worfhip, an excellent magiftrate, and a valiant general, was dain in batte, 609 l. C.

JOTAPATA (anc. grog.), a town of the Lower Galilee, diflant 40 fladia from Gabara; a very frong place, fituated on a rock, walled round, and encompaffed on all hands with mountains, fo as not to be feen but by thofe who came very near. It was with great difficulty taken by Vefpafian, being defended by Jofephus, who commanded in it ; when taken, it was ordered to be razed.

JOUBERT (Lawrence), counfellor and phyfician to the king of France, clancellor and judge of the univerfity of Montpelier, was born at Valance in Dauphiny in 1530. He became the difciple of Rondelet at Mentpelier; and at his death fuccecded to the regins profeflorfhip of that univerfity, where he had given abundant proofs of his merix, and ittengthened his reputation by the lectures he read in that capacity, as well as by the works he fublifhed. Henry III. who paffionately wifhed to have childen, fent for him to Paris, in hopes by his affillance to render his marriage fruitful; but he was difappointed, without any lofs of repute to Joubert. Much offence was indeed taken at a piece he publifhed under the title of Vulgar errors, in which he treated of virginity and generation more plainly than had evcr before been done in the French language. But, though he had promifed fomething more on the fame fubject, he was fo piqued at the clamour raifed againf it, that the public faw no more, of fix parts promifed, than the firft, and part of the fecond, though they were greatly called for. He died in 1582; and his ion Ifaac tranlated fome of his Latin paradoxes into French.

JOVIAN, the Roman emperor, clected by the army, aftcr the death of Julian the apoftate, in $3^{2} 3$. He at firll refufed, faying he would not command idolatrons foldicts; but, upon an affurance that they would embrace Chrilianity, he accepted the throne, and immediately fhut all the Pagan temples, and forbid their facrifices. But he did not long enjoy the dignity to which his merit had raifed him; being fufo focated in his bed by the fumes of a fire that had been made to dry the chamber, in $3^{6} 4$, the 3 3d of his age, and the eighth month of his reign. See Cosstantinople, $n^{7} 67$.

JOVIUS (I'aul), in Italian Giauso, a celebraied hiftorian, was bornat Como in Italy, in the year 1483. As his father died in his infancy, he was educated by Lis eldelt brother Benediat Jovins, under whom he became well fkilled in claffical leaning; and then went to Rome, for the fake of enjuying the benelit of the Vatican library. He thcre wrote lis lirt picce, De pifcibus Ronauis, which he dedicated to cardinal Leevis of Bourbon. He received a penfion of 500 crowns for many years from Francis I. king of France, whofe favour he fecured by his flatteries. But, in the following reign, having difgufted the confable Montmorency, his nane was Atruck out of the litt of penfioners. Jovius did not fuffer his fpirits to fink under his miffortune: he had obtained a high reputation in the learned world by his writings; and having always Thowed great refpect to the houfe of Medicis, on whofe praifes he tad expatiated in his works, he applied to Clement Vil. and obtained the bifhoprick of Nocera. His principal piece is his hitory, which is that of his own time thoughout the world, beginning with i 49 t, and extending to the year 154. This was the chief bufinefs of his life. For he formed the plan of it in the year 1515; and continued upon it till his death, which happened at Florence in 1552 . It is printed is three volumes folio. He is allowed to have been a man of wit as well as learning: he was matter of a bright and polithed Ilyle, and has many curious obfervations: but being a venal writer, his hiflories are not much credited.
JOURNAL, a day-book, regifter, or account of what paffes daily. See Diary.

Joursal, in Merchants Accounts, is a book into which every particular article is pofled out of the wafte-book, and made debtor. This is to be very clearly worded, and fairly engrofied. See BoorKiceping.

Jourval, in navigation, a fort of diary, or daily regifter of the flip's courfe, winds, and weather; together with a general account of whatever is mat terial to be remarked in the period of a fea-voyage.

In all fea-journals, the day, or what is called the $2+$ bours, terminates at noon, becaufe the errors of the dead-reckoning are at that period generally correeted by a folar obfervation. The daily compact ufually contains the fate of the weather; the varia= tion, increafe, or diminution of the wind; and the fuitable fhifting, reducing, or enlarging the quantity of fail extended; as alfo the mult material incidents of the voyage, and the condition of the thip and her crew; together with the difcovery of other fhips or fleets, land, fhoals, breakers, foundings, \&cc.

Journas, is alfo a name common for weekly efays, news.

## I P E [ 310$]$ I P E

Journal newfpapers, \&c. as the Gray's-Inn journal, the Weftmintler journal, \&c.

Journal, is alfo ufed for the titles of feveral hooks which come out at ftated times, and give abflracts, accounts, acc. of the new hooks that are publimed, and the new improvements daily made in arts and feiences;

JOURNEY, a track of ground paffed over in travelling by land; properly as much as may be paffed over in one day.

Management of a Horfe on a Fourner. See Horse.
JOURNEYMAN, properly ene who works by the day only; but the word is now ufed for any one who works under a maller, either by the day, the year, or the piece.

JOUVENET (John), a celcbrated French painter, was born at Rouen in 1644 ; where his father, who was a painter, bred him up to the fame profeflion: but his greatett improvement was confeffedly derived from the inftructions of Nicholas Pouffn, and ftudy. ing the works of that mafter. He acquired fo good a knowledge of defign, as qualified him for employment in feveral grand works in the palaces at Paris and Trianon ; in many of the churches and convents; and in the holpital of invalids, whete he painted the twelve apoltles, each figure being 14 feet high. He was efteemed to have a ready invention, to be correct in his lefigns, and to have a tafte for grandeur in his compofitions: it is obferved of this artift, that being deprived of the ufe of his right hand by a paralytic diforder, he neverthelefs continued to paint with his left. He died in the year 1717.

JOY, in ethics, is that paffion which is produced by love, regarding its object as prefent, either immediately or in profpect, in reality or imagination. This paftion has been found to increafe the perspiration and urine of human bodies.

## JOYNERY. See Jonery.

IPECACUANHA, in the materia medica, a WeftIndian root, of which thete are principally two kinds, diftinguifted by their colour, and brought from different places; but both poffefling the fame virtues, tho' in a different degree. The one is afh-coloured or grey, and brought from Peru; the other is brown, and is brought from the Brafils: and thefe are indifferentIy fent into Europe under the general name of ipecacuanba.

Thife two forts have been by fome fuppofed to be the roots of two different plants: but, according to others, this is a miltake; the only difference being that one grows in a different place, and in a richer and moifer foil, and is better fupplied with juices than the other. The plant they belong to is a fpecies of Psychotria.

The all-coloured ipecacuan is a fmall wrinkled root, bent and contorted into a great variety of figures, brought over in thort pieces full of wrinkles, and deep circular fiffures, quite down to a fmall white woody fibre that runs in the middle of each piece: the cortical part is compact, brittle, looks fmooth and refinous upon breaking: it has very little fmell; the rafte is bitterifl and fubacrid, covering the tongue as it were with a kind of mucilage. The brown fort is fmall, and fomewhat more wrinkled than the foregoing; of a brown or blackifh colour without, and white with-
in. The firft fort, the afli coloured or grey ipecacuan, is that ufually prefersed for medicinal ufe. The brown has been fometimes obfersed, tven in a fmall dofe, to produce violent efircts. A third fort, called the subite from its colour. has alfo been diftinguifhed. It is woody, has no wrinkles, and no perceptible bitternefs in talte This, though taken in a large dofe, has fcarce any effect at all It is fuppofed to belong to a fpecies of Viola. Mr Geoffroy calls this fort buflard ipecactuan, and complains that it is an impnfition upon the public. Geoffroy, Neumann, Dale, and Sir Hans Sloane, inform us, that the ronts of a kind of apocynum (dogs-bane) are too frequently brought over inftead of it; and inftances are given of ill confequences following from the ufe of it. But if the marks above laid down. particularly the afh colour, brittlenefs, deep wrinkles, and bitterihl tafte, be carefully attended to, all mitakes of this kind may be prevented.
